| <i>udf-id</i>                                 | Indicates the ID of UDF. (Range:1 to 8)                                                                                                                                                                                                                |
| <i>header</i>                                 | Indicates the protocol layer.                                                                                                                                                                                                                          |
| <i>pos</i>                                    | Indicates the offset. (Range:0 to 126)                                                                                                                                                                                                                 |
| <i>value</i>                                  | Indicates the data (2 bytes).                                                                                                                                                                                                                          |

|                  |                                               |
|------------------|-----------------------------------------------|
| <i>mask</i>      | Indicates the mask (2 bytes).                 |
| <b>int-flag</b>  | Matches the int header of the packets.        |
| <b>mpls</b>      | Matches the IP field of the MPLS packets.     |
| <b>vxlan</b>     | Matches the quintet of the VXLAN packets.     |
| <b>tagged</b>    | Matches the tagged VXLAN packets.             |
| <b>udp-dport</b> | Matches the UDP port ID of the VXLAN packets. |
| <i>dport</i>     | UDP port ID.                                  |

**Defaults**

None

**Command****Mode**

Global configuration mode.

**Usage Guide**

To filter the data by using the access control list, you must first define a series of rule statements by using the access list. You can use ACLs of the appropriate types according to the security needs:

The standard IP ACL (1 to 99, 1300 to 1999) only controls the source IP addresses.

The extended IP ACL (100 to 199, 2000 to 2699) can enforce strict control over the source and destination IP addresses.

The extended MAC ACL (700 to 799) can match against the source/destination MAC addresses and Ethernet type.

The extended expert access list (2700 to 2899) is a combination of the above and can match and filter the VLAN ID.

For the layer-3 routing protocols including the unicast routing protocol and multicast routing protocol, the following parameters are not supported by the ACL: **precedence** *precedence/tos*

*tos/fragments/fragment-ipid fragment-ipid/range lower upper/time-range time-range-name*

The TCP Flag includes part or all of the following:

- urg
- ack
- psh
- rst
- syn
- fin

The packet precedence is as below:

- critical
- flash
- flash-override
- immediate
- internet

- network
- priority
- routine

The service types are as below:

- max-reliability
- max-throughput
- min-delay
- min-monetary-cost
- normal

The ICMP message types are as below:

- administratively-prohibited
- dod-host-prohibited
- dod-net-prohibited
- echo
- echo-reply
- fragment-time-exceeded
- general-parameter-problem
- host-isolated
- host-precedence-unreachable
- host-redirect
- host-tos-redirect
- host-tos-unreachable
- host-unknown
- host-unreachable
- information-reply
- information-request
- mask-reply
- mask-request
- mobile-redirect
- net-redirect
- net-tos-redirect
- net-tos-unreachable
- net-unreachable

- network-unknown
- no-room-for-option
- option-missing
- packet-too-big
- parameter-problem
- port-unreachable
- precedence-unreachable
- protocol-unreachable
- redirect
- device-advertisement
- device-solicitation
- source-quench
- source-route-failed
- time-exceeded
- timestamp-reply
- timestamp-request
- ttl-exceeded
- unreachable

The TCP ports are as follows. A port can be specified by port name and port number:

- bgp
- chargen
- cmd
- daytime
- discard
- domain
- echo
- exec
- finger
- ftp
- ftp-data
- gopher
- hostname
- ident

- irc
- klogin
- kshell
- ldp
- login
- nntp
- pim-auto-rp
- pop2
- pop3
- smtp
- sunrpc
- syslog
- tacacs
- talk
- telnet
- time
- uucp
- whois
- www

The UDP ports are as follows. A UDP port can be specified by port name and port number.

- biff
- bootpc
- bootps
- discard
- dnsix
- domain
- echo
- isakmp
- mobile-ip
- nameserver
- netbios-dgm
- netbios-ns
- netbios-ss

- ntp
- pim-auto-rp
- rip
- snmp
- snmptrap
- sunrpc
- syslog
- tacacs
- talk
- tftp
- time
- who
- xdmcp

The Ethernet types are as below:

- aarp
- appletalk
- decnet-iv
- diagnostic
- etype-6000
- etype-8042
- lat
- lavc-sca
- mop-console
- mop-dump
- mumps
- netbios
- vines-echo
- xns-idp

The UDF headers are as below:

- I2-head
- I3-head
- I4-head
- I5-head

**Configuration** 1. Example of the standard IP ACL**Examples**

The following basic IP ACL allows the packets whose source IP addresses are 192.168.1.64 - 192.168.1.127 to pass:

```
Ruijie (config)#access-list 1 permit 192.168.1.64 0.0.0.63
```

## 2. Example of the extended IP ACL

The following extended IP ACL allows the DNS messages and ICMP messages to pass:

```
Ruijie(config)#access-list 102 permit tcp any any eq domain log
Ruijie(config)#access-list 102 permit udp any any eq domain log
Ruijie(config)#access-list 102 permit icmp any any echo log
Ruijie(config)#access-list 102 permit icmp any any echo-reply
```

## 3. Example of the extended MAC ACL

This example shows how to deny the host with the MAC address 00d0f8000c0c to provide service with the protocol type 100 on gigabit Ethernet port 1/1. The configuration procedure is as below:

```
Ruijie(config)#access-list 702 deny host 00d0f8000c0c any aarp
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# mac access-group 702 in
```

## 4. Example of the extended expert ACL

The following example shows how to create and display an extended expert ACL. This expert ACL denies all the TCP packets with the source IP address 192.168.12.3 and the source MAC address 00d0.f800.0044.

```
Ruijie(config)#access-list 2702 deny tcp host 192.168.12.3 mac 00d0.f800.0044
any any
Ruijie(config)# access-list 2702 permit any any any any
Ruijie(config)# show access-lists
expert access-list extended 2702
10 deny tcp host 192.168.12.3 mac 00d0.f800.0044 any any
10 permit any any any any
```

**Related  
Commands**

| Command                  | Description        |
|--------------------------|--------------------|
| <b>show access-lists</b> | Show all the ACLs. |

**mac access-group**

Apply the extended MAC ACL on the interface.

**Platform** N/A**Description**

### 1.3 access-list list-remark

Use this command to write a helpful comment (remark) for an access list. Use the **no** form of this command to remove the remark.

**access-list** *id* **list-remark** *text*

**no access-list** *id* **list-remark**

**Parameter  
Description**

| Parameter   | Description                                                                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>id</i>   | Access list number.<br>Standard IP ACL: 1 to 99, 1300 to 1999.<br>Extended IP ACL: 100 to 199. 2000 to 2699.<br>Extended MAC ACL: 700 to 799.<br>Extended Expert ACL: 2700 to 2899. |
| <i>text</i> | Comment that describes the access list.                                                                                                                                             |

**Defaults** The access lists have no remarks by default.

**Command  
Mode** Global configuration mode

**Usage Guide** You can use this command to write a helpful comment for a specified access list. If the specified access list does not exist, the command will create the access list, then add remarks for the access list.

**Configuration Examples** The following example writes a comment of "this acl is to filter the host 192.168.4.12" for ACL100.

```
Ruijie(config)# ip access-list extended 100
Ruijie(config)# access-list 100 list-remark this acl is to filter the host
192.168.4.12
```

**Related  
Commands**

| Command                              | Description                                                                                |
|--------------------------------------|--------------------------------------------------------------------------------------------|
| <b>show access- lists</b>            | Displays all access lists, including the remarks for the access lists.                     |
| <b>show access-lists</b> <i>id</i>   | Displays the access list of a specified number, including the remarks for the access list. |
| <b>show access-lists</b> <i>name</i> | Displays the access list of a specified name, including the remarks for the access list.   |

**Platform****Description**

## 1.4 access-list remark

Use this command to write a helpful comment (remark) for an entry in a numbered access list. Use the **no** form of this command to remove the remark.

**access-list** *id* **remark** *text*

**no access-list** *id* **remark** *text*

**Parameter****Description**

| Parameter   | Description                                                                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>id</i>   | Access list number.<br>Standard IP ACL: 1 to 99, 1300 to 1999.<br>Extended IP ACL: 100 to 199. 2000 to 2699.<br>Extended MAC ACL: 700 to 799.<br>Extended Expert ACL: 2700 to 2899. |
| <i>text</i> | Comment that describes the access list entry.                                                                                                                                       |

**Defaults**

The access list entries have no remarks by default.

**Command**

Global configuration mode

**Mode****Usage Guide**

You can use this command to write a helpful comment for an entry in a specified access list. If the specified access list does not exist, the command will create the access list, then add remarks for the access entry.

**Configuration**

The following example writes a comment for an entry in ACL102.

**Examples**

```
Ruijie(config)# access-list 102 remark deny-host-10.1.1.1
```

**Related****Commands**

| Command                              | Description                                                                                      |
|--------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>show access-lists</b>             | Displays all access lists, including the remarks for the access list entries.                    |
| <b>show access-lists</b> <i>id</i>   | Displays the access list of a specified number, including the remarks for the access list entry. |
| <b>show access-lists</b> <i>name</i> | Displays the access list of a specified name, including the remarks for the access list entry.   |

**Platform****Description**

## 1.5 clear counters access-list

Use this command to clear counters of packets matching ACLs.

**clear counters access-list** [ *id* | *name* ]

### Parameter Description

| Parameter   | Description        |
|-------------|--------------------|
| <i>id</i>   | Access list number |
| <i>name</i> | Access list name   |

### Defaults

**Command** Privileged EXEC mode  
**Mode**

**Usage Guide** This command is used to clear the counters of packets matching the specified or all ACLs.

**Configuration** The following example clears the packet matching counter of ACL No. 2700:

### Examples

```
Ruijie #show access-lists 2700
expert access-list extended 2700
    10 permit ip VID 4 host 192.168.3.55 any host 192.168.99.6 any (88 matches)
    20 deny tcp any any eq login any any (33455 matches)
    30 permit tcp any any host 192.168.6.9 any (10 matches)

Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# clear expert access-list counters 2700
Ruijie(config)# end
Ruijie #show access-lists 2700
expert access-list extended 2700
    10 permit ip VID 4 host 192.168.3.55 any host 192.168.99.6 any
    20 deny tcp any any eq login any any
    30 permit tcp any any host 192.168.6.9 any
```

### Related Commands

| Command                   | Description                  |
|---------------------------|------------------------------|
| <b>expert access-list</b> | Defines an expert ACL.       |
| <b>deny</b>               | Defines a deny ACL entry.    |
| <b>permit</b>             | Defines a permits ACL entry. |

**Platform** N/A

**Description**

## 1.6 clear access-list counters

Use this command to clear counters of packets matching the deny entries in ACLs.

**clear access-list counters** [*id* | *name*]

**Parameter  
Description**

| Parameter   | Description        |
|-------------|--------------------|
| <i>id</i>   | Access list number |
| <i>name</i> | Access list name   |

**Defaults**

**Command** Privileged EXEC mode  
**Mode**

**Usage Guide** This command is used to clear the counters of packets matching the deny entries in ACLs.

**Configuration** The following example clears the packet matching counter of ACL No. 1:

**Examples**

Before configuration:

```
Ruijie #show access-lists
ip access-list standard 1
    10 deny host 50.1.1.2 (10 matches)
    20 permit host 60.1.1.2 (15 matches)
    (10 packets filtered)
```

After configuration:

```
Ruijie# end
Ruijie# clear access-list counters
Ruijie# show access-lists
ip access-list standard 1
    10 deny host 50.1.1.2 (10 matches)
    20 permit host 60.1.1.2 (15 matches)
```

**Related  
Commands**

| Command            | Description                  |
|--------------------|------------------------------|
| expert access-list | Defines an expert ACL.       |
| deny               | Defines a deny ACL entry.    |
| permit             | Defines a permits ACL entry. |

**Platform** N/A  
**Description**

## 1.7 deny

One or multiple **deny** conditions are used to determine whether to forward or discard the packet. In ACL configuration mode, you can modify the existent ACL or configure according to the protocol details.

### 1. Standard IP ACL

```
[sn] deny {source source-wildcard | host source | any} interface idx {[time-range tm-range-name]
[ log ]
```

### 2. Extended IP ACL

```
[ sn ] deny protocol source source-wildcard destination destination-wildcard [[ precedence
precedence ] [ tos tos ] [ dscp dscp ] [ecn ecn] ] [ fragment ] [ fragment-ipid fragment-ipid ] [ range
lower upper ] [ udf udf-id header pos value mask ] [ time-range time-range-name ] [ log ]
```

Extended IP ACLs of some important protocols:

- Internet Control Message Prot (ICMP)

```
[ sn ] deny icmp { source source-wildcard | host source | any } { destination destination-wildcard |
host destination | any } [ icmp-type ] [ [ icmp-type [ icmp-code ] ] [ icmp-message ] ] [ precedence
precedence ] [ tos tos ] [ fragment ] [ fragment-ipid fragment-ipid ] [ udf udf-id header pos value
mask ] [ time-range time-range-name ]
```

- Transmission Control Protocol (TCP)

```
[ sn ] deny tcp { source source-wildcard | host Source | any } [ operator port [ port ] ] { destination
destination-wildcard | host destination | any } [ operator port [ port ] ] [[ precedence precedence ]
[ tos tos ] [ dscp dscp ] [ecn ecn] ] [ fragment ] [ fragment-ipid fragment-ipid ] [ range lower upper ]
[ udf udf-id header pos value mask ] [ time-range time-range-name ] [ match-all tcp-flag ]
established ]
```

- User Datagram Protocol (UDP)

```
[ sn ] deny udp { source source-wildcard | host source | any } [ operator port [ port ] ] { destination
destination-wildcard | host destination | any } [ operator port [ port ] ] [[ precedence precedence ]
[ tos tos ] [ dscp dscp ] [ecn ecn] ] [ fragment ] [ fragment-ipid fragment-ipid ] [ range lower
upper ] [ udf udf-id header pos value mask ] [ time-range time-range-name ]
```

### 3. Extended MAC ACL

```
[ sn ] deny { any | host source-mac-address } { any | host destination-mac-address } [ ethernet-type ]
[ cos [ out ] [ inner in ] ]
```

### 4. Extended expert ACL

```
[ sn ] deny [ protocol | [ ethernet-type ] [ cos [ out ] [ inner in ] ] ] [ [ VID [ out ] [ inner in ] ] ] { source
source-wildcard | host source | any } { host source-mac-address | any } { destination
destination-wildcard | host destination | any } { host destination-mac-address | any } [ [ precedence
precedence ] [ tos tos ] [ dscp dscp ] [ecn ecn] ] [ fragment ] [ fragment-ipid fragment-ipid ] [ range
lower upper ] [ [ udf udf-id header pos value mask ] [ int-flag-a ] [ int-flag-b ] ] [ time-range
time-range-name ]
```

- When you select the ethernet-type field or cos field:

```
[sn] deny {[ethernet-type][cos [out] [inner in]]} [[VID [out][inner in]]] {source source-wildcard | host
```

*source | any* { *host source-mac-address | any* } { *destination destination-wildcard | host destination | any* } { *host destination-mac-address | any* } [ *udf udf-id header pos value mask* ] [ *time-range time-range-name* ]

- When you select the protocol field:

[ *sn* ] **deny protocol** [ [ **VID** [ *out* ] [ *inner in* ] ] ] { *source source-wildcard | host source | any* } { *host source-mac-address | any* } { *destination destination-wildcard | host destination | any* } { *host destination-mac-address | any* } [ [ **precedence** *precedence* ] [ **tos** *tos* ] ] [ **dscp** *dscp* ] [ **ecn** *ecn* ] ] [ **fragment** ] [ **fragment-ipid** *fragment-ipid* ] [ **range** *lower upper* ] [ [ **udf** *udf-id header pos value mask* ] | [ *int-flag-a* ] [ *int-flag-b* ] ] [ **time-range** *time-range-name* ]

- Extended expert ACLs of some important protocols

#### Internet Control Message Protocol (ICMP)

[ *sn* ] **deny icmp** [ [ **VID** [ *out* ] [ *inner in* ] ] ] { *source source-wildcard | host source | any* } { *host source-mac-address | any* } { *destination destination-wildcard | host destination | any* } { *host destination-mac-address | any* } [ *icmp-type* ] [ [ *icmp-type* [ *icmp-code* ] ] | [ *icmp-message* ] ] [ [ **precedence** *precedence* ] [ **tos** *tos* ] ] [ **dscp** *dscp* ] [ **ecn** *ecn* ] ] [ **fragment** ] [ **fragment-ipid** *fragment-ipid* ] [ **udf** *udf-id header pos value mask* ] [ **time-range** *time-range-name* ]

[ *sn* ] **deny udp** [ [ **VID** [ *out* ] [ *inner in* ] ] ] { *source source-wildcard | host source | any* } { *host source-mac-address | any* } [ *operator port* [ *port* ] ] { *destination destination-wildcard | host destination | any* } { *host destination-mac-address | any* } [ *operator port* [ *port* ] ] [ [ **precedence** *precedence* ] [ **tos** *tos* ] ] [ **dscp** *dscp* ] [ **ecn** *ecn* ] ] [ **fragment** ] [ **fragment-ipid** *fragment-ipid* ] [ **range** *lower upper* ] [ [ **udf** *udf-id header pos value mask* ] | [ *int-flag-a* ] [ *int-flag-b* ] ] [ **time-range** *time-range-name* ]

#### Address Resolution Protocol (ARP)

[ *sn* ] **deny arp** { *vid vlan-id* } [ *host source-mac-address | any* ] [ *host destination-mac-address | any* ] { *sender-ip sender-ip-wildcard | host sender-ip | any* } { *sender-mac sender-mac-wildcard | host sender-mac | any* } { *target-ip target-ip-wildcard | host target-ip | any* } [ **udf** *udf-id header pos value mask* ]

#### Virtual Extensible LAN(VXLAN):

[ *sn* ] **deny vxlan** { **tcp** | **udp** } { *source source-wildcard | host source | any* } [ **eq** *port* ] { *destination destination-wildcard | host destination | any* } [ **eq** *port* ] [ **tagged** ] [ **udp-dport** *dport* ] [ **time-range** *time-range-name* ]

#### 5. Extended IPv6 ACL

[ *sn* ] **deny protocol** { *source-ipv6-prefix/prefix-length | any* | *host source-ipv6-address* } { *destination-ipv6-prefix / prefix-length | any* | *host destination-ipv6-address* } [ **dscp** *dscp* ] [ **flow-label** *flow-label* ] [ **fragment** ] [ **range** *lower upper* ] [ **udf** *udf-id header pos value mask* ] [ **time-range** *time-range-name* ]

*time-range-name*]

Extended ipv6 ACLs of some important protocols:

#### Internet Control Message Protocol (ICMP)

[*sn*]**deny icmp** {*source-ipv6-prefix / prefix-length* | **any** *source-ipv6-address* | **host**}  
 {*destination-ipv6-prefix / prefix-length* | **host** *destination-ipv6-address* | **any**} [*icmp-type*] [*icmp-type*  
*icmp-code*] | [*icmp-message*] [**dscp** *dscp*] [**flow-label** *flow-label*] [**fragment**] [ **udf** *udf-id* *header pos*  
*value mask* ] [**time-range** *time-range-name*]

#### Transmission Control Protocol (TCP)

[*sn*] **deny tcp** {*source-ipv6-prefix / prefix-length* | **host** *source-ipv6-address* | **any**} [*operator* **port** [*port*]]  
 {*destination-ipv6-prefix / prefix-length* | **host** *destination-ipv6-address* | **any**} [*operator* **port** [*port*]]  
 [**dscp** *dscp*] [**flow-label** *flow-label*] [**fragment**] [**range** *lower upper*] [ **udf** *udf-id* *header pos* *value*  
*mask* ] [**time-range** *time-range-name*] [**match-all** *tcp-flag* | **established**]

#### User Datagram Protocol (UDP)

[*sn*] **deny udp** {*source-ipv6-prefix/prefix-length* | **host** *source-ipv6-address* | **any**} [*operator* **port**  
 [*port*]] {*destination-ipv6-prefix /prefix-length* | **host** *destination-ipv6-address* | **any**} [*operator* **port**  
 [*port*]] [**dscp** *dscp*] [**flow-label** *flow-label*] [**fragment**] [**range** *lower upper*] [ **udf** *udf-id* *header pos*  
*value mask* ] [**time-range** *time-range-name*]

#### Parameter Description

| Parameter                                 | Description                                                                                                                                                                                                                                            |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>sn</i>                                 | ACL entry sequence number                                                                                                                                                                                                                              |
| <b>deny</b>                               | If not matched, access is denied.                                                                                                                                                                                                                      |
| <i>source</i>                             | Specify the source IP address (host address or network address).                                                                                                                                                                                       |
| <i>source-wildcard</i>                    | It can be discontinuous, for example, 0.255.0.32.                                                                                                                                                                                                      |
| <i>protocol</i>                           | IP protocol number. It can be one of EIGRP, GRE, IPINIP, IGMP, NOS, OSPF, ICMP, UDP, TCP, and IP. It can also be a number representing the IP protocol between 0 and 255. The important protocols such as ICMP, TCP, and UDP are described separately. |
| <i>destination</i>                        | Specify the destination IP address (host address or network address).                                                                                                                                                                                  |
| <i>destination-wildcard</i>               | Wildcard of the destination IP address. It can be discontinuous, for example, 0.255.0.32.                                                                                                                                                              |
| <b>fragment</b>                           | Packet fragment filtering                                                                                                                                                                                                                              |
| <b>fragment-ipid</b> <i>fragment-ipid</i> | Fragment ID of the header in segmented packet                                                                                                                                                                                                          |
| <b>precedence</b>                         | Specify the packet priority.                                                                                                                                                                                                                           |
| <i>precedence</i>                         | Packet precedence value (0 to 7)                                                                                                                                                                                                                       |
| <b>range</b>                              | Layer4 port number range of the packet.                                                                                                                                                                                                                |
| <i>lower</i>                              | Lower limit of the layer4 port number.                                                                                                                                                                                                                 |
| <i>upper</i>                              | Upper limit of the layer4 port number.                                                                                                                                                                                                                 |
| <b>time-range</b>                         | Time range of packet filtering                                                                                                                                                                                                                         |
| <i>time-range-name</i>                    | Time range name of packet filtering                                                                                                                                                                                                                    |
| <b>tos</b>                                | Specify type of service.                                                                                                                                                                                                                               |
| <i>tos</i>                                | ToS value (0 to 15)                                                                                                                                                                                                                                    |
| <i>icmp-type</i>                          | ICMP message type (0 to 255)                                                                                                                                                                                                                           |

|                                               |                                                                                             |
|-----------------------------------------------|---------------------------------------------------------------------------------------------|
| <i>icmp-code</i>                              | ICMP message type code (0 to 255)                                                           |
| <i>icmp-message</i>                           | ICMP message type name                                                                      |
| <i>operator</i>                               | Operator (lt-smaller, eq-equal, gt-greater, neq-unequal, range-range)                       |
| <b>port</b> [ <i>port</i> ]                   | Port number; range needs two port numbers, while other operators only need one port number. |
| <b>host</b> <i>source-mac-address</i>         | Source physical address                                                                     |
| <b>host</b><br><i>destination-mac-address</i> | Destination physical address                                                                |
| <b>VID</b> <i>vid</i>                         | Match the specified VID.                                                                    |
| <i>ethernet-type</i>                          | Ethernet type                                                                               |
| <b>match-all</b>                              | Match all the bits of the TCP flag.                                                         |
| <i>tcp-flag</i>                               | Match the TCP flag.                                                                         |
| <b>established</b>                            | Match the RST or ACK bits, not other bits of the TCP flag.                                  |
| <b>udf</b>                                    | Indicates the customized field.                                                             |
| <i>udf-id</i>                                 | Indicates the ID of UDF. (Range:1 to 8)                                                     |
| <i>header</i>                                 | Indicates the protocol layer.                                                               |
| <i>pos</i>                                    | Indicates the offset. (Range:0 to 126)                                                      |
| <i>value</i>                                  | Indicates the data (2 bytes).                                                               |
| <i>mask</i>                                   | Indicates the mask (2 bytes).                                                               |
| <b>int-flag</b>                               | Matches the int header of the packets.                                                      |
| <i>source-ipv6-prefix</i>                     | Source IPv6 network address or network type                                                 |
| <i>destination-ipv6-prefix</i>                | Destination IPv6 network address or network type                                            |
| <i>prefix-length</i>                          | Prefix mask length                                                                          |
| <i>source-ipv6-address</i>                    | Source IPv6 address                                                                         |
| <i>destination-ipv6-address</i>               | Destination IPv6 address                                                                    |
| <b>dscp</b>                                   | Differential Service Code Point                                                             |
| <i>dscp</i>                                   | Code value, within the range of 0 to 63                                                     |
| <b>ecn</b>                                    | Specifies the congestion notification type.                                                 |
| <i>ecn</i>                                    | Specifies the congestion notification type value (0 to 3).                                  |
| <b>flow-label</b>                             | Flow label                                                                                  |
| <i>flow-label</i>                             | Flow label value, within the range of 0 to 1048575.                                         |
| <i>protocol</i>                               | For the IPv6, the field can be ipv6   icmp   tcp   udp and number in the range 0 to 255     |
| <b>time-range</b>                             | Time range of the packet filtering                                                          |
| <i>time-range-name</i>                        | Time range name of the packet filtering                                                     |
| <b>mpls</b>                                   | Matches the IP field of MPLS packets.                                                       |
| <b>vxlan</b>                                  | Matches the quintet of the VXLAN packets.                                                   |
| <b>tagged</b>                                 | Matches the tagged VXLAN packets.                                                           |
| <b>udp-dport</b>                              | Matches the UDP port ID of the VXLAN packets.                                               |
| <i>dport</i>                                  | UDP port ID.                                                                                |

**Defaults**

No entry

**Command**           ACL configuration mode.

**mode**

**Usage Guide**       Use this command to configure the filtering entry of ACLs in ACL configuration mode.

**Configuration Examples**   The following example shows how to create and display an extended expert ACL. This expert ACL denies all the TCP packets with the source IP address 192.168.4.12 and the source MAC address 001300498272.

```
Ruijie(config)#expert access-list extended 2702
Ruijie(config-exp-nacl)#deny tcp host
192.168.4.12 host 0013.0049.8272 any any
Ruijie(config-exp-nacl)#permit any any any any
Ruijie(config-exp-nacl)#show access-lists
expert access-list extended 2702
10 deny tcp host 192.168.4.12 host 0013.0049.8272 any any
20 permit any any any any
Ruijie(config-exp-nacl)#
```

This example shows how to use the extended IP ACL. The purpose is to deny the host with the IP address 192.168.4.12 to provide services through the TCP port 100 and apply the ACL to Interface gigabitethernet 1/1. The configuration procedure is as below:

```
Ruijie(config)# ip access-list extended ip-ext-acl
Ruijie(config-ext-nacl)# deny tcp host 192.168.4.12 eq 100 any
Ruijie(config-ext-nacl)# show access-lists
ip access-list extended ip-ext-acl
10 deny tcp host 192.168.4.12 eq 100 any
Ruijie(config-ext-nacl)#exit
Ruijie(config)#interface gigabitethernet 1/1
Ruijie(config-if)#ip access-group ip-ext-acl in
Ruijie(config-if)#
```

This example shows how to use the extended MAC ACL. The purpose is to deny the host with the MAC address 0013.0049.8272 to send Ethernet frames of the type 100 and apply the rule to Interface gigabitethernet 1/1. The configuration procedure is as below:

```
Ruijie(config)#mac access-list extended mac1
Ruijie(config-mac-nacl)#deny host 0013.0049.8272 any aarp
Ruijie(config-mac-nacl)# show access-lists
mac access-list extended mac1
10 deny host 0013.0049.8272 any aarp
Ruijie(config-mac-nacl)#exit
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# mac access-group mac1 in
```

This example shows how to use the standard IP ACL. The purpose is to deny the host with the IP address 192.168.4.12 and apply the rule to Interface gigabitethernet 1/1. The configuration procedure is as below:

```
Ruijie(config)#ip access-list standard 34
```

```

Ruijie(config-ext-nacl)# deny host 192.168.4.12
Ruijie(config-ext-nacl)#show access-lists
ip access-list standard 34
10 deny host 192.168.4.12
Ruijie(config-ext-nacl)#exit
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# ip access-group 34 in

```

This example shows how to use the extended IPV6 ACL. The purpose is to deny the host with the IP address 192.168.4.12 and apply the rule to Interface gigabitethernet 1/1. The configuration procedure is as below:

```

Ruijie(config)#ipv6 access-list extended v6-acl
Ruijie(config-ipv6-nacl)#11 deny ipv6 host 192.168.4.12 any
Ruijie(config-ipv6-nacl)#show access-lists
ipv6 access-list extended v6-acl
11 deny ipv6 host 192.168.4.12 any
Ruijie(config-ipv6-nacl)# exit
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# ipv6 traffic-filter v6-acl in

```

**Platform** N/A

**Description**

## 1.8 expert access-group

Use this command to apply the specified expert access list on the specified interface or globally. Use the **no** form of the command to remove the application.

**expert access-group** { *id* | *name* } { **in** | **out** } [ **counter-only** ] [ **forward-plane** ] [ **priority** ]

**no expert access-group** { *id* | *name* } { **in** | **out** } [ **counter-only** ] [ **counter-only** ] [ **forward-plane** ] [ **priority** ]

| Parameter<br>Description | Parameter            | Description                                                                                                                                             |
|--------------------------|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <i>id</i>            | Expert access list number: 2700 to 2899                                                                                                                 |
|                          | <i>name</i>          | Name of the expert access list                                                                                                                          |
|                          | <b>in</b>            | Specifies filtering on inbound packets.                                                                                                                 |
|                          | <b>out</b>           | Specifies filtering on outbound packets.                                                                                                                |
|                          | <b>counter-only</b>  | Specifies the ACL dedicated for packet statistics on an interface.                                                                                      |
|                          | <b>forward-plane</b> | Specifies the ACL dedicated for the forwarding plane                                                                                                    |
|                          | <b>priority</b>      | Sets a higher priority for the interface configured with an SVI interface (only configured on the SVI interface and effective on the forwarding plane). |

**Defaults** No expert access list is applied on the interface or globally.

**Command mode** Interface configuration mode, global configuration mode.

**Usage Guide** This command is used to apply the specified access list on the interface or globally to control the input and output data streams on the interface or globally. Use the **show access-group** command to view the setting.

**Configuration Examples** The following example shows how to apply the **access-list accept\_00d0f8xxxxxx** only to Gigabit interface 0/1:

```
Ruijie(config)# interface GigaEthernet 0/1
Ruijie(config-if)# expert access-group
accept_00d0f8xxxxxx_only in
```

The following example applies the ACL numbered 2700 on interface fastEthernet0/1 to collect statistics on incoming packets:

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)#expert access-group 2700 in counter-only
```

The following example applies the ACL numbered 2700 on interface fastEthernet0/1 to the forwarding plane:

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)#expert access-group 2700 in forward-plane
```

| Related<br>Commands | Command                  | Description                     |
|---------------------|--------------------------|---------------------------------|
|                     | <b>show access-group</b> | Displays the ACL configuration. |

**Platform Description** N/A

## 1.9 expert access-list advanced

Use this command to create an advanced expert access list and place the device in expert advanced access list configuration mode. Use the **no** form of this command to remove the advanced expert access list.

**expert access-list advanced** *name*

**no expert access-list advanced** *name*

### Parameter Description

| Parameter   | Description                             |
|-------------|-----------------------------------------|
| <i>name</i> | Name of the advanced expert access list |

**Defaults** None

**Command mode** Global configuration mode

**Usage Guide** Use this command to create an advanced expert access list (namely, ACL80) to match your custom fields.

**Configuration** The following example creates an advanced expert access list named adv-acl.

### Examples

```
Ruijie(config)# expert access-list advanced adv-acl
Ruijie(config-exp-dacl)# show access-lists
expert access-list advanced adv-acl
```

### Related Commands

| Command                              | Description                                   |
|--------------------------------------|-----------------------------------------------|
| <b>show access-lists</b>             | Displays all access lists.                    |
| <b>show access-lists</b> <i>name</i> | Displays the access list of a specified name. |

**Platform** N/A

**Description**

## 1.10 expert access-list extended

Use this command to create an extended expert access list. Use the **no** form of the command to remove the ACL.

**expert access-list extended** {*id* | *name*}

**no expert access-list extended** {*id* | *name*}

### Parameter Description

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|             |                                                  |
|-------------|--------------------------------------------------|
| <i>id</i>   | Extended expert access list number: 2700 to 2899 |
| <i>name</i> | Name of the extended expert access list          |

**Defaults** None

**Command mode** Global configuration mode.

**Usage Guide** Use the **show access-lists** command to display the ACL configurations.

**Configuration** Create an extended expert ACL named exp-acl:

**Examples**

```
Ruijie(config)# expert access-list extended exp-acl
Ruijie(config-exp-nacl)# show access-lists expert access-list extended exp-acl
Ruijie(config-exp-nacl)#
```

Create an extended expert ACL numbered 2704:

```
Ruijie(config)# expert access-list extended 2704
Ruijie(config-exp-nacl)# show access-lists access-list extended 2704
Ruijie(config-exp-nacl)#
```

**Related Commands**

| Command                  | Description                       |
|--------------------------|-----------------------------------|
| <b>show access-lists</b> | Displays the extended expert ACLs |

**Platform** N/A

**Description**

## 1.11 expert access-list counter

Use this command to enable the counter of packets matching the specified expert access list. Use the **no** form of this command to disable this function.

**expert access-list counter** { *id* | *name* }

**no expert access-list counter** { *id* | *name* }

**Parameter Description**

| Parameter   | Description                              |
|-------------|------------------------------------------|
| <i>id</i>   | Expert access list number: 2700 to 2899. |
| <i>name</i> | Name of the access list.                 |

**Defaults** The counter of the packets matching the expert access list is disabled.

**Command mode** Global configuration mode

**Usage Guide** Use this command to enable the counter of packets matching the specified expert access list, so that

you can analyze the counters to learn whether the network is attacked by the illegal packets.

**Configuration Examples** The following example enables the counter of packets matching the extended expert access list named exp-acl:

```
Ruijie(config)# expert access-list counter exp-acl
Ruijie(config)# show access-lists
expert access-list extended exp-acl
 10 permit ip VID 4 host 192.168.3.55 any host 192.168.99.6 any (16 matches)
 20 deny tcp any any eq login any any (78 matches)
```

The following example disables the counter of packets matching the extended expert access list named exp-acl.

```
Ruijie(config)#no expert access-list counter exp-acl
Ruijie(config)# show access-lists
expert access-list extended 2700
 10 permit ip VID 4 host 192.168.3.55 any host 192.168.99.6 any
 20 deny tcp any any eq login any any
```

**Related Commands**

| Command                  | Description                       |
|--------------------------|-----------------------------------|
| <b>show access-lists</b> | Displays the extended expert ACL. |

**Platform**

N/A

**Description**

## 1.12 expert access-list new-fragment-mode

Use this command to switch the matching mode of fragmentation packets. Use the **no** form of this command to restore the default matching mode of fragmentation packets.

**expert access-list new-fragment-mode** { *id* | *name* }

**no expert access-list new-fragment-mode** { *id* | *name* }

**Parameter Description**

| Parameter   | Description                              |
|-------------|------------------------------------------|
| <i>id</i>   | Expert access list number: 2700 to 2899. |
| <i>name</i> | Name of the expert access list.          |

**Defaults**

Use the default matching mode of fragmentation packets. By default, if the access rule is tagged with fragment, it will match all packets except for the first fragmentation packet. If the access rule is not tagged with fragment, all packets including the first and all subsequent fragmentation packets will be matched.

**Command mode**

Global configuration mode

**Usage Guide** Use this command to switch and control the matching mode of access rules to fragmentation packets.

**Configuration Examples** The following example switches the matching mode of fragmentation packets for the ACL 2700 from the default mode to a new matching mode:

```
Ruijie(config)#expert access-list new-fragment-mode 2700
```

**Related Commands**

**Platform** N/A

**Description**

## 1.13 expert access-list resequence

Use this command to resequence an expert access list. Use the **no** form of this command to restore the default order of access entries.

**expert access-list resequence** { *id* | *name* } *start-sn* *inc-sn*

**no expert access-list resequence** { *id* | *name* }

**Parameter Description**

| Parameter       | Description                                              |
|-----------------|----------------------------------------------------------|
| <i>id</i>       | Expert access list number: 2700 to 2899.                 |
| <i>name</i>     | Name of the expert access list                           |
| <i>start-sn</i> | Start sequence number. Range: 1 to 2147483647            |
| <i>inc-sn</i>   | Increment of the sequence number. Range: 1 to 2147483647 |

**Defaults** *start-sn*: 10  
*inc-sn*: 10

**Command mode** Global configuration mode

**Usage Guide** Use this command to change the order of the access entries.

**Configuration Examples** The following example resequences entries of expert access list "exp-acl":

**Examples** Before the configuration:

```
Ruijie# show access-lists
expert access-list extended exp-acl
 10 permit ip any any any any
 20 deny ip any any any any
```

After the configuration:

```
Ruijie# config
Ruijie(config)# expert access-list resequence exp-acl 21 43
Ruijie(config)# exit
Ruijie# show access-lists
expert access-list extended exp-acl
 21 permit ip any any any any
 64 deny ip any any any any
```

**Related  
Commands**

## 1.15 ip access-group

Use this command to apply a specific access list to an interface or globally. Use the **no** form of this command to remove the access list from the interface.

**ip access-group** { *id* | *name* } { **in** | **out** } [**counter-only**] | [**forward-plane**] | [**priority**]

**no ip access-group** { *id* | *name* } { **in** | **out** } [**counter-only**] | [**forward-plane**] | [**priority**]

### Parameter Description

| Parameter            | Description                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>id</i>            | IP access list or extended IP access list number:<br>1 to 199, 1300 to 2699                                                                             |
| <i>name</i>          | Name of the IP ACL                                                                                                                                      |
| <b>in</b>            | Filters the incoming packets of the interface.                                                                                                          |
| <b>out</b>           | Filters the outgoing packets of the interface.                                                                                                          |
| <b>reflect</b>       | Enables the reflexive ACL.                                                                                                                              |
| <b>counter-only</b>  | Specifies the ACL dedicated for packet statistics on an interface.                                                                                      |
| <b>forward-plane</b> | Specifies the ACL dedicated for the forwarding plane                                                                                                    |
| <b>priority</b>      | Sets a higher priority for the interface configured with an SVI interface (only configured on the SVI interface and effective on the forwarding plane). |

**Defaults** No access list is applied on the interface or globally by default.

**Command mode** Interface configuration mode, global configuration mode.

**Usage Guide** Use this command to control access to a specified interface or globally. Use the **expert access-group** { *id* | *name* } { **in** | **out** } **counter-only** command on the interface to only collect packet statistics and not filter packets.

**Configuration Examples** The following example applies the ACL 120 on interface fastEthernet0/0 to filter the incoming packets:

```
Ruijie(config)# interface fastEthernet 0/0
Ruijie(config-if-GigabitEthernetFastEthernet 0/0)#ip access-group 120 in
```

The following example applies the ACL numbered 120 on fastEthernet0/1 to collect statistics on incoming packets:

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)#ip access-group 120 in counter-only
```

The following example applies the ACL numbered 120 globally to filter packets on the forwarding plane:

```
Ruijie(config)# ip access-group 120 in forward-plane
```

| Related Commands | Command                                                     | Description                                                         |
|------------------|-------------------------------------------------------------|---------------------------------------------------------------------|
|                  | <b>show ip access-group</b>                                 | Displays all standard and extended IP ACL.                          |
|                  | <b>show ip access-group interface</b> <i>interface-name</i> | Displays all standard and extended IP ACL on a specified interface. |

**Prompt**

1: When an ACL is attached, if another ACL of the following type has been attached on the same direction of the interface, then an error message is displayed:  
Standard IP ACL, Extended IP ACL, Extended MAC IP, Expert ACL  
Another acl has attached at FastEthernet 0/2, Operation fail.

2: When an ACL is discarded, if the specified ACL is not attached on the specified direction of the interface, then an error message is displayed:  
The acl has not attached at %, Operation fail

## 1.16 ip access-list

Use this command to create a standard IP access list or extended IP access list. Use the **no** form of the command to remove the access list.

**ip access-list** {**extended** | **standard**} {*id* | *name*}

**no ip access-list** {**extended** | **standard**} {*id* | *name*}

| Parameter Description | Parameter   | Description                                                                                    |
|-----------------------|-------------|------------------------------------------------------------------------------------------------|
|                       | <i>id</i>   | Access list number:<br>Standard: 1 to 99, 1300 to 1999;<br>Extended: 100 to 199, 2000 to 2699. |
|                       | <i>name</i> | Name of the access list                                                                        |

**Defaults** None

**Command mode** Global configuration mode

**Usage Guide** Configure a standard access list if you need to filter on source address only. If you want to filter on anything other than source address, you need to create an extended access list.  
Refer to **deny** or **permit** in the two modes. Use the **show access-lists** command to display the ACL configurations.

**Configuration** The following example creates a standard access list named std-acl.

**Examples**

```
Ruijie(config)# ip access-list standard std-acl
Ruijie(config-std-nacl)# show access-lists
ip access-list standard std-acl
Ruijie(config-std-nacl)#
```

The following example creates an extended ACL numbered 123:

```
Ruijie(config)# ip access-list extended 123
Ruijie(config-ext-nacl)# show access-lists
ip access-list extended 123
```

**Description**

## 1.17 ip access-list log-update interval

Use this command to configure the interval at which the IPv4 access list log is updated. Use the **no** form of this command to restore the default interval.

**ip access-list log-update interval** *time*

**no ip access-list log-update interval**

#### Parameter Description

| Parameter   | Description                                                                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>time</i> | For the access rule with the <b>log</b> option, a packet hit is output at the interval of ACL logging output. The interval ranges from 0 to 1440 minutes, and the default value is 5 minutes, indicating that the ACL matching log of a specified flow is output every 5 minutes. 0 indicates that no ACL logging is output. |

**Defaults** The default interval at which the IPv4 access list log is updated is 5 minutes.

**Command mode** Global configuration mode

**Usage Guide** Use this command to configure the interval at which the IPv4 access list log is updated.

**Configuration Examples** The following example configures the interval for the IPv4 access list log update to 10 minutes:

#### Examples

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# ip access-list log-update interval 10
```

#### Related Commands

| Command               | Description                             |
|-----------------------|-----------------------------------------|
| <b>ip access-list</b> | Defines an IPv4 access list.            |

## 1.18 ip access-list counter

Use this command to enable the counter of packets matching the standard or extended IP access list.  
Use the **no** form of this command to disable the counter.

**ip access-list counter** { *id* | *name* }

**no ip access-list counter** { *id* | *name* }

**Parameter**  
**Description**

| Parameter   | Description                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------------------|
| <i>id</i>   | IP access list number:<br>Standard IP access list: 1 to 99, 1300 to 1999;<br>Extended IP access list: 100 to 199, 2000 to 2699. |
| <i>name</i> | Name of the IP access list.                                                                                                     |

**Defaults** The counter of packets matching the standard or extended IP access list is disabled by default.

**Command mode** Global configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example enables the counter of packets matching the standard access list:

```
Ruijie(config)# ip access-list counter std-acl
Ruijie(config-std-nacl)# show access-lists
ip access-list standard std-acl
 10 permit 195.168.6.0 0.0.0.255 (999 matches)
 20 deny host 5.5.5.5 time-range tm (2000 matches)
```

The following example disables the counter of packets matching the standard access list:

```
Ruijie(config)#no ip access-list counter std-acl
Ruijie(config-std-nacl)# show access-lists
ip access-list standard std-acl
 10 permit 195.168.6.0 0.0.0.255
 20 deny host 5.5.5.5 time-range tm
```

## 1.19 ip access-list new-fragment-mode

Use this command to switch the matching mode of fragmentation packets of standard or extended IP access list. Use the **no** form of this command to restore the default matching mode of fragmentation packets.

**ip access-list new-fragment-mode** { *id* | *name* }

**no ip access-list new-fragment-mode** { *id* | *name* }

**Parameter**  
**Description**

| Parameter   | Description                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------------------|
| <i>id</i>   | IP access list number:<br>Standard IP access list: 1 to 99, 1300 to 1999;<br>Extended IP access list: 100 to 199, 2000 to 2699. |
| <i>name</i> | Name of the standard or extended IP access list                                                                                 |

**Defaults**

Use the default matching mode of fragmentation packets. By default, if the access rule is tagged with fragment, it will match all packets except for the first fragmentation packet. If the access rule is not tagged with fragment, all packets including the first and all subsequent fragmentation packets will be matched.

**Command**  
**mode**

Global configuration mode

**Usage Guide**

This command is used to switch and control the fragmentation packet matching mode of access rules.

**Configuration**  
**Examples**

The following example switches the fragmentation packet matching mode of the ACL 100 from the default mode to a new mode:

```
Ruijie(config)#ip access-list new-fragment-mode 100
```

## 1.20 ip access-list resequence

Use this command to resequence a standard or extended IP access list. Use the **no** form of this command to restore the default order of access entries.

**ip access-list resequence** { *id* | *name* } *start-sn* *inc-sn*

**no ip access-list resequence** { *id* | *name* }

### Parameter Description

| Parameter       | Description                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------|
| <i>id</i>       | IP access list number:<br>Standard IP access list: 1 to 99, 1300 to 1999;<br>Extended IP access list: 100 to 199, 2000 to 2699. |
| <i>name</i>     | Name of the standard or extended IP access list                                                                                 |
| <i>start-sn</i> | Start sequence number. Range: 1 to 2147483647                                                                                   |
| <i>inc-sn</i>   | Increment of the sequence number. Range: 1 to 2147483647                                                                        |

### Defaults

*start-sn*: 10

*inc-sn*: 10

### Command mode

Global configuration mode

### Usage Guide

Use this command to change the order of the access entries.

### Configuration

The following example resequences entries of ACL1:

### Examples

Before the configuration:

```
Ruijie# show access-lists
ip access-list standard 1
10 permit host 192.168.4.12
20 deny any any
```

After the configuration:

```
Ruijie# config
Ruijie(config)# ip access-list resequence 1 21 43
Ruijie(config)# exit
Ruijie# show access-lists
ip access-list standard 1
21 permit host 192.168.4.12
64 deny any any
```

### Related Commands

**Description**

## 1.21 ipv6 access-list

Use this command to create an IPv6 access list and to place the device in IPv6 access list configuration mode. Use the **no** form of this command to remove the access list.

**ipv6 access-list** *name*

**no ipv6 access-list** *name*

| Parameter<br>Description | Parameter   | Description                   |
|--------------------------|-------------|-------------------------------|
|                          | <i>name</i> | Name of the IPv6 access list. |

**Defaults** None

**Command mode** Global configuration mode

**Usage Guide** To filter the IPv6 packets through the access list, you need to define an IPv6 access list by using the **ipv6 access-list** command.

**Configuration Examples** The following example creates an IPv6 access list named v6-acl:

```
Ruijie(config)# ipv6 access-list v6-acl
Ruijie(config-ipv6-nacl)# show access-lists
ipv6 access-list extended v6-acl
Ruijie(config-ipv6-nacl)#
```

## 1.23 ipv6 access-list log-update interval

Use this command to configure the interval at which the IPv6 access list log is updated. Use the **no** form of this command to restore the default interval.

**ipv6 access-list log-update interval *time***

**no ipv6 access-list log-update interval**

|------------------------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              | <i>time</i> | For the access rule with the <b>logging</b> option, a packet hit is output at the interval of ACL logging output. The interval ranges from 0 to 1440 minutes, and the default value is 5 minutes, indicating that the ACL |

|  |                                                                                                       |
|--|-------------------------------------------------------------------------------------------------------|
|  | matching log of a specific flow is output every 5 minutes. 0 indicates that no ACL logging is output. |
|--|-------------------------------------------------------------------------------------------------------|

**Defaults** N/A

**Command mode** Global configuration mode

**Usage Guide** Use this command to configure the interval at which the IPv6 access list log is updated.

**Configuration Examples** The following example configures the interval for the IPv6 access list log update to 10 minutes:

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# ipv6 access-list log-update interval 9
```

**Related Commands**

| Command                 | Description                                        |
|-------------------------|----------------------------------------------------|
| <b>ipv6 access-list</b> | Defines an IPv6 access list.                       |
| <b>deny</b>             | Defines the <b>deny</b> access entries.            |
| <b>permit</b>           | Defines the <b>permit</b> access entries.          |
| <b>show running</b>     | Displays the running configurations of the device. |

**Platform Description** N/A

## 1.24 ipv6 access-list resequence

Use this command to resequence an IPv6 access list. Use the **no** form of this command to restore the default order of access entries.

**ipv6 access-list resequence** *name start-sn inc-sn*

**no ipv6 access-list resequence** *name*

**Parameter Description**

| Parameter       | Description                                              |
|-----------------|----------------------------------------------------------|
| <i>name</i>     | Name of the IPv6 access list                             |
| <i>start-sn</i> | Start sequence number. Range: 1 to 2147483647            |
| <i>inc-sn</i>   | Increment of the sequence number. Range: 1 to 2147483647 |

**Defaults** *start-sn*: 10  
*inc-sn*: 10

**Command** Global configuration mode

**mode**

**Usage Guide** Use this command to change the order of the access entries.

**Configuration** The following example resequences entries of IPv6 access list "v6-acl":

**Examples** Before the configuration:

```
Ruijie# show access-lists
ipv6 access-list v6-acl
 10 permit ipv6 any any
 20 deny ipv6 any any
```

After the configuration:

```
Ruijie# config
Ruijie(config)# ipv6 access-list resequence v6-acl 21 43
Ruijie(config)# exit
Ruijie# show access-lists
ipv6 access-list v6-acl
 21 permit ipv6 any any
 64 deny ipv6 any any
```

**Related  
Commands**

| Command                  | Description                 |
|--------------------------|-----------------------------|
| <b>show access-lists</b> | Displays all access lists.. |

**Platform** N/A

**Description**

## 1.25 ipv6 traffic-filter

Use this command to apply an IPV6 access list on the specified interface or globally. Use the **no** form of the command to remove the IPv6 access list from the interface.

**ipv6 traffic-filter** *name* { **in** | **out** } [ **[counter-only]** ] [ **[forward-plane]** ] [ **[priority]** ]

**no ipv6 traffic-filter** *name* { **in** | **out** } [ **[counter-only]** ] [ **[forward-plane]** ] [ **[priority]** ]

**Parameter  
Description**

| Parameter            | Description                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i>          | Name of IPv6 access list                                                                                                                                |
| <b>in</b>            | Specifies filtering on inbound packets                                                                                                                  |
| <b>out</b>           | Specifies filtering on outbound packets                                                                                                                 |
| <b>forward-plane</b> | Specifies the ACL dedicated for the forwarding plane                                                                                                    |
| <b>counter-only</b>  | Specifies the ACL dedicated for packet statistics on an interface.                                                                                      |
| <b>priority</b>      | Sets a higher priority for the interface configured with an SVI interface (only configured on the SVI interface and effective on the forwarding plane). |

**Defaults** None

**Command mode** Global/Interface configuration mode.

**Usage Guide** Use this command to apply the IPv6 access list to a specified interface or globally to filter the inbound or outbound packets.

**Configuration** The following example applies the IPv6 access list named **v6-acl** to interface GigabitEthernet 0/1:

**Examples**

```
Ruijie(config)# interface GigaEthernet 0/1
```

```
Ruijie(config-if)# ipv6 traffic-filter v6-acl in
```

The following example applies the ACL named access-list v6-acl globally:

```
Ruijie(config)# ipv6 traffic-filter v6-acl in
```

The following example applies IPv6 ACL named v6-acl on fastEthernet0/1 to filter incoming packets on the forwarding plane:

```
Ruijie(config)# interface fastEthernet 0/1
```

```
Ruijie(config-if-FastEthernet 0/1)# ipv6 traffic-filter v6-acl in
forward-plane
```

**Related Commands**

| Command                  | Description                                   |
|--------------------------|-----------------------------------------------|
| <b>show access-group</b> | Displays ACL configurations on the interface. |

**Platform** N/A

**Description**

## 1.26 list-remark

Use this command to write a helpful comment (remark) for an access list. Use the **no** form of this command to remove the remark.

**list-remark** *text*

**no list-remark**

**Parameter Description**

| Parameter   | Description                             |
|-------------|-----------------------------------------|
| <i>text</i> | Comment that describes the access list. |

**Defaults** The access lists have no remarks by default.

**Command mode** ACL configuration mode

**Usage Guide** You can use this command to write a helpful comment for a specified access list.

**Configuration** The following example writes a comment of “this acl is to filter the host 192.168.4.12” for ACL102.

**Examples**

```
Ruijie(config)# ip access-list extended 102
Ruijie(config-ext-nacl)# list-remark this acl is to filter the host
192.168.4.12
Ruijie(config-ext-nacl)# show access-lists
ip access-list extended 102
deny ip host 192.168.4.12 any
1000 hits
this acl is to filter the host 192.168.4.12
Ruijie(config-ext-nacl)#
```

|--------------------------------|-------------------------------------------------------------------------|
| <b>show access-lists</b>       | Displays all access lists.                                              |
| <b>ip access-list</b>          | Defines an IPv4 access list.                                            |
| <b>access-list list remark</b> | Adds a helpful comment for an access list in global configuration mode. |

**Platform** N/A

**Description**

## 1.27 mac access-group

Use this command to apply the specified MAC access list on the specified interface or globally. Use the **no** form of the command to remove the access list from the interface.

**mac access-group** { *id* | *name* } { **in** | **out** } [ **counter-only** ] [ **forward-plane** ] [ **priority** ]

**no mac access-group** { *id* | *name* } { **in** | **out** } [ **counter-only** ] [ **forward-plane** ] [ **priority** ]

**Parameter  
Description**

| Parameter            | Description                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>id</i>            | MAC access list number. The range is from 700 to 799.                                                                                                   |
| <i>name</i>          | Name of the MAC access list                                                                                                                             |
| <b>in</b>            | Specifies filtering on the inbound packets.                                                                                                             |
| <b>out</b>           | Specifies filtering on the outbound packets.                                                                                                            |
| <b>forward-plane</b> | Specifies the ACL dedicated for the forwarding plane                                                                                                    |
| <b>counter-only</b>  | Specifies the ACL dedicated for packet statistics on an interface.                                                                                      |
| <b>priority</b>      | Sets a higher priority for the interface configured with an SVI interface (only configured on the SVI interface and effective on the forwarding plane). |

**Defaults** None

**Command** Interface configuration mode , global configuration mode.

**mode**

**Usage Guide** Use this command to apply the access list to the interface or globally to filter the inbound or outbound packets based on the MAC address. Use the **mac access-group { id | name } { in | out }** **counter-only** command on the interface to only collect packet statistics and not filter packets.

**Configuration Examples** The following example applies the MAC access-list **accept\_00d0f8xxxxxx\_only** to interface GigabitEthernet 1/1:

```
Ruijie(config)# interface GigabitEthernet 1/1
Ruijie(config-if-GigabitEthernet 1/1)# mac access-group
accept_00d0f8xxxxxx_only in
```

The following example applies the ACL numbered 700 on fastEthernet0/1 to collect statistics on incoming packets:

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)#mac access-group 700 in counter-only
```

The following example applies the ACL numbered 700 on fastEthernet0/1 to filter packets on the forwarding plane:

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)#mac access-group 700 in forward-plane
```

**Related Commands**

| Command                  | Description                                      |
|--------------------------|--------------------------------------------------|
| <b>show access-group</b> | Displays the ACL configuration on the interface. |

**Platform** N/A

**Description**

## 1.28 mac access-list extended

Use this command to create an extended MAC access list. Use the **no** form of the command to remove the MAC access list.

**mac access-list extended { id | name }**

**no mac access-list extended { id | name }**

**Parameter Description**

| Parameter   | Description                                                    |
|-------------|----------------------------------------------------------------|
| <i>id</i>   | Extended MAC access list number. The range is from 700 to 799. |
| <i>name</i> | Name of the extended MAC access list                           |

**Defaults** None

**Command** Global configuration mode.

**mode**

**Usage Guide** To filter the packets based on the MAC address, you need to define a MAC access list by using the **mac access-list extended** command.

**Configuration** The following command creates an extended MAC access list named mac-acl:

**Examples**

```
Ruijie(config)# mac access-list extended mac-acl
```

```
Ruijie(config-mac-nacl)# show access-lists mac access-list extended mac-acl
```

The following command creates an extended MAC access list numbered 704:

```
Ruijie(config)# mac access-list extended 704
```

```
Ruijie(config-mac-nacl)# show access-lists mac access-list extended 704
```

**Related  
Commands**

| Command                  | Description                |
|--------------------------|----------------------------|
| <b>show access-lists</b> | Displays all access lists. |

**Platform** N/A

**Description**

## 1.29 mac access-list counter

Use this command to enable the counter of packet matching the extended MAC access list. Use the **no** form of this command to disable the counter.

**mac access-list counter** { *id* | *name* }

**no mac access-list counter** { *id* | *name* }

**Parameter  
Description**

| Parameter   | Description                                                    |
|-------------|----------------------------------------------------------------|
| <i>id</i>   | Extended MAC access list number. The range is from 700 to 799. |
| <i>name</i> | Name of the extended MAC access list                           |

**Defaults** The counter is disabled by default.

**Command  
mode** Global configuration mode

**Usage Guide** Use this command to enable the counter of packets matching the MAC access list to monitor the packets matching and filtering.

**Configuration  
Examples** The following example enables the counter of packet matching the extended MAC access list named mac-acl:

```
Ruijie(config)# mac access-list counter mac-acl
```

```
Ruijie(config)# show access-lists
```

```
mac access-list extended mac-acl
```

```
10 permit host 0023.56ac.8965 any (170 matches)
```

```
20 deny any any etype-any cos 6 (239 matches)
```

The following example disables the counter of packet matching the extended MAC access list named `mac-acl`:

```
Ruijie(config)#no mac access-list counter mac-acl
Ruijie(config)# show access-lists
mac access-list extended mac-acl
 10 permit host 0023.56ac.8965 any
 20 deny any any etype-any cos 6
```

#### Related Commands

| Command                  | Description                |
|--------------------------|----------------------------|
| <b>show access-lists</b> | Displays all access lists. |

**Platform** N/A

**Description**

## 1.30 mac access-list resequence

Use this command to resequence an extended MAC access list. Use the **no** form of this command to restore the default order of access entries.

**mac access-list resequence** { *id* | *name* } *start-sn inc-sn*

**no mac access-list resequence** { *id* | *name* }

#### Parameter Description

| Parameter       | Description                                              |
|-----------------|----------------------------------------------------------|
| <i>id</i>       | Extended MAC access list number: 700 to 799.             |
| <i>name</i>     | Name of the extended MAC access list                     |
| <i>start-sn</i> | Start sequence number. Range: 1 to 2147483647            |
| <i>inc-sn</i>   | Increment of the sequence number. Range: 1 to 2147483647 |

**Defaults** *start-sn*: 10  
*inc-sn*: 10

**Command mode** Global configuration mode

**Usage Guide** Use this command to change the order of the access entries.

**Configuration Examples** The following example resequences entries of extended MAC access list “mac-acl”:

**Examples** Before the configuration:

```
Ruijie# show access-lists
mac access-list extended mac-acl
 10 permit any any etype-any
```

```
20 deny any any etype-any
```

After the configuration:

```
Ruijie# config
Ruijie(config)# mac access-list resequence exp-acl 21 43
Ruijie(config)# exit
Ruijie# show access-lists
mac access-list extended mac-acl
 21 permit any any etype-any
 64 deny any any etype-any
```

#### Related Commands

| Command                  | Description                 |
|--------------------------|-----------------------------|
| <b>show access-lists</b> | Displays all access lists.. |

**Platform** N/A  
**Description**

## 1.31 permit

One or multiple **permit** conditions are used to determine whether to forward or discard the packet. In ACL configuration mode, you can modify the existent ACL or configure according to the protocol details.

### 1. Standard IP ACL

```
[ sn ] permit { source source-wildcard | host source | any | interface idx } [ time-range tm-range-name ] [ log ]
```

### 2. Extended IP ACL

```
[ sn ] permit protocol source source-wildcard destination destination-wildcard [[ precedence precedence ] [ tos tos ] [ dscp dscp ] [ecn ecn ] [ fragment ] [ fragment-ipid fragment-ipid ] [ range lower upper ] [ udf udf-id header pos value mask ] [ time-range time-range-name ] [ log ]
```

Extended IP ACLs of some important protocols:

Internet Control Message Protocol (ICMP)

```
[ sn ] permit icmp { source source-wildcard | host source | any } { destination destination-wildcard | host destination | any } [ icmp-type ] [ [ icmp-type [ icmp-code ] ] | [ icmp-message ] ] [[ precedence precedence ] [ tos tos ] [ dscp dscp ] [ecn ecn ] [ fragment ] [ fragment-ipid fragment-ipid ] [ udf udf-id header pos value mask ] [ time-range time-range-name ]
```

Transmission Control Protocol (TCP)

```
[ sn ] permit tcp { source source-wildcard | host Source | any } [ operator port [ port ] ] { destination destination-wildcard | host destination | any } [ operator port [ port ] ] [[ precedence precedence ] [ tos tos ] [ dscp dscp ] [ecn ecn ] [ fragment ] [ fragment-ipid fragment-ipid ] [ range lower upper ] [ udf udf-id header pos value mask ] [ time-range time-range-name ] [ match-all tcp-flag | established ]
```

User Datagram Protocol (UDP)

```
[ sn ] permit udp { source source -wildcard | host source | any } [ operator port [ port ] ] { destination destination-wildcard | host destination | any } [ operator port [ port ] ] [[ precedence precedence ] [ tos tos ] [ dscp dscp ] [ecn ecn ] [ fragment ] [ fragment-ipid fragment-ipid ] [ range lower upper ] [ udf
```

*udf-id header pos value mask* ] [ **time-range** *time-range-name* ]

### 3. Extended MAC ACL

[sn] **permit** { **any** | **host** *source-mac-address* / *source-mac-address mask* } { **any** | **host** *destination-mac-address* / *destination-mac-address mask* } [ *ethernet-type* ] [ **cos** [ *out* ] [ **inner in** ] ]

### 4. Extended expert ACL

[ *sn* ] **permit** [ **protocol** | [ *ethernet-type* ] [ **cos** [ *out* ] [ **inner in** ] ] ] [ **VID** [ *out* ] [ **inner in** ] ] { *source source-wildcard* | **host source** | **any** } { **host** *source-mac-address* | **any** } { *destination destination-wildcard* | **host destination** | **any** } { **host** *destination-mac-address* | **any** } [ **precedence precedence** ] [ **tos tos** ] [ **dscp dscp** ] [ **ecn ecn** ] [ **fragment** ] [ **fragment-ipid fragment-ipid** ] [ **range lower upper** ] [ *udf udf-id header pos value mask* ] [ [ *int-flag-a* ] [ *int-flag-b* ] ] [ **time-range time-range-name** ]

When you select the Ethernet-type field or cos field:

[sn] **permit** { *ethernet-type* | **cos** [ *out* ] [ **inner in** ] ] [ **VID** [ *out* ] [ **inner in** ] ] { *source source-wildcard* | **host source** | **any** } { **host** *source-mac-address* | **any** } { *destination destination-wildcard* | **host destination** | **any** } { **host** *destination-mac-address* | **any** } [ *udf udf-id header pos value mask* ] [ **time-range time-range-name** ]

When you select the protocol field:

[sn] **permit protocol** [ **VID** [ *out* ] [ **inner in** ] ] { *source source-wildcard* | **host Source** | **any** } { **host** *source-mac-address* | **any** } { *destination destination-wildcard* | **host destination** | **any** } { **host** *destination-mac-address* | **any** } [ **precedence precedence** ] [ **tos tos** ] [ **dscp dscp** ] [ **ecn ecn** ] [ **fragment** ] [ **range lower upper** ] [ *udf udf-id header pos value mask* ] [ [ *int-flag-a* ] [ *int-flag-b* ] ] [ **time-range time-range-name** ]

Extended expert ACLs of some important protocols:

Internet Control Message Protocol (ICMP)

[ *sn* ] **permit icmp** [ **VID** [ *out* ] [ **inner in** ] ] { *source source-wildcard* | **host source** | **any** } { **host** *source-mac-address* | **any** } { *destination destination-wildcard* | **host destination** | **any** } { **host** *destination-mac-address* | **any** } [ *icmp-type* ] [ [ *icmp-type icmp-code* ] ] [ *icmp-message* ] ] [ **precedence precedence** ] [ **tos tos** ] [ **dscp dscp** ] [ **ecn ecn** ] [ **fragment** ] [ **fragment-ipid fragment-ipid** ] [ *udf udf-id header pos value mask* ] [ **time-range time-range-name** ]

Transmission Control Protocol (TCP)

[ *sn* ] **permit tcp** [ **VID** [ *out* ] [ **inner in** ] ] { *source source-wildcard* | **host Source** | **any** } { **host** *source-mac-address* | **any** } [ *operator port* [ *port* ] ] { *destination destination-wildcard* | **host destination** | **any** } { **host** *destination-mac-address* | **any** } [ *operator port* [ *port* ] ] [ **precedence precedence** ] [ **tos tos** ] [ **dscp dscp** ] [ **ecn ecn** ] [ **fragment** ] [ **fragment-ipid fragment-ipid** ] [ **range lower upper** ] [ *udf udf-id header pos value mask* ] [ [ *int-flag-a* ] [ *int-flag-b* ] ] [ **time-range time-range-name** ] [ **match-all tcp-flag** | **established** ]

User Datagram Protocol (UDP)

[ *sn* ] **permit udp** [ **VID** [ *out* ] [ **inner in** ] ] { *source source-wildcard* | **host source** | **any** } { **host** *source-mac-address* | **any** } [ *operator port* [ *port* ] ] { *destination destination-wildcard* | **host destination** | **any** } { **host** *destination-mac-address* | **any** } [ *operator port* [ *port* ] ] [ **precedence precedence** ] [ **tos tos** ] [ **dscp dscp** ] [ **ecn ecn** ] [ **fragment** ] [ **fragment-ipid fragment-ipid** ] [ **range lower upper** ] [ *udf udf-id header pos value mask* ] [ [ *int-flag-a* ] [ *int-flag-b* ] ] [ **time-range time-range-name** ]

Address Resolution Protocol (ARP)

[sn] **permit arp** { *vid vlan-id* } [ **host** *source-mac-address* | **any** ] [ **host** *destination-mac-address* | **any** ]

```
{sender-ip sender-ip-wildcard | host sender-ip | any} {sender-mac sender-mac-wildcard | host sender-mac | any} {target-ip target-ip-wildcard | host target-ip | any} [ udf udf-id header pos value mask ]
```

Virtual Extensible LAN(VXLAN):

```
access-list id { deny | permit } vlan {tcp | udp} { source source-wildcard | host source | any } [ eq port ] { destination destination-wildcard | host destination | any } [ eq port ] [ tagged ] [ udp-dport dport ] [ time-range time-range-name ]
```

## 5. Extended IPv6 ACL

```
[sn] permit protocol {source-ipv6-prefix / prefix-length | any | host source-ipv6-address} {destination-ipv6-prefix / prefix-length | any | host destination-ipv6-address} [dscp dscp] [flow-label flow-label] [fragment] [range lower upper] [ udf udf-id header pos value mask ] [ time-range time-range-name ]
```

Extended IPv6 ACLs of some important protocols:

Internet Control Message Protocol (ICMP)

```
[sn] permit icmp {source-ipv6-prefix / prefix-length | any source-ipv6-address | host} {destination-ipv6-prefix / prefix-length | host destination-ipv6-address | any} [icmp-type] [[icmp-type [icmp-code]] | [icmp-message]] [dscp dscp] [flow-label flow-label] [fragment] [ udf udf-id header pos value mask ] [ time-range time-range-name ]
```

Transmission Control Protocol (TCP)

```
[sn] permit tcp {source-ipv6-prefix / prefix-length | host source-ipv6-address | any} [operator port [port]] {destination-ipv6-prefix / prefix-length | host destination-ipv6-address | any} [operator port [port]] [dscp dscp] [flow-label flow-label] [fragment] [range lower upper] [ udf udf-id header pos value mask ] [ time-range time-range-name ] [match-all tcp-flag | established]
```

User Datagram Protocol (UDP)

```
[sn] permit udp {source-ipv6-prefix / prefix-length | host source-ipv6-address | any} [operator port [port]] {destination-ipv6-prefix / prefix-length | host destination-ipv6-address | any} [operator port [port]] [dscp dscp] [flow-label flow-label] [fragment] [range lower upper] [ udf udf-id header pos value mask ] [ time-range time-range-name ]
```

## Parameter Description

| Parameter            | Description                                                                                                                                                                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| N/A                  | N/A                                                                                                                                                                                                                                                    |
| sn                   | ACL entry sequence number                                                                                                                                                                                                                              |
| deny                 | If not matched, access is denied.                                                                                                                                                                                                                      |
| source               | Specify the source IP address (host address or network address).                                                                                                                                                                                       |
| source-wildcard      | It can be discontinuous, for example, 0.255.0.32.                                                                                                                                                                                                      |
| protocol             | IP protocol number. It can be one of EIGRP, GRE, IPINIP, IGMP, NOS, OSPF, ICMP, UDP, TCP, and IP. It can also be a number representing the IP protocol between 0 and 255. The important protocols such as ICMP, TCP, and UDP are described separately. |
| destination          | Specify the destination IP address (host address or network address).                                                                                                                                                                                  |
| destination-wildcard | Wildcard of the destination IP address. It can be discontinuous, for                                                                                                                                                                                   |

|                                           |                                                                                             |
|-------------------------------------------|---------------------------------------------------------------------------------------------|
|                                           | example, 0.255.0.32.                                                                        |
| fragment                                  | Packet fragment filtering                                                                   |
| <b>fragment-ipid</b> <i>fragment-ipid</i> | Fragment ID of the header in segmented packet                                               |
| precedence                                | Specify the packet priority.                                                                |
| precedence                                | Packet precedence value (0 to 7)                                                            |
| range                                     | Layer4 port number range of the packet.                                                     |
| lower                                     | Lower limit of the layer4 port number.                                                      |
| upper                                     | Upper limit of the layer4 port number.                                                      |
| time-range                                | Time range of packet filtering                                                              |
| time-range-name                           | Time range name of packet filtering                                                         |
| tos                                       | Specify type of service.                                                                    |
| tos                                       | ToS value (0 to 15)                                                                         |
| icmp-type                                 | ICMP message type (0 to 255)                                                                |
| icmp-code                                 | ICMP message type code (0 to 255)                                                           |
| icmp-message                              | ICMP message type name                                                                      |
| operator                                  | Operator (lt-smaller, eq-equal, gt-greater, neq-unequal, range-range)                       |
| port [ port ]                             | Port number; range needs two port numbers, while other operators only need one port number. |
| host source-mac-address                   | Source physical address                                                                     |
| host destination-mac-address              | Destination physical address                                                                |
| VID vid                                   | Match the specified VID.                                                                    |
| ethernet-type                             | Ethernet type                                                                               |
| match-all                                 | Match all the bits of the TCP flag.                                                         |
| tcp-flag                                  | Match the TCP flag.                                                                         |
| established                               | Match the RST or ACK bits, not other bits of the TCP flag.                                  |
| <b>udf</b>                                | Indicates the customized field.                                                             |
| <i>udf-id</i>                             | Indicates the ID of UDF. (Range:1 to 8)                                                     |
| <i>header</i>                             | Indicates the protocol layer.                                                               |
| <i>pos</i>                                | Indicates the offset. (Range:0 to 126)                                                      |
| <i>value</i>                              | Indicates the data (2 bytes).                                                               |
| <i>mask</i>                               | Indicates the mask (2 bytes).                                                               |
| <b>int-flag</b>                           | Matches the int header of the packets.                                                      |
| <i>source-ipv6-prefix</i>                 | Source IPv6 network address or network type                                                 |
| <i>destination-ipv6-prefix</i>            | Destination IPv6 network address or network type                                            |
| <i>prefix-length</i>                      | Prefix mask length                                                                          |
| <i>source-ipv6-address</i>                | Source IPv6 address                                                                         |
| <i>destination-ipv6-address</i>           | Destination IPv6 address                                                                    |
| <b>dscp</b>                               | Differential Service Code Point                                                             |
| <i>dscp</i>                               | Code value, within the range of 0 to 63                                                     |
| <b>ecn</b>                                | Specifies the congestion notification type.                                                 |
| <i>ecn</i>                                | Specifies the congestion notification type value (0 to 3).                                  |
| flow-label                                | Flow label                                                                                  |
| <i>flow-label</i>                         | Flow label value, within the range of 0 to 1048575.                                         |

|                        |                                                                                         |
|------------------------|-----------------------------------------------------------------------------------------|
| <i>protocol</i>        | For the IPv6, the field can be ipv6   icmp   tcp   udp and number in the range 0 to 255 |
| <i>time-range</i>      | Time range of the packet filtering                                                      |
| <i>time-range-name</i> | Time range name of the packet filtering                                                 |
| <b>mpls</b>            | Matches the IP field of MPLS packets.                                                   |
| <b>vlan</b>            | Matches the quintet of the VXLAN packets.                                               |
| <b>tagged</b>          | Matches the tagged VXLAN packets.                                                       |
| <b>udp-dport</b>       | Matches the UDP port ID of the VXLAN packets.                                           |
| <i>dport</i>           | UDP port ID.                                                                            |

**Defaults** No entry

**Command mode** ACL configuration mode.

**Usage Guide** Use this command to configure the filtering entry of ACLs in ACL configuration mode.

**Configuration Examples** The following example shows how to create and display an extended expert ACL. This expert ACL denies all the TCP packets with the source IP address 192.168.4.12 and the source MAC address 001300498272.

```
Ruijie(config)#expert access-list extended 2702
Ruijie(config-exp-nacl)#deny tcp host
192.168.4.12 host 0013.0049.8272 any any
Ruijie(config-exp-nacl)#permit any any any any
Ruijie(config-exp-nacl)#show access-lists
expert access-list extended 2702
10 deny tcp host 192.168.4.12 host 0013.0049.8272 any any
20 permit any any any any
Ruijie(config-exp-nacl)#
```

This example shows how to use the extended IP ACL. The purpose is to deny the host with the IP address 192.168.4.12 to provide services through the TCP port 100 and apply the ACL to Interface gigabitethernet 1/1. The configuration procedure is as below:

```
Ruijie(config)# ip access-list extended ip-ext-acl
Ruijie(config-ext-nacl)# deny tcp host 192.168.4.12 eq 100 any
Ruijie(config-ext-nacl)# show access-lists
ip access-list extended ip-ext-acl
10 deny tcp host 192.168.4.12 eq 100 any
Ruijie(config-ext-nacl)#exit
Ruijie(config)#interface gigabitethernet 1/1
Ruijie(config-if)#ip access-group ip-ext-acl in
Ruijie(config-if)#
```

This example shows how to use the extended MAC ACL. The purpose is to deny the host with the MAC address 0013.0049.8272 to send Ethernet frames of the type 100 and apply the rule to Interface gigabitethernet 1/1. The configuration procedure is as below:

```

Ruijie(config)#mac access-list extended mac1
Ruijie(config-mac-nacl)#deny host 0013.0049.8272 any arp
Ruijie(config-mac-nacl)# show access-lists
mac access-list extended mac1
10 deny host 0013.0049.8272 any arp
Ruijie(config-mac-nacl)#exit
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# mac access-group mac1 in

```

This example shows how to use the standard IP ACL. The purpose is to deny the host with the IP address 192.168.4.12 and apply the rule to Interface gigabitethernet 1/1. The configuration procedure is as below:

```

Ruijie(config)#ip access-list standard 34
Ruijie(config-ext-nacl)# deny host 192.168.4.12
Ruijie(config-ext-nacl)#show access-lists
ip access-list standard 34
10 deny host 192.168.4.12
Ruijie(config-ext-nacl)#exit
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# ip access-group 34 in

```

This example shows how to use the extended IPV6 ACL. The purpose is to deny the host with the IP address 192.168.4.12 and apply the rule to Interface gigabitethernet 1/1. The configuration procedure is as below:

```

Ruijie(config)#ipv6 access-list extended v6-acl
Ruijie(config-ipv6-nacl)#11 deny ipv6 host 192.168.4.12 any
Ruijie(config-ipv6-nacl)#show access-lists
ipv6 access-list extended v6-acl
11 deny ipv6 host 192.168.4.12 any
Ruijie(config-ipv6-nacl)# exit
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# ipv6 traffic-filter v6-acl in

```

#### Related Commands

| Command                    | Description                                     |
|----------------------------|-------------------------------------------------|
| <b>show access-lists</b>   | Displays all ACLs.                              |
| <b>ipv6 traffic-filter</b> | Applies the extended IPv6 ACL on the interface. |
| <b>ip access-group</b>     | Applies the IP ACL on the interface.            |
| <b>mac access-group</b>    | Applies the extended MAC ACL on the interface.  |
| <b>ip access-list</b>      | Defines an IP ACL.                              |
| <b>mac access-list</b>     | Defines an extended MAC ACL.                    |
| <b>expert access-list</b>  | Defines an extended expert ACL.                 |
| <b>ipv6 access-list</b>    | Defines an extended IPv6 ACL.                   |
| <b>permit</b>              | Permits the access.                             |

#### Platform Description

N/A

## 1.32 redirect destination interface

Use this command to redirect the traffic matching the access list to the specified interface. Use the **no** form of this command to remove the redirection.

**redirect destination interface** *interface-name* **acl** { *id* | *name* } **in**

**no redirect destination interface** *interface-name* **acl** { *id* | *name* } **in**

### Parameter Description

| Parameter             | Description        |
|-----------------------|--------------------|
| <i>interface-name</i> | Redirect interface |
| <i>id</i>             | Access list number |
| <i>name</i>           | Access list name   |

**Defaults** No redirection is configured.

**Command mode** Interface configuration mode

**Usage Guide** Use this command to configure access redirection, namely, to redirect the traffic matching the access list to the specified interface. You can monitor the operation of a specified access list by using this command.

**Configuration** The following example configures access redirection.

### Examples

```
Ruijie(config)# interface gigabitEthernet 0/3
Ruijie(config-if-GigabitEthernet 0/3)# redirect destination interface
gigabitEthernet 0/2 acl1 in
```

### Related Commands

**Platform** N/A  
**Description**

## 1.33 remark

Use this command to write a helpful comment (remark) for an entry in the access list. Use the **no** form of this command to remove the remark.

[*sn*] **remark** *text*

**no** [*sn*] **remark**

### Parameter

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

| Description |             |                                                  |
|-------------|-------------|--------------------------------------------------|
|             | <i>text</i> | Comment that describes the access entry.         |
|             | <i>sn</i>   | Indicates the sequence number of an ACE comment. |

**Defaults** The access entries have no remarks.

**Command mode** ACL configuration mode.

**Usage Guide** Use this command to write a helpful comment for an access entry.

Up to 100 characters are allowed in the remark.

Two identical access entry remarks in one access list are not allowed.

Removing an access entry may delete the remark for it as well.

If the sn is specified, the comment will match a specified ACE; if no, the comment will match the last ACE in the ACL.

**Configuration** The following example writes remarks for the entry in extended IP access list 102.

**Examples**

```
Ruijie(config)# ip access-list extended 102
Ruijie(config-ext-nacl)# remark first_remark
Ruijie(config-ext-nacl)# 10 permit tcp 1.1.1.1 0.0.0.0 2.2.2.2 0.0.0.0
Ruijie(config-ext-nacl)# 10 remark second_remark
Ruijie(config-ext-nacl)# permit tcp 3.3.3.3 0.0.0.0 4.4.4.4 0.0.0.0
Ruijie(config-ext-nacl)# end
Ruijie#
```

**Description**

## 1.34 security access-group

Use this command to configure a interface secure channel.

**security access-group { id | name }**

**no security access-group**

| Parameter Description | Parameter   | Description              |
|-----------------------|-------------|--------------------------|
|                       | <i>id</i>   | Access list number.      |
|                       | <i>name</i> | Name of the access list. |

**Defaults** None

**Command mode** Interface configuration mode

**Usage Guide** If a device is configured authentications such as 802.1x or Web authentication, the user cannot access the external network before passing the authentication. You can use this command to configure a secure channel for the users on the specified interface to access the external network without authentication.

**Configuration** The following example configures a secure channel on interface GigaEthernet 1/1.

**Examples**

```
Ruijie(config)# interface GigaEthernet 1/1
Ruijie(config-if-GigabitEthernet 1/1)# security access-group 1
```

**Related Commands**

|----------------------|--------------------------------------------|
| <b>show secu-acl</b> | Displays the secure channel configuration. |

**Platform** N/A

**Description**

## 1.35 security global access-group

Use this command to configure the global secure channel.

**security global access-group** { *id* | *name* }

**no security global access-group**

**Parameter Description**

| Parameter   | Description              |
|-------------|--------------------------|
| <i>id</i>   | Access list number.      |
| <i>name</i> | Name of the access list. |

**Defaults** -

**Command mode** Global configuration mode

**Usage Guide** If a device is configured authentications such as 802.1x or Web authentication, the user cannot access the external network before passing the authentication. You can use this command to configure a global secure channel for some users to access the external network without authentication.

**Configuration** The following example configures a global secure channel.

**Examples**

```
Ruijie(config)#security global access-group 1
```

|----------------------|---------------------------------------------|
| <b>show secu-acl</b> | Displays the secure channel configuration.. |

**Platform**

N/A

**Description**

## 1.36 security uplink enable

Use this command to configure an exceptional interface of the global secure channel.

**security uplink enable**

**no security uplink enable**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

The global secure channel takes effect on all interfaces by default.

**Command  
mode**

Interface configuration mode.

**Usage Guide**

The global secure channel takes effect on all interfaces by default. To disable the secure channel function on some interfaces, you can use this command to configure the interface as exceptional.

**Configuration  
Examples**

The following example configures interface GigaEthernet 1/1 as an exceptional interface of the secure channel.

```
Ruijie(config)# interface GigaEthernet 1/1
Ruijie(config-if-GigabitEthernet 1/1)# security uplink enable
```

**Description**

## 1.37 show access-group

Use this command to display the access list applied to the interface.

**show access-group [ interface *interface* ] [ [ wlan *wlan-id* ]**

| Parameter<br>Description | Parameter        | Description    |
|--------------------------|------------------|----------------|
|                          | <i>interface</i> | Interface name |
|                          | <i>wlan-id</i>   | WLAN ID        |

**Defaults** -

**Command mode** Privileged EXEC mode

**Usage Guide** Use this command to display the access list configuration on the specified interface. If no interface is specified, access list configuration on all interfaces is displayed.

**Configuration Examples**

```
Ruijie# show access-group
ip access-list standard ipstd3
Applied On interface GigabitEthernet 0/1.
ip access-list standard ipstd4
Applied On interface GigabitEthernet 0/2.
ip access-list extended 101
Applied On interface GigabitEthernet 0/3.
ip access-list extended 102
Applied On interface GigabitEthernet 0/8.
```

|                     | <b>expert access-group</b> | Applies the expert access list to the interface. |
|                     | <b>ipv6 traffic-filter</b> | Applies the IPv6 access list to the interface.   |

**Platform** N/A

**Description**

## 1.38 show access-lists

Use this command to display all access lists or the specified access list.

**show access-lists** [ *id* | *name* ] [ **summary** ]

| Parameter<br>Description | Parameter   | Description                |
|--------------------------|-------------|----------------------------|
|                          | <i>id</i>   | Access list number         |
|                          | <i>name</i> | Name of the IP access list |

|                |                     |
|----------------|---------------------|
| <b>summary</b> | Access list summary |
|----------------|---------------------|

**Defaults** N/A

**Command mode** Global configuration mode

**Usage Guide** Use this command to display the specified access list. If no access list number or name is specified, all the access lists are displayed.

**Configuration Examples**

```
Ruijie# show access-lists n_acl
ip access-list standard n_acl
Ruijie# show access-lists 102
ip access-list extended 102
Ruijie# show access-lists
ip access-list standard n_acl
ip access-list extended 101
permit icmp host 192.168.1.1 any log (1080 matches)
  permit tcp host 1.1.1.1 any established
  deny ip any any (80021 matches)
mac access-list extended mac_acl
expert access-list extended exp_acl
ipv6 access-list extended v6_acl
petmit ipv6 ::192.168.4.12 any (100 matches)
deny any any (9 matches)
```

**Related Commands**

| <b>expert access-list</b> | Defines an extended expert access list. |
| <b>ipv6 access-list</b>   | Defines an extended IPv6 access list.   |

**Platform** N/A

**Description**

## 1.39 show expert access-group

Use this command to display the expert access list applied to the interface.

**show expert access-group [ interface *interface* ] [ [ wlan *wlan-id* ]**

| Parameter Description | Parameter        | Description    |
|-----------------------|------------------|----------------|
|                       | <i>interface</i> | Interface name |

|                |         |
|----------------|---------|
| <i>wlan-id</i> | WLAN ID |
|----------------|---------|

**Defaults** -

**Command mode** Privileged EXEC mode

**Usage Guide** Use this command to display the expert access list configured on the interface. If no interface is specified, the expert access lists on all interfaces are displayed.

**Configuration Examples**

```
Ruijie# show expert access-group interface gigabitethernet 0/2
expert access-group ee in
Applied On interface GigabitEthernet 0/2.
```

| Related Commands | Command                   | Description                             |

|                  | <b>expert access-list</b> | Defines an extended expert access list. |

**Platform Description** N/A

## 1.40 show ip access-group

Use this command to display the standard and extended IP access lists on the interface.

**show ip access-group** [ **interface** *interface* ] [ [ **wlan** *wlan-id* ]

| Parameter Description | Parameter        | Description    |
|-----------------------|------------------|----------------|
|                       | <i>interface</i> | Interface name |
|                       | <i>wlan-id</i>   | WLAN ID        |

**Defaults** N/A

**Command mode** Privileged EXEC mode

**Usage Guide** Use this command to display the standard and extended IP access lists configured on the interface. If no interface is specified, the standard and extended IP access lists on all interfaces are displayed.

**Configuration Examples**

```
Ruijie# show ip access-group interface gigabitethernet 0/1
ip access-group aaa in
Applied On interface GigabitEthernet 0/1.
```

|          | <b>ip access-list</b> | Defines an IP access list. |

Platform N/A

Description

## 1.41 show ipv6 traffic-filter

Use this command to display the IPv6 access list on the interface.

**show ipv6 traffic-filter** [ **interface** *interface* ]

| Parameter<br>Description | Parameter        | Description    |
|--------------------------|------------------|----------------|
|                          | <i>interface</i> | Interface name |

Defaults -

Command Privileged EXEC mode

Usage Guide Use this command to display the IPv6 access list configured on the interface. If no interface is specified, the IPv6 access lists on all interfaces are displayed.

Configuration Examples  
Ruijie# show ipv6 traffic-filter interface gigabitethernet 0/4  
ipv6 access-group v6 in  
Applied On interface GigabitEthernet 0/4.

|---------------------|-------------------------|------------------------------|
|                     | <b>ipv6 access-list</b> | Defines an IPv6 access list. |

Platform N/A

Description

## 1.42 show mac access-group

Use this command to display the MAC access list on the interface.

**show mac access-group** [ **interface** *interface* ] [ **wlan** *wlan-id* ]

| Parameter<br>Description | Parameter        | Description    |
|--------------------------|------------------|----------------|
|                          | <i>interface</i> | Interface name |
|                          | <i>wlan-id</i>   | WLAN ID        |

**Defaults** N/A

**Command mode** Privileged EXEC mode

**Usage Guide** Use this command to display the MAC access list configured on the interface. If no interface is specified, the MAC access lists on all interfaces are displayed.

**Configuration Examples**

```
Ruijie# show mac access-group interface gigabitethernet 0/3
mac access-group mm in
Applied On interface GigabitEthernet 0/3.
```

**Related Commands**

| Command                | Description                |
|------------------------|----------------------------|
| <b>mac access-list</b> | Defines a MAC access list. |

**Platform Description** N/A

## 1.43 show acl res

Use this command to display information about all Ternary Content Address Memories (TCAMs) or a specified TCAM.

**show acl res** [**dev** *dev-num* [**slot** *slot-num*]]

**Parameter Description**

| Parameter                   | Description              |
|-----------------------------|--------------------------|
| <b>dev</b> <i>dev_num</i>   | Specifies the device ID. |
| <b>slot</b> <i>slot-num</i> | Specifies the slot ID.   |

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** Use this command to display information about the TCAM of a specified slot in a device. If no slot ID of a device is specified, information about TCAMs of all slots of the device is displayed. If no device ID is specified, information about TCAMs of all devices is displayed.

**Configuration Examples** The following example displays the usage amount, usage rate, and available capacity of TCAM resources on all devices.

```
Ruijie#show acl res
```

```

## 1.44 show acl res detail

Use this command to display the details of all Ternary Content Address Memories (TCAMs) or a

specified TCAM.

**show acl res detail** [ **dev** *dev-num* [ **slot** *slot-num* ]]

**Parameter  
Description**

| Parameter                          | Description      |
|------------------------------------|------------------|
| <u><b>dev</b> <i>dev-num</i></u>   | <u>Device ID</u> |
| <u><b>slot</b> <i>slot-num</i></u> | <u>Slot ID</u>   |

**Command  
mode**

Privileged EXEC mode

**Usage Guide**

Use this command to display the details of the TCAM of a specified slot in a device. If no slot ID of a device is specified, information about TCAMs of all slots of the device is displayed. If no device ID is specified, information about TCAMs of all devices is displayed.

**Configuration**

The following example displays the details of TCAM resource usage on all devices.

**Examples**

```

## 1.45 show redirect interface

Use this command to display the access redirection configuration.

**show redirect** [ **interface** *interface-name* ]

**Parameter  
Description**

| Parameter             | Description    |
|-----------------------|----------------|
| <i>interface-name</i> | Interface name |

**Defaults**

N/A

**Command**

Privileged EXEC mode

**mode**

**Usage Guide** Use this command to display the access redirection configuration on the interface. If no interface is specified, the access redirection configuration on all interfaces is displayed.

**Configuration** The following example displays the access redirection configuration on interface GigabitEthernet 0/3.

**Examples**

```
Ruijie #show redirect interface gigabitEthernet 0/3
acl redirect configuration on interface gigabitEthernet 0/3
redirect destination interface gigabitEthernet 0/3 acl 1 in
```

**Description**

## 1.46 svi router-acls enable

Use this command to enable the SVI filter only for the Layer3 packets. Use the **no** form of this command to disable this function.

**svi router-acls enable**

**no svi router-acls enable**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A.        |

**Defaults** The SVI filter takes effect for both Layer2 and Layer3 packets by default.

**Command mode** Global configuration mode

**Usage Guide** Use this command to make the SVI filter take effect only for the Layer3 packets,

**Configuration** The following example enables the SVI filter only for the Layer3 packets.

**Examples**

```
Ruijie(config)#svi router-acls enable
```

## 2 QoS Commands

### 2.1 apply acl

Use this command to apply the ACL in the policy map class configuration mode. Use the **no** form of this command to delete the ACL.

**apply acl**

**no apply acl**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description |           |             |

**Defaults** No stream behavior is specified for the class associated with the policy by default.

**Command Mode** Policy map class configuration mode

**Usage Guide** ACL should be created first.  
Only one ACL can be applied in one policy, and the behavior takes effect according to the ACL.

**Configuration Examples** The following example creates the class cmap1 and matches the ACL acl\_10.

```
Ruijie(config)# class-map cmap1
Ruijie(config-cmap)# match acl acl_10
```

The following example creates the policy pmap1 and enters the policy configuration mode; associates the class cmap1 and enters the policy map class configuration mode.

```
Ruijie(config)# policy-map pmap1
Ruijie(config-pmap)# class cmap1
```

The following example applies the ACL.

```
Ruijie(config-pmap-c)# apply acl
```

| Related Commands | Command                                                                                  | Description              |
|------------------|------------------------------------------------------------------------------------------|--------------------------|
|                  | <b>show policy-map</b> [ <i>policy-map-name</i> [ <b>class</b> <i>class-map-name</i> ] ] | Displays the policy map. |

**Platform Description** N/A

## 2.2 class

Use this command to add reference to an existing class map. Use the **no** form of this command to remove the a class from the policy map.

**class** *class-map-name*

**no class** *class-map-name*

| Parameter   | Parameter             | Description               |
|-------------|-----------------------|---------------------------|
| Description | <i>class-map-name</i> | Reference to a class map. |

**Defaults** None

**Command Mode** Policy configuration mode

**Usage Guide** N/A

**Configuration** The following example adds reference to the class map named cmap1.

**Examples**

```
Ruijie(config)# class-map cmap1
Ruijie(config-cmap)# match ip dscp 5
Ruijie(config-cmap)# exit

Ruijie(config)# policy-map pmap1
Ruijie(config-pmap)# class cmap1
Ruijie(config-pmap-c)# end
```

| Related Commands | Command                                                                                  | Description              |
|------------------|------------------------------------------------------------------------------------------|--------------------------|
|                  | <b>show policy-map</b> [ <i>policy-map-name</i> [ <b>class</b> <i>class-map-name</i> ] ] | Displays the policy map. |

**Platform** N/A

**Description**

## 2.3 class map

Use this command to create a class map and enter class-map configuration mode. Use the **no** or **default** form of this command to remove a class map.

**class-map** *class-map-name*

**no class-map** *class-map-name*

**default class-map** *class-map-name*

| Parameter   | Parameter             | Description                                                           |
|-------------|-----------------------|-----------------------------------------------------------------------|
| Description | <i>class-map-name</i> | Class map name. The class map name can be a maximum of 31 characters. |

**Defaults** None

**Command Mode** Global configuration mode

**Usage Guide** N/A

**Configuration** The following example creates a class map named *cm\_acl* to match an access list named *me*.

**Examples**

```
Ruijie(config)# mac access-list extended me
Ruijie(config-ext-macl)# permit host 1111.2222.3333 any
Ruijie(config-ext-macl)# exit
Ruijie(config)# class-map cm_acl
Ruijie(config-cmap)# match access-group me
Ruijie(config-cmap)# exit
```

The following example creates a class map named *cm\_dscp* to match DHCP 8, 16 and 24.

```
Ruijie(config)# class-map cm_dscp
Ruijie(config-cmap)# match ip dscp 8 16 24
Ruijie(config-cmap)# exit
```

| Commands | <b>show class-map</b> [ <i>class-map-name</i> ] | Displays the class map. |

**Platform** N/A

**Description**

## 2.4 clear qos wred-ecn statistics

Use this command to clear the statistics of packets discarded by WRED and packets marked by ECN.

**clear qos wred-ecn statistics** [ **interfaces** *interface-id* ]

| Parameter   | Parameter           | Description                               |
|-------------|---------------------|-------------------------------------------|
| Description | <i>interface-id</i> | Indicates the to-be-cleared interface ID. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode/global configuration mode/interface configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example clears the statistics of packets discarded by WRED and packets marked by ECN on all interfaces.

```
Ruijie#clear qos wred-ecn statistics
```

**Related Commands**

| Command | Description |
|---------|-------------|
| N/A     | N/A         |

**Platform Description** N/A

## 2.5 drr-queue bandwidth

Use this command to set the DRR queue weight ratio. Use the **no** or **default** form of this command to restore the default setting.

**drr-queue bandwidth** *weight1...weight8*

**no drr-queue bandwidth**

**default drr-queue bandwidth**

**Parameter Description**

| Parameter                | Description                                                                                                                                                                                                                                             |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>weight1...weight8</i> | 8 queue weights. The default queue weight ratio is 1:1:1:1:1:1:1:1. For the products supporting the SP scheduling policy, the weight range is from 0 to 15. For the products not supporting the SP scheduling policy, the weight range is from 1 to 15. |

**Defaults** The default queue weight ratio is 1:1:1:1:1:1:1:1.

**Command Mode** Global configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example configures the DRR queue weight ratio to 1:1:1:2:2:4:6:8.

```
Ruijie(config)# drr-queue bandwidth 1 2 3 4 5 6 7 8
```

**Related Commands**

| Command                     | Description                           |
|-----------------------------|---------------------------------------|
| <b>show mls qos queuing</b> | Displays information about the queue. |

**Platform Description** N/A

## 2.6 match

Use this command to define a match criteria in class map configuration mode. Use the **no** form of this command to remove the match criteria.

**match** { **access-group** *access\_list* }

**no match** { **access-group** *access\_list* }

| Parameter   | Parameter                              | Description                                                       |
|-------------|----------------------------------------|-------------------------------------------------------------------|
| Description | <b>access-group</b> <i>access_list</i> | Identifies a numbered or named access list as the match criteria. |

**Defaults** None

**Command Mode** Class map configuration mode

**Usage Guide** N/A

**Configuration** N/A

**Examples**

| Related Commands | Command                                         | Description             |
|------------------|-------------------------------------------------|-------------------------|
|                  | <b>show class-map</b> [ <i>class-map-name</i> ] | Displays the class map. |

**Platform** N/A

**Description**

## 2.7 mls qos cos

Use this command to configure the CoS value of an interface. Use the **no** form of this command to restore the default setting.

**mls qos cos** *default-cos*

**no mls qos cos**

| Parameter   | Parameter          | Description                                           |
|-------------|--------------------|-------------------------------------------------------|
| Description | <i>default-cos</i> | CoS value of the interface. The range is from 0 to 7. |

**Defaults** The default CoS value is 0.

**Command Mode** Interface configuration mode.

**Usage Guide** N/A

**Configuration** The following example configures the default CoS value to 7.

**Examples**

```
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# mls qos cos 7
```

| Related  | Command                                           | Description                                      |
|----------|---------------------------------------------------|--------------------------------------------------|
| Commands | <b>show mls qos interface</b> <i>interface-id</i> | Displays information of the specified interface. |

**Platform** N/A

**Description**

## 2.8 mls qos map cos-dscp

Use this command to map the CoS value to the DSCP value. Use the **no** or **default** form of this command to restore the default CoS-DSCP mapping.

**mls qos map cos-dscp** *dscp1...dscp8*

**no mls qos map cos-dscp**

**default mls qos map cos-dscp**

| Parameter   | Parameter            | Description                                          |
|-------------|----------------------|------------------------------------------------------|
| Description | <i>dscp1...dscp8</i> | Specifies the DSCP value. The range is from 0 to 63. |

**Defaults** By default, the CoS 0, 1, 2, 3, 4, 5, 6, 7 is mapped to the DSCP 0, 8, 16, 24, 32, 40, 48, 56 respectively.

**Command** Global configuration mode  
**Mode**

**Usage Guide** N/A

**Configuration**

```
Ruijie(config)# mls qos map cos-dscp 8 10 16 18 24 26 32 34
```

**Examples**

| Related  | Command                                     | Description                    |
|----------|---------------------------------------------|--------------------------------|
| Commands | <b>show mls qos maps</b><br><b>cos-dscp</b> | Displays the CoS-DSCP mapping. |

**Platform** N/A

**Description**

## 2.9 mls qos map dscp-cos

Use this command to map the DSCP value to the CoS value. Use the **no** or **default** form of this

command to restore the default DSCP-CoS mapping.

**mls qos map dscp-cos** *dscp-list* **to** *cos*

**no mls qos map dscp-cos**

**default mls qos map dscp-cos**

| Parameter   | Parameter        | Description                           |
|-------------|------------------|---------------------------------------|
| Description | <i>dscp-list</i> | DSCP list. The range is from 0 to 63. |
|             | <i>cos</i>       | CoS value. The range is from 0 to 7.  |

#### Defaults

The default DSCP-CoS mapping is listed below:

| DSCP<br>0-7 | DSCP<br>8-15 | DSCP<br>16-23 | DSCP<br>24-31 | DSCP<br>32-39 | DSCP<br>40-47 | DSCP<br>48-55 | DSCP<br>56-63 |
|-------------|--------------|---------------|---------------|---------------|---------------|---------------|---------------|
| CoS 0       | CoS 1        | CoS 2         | CoS 3         | CoS 4         | CoS 5         | CoS 6         | CoS 7         |

#### Command

Global configuration mode.

#### Mode

**Usage Guide** N/A

**Configuration** Ruijie(config)# mls qos map dscp-cos 8 10 16 18 to 0

#### Examples

#### Description

## 2.10 mls qos remark disable

Use this command to disable the packet priority modification function.

**mls qos remark disable**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description |           |             |

**Defaults** The packet priority can be modified by default, that is, the remark function is enabled.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** Whether this command is supported depends on the product chip capability value.

**Configuration** The following example disables the packet priority modification function.

**Examples**  
`Ruijie(config)# mls qos remark disable`

## 2.11 mls qos scheduler

Use this command to configure the output queue scheduling. Use the **no** or **default** form of this command to restore the default scheduler.

**mls qos scheduler [ sp | rr | wrr | drr | wfq ]**

**no mls qos scheduler**

**default mls qos scheduler**

| Parameter   | Parameter  | Description                                                 |
|-------------|------------|-------------------------------------------------------------|
| Description | <b>sp</b>  | Specifies the absolute priority scheduling.                 |
|             | <b>rr</b>  | Specifies the round-robin scheduling.                       |
|             | <b>wrr</b> | Specifies the frame count weighted round-robin scheduling.  |
|             | <b>drr</b> | Specifies the frame length weighted round-robin scheduling. |
|             | <b>wfq</b> | Specifies the weighted fair queuing.                        |

**Defaults** The default queue scheduling is **wrr**.

**Command Mode** Global configuration mode.

**Usage Guide** N/A

**Configuration** The following example specifies the sp scheduling.

**Examples** Ruijie(config)# mls qos scheduler sp

**Description**

## 2.12 mls qos trust

Use this command to configure the trust mode on an interface. Use the **no** or **default** form of this command to restore the default setting.

**mls qos trust { cos | dscp | ip-precedence }**

**no mls qos trust**

**default mls qos trust**

| Parameter   | Parameter     | Description                      |
|-------------|---------------|----------------------------------|
| Description | cos           | Specifies the CoS trust mode.    |
|             | dscp          | Specifies the DSCP trust mode.   |
|             | ip-precedence | Specifies the IP-PRE trust mode. |

**Defaults** No trust mode is configured by default.

**Command** Interface configuration mode.  
**Mode**

**Usage Guide** N/A

**Configuration** The following example configures the CoS trust mode.

**Examples** Ruijie(config)# interface gigabitethernet 1/1  
Ruijie(config-if)# mls qos trust cos

| Related  | Command                                    | Description                                     |
|----------|--------------------------------------------|-------------------------------------------------|
| Commands | show mls qos interface <i>interface-id</i> | Displays the specified interface configuration. |

**Platform** N/A

**Description**

## 2.13 police

Use this command to configure traffic policing for a class map in a policy map. Use the **no** form of this command to remove traffic policing for the class map.

**police** *rate-bps burst-byte* [ **exceed-action** { **drop** | **dscp** *new-dscp* | **cos** *new-cos* [ **none-tos** ] } ]  
**no police**

| Parameter   | Parameter                   | Description                                                                                                                                  |
|-------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>rate-bps</i>             | Bandwidth limit value per second (The unit is KBits). This value depends on the specific product.                                            |
|             | <i>burst-byte</i>           | Burst traffic limit value (The unit is KBytes). This value depends on the specific product.                                                  |
|             | <b>drop</b>                 | Drops the packet. This is available only when the packet exceeds the bandwidth limit.                                                        |
|             | <b>dscp</b> <i>new-dscp</i> | Modifies the DSCP value of the packet. This is available only when the packet exceeds bandwidth limit. The DSCP value range is from 0 to 63. |
|             | <b>cos</b> <i>new-cos</i>   | Modifies the CoS value of the packet. This is available only when the packet exceeds bandwidth limit. The CoS value range is from 0 to 7.    |
|             | <b>none-tos</b>             | Modifies the CoS value only.                                                                                                                 |

**Defaults** No traffic policing is configured for the class map by default.

**Command Mode** Policy map class configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example configures traffic policing which modifies the DSCP value of the packet to 6 for class map "cm-acl" in policy map "pmap1".

```
Ruijie(config)# policy-map pmap1
Ruijie(config-pmap)# class cm-acl
Ruijie(config-pmap-c)# police 102400 4096 exceed-action dscp 16
```

| Related Commands | Command                                                                                  | Description                            |

|                  | <b>show policy-map</b> [ <i>policy-map-name</i> [ <b>class</b> <i>class-map-name</i> ] ] | Displays the policy map configuration. |

**Platform Description** N/A

## 2.14 policy map

Use the following command to create a policy map and enter policy map configuration mode. Use the **no** or **default** form of this command to remove the specified policy map.

**policy-map** *policy-map-name*

**no policy-map** *policy-map-name*  
**default policy-map** *policy-map-name*

| Parameter   | Parameter              | Description                                                             |
|-------------|------------------------|-------------------------------------------------------------------------|
| Description | <i>policy-map-name</i> | Policy map name. The policy map name can be a maximum of 31 characters. |

**Defaults** No policy map is configured by default.

**Command Mode** Global configuration mode.

**Usage Guide** N/A

**Configuration Examples** The following example creates policy map “po”, and then adds a reference to class map “cmap1”.

```
Ruijie(config)# policy-map po
Ruijie(config-pmap)# class cmap1
```

| Related Commands | Command                                                                                  | Description                            |
|------------------|------------------------------------------------------------------------------------------|----------------------------------------|
|                  | <b>show policy-map</b> [ <i>policy-map-name</i> [ <b>class</b> <i>class-map-name</i> ] ] | Displays the policy map configuration. |

**Platform Description** N/A

## 2.15 priority-queue

Use this command to configure the output queue scheduling policy to SP. Use the **no** or **default** form of this command to restore the default queue scheduling policy.

**priority-queue**  
**no priority-queue**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** The default output queue scheduling policy is WRR.

**Command Mode** Global configuration mode.

**Usage Guide** This command shares the same configuration with the **mls qos scheduler sp**. The **show run** command displays this configuration in the **mls qos scheduler sp** item instead of **priority-queue**.

**Configuration** The following example configures the output queue scheduling policy to SP.

**Examples**

```
Ruijie(config)# priority-queue
```

| Related  | Command                       | Description                                  |
|----------|-------------------------------|----------------------------------------------|
| Commands | <b>show mls qos scheduler</b> | Displays the output queue scheduling policy. |

**Platform** N/A

**Description**

## 2.16 priority-queue cos-map

Use this command to configure the mapping between the CoS value and the queue ID. Use the **no** or **default** form of this command to restore the default CoS mapping to the queue.

**priority-queue cos-map** *qid cos0 [ cos1 [ cos2 [ cos3 [ cos4 [ cos5 [ cos6 [ cos7 ] ] ] ] ] ] ] ] ] ] ]*

**no priority-queue cos-map**

**default priority-queue cos-map**

| Parameter   | Parameter            | Description                          |
|-------------|----------------------|--------------------------------------|
| Description | <i>qid</i>           | Queue ID. The range is from 1 to 8.  |
|             | <i>cos0 ... cos7</i> | CoS value. The range is from 0 to 7. |

**Defaults** The default mapping between the CoS value and the queue ID is listed below:

| Queue 1 | Queue 2 | Queue 3 | Queue 4 | Queue 5 | Queue 6 | Queue 7 | Queue 8 |
|---------|---------|---------|---------|---------|---------|---------|---------|
| CoS 0   | CoS 1   | CoS 2   | CoS 3   | CoS 4   | CoS 5   | CoS 6   | CoS 7   |

**Command** Global configuration mode.

**Mode**

**Usage Guide** N/A

**Configuration** The following example maps the CoS 3, 5 to the output queue 1.

**Examples**

```
Ruijie(config)#priority-queue cos-map 1 3 5
```

| Related  | Command                     | Description                 |
|----------|-----------------------------|-----------------------------|
| Commands | <b>show mls qos queuing</b> | Displays the output queues. |

**Platform** N/A

**Description**

## 2.17 qos-queue compatible enable

This command is used to configure the queue display of all queues on the device to 0–7.

**qos-queue compatible enable**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** By default, the queue display of all queues on the device is 1–8.

**Command Mode** Global configuration mode

**Usage Guide** The chip capability depends whether the command is supported.

The following example configures the queue display of all queues on the device to 0–7.

Ruijie(config)# qos-queue compatible enable

**Description**

## 2.18 qos queue

Use this command to configure a minimum or maximum of the interface bandwidth to a queue. Use the **no** or **default** form of this command to remove the minimum or maximum of the interface bandwidth.

**qos queue** *queue-id* **bandwidth** { **minimum** | **maximum** } *bandwidth*

**no qos queue** *queue-id* **bandwidth** { **minimum** | **maximum** }

**default qos queue** *queue-id* **bandwidth** { **minimum** | **maximum** }

**Parameter**

**Description**

| Parameter                                                                   | Description                                                                                                                                                                                      |
|-----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>queue]</b>                                                               | The <b>queue</b> keyword indicates configuring the minimum or maximum of the interface bandwidth to the queue on the device supporting both unicast and multicast queue bandwidth configuration. |
| <i>queue-id</i>                                                             | Queue ID. The range is from 1 to 8.                                                                                                                                                              |
| <b>bandwidth</b><br>{ <b>minimum</b>   <b>maximum</b> }<br><i>bandwidth</i> | Bandwidth value. The value range depends on the specific product.                                                                                                                                |

**Defaults** No minimum or maximum of interface bandwidth to a queue is configured by default.

**Command Mode** Interface configuration mode

**Usage Guide** N/A

**Configuration Examples** N/A

| Related Commands | Command                                               | Description                                    |
|------------------|-------------------------------------------------------|------------------------------------------------|
|                  | <b>show qos bandwidth [ interfaces interface-id ]</b> | Displays the interface bandwidth of the queue. |

**Platform Description** N/A

## 2.19 qos queue ecn

Use this command to enable the queue ECN function. Use the **no** form of this command to disable the function.

**qos queue queue-id ecn**

**no qos queue queue-id ecn**

| Parameter          | Parameter       | Description                         |
|--------------------|-----------------|-------------------------------------|
| <b>Description</b> | <i>queue-id</i> | Queue ID. The range is from 1 to 8. |

**Defaults** By default, it is disabled.

**Command Mode** Interface configuration mode

**Usage Guide** Both the **qos queue ecn** and global **queueing wred** command must be configured to enable the queue ECN function

**Configuration Examples** The following example enables ECN on queue 1 of interface gigabitEthernet 0/1.

```
Ruijie# configure terminal
Ruijie(config)# queueing wred
Ruijie(config)# interface gigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)# qos queue 1 ecn
Ruijie(config-if-GigabitEthernet 0/1)# exit
```

**Platform** N/A  
**Description**

## 2.20 qos wred-ecn statistics sample-period

Use this command to configure the statistics sampling interval of packets discarded by WRED and packets marked by ECN. Use the **no** or **default** form of this command to restore the default settings.

**qos wred-ecn statistics sample-period** *period*

**no qos wred-ecn statistics sample-period**

**default qos wred-ecn statistics sample-period**

| Parameter   | Parameter     | Description                                                     |
|-------------|---------------|-----------------------------------------------------------------|
| Description | <i>period</i> | Indicates the sampling interval. The default range is 1 to 100. |

**Defaults** The default range varies with products.

**Command** Global configuration mode  
**Mode**

**Usage Guide** N/A

**Configuration** The following example sets the sampling interval to 5 seconds.

**Examples**

```
Ruijie# configure terminal
Ruijie(config)# qos wred-ecn statistics sample-period 5
```

**Platform** N/A  
**Description**

## 2.21 queueing wred

Use this command to enable the WRED (Weighted Random Early Detection) function. Use the **no** or **default** form of this command to disable the WRED function.

**queueing wred**

**no queueing wred**

**default queueing wred**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** WRED is disabled by default.

**Command Mode** Global configuration mode

**Usage Guide** N/A

**Configuration** The following example enables WRED.

**Examples** Ruijie(config)# queueing wred

| Related  | Command | Description |

**Description**

## 2.22 rate-limit

Use this command to configure rate limiting on the interface. Use the **no** or **default** form of this command to remove rate limiting from the interface.

**rate-limit { input | output } bps burst-size**

**no rate-limit { input | output }**

**default rate-limit { input | output }**

| Parameter   | Parameter         | Description                                                                                       |
|-------------|-------------------|---------------------------------------------------------------------------------------------------|
| Description | <b>input</b>      | Configures input rate limiting.                                                                   |
|             | <b>output</b>     | Configures output rate limiting.                                                                  |
|             | <i>bps</i>        | Bandwidth limit value per second (The unit is KBits). This value depends on the specific product. |
|             | <i>burst-size</i> | Burst traffic limit value (The unit is KBytes). This value depends on the specific product.       |

**Defaults** Rate limiting is not configured by default.

**Command Mode** Interface configuration mode.

**Usage Guide** This command can be configured only on Ethernet interfaces.

**Configuration Examples** The following example configures the rate limit value to 10 Mbps, and the burst traffic limit value to 256 Kbps.

```
Ruijie(config)# interface gigabitethernet 1/3
```

```
Ruijie(config-if-GigabitEthernet 1/3)# rate-limit input 10240 256
```

| Related<br>Commands | Command                                                                 | Description                                                |
|---------------------|-------------------------------------------------------------------------|------------------------------------------------------------|
|                     | <b>show mls qos rate-limit</b> [ <b>interface</b> <i>interface-id</i> ] | Displays the rate limiting configuration of the interface. |

**Description**

## 2.23 service-policy

Use this command to apply the policy map to the interface, the virtual group or globally. Use the **no** or **default** form of this command to remove the policy map from the interface, the virtual group or globally.

**service-policy** { **input** | **output** } *policy-map-name*

**no service-policy** { **input** | **output** } *policy-map-name*

**default service-policy** { **input** | **output** } *policy-map-name*

| Parameter<br>Description | Parameter              | Description                                     |
|--------------------------|------------------------|-------------------------------------------------|
|                          | <i>policy-map-name</i> | Policy map name                                 |
|                          | <b>input</b>           | Applies the policy map to the input direction.  |
|                          | <b>output</b>          | Applies the policy map to the output direction. |

**Defaults** No policy map is configured on the interface or virtual group by default.

**Command Mode** Interface configuration mode, virtual group configuration mode, global configuration mode.

**Usage Guide** N/A

**Configuration Examples** The following example applies policy map “po” to the input direction of interface GigabitEthernet 1/3.

```
Ruijie(config)# interface gigabitethernet 1/3
Ruijie(config-if-GigabitEthernet 1/3)# service-policy input po
```

The following example applies policy map “po” to the output direction of virtual group 3.

```
Ruijie(config)# virtual-group 3
Ruijie(config-VirtualGroup)# service-policy output po
```

The following example applies policy map “po” to the output direction globally.

```
Ruijie(config)# service-policy output po
```

**Description**

## 2.24 set

Use this command to configure the CoS, DSCP or VID value for the traffic. Use the **no** form of this command to remove the CoS, DSCP or VID value from the traffic.

**set { ip dscp *new-dscp* [with cos *new-cos* **priority**] | cos *new-cos* [**priority** | **none-tos** ] | vid *new-vid* }**  
**no set { ip dscp | cos | vid }**

| Parameter          | Parameter                                      | Description                                                            |
|--------------------|------------------------------------------------|------------------------------------------------------------------------|
| <b>Description</b> | <b>ip dscp</b> <i>new-dscp</i>                 | Configures the DSCP value for the traffic. The range is from 0 to 63.  |
|                    | <b>with cos</b> <i>new-cos</i> <b>priority</b> | Configures the queue priority (same as <b>priority</b> )               |
|                    | <b>cos</b> <i>new-cos</i>                      | Configures the CoS value for the traffic. The range is from 0 to 7.    |
|                    | <b>priority</b>                                | Configures the queue priority but does not change CoS value.           |
|                    | <b>none-tos</b>                                | Configures the CoS value only.                                         |
|                    | <b>vid</b> <i>new-vid</i>                      | Configures the VID value for the traffic. The range is from 1 to 4094. |

**Defaults** No CoS or DSCP value is configured for the traffic in policy map class mode.

**Command Mode** Policy map class configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example creates policy map “pmap1”, and adds a reference to class map “cmap1”.

```
Ruijie(config)# policy-map pmap1
Ruijie(config-pmap)# class cmap1
```

The following example modifies the CoS value of the traffic to 3.

```
Ruijie(config-pmap-c)# set cos 3
```

|                  | <b>show</b><br><b>policy-map</b> [ <i>policy-map-name</i> ]<br>[ <b>class</b> <i>class-map-name</i> ] ] | Displays the policy map configuration on the interface. |

**Platform** N/A

## Description

## 2.25 show class-map

Use this command to display the class map.

**show class-map** [ *class-map-name* ]

| Parameter   | Parameter             | Description     |
|-------------|-----------------------|-----------------|
| Description | <i>class-map-name</i> | Class map name. |

**Defaults** None

**Command Mode** Privileged EXEC mode, global configuration mode, interface configuration mode.

**Usage Guide** N/A

**Configuration** The following example displays all class maps.

**Examples**

```
Ruijie# show class-map

Class Map cmap1
  Match ip dscp 20 40
Class Map cmap2
  Match access-group 110
```

The fields in the output of this command are described in the following table.

| Field     | Description                   |
|-----------|-------------------------------|
| Class Map | Indicates the class map name. |
| Match     | Indicates the matched rule.   |

| Related Commands | Command | Description |

**Description**

## 2.26 show mls qos interface

Use this command to display the QoS configuration of the interface.

**show mls qos interface** [ *interface-id* ] [ *policers* ]

| Parameter   | Parameter           | Description    |
|-------------|---------------------|----------------|
| Description | <i>interface-id</i> | Interface name |

|                 |                                                            |
|-----------------|------------------------------------------------------------|
| <b>policers</b> | Displays the traffic policing configured on the interface. |
|-----------------|------------------------------------------------------------|

**Defaults**      None

**Command Mode**      Privileged EXEC mode, global configuration mode, interface configuration mode.

**Usage Guide**      N/A

**Configuration**      The following example displays the QoS configuration of interface GigabitEthernet 1/3.

**Examples**      Ruijie# show mls qos interface gigabitethernet 1/3

```
Interface: GigabitEthernet 1/3
Ratelimit input: 10240 256
Ratelimit output: 51200 4096
Attached input policy-map: pmap1
Attached output policy-map:
Default trust: dscp
Default cos: 3
Scheduler type: drr
Wrr queue bandwidth: 1 1 1 1 2 2 2 2
Wfq queue bandwidth: 1 1 2 2 4 4 4 4
```

The fields in the output of this command are described in the following table.

| Field                      | Description                                                                                                             |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Interface                  | Indicates the interface name.                                                                                           |
| Ratelimit input            | Indicates the input rate limit value .                                                                                  |
| Ratelimit output           | Indicates the output rate limit value .                                                                                 |
| Attached input policy-map  | Indicates the input policy map .                                                                                        |
| Attached output policy-map | Indicates the output policy map.                                                                                        |
| Default trust              | Indicates the trust mode of the interface.                                                                              |
| Default cos                | Indicates the default CoS value.                                                                                        |
| Scheduler type             | Indicate the scheduling policy of the interface, which is only displayed on products that support the scheduling policy |
| Wrr queue bandwidth        | Indicates the WRR queue weight, which is only displayed on products that support the scheduling policy                  |
| Drr queue bandwidth        | Indicates the DRR queue weight, which is only displayed on products that support the scheduling policy                  |
| Wfq queue bandwidth        | Indicates the WFQ queue weight, which is only displayed on products that support the scheduling policy                  |

The following example displays the QoS configuration of all interfaces.

```
Ruijie# show mls qos interface policers
```

```

Interface: GigabitEthernet 0/1
Attached input  policy-map: pmap1
Attached output policy-map: pmap1
Interface: GigabitEthernet 0/2
Attached input  policy-map: p1

```

**Description**

## 2.27 show mls qos maps

Use this command to display DSCP-CoS mapping and CoS-DSCP mapping.

**show mls qos maps [ cos-dscp | dscp-cos ]**

| Parameter          | Parameter       | Description                    |
|--------------------|-----------------|--------------------------------|
| <b>Description</b> | <b>cos-dscp</b> | Displays the CoS-DSCP mapping. |
|                    | <b>dscp-cos</b> | Displays the DSCP-CoS mapping. |

**Defaults** None

**Command Mode** Privileged EXEC mode, global configuration mode, interface configuration mode.

**Usage Guide** N/A

**Configuration** The following example displays the CoS-DSCP mapping.

### Examples

```

Ruijie# show mls qos maps cos-dscp
cos dscp
--- ----
0      0
1      8
2     16
3     24
4     32
5     40
6     48
7     56

```

The fields in the output of this command are described in the following table.

| Field | Description                       |
|-------|-----------------------------------|
| cos   | Indicates the CoS value.          |
| dscp  | Indicates the DSCP value mapped . |

The following example displays the DSCP- CoS mapping.

```
Ruijie# show mls qos maps dscp-cos
dscp cos      dscp cos      dscp cos      dscp cos
---- --      ---- --      ---- --      ---- --
 0  0         1  0         2  0         3  0
 4  0         5  0         6  0         7  0
 8  1         9  1        10  1        11  1
12  1        13  1        14  1        15  1
16  2        17  2        18  2        19  2
20  2        21  2        22  2        23  2
24  3        25  3        26  3        27  3
28  3        29  3        30  3        31  3
32  4        33  4        34  4        35  4
36  4        37  4        38  4        39  4
40  5        41  5        42  5        43  5
44  5        45  5        46  5        47  5
48  6        49  6        50  6        51  6
52  6        53  6        54  6        55  6
56  7        57  7        58  7        59  7
60  7        61  7        62  7        63  7
```

The fields in the output of this command are described in the following table.

| Field | Description                      |
|-------|----------------------------------|
| dscp  | Indicates the DSCP value.        |
| cos   | Indicates the CoS value mapped . |

|                     |         |             |

## Description

## 2.29 show mls qos rate-limit

Use this command to display the rate limiting configuration of the interface.

**show mls qos rate-limit** [ **interface** *interface-id* ]

| Parameter   | Parameter           | Description    |
|-------------|---------------------|----------------|
| Description | <i>interface-id</i> | Interface name |

**Defaults** N/A

**Command Mode** Privileged EXEC mode, global configuration mode, interface configuration mode.

**Usage Guide** N/A

**Configuration** The following example displays the rate limiting configuration of all interfaces.

**Examples**

```
Ruijie# show mls qos rate-limit
Interface: GigabitEthernet 0/1
  rate limit input Kbps = 10240 burst = 256
Interface: GigabitEthernet 0/3
  rate limit output Kbps = 102400 burst = 4096
```

The fields in the output of this command are described in the following table.

| Field                                | Description                                                                      |
|--------------------------------------|----------------------------------------------------------------------------------|
| Interface                            | Indicates the interface name.                                                    |
| rate limit input Kbps = x burst = y  | Indicates the input rate limit value, and the input burst traffic limit value.   |
| rate limit output Kbps = x burst = y | Indicates the output rate limit value, and the output burst traffic limit value. |

## 2.30 show mls qos scheduler

Use this command to display the queue scheduling policy.

**show mls qos scheduler**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** None

**Command Mode** Privileged EXEC mode, global configuration mode, interface configuration mode.

**Usage Guide** N/A

**Configuration** The following example displays the queue scheduling policy.

**Examples**

```
Ruijie# show mls qos scheduler
Global Multi-Layer Switching scheduling
Weighted Round Robin
```

The fields in the output of this command are described in the following table.

| Field                | Description                                                                                                                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Weighted Round Robin | Indicates that the queue scheduling policy is WRR.<br>The other queue scheduling policies are listed as follows:<br>SP: Strict Priority<br>RR: Round Robin<br>DRR: Deficit Round Robin<br>WFQ: Weighted Fair Queue |

## 2.31 show mls qos virtual-group

Use this command to display the policy map configuration on the virtual group.

**show mls qos virtual-group** [ *virtual-group-number* | **policers** ]

| Parameter   | Parameter                   | Description                                                  |
|-------------|-----------------------------|--------------------------------------------------------------|
| Description | <i>virtual-group-number</i> | Virtual group number. The range is from 1 to 128.            |
|             | <b>policers</b>             | Displays the policy map configuration on all virtual groups. |

**Defaults** None

**Command** Privileged EXEC mode, global configuration mode, interface configuration mode.

**Usage Guide** N/A

**Configuration** The following example displays the policy map configuration on all virtual groups.

**Examples**

```
Ruijie# show mls qos virtual-group policers
Virtual-group: 1
Attached input policy-map: pmap1
Virtual-group: 20
Attached output policy-map: pmap2
```

The fields in the output of this command are described in the following table.

| Field                      | Description                                                   |
|----------------------------|---------------------------------------------------------------|
| Virtual-group              | Indicates the virtual group number.                           |
| Attached input policy-map  | Indicates the policy map applied on the input virtual group.  |
| Attached output policy-map | Indicates the policy map applied on the output virtual group. |

## 2.32 show policy-map

Use this command to display policy maps.

**show policy-map** [*policy-map-name* [**class** *class-map-name* ] ]

| Parameter          | Parameter              | Description     |
|--------------------|------------------------|-----------------|
| <b>Description</b> | <i>policy-map-name</i> | Policy map name |
|                    | <i>class-map-name</i>  | Class map name  |

**Defaults** None

**Command** Privileged EXEC mode, global configuration mode, interface configuration mode.

**Usage Guide** N/A

**Configuration** The following example displays configuration of policy map “pmap1”.

**Examples**

```
Ruijie# show policy-map pmap1

Policy Map pmap1
  Class cmap1
    set ip dscp 16
  Class cmap2
    police 10240 256 exceed-action dscp 8
  Class cmap3
    police 512000 4096 exceed-action drop
```

The fields in the output of this command are described in the following table.

| Field      | Description                                                                             |
|------------|-----------------------------------------------------------------------------------------|
| Policy Map | Indicates the policy map name.                                                          |
| Class      | Indicates the class map name.                                                           |
| set        | Indicates that the CoS, DSCP and VID values are modified in this example.               |
| police     | Indicates bandwidth limit configuration and the action policy for the violated packets. |

The following example displays the action policy for the traffic of class map “cmap1” in policy map “pmap1”.

```
Ruijie#show policy-map pmap1 class cmap1
Class cmap1
set ip dscp 16
```

**Command**

Privileged EXEC mode, global configuration mode, interface configuration mode.

**Mode****Usage Guide** N/A

**Configuration** The following example displays the bandwidth configuration of interface GigabitEthernet 0/1. (Taking the device supporting the bandwidth configuration of the unicast queue or the multicast queue for example. )

**Examples**

```
Ruijie# show qos bandwidth interface gigabitEthernet 0/1
```

```
Interface: GigabitEthernet 0/1
```

```
-----
```

| uc-queue-id | minimum-bandwidth | maximum-bandwidth |
|-------------|-------------------|-------------------|
| 1           | 5120              | 10240             |
| 2           | 0                 | 0                 |

The fields in the output of this command are described in the following table.

| Field             | Description                                    |
|-------------------|------------------------------------------------|
| Interface         | Indicates the interface name.                  |
| queue-id          | Indicates the queue ID.                        |
| uc-queue-id       | Indicates the unicast queue ID.                |
| mc-queue-id       | Indicates the multicast queue ID.              |
| minimum-bandwidth | Indicates the minimum bandwidth configuration. |

|                                                                            |                                                                                                            |
|----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
|                                                                            | The unit is Kbps.                                                                                          |
| maximum-bandwidth                                                          | Indicates the maximum bandwidth configuration. The unit is Kbps.                                           |
| Total queue minimum-bandwidth<br>Total queue maximum-bandwidth             | Indicates the total bandwidth of minimum and maximum when both unicast and multicast queues are displayed. |
| Total ucast-queue minimum-bandwidth<br>Total ucast-queue maximum-bandwidth | Indicates the total bandwidth of minimum and maximum when only unicast queue is displayed.                 |
| Total mcast-queue minimum-bandwidth<br>Total mcast-queue maximum-bandwidth | Indicates the total bandwidth of minimum and maximum when only multicast queue is displayed.               |

**Description**

## 2.34 show qos wred-ecn statistics

Use this command to display the statistics of packets discarded by WRED and packets marked by ECN.

**show qos wred-ecn statistics** [ **interfaces** *interface-id* ]

| Parameter Description | Parameter           | Description  |
|-----------------------|---------------------|--------------|
|                       | <i>interface-id</i> | Interface ID |

**Defaults** N/A

**Command mode** Privileged EXEC mode/global configuration mode/interface configuration mode

**Usage Guide** The chip capability depends whether this command is available.

**Configuration Examples** The following example displays the statistics of packets discarded by WRED and packets marked by ECN.

Products do not support port queue statistics display:

```
Ruijie#show qos wred-ecn statistics
Wred ecn stats result:
Port                WredDropped        EcnSended
```

```

-----
TFGigabitEthernet 0/1          0          0
TFGigabitEthernet 0/2          0          0
TFGigabitEthernet 0/3          0          0
TFGigabitEthernet 0/4          0          0
TFGigabitEthernet 0/5          0          0
TFGigabitEthernet 0/6          0          0
TFGigabitEthernet 0/7          0          0
TFGigabitEthernet 0/8          0          0
TFGigabitEthernet 0/9          0          0
TFGigabitEthernet 0/10         0          0
TFGigabitEthernet 0/11         0          0
TFGigabitEthernet 0/12         0          0

```

Products support port queue statistics display:

```
Ruijie#show qos wred-ecn statistics
```

Wred ecn stats result:

```

port                               WredDropped    EcnsSended

**Description**

## 2.35 show queueing wred interface

Use this command to display WRED settings on the interface.

**show queueing wred interface** *interface-id*

**Parameter Description**

| Parameter           | Description    |
|---------------------|----------------|
| <i>interface-id</i> | Interface name |

**Defaults**

None

**Command mode**

Privileged EXEC mode, global configuration mode, interface configuration mode.

**Usage Guide**

Products depend whether max\_cell x and min\_cell\_x are displayed.

**Configuration Examples**

The following example displays the WRED settings on interface GigabitEthernet 1/3.

```
Ruijie# show queueing wred interface gigabitethernet 1/3
-----
qid  max_cell_1  min_cell 1  max_1  min_1  prob_1  max_cell_2  min_cell 2  max_2  min_2  prob_2
----  -
1    120000      120000    100    30     100     120000      120000    100    70     100

## 2.36 show virtual-group

Use this command to display the member port in the virtual group.

**show virtual-group** [ *virtual-group-number* | **summary** ]

#### Parameter Description

| Parameter                   | Description                                       |
|-----------------------------|---------------------------------------------------|
| <i>virtual-group-number</i> | Virtual group number. The range is from 1 to 128. |
| <b>summary</b>              | Displays the member port in all virtual groups.   |

**Defaults** N/A

**Command Mode** Privileged EXEC mode, global configuration mode, interface configuration mode.

**Usage Guide** N/A

**Configuration** The following example displays the member port in all virtual groups.

**Examples**

```
Ruijie# show virtual-group summary
```

```
virtual-group      member
```

```
-----
```

```
1                Gi0/1 Gi0/2
```

```
2                Gi0/0
```

The fields in the output of this command are described in the following table.

| Field         | Description                                     |
|---------------|-------------------------------------------------|
| virtual-group | Indicates the virtual group number.             |
| member        | Indicates the member port in the virtual group. |

**Description**

## 2.37 virtual-group

Use this command to create a virtual group in global configuration mode.

Use this command to configure add an interface to a virtual group in interface configuration mode.

Use the **no** or **default** form of this command to remove a virtual group in global configuration mode.

Use the **no** or **default** form of this command to remove an interface from a virtual group in interface configuration mode.

**virtual-group** *virtual-group-number*

**no virtual-group** *virtual-group-number*

**default virtual-group** *virtual-group-number*

**Parameter**

**Description**

| Parameter                   | Description                                       |
|-----------------------------|---------------------------------------------------|
| <i>virtual-group-number</i> | Virtual group number. The range is from 1 to 128. |

**Defaults** No virtual group is configured, or no interface is added to a virtual group, by default.

**Command Mode** Interface configuration mode, global configuration mode.

**Usage Guide** The member port added to the virtual group must be a physical port or an aggregate port member.  
The member ports of a virtual group must be on the same module of a chassis switch or on the same box switch.

**Configuration** The following example sets the interface gigabitEthernet 1/3 as the member of virtual group 3:

**Examples**

```
Ruijie(config)# interface gigabitEthernet 1/3
Ruijie(config-if)# virtual-group 3
```

## 2.38 wfq-queue bandwidth

Use this command to configure the WFQ queue weight ratio. Use the **no** or **default** form of this command to restore the default setting.

**wfq-queue bandwidth** *weight1 ... weight8*

**no wfq-queue bandwidth**

**default wfq-queue bandwidth**

| Parameter   | Parameter                | Description                                                                                                                                                                                                                                                   |
|-------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>weight1...weight8</i> | 8 queue weights. The default queue weight ratio is 1:1:1:1:1:1:1:1.<br>For the products supporting the SP scheduling policy, the weight range is from 0 to 15.<br>For the products not supporting the SP scheduling policy, the weight range is from 1 to 15. |

**Defaults** The default queue weight ratio is 1:1:1:1:1:1:1:1.

**Command Mode** Global configuration mode.

**Usage Guide** If the weight value is 0, the SP scheduling policy is applied.

**Configuration** The following example configures the WFQ queue weight ratio to 1:1:2:4:4:4:6:8.

**Examples**

```
Ruijie(config)# wfq-queue bandwidth 1 1 2 4 4 4 6 8
```

### Description

## 2.40 cos-map

Use this command to map the CoS value to a threshold for a specified queue. Use the **no** or **default** form of this command to restore the default settings.

```
wrr-queue cos-map threshold_id cos1 [ cos2 [ cos3 [ cos4 [ cos5 [ cos6 [ cos7 [ cos8 ] ] ] ] ] ] ]
```

**no wrr-queue cos-map** *threshold\_id*  
**default wrr-queue cos-map** *threshold\_id*

**Parameter  
Description**

| Parameter           | Description                                                                               |
|---------------------|-------------------------------------------------------------------------------------------|
| <i>threshold_id</i> | Threshold number. The range is from 1 to 2. Up to two threshold values can be configured. |
| <i>cos_N</i>        | CoS value. The range is from 0 to 7. Up to 8 CoS values can be configured.                |

**Defaults** All CoS values are mapped to the threshold 1.

**Command mode** Interface configuration mode.

**Usage Guide** DSCP-threshold mapping can be enabled by mapping DSCP-CoS to CoS-threshold. When all CoS values are mapped to one threshold on the interface, it changes the enabled WRED to RED.

**Configuration Examples** The following example enters the interface GigabitEthernet 1/3 to map CoS 1, 2 to threshold 2.

```
Ruijie(config)# interface gigabitethernet 1/3
Ruijie(config-if-GigabitEthernet 1/3)#wrr-queue cos-map 2 1 6
```

**Related  
Commands**

| Command                                                 | Description                                       |
|---------------------------------------------------------|---------------------------------------------------|
| <b>show queueing wred interface</b> <i>interface-id</i> | Displays the WRED configuration on the interface. |

**Platform  
Description** N/A.

## 2.41 wrr-queue random-detect sample-period

Use this command to configure the sampling interval for discarding of WRED. You can also restore the default configuration .

**wrr-queue random-detect sample-period** *period*  
**no wrr-queue random-detect sample-period**  
**default wrr-queue random-detect sample-period**

**Parameter  
Description**

| Parameter     | Description                                                                          |
|---------------|--------------------------------------------------------------------------------------|
| <i>period</i> | Indicates the sampling interval in the unit of sampling cycle, ranging from 1 to 64. |

**Defaults** The default range varies with product.

**Command** Global configuration mode  
**Mode**

**Usage Guide** Whether this command is available is determined by products.

Because the configured sampling interval takes effect on the discarding function of WRED in interface configuration mode, it is recommended to configure the sampling interval after the higher and lower thresholds for packets to be discarded by WRED. Use this command together with the sampling weight configuration command for packets to be discarded by WRED, to precisely adjust the discarding function of WRED.

**Configuration** The following example sets the sampling interval to 10.

**Examples**

```
Ruijie# configure terminal
Ruijie(config)# wrr-queue random-detect sample-period 10
```

**Description**

## 2.42 wrr-queue random-detect sample-weight

Use this command to set the sampling weight for WRED. Use the **no** or **default** form of this command to restore the default settings.

**wrr-queue random-detect sample-weight** *queue\_id* *weight*  
**no wrr-queue random-detect sample-weight** *queue\_id*  
**default wrr-queue random-detect sample-weight** *queue\_id*

| Parameter<br>Description | Parameter       | Description                                                                                |
|--------------------------|-----------------|--------------------------------------------------------------------------------------------|
|                          | <i>queue_id</i> | Indicates the ID of a queue on an interface.                                               |
|                          | <i>weight</i>   | Indicates the weight factor, ranging from 0 to 15. The value range may vary with products. |

**Defaults** The default value is determined by products.

**Command mode** Interface configuration mode.

**Usage Guide** Whether this command is available is determined by products.

Because the configured sampling interval takes effect on the discarding function of WRED in interface

configuration mode, it is recommended to configure the sampling interval after the higher and lower thresholds for packets to be discarded by WRED. Use this command together with the sampling interval configuration command for packets to be discarded by WRED, to precisely adjust the discarding function of WRED.

**Configuration** The following example sets the sampling weight on interface 1/3 to 6:

**Examples**

```
Ruijie(config)# interface gigabitethernet 1/3
Ruijie(config-if-GigabitEthernet 1/3)# wrr-queue random-detect sample-weight 1 6
```

**Description**

## 2.43 wrr-queue random-detect min-threshold

Use this command to configure the minimum WRED drop threshold. Use the **no** or **default** form of this command to restore the default WRED drop threshold. Unit: percentage

**wrr-queue random-detect min-threshold** *queue\_id* *thr1* [ *thr2* ]

**no wrr-queue random-detect min-threshold** *queue\_id*

**default wrr-queue random-detect min-threshold** *queue\_id*

**Parameter Description**

| Parameter       | Description                                                                               |
|-----------------|-------------------------------------------------------------------------------------------|
| <i>queue_id</i> | Queue ID.                                                                                 |
| <i>thrN</i>     | Up to two threshold values can be configured. The threshold value range is from 1 to 100. |

**Defaults**

Two threshold values are configured, and the default threshold values are 100 and 80.

**Command mode**

Interface configuration mode.

**Usage Guide**

As the maximum value of the configuration range is equal to the current higher threshold, you need to pay attention to the setting of the higher threshold when configuring the lower threshold.

The threshold for packets to be discarded by WRED can be configured in the unit of percentage or cell. The latter configured mode prevails.

**Configuration** The following example configures the low WRED drop thresholds to 60 and 70 for queue 1.

**Examples**

```
Ruijie(config)# interface gigabitethernet 1/3
```

```
Ruijie(config-if-GigabitEthernet 1/3)# wrr-queue random-detect min-threshold
1 60 70
```

**Related  
Commands**

| Command                                                 | Description                                       |
|---------------------------------------------------------|---------------------------------------------------|
| <b>show queueing wred interface</b> <i>interface-id</i> | Displays the WRED configuration on the interface. |

**Platform** N/A.  
**Description**

## 2.44 wrr-queue random-detect max-threshold

Use this command to set the maximum WRED threshold (in the unit of percentage) for the specified queue on the interface. Use the **no** form of this command to remove the maximum WRED threshold.

**wrr-queue random-detect max-threshold** *queue\_id* *thr1* [*thr2* *thr3*]

**no wrr-queue random-detect max-threshold** *queue\_id*

**Parameter  
Description**

| Parameter       | Description                                                                                |
|-----------------|--------------------------------------------------------------------------------------------|
| <i>queue_id</i> | The interface queue id.                                                                    |
| <i>thrN</i>     | Supports 2 groups of higher thresholds, ranging from the specified lower threshold to 100. |

**Defaults** When the unit is percentage, the default value is 100, 100.

**Command mode** Interface configuration mode.

**Usage Guide** Because the minimum value of the configured range is equal to the current lower threshold, you need to consider the lower threshold when configuring the higher threshold.

The threshold for packets to be discarded by WRED can be configured in the unit of percentage or cell. The latter configured mode prevails.

**Configuration Examples** The following example shows how to set the max-threshold for queue1 on an interface:

```
Ruijie(config-if)# wrr-queue random-detect max-threshold 1 88 89 90
```

**Platform** N/A.

## Description

## 2.45 wrr-queue random-detect min-threshold cell

Use this command to set the lower WRED threshold in the unit of cell. Use the **no** or **default** form of this command to restore the default settings.

**wrr-queue random-detect min-threshold cell** *queue\_id* *thr1* [ *thr2* ]

**no wrr-queue random-detect min-threshold cell** *queue\_id*

**default wrr-queue random-detect min-threshold cell** *queue\_id*

### Parameter Description

| Parameter       | Description                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>queue_id</i> | Indicates the ID of a queue on an interface, ranging from <b>1</b> to <b>8</b> .                                                      |
| <i>thrN</i>     | Supports 2 groups of lower thresholds, ranging from 1 to the specified higher threshold. The default value is determined by products. |

**Defaults** The default value is determined by products.

**Command mode** Interface configuration mode.

**Usage Guide** Whether this command is available is determined by products.

Because the maximum value of the configuration range is equal to the current higher threshold, you need to pay attention to the setting of the higher threshold when configuring the lower threshold.

The threshold for packets to be discarded by WRED can be configured in the unit of percentage or cell. The latter configured mode prevails.

**Configuration Examples** The following example sets the lower threshold of the first queue on interface 1/3 to 1000, 1000 :

```
Ruijie(config)# interface gigabitethernet 1/3
Ruijie(config-if-GigabitEthernet 1/3)# wrr-queue random-detect cell
min-threshold 1 1000 1000
```

## 2.46 wrr-queue random-detect max-threshold cell

Use this command to set the higher WRED threshold in the unit of cell. Use the **no** or **default** form of this command to restore the default settings.

**wrr-queue random-detect max-threshold cell** *queue\_id* *thr1* [ *thr2* ]

**no wrr-queue random-detect max-threshold cell** *queue\_id*

**default wrr-queue random-detect max-threshold cell** *queue\_id*

### Parameter Description

| Parameter       | Description                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------|
| <i>queue_id</i> | Indicates the ID of a queue on an interface.                                                                  |
| <i>thrN</i>     | Supports 2 groups of higher thresholds, ranging from the set lower threshold to the maximum higher threshold. |

**Defaults** The default value is determined by products.

**Command mode** Interface configuration mode.

**Usage Guide** Whether this command is available is determined by products.

Because the minimum value of the configuration range is equal to the current lower threshold, you need to consider the lower threshold when configuring the higher threshold.

The threshold for packets to be discarded by WRED can be configured in the unit of percentage or cell. The latter configured mode prevails.

**Configuration Examples** The following example sets the higher threshold of the first queue on interface 0/1 to 1000, 1000 :

```
Ruijie(config)# interface tFGigabitEthernet 0/1
Ruijie(config-if-TFGigabitEthernet 0/1)# wrr-queue random-detect cell
max-threshold 1 1000 1000
```

## 3 MMU Commands

### 3.1 clear mmu pg-buffer peaked

Use this command to clear the historical peak value of the priority group buffer.

**clear mmu pg-buffer peaked**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** -

**Configuration Examples** The following example clears the historical peak value of all priority group buffers:

```
Ruijie# clear mmu pg-buffer peaked
```

### 3.2 clear mmu queue-buffer peaked

Use this command to clear the historical peak value of the queue buffer.

**clear mmu queue-buffer peaked**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Examples** The following example clears the historical peak value of the buffer.

```
Ruijie# clear mmu queue-buffer peaked
Ruijie#
```

**Platform**  
**Description**

N/A

### 3.3 clear queue-counters

Use this command to clear queue statistics.

**clear queue-counter** [**interface** *interface\_id*]

**Parameter**  
**Description**

| Parameter           | Description |
|---------------------|-------------|
| <i>interface_id</i> | Port Number |

**Command**  
**Mode**

Privileged EXEC mode

**Default Level**

14

**Usage Guide**

N/A

**Configuration** The following example clears all queue statistics.

**Examples**

```
Ruijie# clear queue-counter  
Ruijie#
```

The following example clears queue statistics of an interface.

```
Ruijie# clear queue-counter Interface TenGigabitEthernet 1/9  
Ruijie#
```

**Platform**  
**Description**

N/A

### 3.4 clear mmu usage-warn-count

Use this command to clear the number of buffer usage warnings.

**clear mmu usage-warn-count**

**Parameter**  
**Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

|                               |                                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Command Mode</b>           | Privileged EXEC mode                                                                                               |
| <b>Default Level</b>          | 14                                                                                                                 |
| <b>Usage Guide</b>            | N/A                                                                                                                |
| <b>Configuration Examples</b> | The following example clears the number of buffer usage warnings.<br><pre>Ruijie# clear mmu usage-warn-count</pre> |

### 3.5 mmu cut-through

Use this command to enable the cut-through function on a port. Use the **no** form of this command to restore the default setting.

**mmu cut-through**

**no mmu cut-through**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** The default value depends on the product.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide**

1. The effective way of this command varies with the equipment and depends on the product.
2. The user-configured value is displayed when the **show run** command is executed, even if the user-configured value is the default value.

**Configuration Examples** The following example enables the cut-through function on a port.

```
Ruijie#config
Ruijie(config)# interface hundredGigabitEthernet 0/50
Ruijie(config-if-HundredGigabitEthernet 0/50)#mmu cut-through
Ruijie(config-if-HundredGigabitEthernet 0/50)#exit
```

**Verification** Run the **show run** command to display the cut-through configuration.

### 3.6 mmu guarantee-limit set

Use this command to ensure the quantity of guaranteed buffer cell. Use the **no** form of this command to

disable this function.

**mmu guarantee-limit set cell**

**no mmu guarantee-limit**

**Parameter  
Description**

| Parameter   | Description                                   |
|-------------|-----------------------------------------------|
| <i>cell</i> | ensure the quantity of guaranteed buffer cell |

**Command  
Mode**

Global configuration mode

**Default Level**

14

**Usage Guide**

Certain buffer is reserved by default, and the cell quantity is subject to the actual product.

**Configuration**

1: In the global configuration mode, reserve 10000 guaranteed cells.

**Examples**

```
Ruijie#config
Ruijie(config)# mmu guarantee-limit set 10000
Ruijie(config)#exit
Ruijie#
```

**Verification**

1: Run the **show run** command to check the current configuration.

## 3.7 mmu ha disable

Use this command to enable MMU-HA function. Use the no form of this command to disable this function.

**mmu ha disable**

**no mmu ha disable**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
|           |             |

**Command  
Mode**

Global configuration mode

**Default Level**

14

**Usage Guide**

MMU-HA is enabled by default.

**Configuration**

1: In the global configuration mode, disable MMU-HA.

**Examples**

```
Ruijie#config
```

```
Ruijie(config)# mmu ha disable
Ruijie(config)#exit
Ruijie#
```

**Verification** 1: Run the **show run** command to check the current configuration.

## 3.8 mmu ha reset disable

Use this command to enable MMU-HA reset. Use the **no** form of this command to disable this function.

**mmu ha reset disable**

**no mmu ha reset disable**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
|           |             |

**Command  
Mode** Global configuration mode

**Default Level** 14

**Usage Guide** MMU-HA reset is enabled by default.

**Configuration** 1: In the global configuration mode, disable MMU-HA reset.

**Examples**

```
Ruijie#config
Ruijie(config)# mmu ha reset disable
Ruijie(config)#exit
Ruijie#
```

**Verification** 1: Run the **show run** command to check the current configuration.

## 3.9 mmu headroom-threshold

Use this command to configure the priority group headroom buffer size. Use the **no** form of this command to restore the default setting.

**mmu headroom-threshold pg [pg-id0 [pg-id1 [pg-id N] ] set value**

**no mmu headroom-threshold pg**

**Parameter  
Description**

| Parameter | Description       |
|-----------|-------------------|
| pg-idN    | Priority group ID |

|              |                                                |
|--------------|------------------------------------------------|
| <i>value</i> | Headroom threshold value, in the unit of cell. |
|--------------|------------------------------------------------|

**Defaults** The default value depends on the product.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide**

1. The effective way of this command varies with the equipment and depends on the product.
2. The user-configured value is displayed when the **show run** command is executed, even if the user-configured value is the default value.

**Configuration** The following example configures the priority group headroom buffer size.

**Examples**

```
Ruijie#config
Ruijie(config)# interface tenGigabitEthernet 0/9
Ruijie(config-if)#mmu headroom-threshold pg 1 3 7 8 set 100
Ruijie(config-if)#exit
```

**Verification** Run the **show run** command to display the headroom buffer size configuration.

## 3.10 mmu ingress-threshold

Use this command to configure the ingress shared buffer. Use **no** form of this command to restore the default setting.

**mmu ingress-threshold pg** [*pg-id0* [*pg-id1* [*pg-id N* ] ] **set** *thr%*

**no mmu ingress-threshold pg**

**Parameter Description**

| Parameter     | Description                                                                         |
|---------------|-------------------------------------------------------------------------------------|
| <i>pg-idN</i> | Priority group ID                                                                   |
| <i>thr%</i>   | Total shared buffer x Threshold percentage = Maximum available buffer for the queue |

**Defaults** The default value depends on the product.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide**

1. The effective way of this command varies with the equipment and depends on the product.
2. The configuration takes effect only when flow control/Priority-based Flow Control (PFC) is not

enabled.

3. The user-configured value is displayed when the **show run** command is executed, even if the user-configured value is the default value.

**Configuration** The following example configures the percentage of multi-priority group shared buffer.

**Examples**

```
Ruijie#config
Ruijie(config)# interface tenGigabitEthernet 0/9
Ruijie(config-if)#mmu ingress-threshold pg 1 3 7 8 set 80
Ruijie(config-if)#exit
```

**Verification** Run the **show run** command to display the shared buffer configuration.

## 3.11 mmu {ingress|egress} service-pool

Use this command to configure the size of shared service pool on the input/output. Use the **no** form of this command to disable this function.

**mmu {ingress|egress} service-pool sp-id set cell**

**no mmu {ingress|egress} service-pool sp-id**

**Parameter  
Description**

| Parameter      | Description                                      |
|----------------|--------------------------------------------------|
| <i>ingress</i> | Configures the shared service pool on the input  |
| <i>egress</i>  | Configures the shared service pool on the output |
| <i>sp-id</i>   | ID of the shared service pool                    |
| <i>cell</i>    | Cell quantity of the shared service pool         |

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** By default, buffer is all allocated to the shared service pool sp0 whose size is subject to the actual product. The size of other pools is 0.  
It is recommended to set the same size for shared service pools on the input/output for the same traffic, or packet loss may occur.

**Configuration** 1: sp1 on the input/output in the global configuration mode has 10000 cells

**Examples**

```
Ruijie#config
Ruijie(config)# mmu ingress service-pool 1 set 10000
Ruijie(config)# mmu egress service-pool 1 set 10000
Ruijie(config)#exit
Ruijie#
```

- Verification**
- 1: Run the **show run** command to check the current configuration.
  - 2: Run the **show pg-buffer** and **show queue-buffer** to check the configuration result.

### 3.12 mmu pg-guarantee

Use this command to configure the ingress PG guarantee buffer size. Use the **no** form of this command to restore the default setting.

**mmu pg-guarantee pg** { *priority -id1* [*priority-id2* [*priority -idN*] } *set value*

**no mmu pg-guarantee pg** { *priority -id1* [*priority-id2* [*priority -idN*] }

**Parameter  
Description**

| Parameter            | Description                                               |
|----------------------|-----------------------------------------------------------|
| <i>priority -idN</i> | Ingress PG No.                                            |
| <i>value</i>         | Guarantee buffer configuration value, in the unit of cell |

**Defaults** The default value depends on the product.

**Command  
Mode** Interface configuration mode

**Default Level** 14

- Usage Guide**
1. The effective way of this command varies with the equipment and depends on the product.
  2. The user-configured value is displayed when the **show run** command is executed, even if the user-configured value is the default value.

**Configuration** The following example configures the ingress PG guarantee buffer size.

**Examples**

```
Ruijie#config
Ruijie(config)# interface hundredGigabitEthernet 0/50
Ruijie(config-if-HundredGigabitEthernet 0/50)#mmu pg-guarantee pg set 100
Ruijie(config-if-HundredGigabitEthernet 0/50)#exit
```

**Verification** Run the **show run** command to display the PG guarantee buffer configuration.

### 3.13 mmu pg-headroom

Use this command the maximum size of globally available headroom buffer. Use the **no** form of this command to restore the default setting.

**mmu pg-headroom set** *value*

**no mmu pg-headroom**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|              |                                                                         |
|--------------|-------------------------------------------------------------------------|
| <i>value</i> | Maximum size of globally available headroom buffer, in the unit of cell |
|--------------|-------------------------------------------------------------------------|

**Defaults** The default value depends on the product.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** The default value of the global PG headroom buffer varies with the equipment and depends on the product.

**Configuration Examples** The following example configures the maximum size of globally available headroom buffer.

```
Ruijie#config
Ruijie(config)#mmu pg-headroom set 10000
Ruijie(config)#exit
```

**Verification** Run the **show run** command to display the global headroom buffer configuration.

### 3.14 mmu {priority-group| unicast-queue| multicast-queue} attach

Use this command to configure the mapping relationship between the input PG/output queue and the shared service pool. Use the **no** form of this command to disable this function.

**mmu {priority-group| unicast-queue| multicast-queue} [id1 [id2 [idN]] attach service-pool [sp-id]**  
**no mmu {priority-group| unicast-queue| multicast-queue} [id1 [id2 [idN]] attach service-pool**

| Parameter Description | Parameter              | Description                                         |
|-----------------------|------------------------|-----------------------------------------------------|
|                       | <i>priority-group</i>  | Input priority group                                |
|                       | <i>unicast-queue</i>   | Output unicast queue                                |
|                       | <i>multicast-queue</i> | Output multicast queue                              |
|                       | <i>idN</i>             | ID of the priority group or unicast/multicast queue |
|                       | <i>sp-id</i>           | ID of the shared service pool                       |

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** By default, PG and unicast/multicast queue are mapped to SP0. The mapping can be changed to a new SP, and is changed back to SP0 after the configuration is deleted,

**Configuration Examples** 1: In the global configuration mode, establish SP1 on the input, and establish SP1 and SP2 on the output. Map the input PG1 to the input SP1, the unicast queue 1 on the output to the output SP1, and the

multicast queue 1 to the output SP2.

```
Ruijie#config
Ruijie(config)# mmu ingress service-pool 1 set 10000
Ruijie(config)# mmu egress service-pool 1 set 10000
Ruijie(config)# mmu egress service-pool 2 set 10000
Ruijie(config)# mmu priority-group 1 attach service-pool 1
Ruijie(config)# mmu unicast-queue 1 attach service-pool 1
Ruijie(config)# mmu multicast-queue 1 attach service-pool 2
Ruijie(config)#exit
Ruijie#
```

- Verification**
- 1: Run the **show run** command to check the current configuration.
  - 2: Run the **show pg-buffer** and **queue-buffer** to check the configuration result.

### 3.15 mmu queue-guarantee

Use this command to configure the guaranteed buffer.

**mmu queue-guarantee output { unicast | multicast } {queue-id1 [queue-id2 [queue-idN] ]set value**

Use the **no** form of this command to restore the default setting.

**no mmu queue-guarantee output { unicast | multicast }**

#### Parameter Description

| Parameter        | Description                                                 |
|------------------|-------------------------------------------------------------|
| <b>output</b>    | Performs buffer management on the output queue.             |
| <b>unicast</b>   | Performs buffer management on the output unicast queue.     |
| <b>multicast</b> | Performs buffer management on the output multicast queue.   |
| <i>queue-idN</i> | Queue ID                                                    |
| <i>value</i>     | Sets the number of guaranteed buffer, in the unit of cells. |

**Defaults** 8 cells by default.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide** This command is executed in different ways on different devices.

**Configuration Examples** The following example configures guaranteed buffer for unicast queue.

```
Ruijie#config
Ruijie(config)# interface tenGigabitEthernet 1/9
```

```
Ruijie(config-if)#mmu queue-guarantee ouput unicast 1 3 7 8 set 15
Ruijie(config-if)#exit
```

The following example configures guaranteed buffer for multicast queue.

```
Ruijie#config
Ruijie(config)# interface tenGigabitEthernet 1/9
Ruijie(config-if)#mmu queue-guarantee ouput multicast 1 3 7 8 set 15
Ruijie(config-if)#exit
```

**Platform**  
**Description**

N/A

### 3.16 mmu queue-thredshold

Use this command to configure the shared buffer.

**mmu queue-thredshold output { unicast | multicast } { queue-id1 [queue-id2 [queue-idN] ] } set th%**

Use the **no** form of this command to restore the default setting.

**no mmu queue-thredshold output { unicast | multicast }**

**Parameter**  
**Description**

| Parameter        | Description                                               |
|------------------|-----------------------------------------------------------|
| <b>output</b>    | Performs buffer management on the output queue.           |
| <b>unicast</b>   | Performs buffer management on the output unicast queue.   |
| <b>multicast</b> | Performs buffer management on the output multicast queue. |
| <i>queue-idN</i> | Queue ID                                                  |
| <i>th%</i>       | Total shared buffer * threshold = Available buffer        |

**Defaults** 100% for unicast queue and 15% for multicast queue.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide** There are different effective ways on products.

**Configuration Examples** The following example configures shared buffer for unicast queue.

```
Ruijie#config
Ruijie(config)# interface tenGigabitEthernet 1/9
Ruijie(config-if)#mmu queue-thredshold ouput unicast 1 3 7 8 set 80
```

```
Ruijie(config-if)#exit
Ruijie(config)#exit
Ruijie#
```

The following example configures shared buffer for multicast queue.

```
Ruijie#config
Ruijie(config)# interface tenGigabitEthernet 1/9
Ruijie(config-if)#mmu queue-thredshold ouput multicast 1 3 7 8 set 80
Ruijie(config-if)#exit
Ruijie(config)#exit
Ruijie#
```

**Platform**  
**Description**

N/A

### 3.17 mmu queue-loss-warn { unicast | multicast }

Use this command to enable the queue packet loss alarm function. Use the **no** form of this command to disable this function.

**[ no ] mmu queue-loss-warn { unicast | multicast } [ *qid1* [*qid2* [*qidN*]] ] { on | off }**

**Parameter**  
**Description**

| Parameter        | Description                                    |
|------------------|------------------------------------------------|
| <b>unicast</b>   | Indicates a unicast queue.                     |
| <b>multicast</b> | Indicates a multicast queue.                   |
| <i>qid</i>       | Indicates a queue ID.                          |
| <b>on</b>        | Enables the queue packet loss alarm function.  |
| <b>off</b>       | Disables the queue packet loss alarm function. |

**Command**  
**Mode**

Global configuration mode / interface configuration mode

**Default Level**

14

**Usage Guide** The commands in global configuration mode takes effect on all interfaces, the commands in interface configuration mode takes effect on the current interface, and the latter has a higher priority than the former.

**Configuration** The following example enables the packet loss alarm function in global configuration mode.

**Examples**

```
Ruijie#config
```

```
Ruijie(config)# mmu queue-loss-warn unicast 1 2 3 on
Ruijie(config)# mmu queue-loss-warn multicast 5 6 7 on
Ruijie(config)#exit
Ruijie#
```

The following example configures the packet loss alarm function in interface configuration mode.

```
Ruijie#config
Ruijie(config)# interface hundredGigabitEthernet 0/50
Ruijie(config-if-HundredGigabitEthernet 0/50)#mmu queue-loss-warn unicast 1 2
3 on
Ruijie(config-if-HundredGigabitEthernet 0/50)#mmu queue-loss-warn unicast 4 5
6 off
Ruijie(config-if-HundredGigabitEthernet 0/50# mmu queue-loss-warn multicast 2
3 4 on
Ruijie(config-if-HundredGigabitEthernet 0/50# mmu queue-loss-warn multicast 6
7 8 off
Ruijie(config-if-HundredGigabitEthernet 0/50#exit
Ruijie(config)#
```

**Verification** Run the **show run** command to display the configuration.

### 3.18 mmu queue-loss-warn frequency

Use this command to configure the queue packet loss alarm frequency. Use the **no** form of this command to disable this function.

**[no] mmu queue-loss-warn frequency cycle *value1* times *value2***

#### Parameter Description

| Parameter     | Description                                                       |
|---------------|-------------------------------------------------------------------|
| <i>value1</i> | Indicates the alarm printing period, in seconds.                  |
| <i>value2</i> | Indicates the number of alarms that can be printed in one period. |

#### Command Mode

Global configuration mode

#### Default Level

14

#### Usage Guide

Up to 30 packet loss alarms can be printed within 60s by default.

#### Configuration Examples

The following example configures the frequency of packet loss alarms.

```
Ruijie#config
Ruijie(config)# mmu queue-loss-warn frequency cycle 35 times 8
```

```
Ruijie(config)#exit
Ruijie#
```

**Verification** Run the **show run** command to display the configuration.

### 3.19 mmu sample-period

Use this command to configure the sampling interval for counting the occupied buffer and sent and discarded records in a queue. Use the **no** form of this command to restore the default setting.

**mmu sample-period { buffer-counter | queue-counter } value**

**no mmu sample-period { buffer-counter | queue-counter }**

| Parameter Description | Parameter             | Description                                        |
|-----------------------|-----------------------|----------------------------------------------------|
|                       | <b>buffer-counter</b> | Count of the occupied buffer                       |
|                       | <b>queue-counter</b>  | Count of sent and discarded records in a queue     |
|                       | <i>value</i>          | Sampling time, in the unit of seconds, range:1-10. |

**Defaults** 5 seconds

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide**

1. The effective way of this command varies with the equipment and depends on the product.
2. The user-configured value is displayed when the **show run** command is executed, even if the user-configured value is the default value.

**Configuration Examples** The following example configures the sampling interval for counting the occupied buffer and sent and discarded records in a queue.

```
Ruijie#config
Ruijie(config)# mmu sample-period buffer-counter 10
Ruijie(config)# mmu sample-period queue-counter 8
Ruijie(config)#exit
```

**Verification** Run the **show run** command to display the sampling interval configuration.

### 3.20 mmu slice-id compatible

Use this command to switch the numbering mode of slice ID. Use the **no** form of this command to restore the default settings.

**mmu slice-id compatible**

**no mmu slice-id compatible**

| Parameter Description  | Parameter                                                                                                                                                          | Description |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
|                        | N/A                                                                                                                                                                |             |
| Defaults               | By default, the number of slice ID starts from 1; run the command to start ID from 0.                                                                              |             |
| Command Mode           | Global configuration mode                                                                                                                                          |             |
| Default Level          | 14                                                                                                                                                                 |             |
| Usage Guide            | /A                                                                                                                                                                 |             |
| Configuration Examples | The following example switches the numbering mode of slice ID. <pre>Ruijie#config Ruijie(config)# mmu slice-id compatible Ruijie(config)#exit</pre>                |             |
| Verification           | Run the <b>show run</b> command to display the current numbering mode.<br>Run the <b>show queue-buffer</b> command to display the range of current numbering mode. |             |

### 3.21 mmu xoff-threshold

Use this command to configure the flow control threshold. Use the **no** form of this command to restore the default setting.

**mmu xoff-threshold pg** [*pg-id0* [*pg-id1* [*pg-id N* ] ] **set** *thr%*  
**no mmu xoff-threshold pg**

| Parameter Description | Parameter                                                                                                                                                                                                                           | Description                                                                         |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|                       | <i>pg-idN</i>                                                                                                                                                                                                                       | Priority group ID                                                                   |
|                       | <i>th%</i>                                                                                                                                                                                                                          | Total shared buffer x Threshold percentage = Maximum available buffer for the queue |
| Defaults              | The default value depends on the product.                                                                                                                                                                                           |                                                                                     |
| Command Mode          | Interface configuration mode                                                                                                                                                                                                        |                                                                                     |
| Default Level         | 14                                                                                                                                                                                                                                  |                                                                                     |
| Usage Guide           | <div><div>1.</div><div>The effective way of this command varies with the equipment and depends on the product.</div></div> <div><div>2.</div><div>The configuration takes effect only when flow control/PFC is enabled.</div></div> |                                                                                     |

3. If flow control/PFC is not enabled, the shared buffer threshold of the PG is according to the value of **ingress-threshold**.
4. The user-configured value is displayed when the **show run** command is executed, even if the user-configured value is the default value.

**Configuration** The following example configures the percentage of the multi-priority group flow control threshold.

**Examples**

```
Ruijie#config
Ruijie(config)# interface tenGigabitEthernet 0/9
Ruijie(config-if)#mmu xoff-threshold pg 1 3 7 8 set 80
Ruijie(config-if)#exit
```

**Verification** Run the **show run** command to display the flow control threshold configuration.

## 3.22 mmu xon-threshold-offset

Use this command to configure the flow control restoration threshold. Use the **no** form of this command to restore the default setting.

**mmu xon-threshold-offset pg** [*pg-id0* [*pg-id1* [*pg-id N*]]] **set** *value*

**no mmu xon-threshold-offset pg**

**Parameter Description**

| Parameter     | Description                                                                    |
|---------------|--------------------------------------------------------------------------------|
| <i>pg-idN</i> | Priority group ID                                                              |
| <i>value</i>  | Offset value of the xon and xoff thresholds, in the unit of cell, range: 1-500 |

**Defaults** 8 cells by default

**Command Mode** Interface configuration mode

**Default Level** 14

- Usage Guide**
1. The effective way of this command varies with the equipment and depends on the product.
  2. The configuration takes effect only when flow control/PFC is enabled.
  3. The user-configured value is displayed when the **show run** command is executed, even if the user-configured value is the default value.

**Configuration** The following example configures the multi-priority group flow control restoration threshold.

**Examples**

```
Ruijie#config
Ruijie(config)# interface tenGigabitEthernet 0/9
Ruijie(config-if)#mmu xon-threshold-offset pg 1 3 7 8 set 10
```

```
Ruijie(config-if) #exit
```

**Verification** Run the **show run** command to display the flow control restoration threshold configuration.

### 3.23 mmu usage-warn-limit

Use these commands to configure the warning threshold of buffer usage. Use the **no** form of these commands to restore the default settings.

1. For global buffer

**mmu usage-warn-limit set value**

2. For shared service pool

**mmu usage-warn-limit {ingress-service-pool | egress-service-pool} sp-id set value**

3. For ingress pg/headroom or egress unicast/multicast queue buffer

**mmu usage-warn-limit {pg-headroom | priority-group | unicast | multicast} {id1 [id2 [idN]]} set value**

#### Parameter Description

| Parameter            | Description                                                      |
|----------------------|------------------------------------------------------------------|
| ingress-service-pool | Ingress shared service pool                                      |
| egress-service-pool  | Egress shared service pool                                       |
| sp-id                | ID of shared service pool, range 0-3                             |
| pg-headroom          | Priority group headroom                                          |
| priority-group       | Priority group                                                   |
| <b>unicast</b>       | Performs buffer management on the output unicast queue.          |
| <b>multicast</b>     | Performs buffer management on the output multicast queue.        |
| idN                  | Priority group ID or queue ID, range: 1-8                        |
| value                | Usage warning threshold in the unit of percentage, range: 1-100. |

**Defaults** The default threshold is 0.

**Command Mode** Global configuration mode/Interface configuration mode

**Default Level** 14

**Usage Guide** If the buffer usage for the port group/queue exceeds the global threshold, a warning log is printed. If the buffer usage for the queue exceeds the queue threshold, a warning log is printed. To avoid producing excessive logs, the warning log for a port group/queue is printed only once within 30 seconds.

**Configuration** The following example sets the usage warning threshold globally.

**Examples**

```
Ruijie#config
Ruijie(config)# mmu usage-warn-limit set 90
```

The following example sets the usage warning threshold for unicast queue 3 and 8 to 80%.

```
Ruijie#config
Ruijie(config)# int tel/1
Ruijie(config-if)# mmu usage-warn-limit unicast 3 8 set 80
```

The following example sets the usage warning threshold for multicast queue 1 and 4 to 80%.

```
Ruijie#config
Ruijie(config)# int tel/1
Ruijie(config-if)# mmu usage-warn-limit multicast 1 4 set 80
```

The following example sets the buffer usage warning threshold for priority groups 3 and 6 to 80%.

```
Ruijie#config
Ruijie(config)# int tel/1
Ruijie(config-if)# mmu usage-warn-limit priority-group 3 6 set 80
```

The following example sets the headroom usage warning threshold for priority groups 5 and 8 to 80%.

```
Ruijie#config
Ruijie(config)# int tel/1
Ruijie(config-if)# mmu usage-warn-limit pg-headroom 5 8 set 80
```

The following example sets the usage warning threshold for ingress shared service pool SP1 to 10%, and egress shared service pool SP2 to 20%.

```
Ruijie#config
Ruijie(config)# mmu usage-warn-limit ingress-service-pool 1 set 10
Ruijie(config)# mmu usage-warn-limit egress-service-pool 2 set 20
Ruijie(config)#exit
Ruijie#
```

**Platform**

N/A

**Description**

## 3.24 mmu tcb-enable

Use this command to enable MMU-TCB function. Use the **no** form of this command to disable this function.

**mmu tcb-enable**

**no mmu tcb-enable**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
|           |             |

|                               |                                                                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command Mode</b>           | Global configuration mode                                                                                                                                     |
| <b>Default Level</b>          | 14                                                                                                                                                            |
| <b>Usage Guide</b>            | MMU-TCB function is disabled by default.<br>Only devices using TD3/TH2 chip support this function. The effective way of this command varies with the product. |
| <b>Configuration Examples</b> | 1: In the global configuration mode, enable MMU-TCB function.                                                                                                 |
| <b>Examples</b>               | <pre> Ruijie#config Ruijie(config)# mmu tcb-enable Ruijie(config)#exit Ruijie# </pre>                                                                         |
| <b>Verification</b>           | 1: Run the <b>show run</b> command to check the current configuration.                                                                                        |

### 3.25 show pg-buffer interface

Use this command to display the priority group buffer usage of an interface.

**show pg-buffer interface** *interface-id*

| Parameter Description | Parameter           | Description  |
|-----------------------|---------------------|--------------|
|                       | <i>interface-id</i> | Interface ID |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command Mode</b>           | Privileged EXEC mode, global configuration mode, or interface configuration mode                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Default Level</b>          | 14                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Usage Guide</b>            | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|------------------------|-----------------------------------------------------------------------------------------------|
| Slice                  | No. of the module on the chip for buffer division                                             |
| Type                   | Queue type, including unicast queue and multicast queue                                       |
| Queue                  | Queue No., ranging from 1 to 8 by default and can be switched to 0 to 7 through configuration |
| Used cells             | Size of the occupied buffer in a queue, in the unit of cell                                   |
| Available cells        | Size of the available buffer in a queue, in the unit of cell                                  |
| Usage                  | Percentage of the occupied buffer in a queue                                                  |
| Usage warn limit       | Buffer usage warning threshold of a specific port group or queue                              |
| Usage warn count       | Number of times that the occupied buffer exceeds the warning threshold                        |
| Peaked cells           | Historical peak value of the used buffer                                                      |
| Slot                   | Slot No. of the line card                                                                     |
| PortGroup              | Port group No., starting from 1                                                               |
| Total cells            | Total buffer on a specified slice                                                             |
| Total usage            | Percentage of the occupied buffer on a specified slice                                        |
| Static used cells      | Size of the occupied guarantee buffer on a specified slice                                    |
| Global shared cells    | Total shared buffer on a specified slice                                                      |
| Available shared cells | Size of the available shared buffer on a specified slice                                      |

The following example displays the buffer usage of all interfaces (implemented based on the ingress PG).

```
Ruijie#show pg-buffer
```

```
Interface HundredGigabitEthernet 0/1:

## 3.26 show queue-buffer interface

Use this command to display buffer usage of interfaces.

**show queue-buffer interface** *interface-id*

| Parameter   | Parameter           | Description |
|-------------|---------------------|-------------|
| Description | <i>interface-id</i> | Interface   |

**Command Mode** Privileged EXEC mode/Global configuration mode/Interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example displays buffer usage of the specified interface based on output queue.

**Examples**

```

Ruijie(config)#show queue-buffer interface hundredGigabitEthernet 0/1
Interface HundredGigabitEthernet 0/1:

```

| Type      | Queue | Used cells | Available cells | Usage | Usage warn limit | Usage warn count | Peaked cells | Service pool |

| Field                  | Description                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------|
| Slice                  | No. of the module on the chip for buffer division                                             |
| Type                   | Queue type, including unicast queue and multicast queue                                       |
| Queue                  | Queue No., ranging from 1 to 8 by default and can be switched to 0 to 7 through configuration |
| Used cells             | Size of the occupied buffer in a queue, in the unit of cell                                   |
| Available cells        | Size of the available buffer in a queue, in the unit of cell                                  |
| Usage                  | Percentage of the occupied buffer in a queue                                                  |
| Usage warn limit       | Buffer usage warning threshold of a specific port group or queue                              |
| Usage warn count       | Number of times that the occupied buffer exceeds the warning threshold                        |
| Peaked cells           | Historical peak value of the used buffer                                                      |
| Slot                   | Slot No. of the line card                                                                     |
| PortGroup              | Port group No., starting from 1                                                               |
| Total cells            | Total buffer on a specified slice                                                             |
| Total usage            | Percentage of the occupied buffer on a specified slice                                        |
| Static used cells      | Size of the occupied guarantee buffer on a specified slice                                    |
| Global shared cells    | Total shared buffer on a specified slice                                                      |
| Available shared cells | Size of the available shared buffer on a specified slice                                      |
| Service pool           | Shared buffer pool, including ID and name                                                     |

The following example displays the buffer queue information of all interfaces.

```

Ruijie#show queue-buffer

### 3.27 show queue-counter interface

Use this command to display buffer queue statistics of interfaces.

**show queue-counter interface** *interface-id*

**Parameter  
Description**

| Parameter           | Description |
|---------------------|-------------|
| <i>interface-id</i> | Interface   |

**Command Mode** Privileged EXEC mode/Global configuration mode/Interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Examples** The following example displays buffer queue statistics of the specified interface based on output queue.

```
Ruijie#show queue-counter interface gigabitEthernet 0/9
```

```
Interface HundredGigabitEthernet 4/1:
```

```
Unicast
```

| Queue | Transmitted Bytes | Dropped Bytes | Frame Loss Rate(%) | Transmit Rate(bps) |
|-------|-------------------|---------------|--------------------|--------------------|
| 1     | 0                 | 0             | 0                  | 0                  |
| 2     | 0                 | 0             | 0                  | 0                  |
| 3     | 0                 | 0             | 0                  | 0                  |

|           |                     |                 |                    |                    |
|-----------|---------------------|-----------------|--------------------|--------------------|
| 4         | 0                   | 0               | 0                  | 0                  |
| 5         | 0                   | 0               | 0                  | 0                  |

| 8         | 0                   | 0               | 0                  | 0                  |

| Field             | Description                                                                                                                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dev/Slot          | Device/slot ID. If it is a case device, the display format is devid/-, and the case device only pays attention to the device number; if it is a box device, the display format is devid/slotid, and the device pays attention to device and slot number |
| PortGroup         | Port group ID from 1                                                                                                                                                                                                                                    |
| inner-port        | Inner port ID from 1                                                                                                                                                                                                                                    |
| Queue             | Queue ID, from 1-8                                                                                                                                                                                                                                      |
| Transmitted bytes | Transmitted bytes in the specified queue                                                                                                                                                                                                                |

|                     |                                                                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Dropped bytes       | Discarded bytes in the specified queue                                                                                                       |
| Loss Rate(%)        | The rate of discarding bytes (or discarded packets) to the total bytes (or the total packets). This rate counts the total discarding rate    |
| Loss Rate Peak      | The historical peak of the instantaneous discarding rate. This rate counts the bytes (or packets) discarding rate in 5 seconds               |
| Peak Time           | Record the time of historical peak of the instantaneous discarding rate                                                                      |
| Transmit Rate(bps)  | In the specified queue, the forwarding rate is bps (bit rate per second). This rate counts including the frame gap, so it has counting error |
| Transmitted packets | Number of transmitted packets in the specified queue                                                                                         |
| Dropped packets     | Number of discarded packets in the specified queue                                                                                           |
| Transmit Rate(pps)  | Transmitted rate pps (frame per second) in the specified queue                                                                               |

## 2: Display the queue statistics of all interfaces

```
Ruijie#show queue-counter
```

```
Interface HundredGigabitEthernet 0/1:
```

| Unicast   |                   |               |                    |                     |
|-----------|-------------------|---------------|--------------------|---------------------|

# 1 REUP Commands

## 1.1 link state track

Use this command to enable the link state track group. Use the **no** form of this command to disable a link state track group.

**link state track** [ *num* | **up-delay** *timer* | **uplink-port-threshold** *num* ]

**no link state track** [ *num* ]

### Parameter Description

| Parameter                               | Description                                                                       |
|-----------------------------------------|-----------------------------------------------------------------------------------|
| <i>num</i>                              | Interface ID of the link aggregation group.                                       |
| <b>up-delay</b> <i>timer</i>            | Downlink delay for link tracking, the default value is 0.                         |
| <b>uplink-port-threshold</b> <i>num</i> | Upstream port threshold for triggering link state change, the default value is 1. |

**Defaults** N/A.

**Command Mode** Global configuration mode.

**Usage Guide**

1. First create a link state track group and then add a port into the specified link state track group.
2. When the number of UP state upstream ports in the link state track group is smaller than the threshold, the track group becomes DOWN and all its downlink ports are shut down forcibly.
3. When the number of UP state upstream ports in the link state track group is equal to or greater than the threshold, the track group becomes UP and all its downstream ports are recovered to UP state.
4. After a link state track group is created without the downlink delay or upstream port threshold specified, the default value takes effect.

**Configuration** The following example shows how to create a link state track group.

**Examples** Ruijie(config)# link state track 1

The following example shows how to create a link state track group with downlink delay of 30s.

Ruijie(config)# link state track 1 up-delay 30

The following example shows how to create a link state track group with uplink threshold of 3.

Ruijie(config)# link state track 1 uplink-port-threshold 3

The following example shows how to create a link state track group with downlink delay of 30s and uplink threshold of 3.

```
Ruijie(config)# link state track 1 up-delay 30 uplink-port-threshold 3
```

**Related  
Commands**

| Command                 | Description                                            |
|-------------------------|--------------------------------------------------------|
| <b>link state group</b> | Adds the port to the specified link state track group. |

**Platform** N/A.**Description**

## 1.2 link state group

Use this command to add the port into the specified link state track group. Use the **no** form of this command to delete a port from the specified link state track group.

**link state group** *num* { **upstream** | **downstream** }

**no link state group**

**Parameter  
Description**

| Parameter         | Description                                                                |
|-------------------|----------------------------------------------------------------------------|
| Num               | ID of the link state track group.                                          |
| <b>Upstream</b>   | Configures the port to be an upstream port in the link state track group.  |
| <b>Downstream</b> | Configures the port to be a downstream port in the link state track group. |

**Defaults** The port is not added into any link state track group.**Command  
Mode** Interface configuration mode.**Usage Guide** First create a link state track group and then add a port into the specified link state track group.**Configuration** The following example adds the port fa0/2 into the link state track group:**Examples**

```
Ruijie(config)# link state track 1
Ruijie(config)# interface fa 0/2
Ruijie(config-if)# link state group 1 upstream
```

**Related  
Commands**

| Command                 | Description                       |
|-------------------------|-----------------------------------|
| <b>link state track</b> | Enables a link state track group. |

**Platform** N/A.**Description**

## 1.3 mac-address-table move update max-update-rate

Use this command to configure the maximum number of MAC address update packets sent per second. Use the **no** form of this command to remove the settings.

**mac-address-table move update max-update-rate** *pkts-per-second*

**no mac-address-table move update max-update-rate**

### Parameter Description

| Parameter       | Description                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------|
| pkts-per-second | The maximum number of MAC address update packets sent per second. It ranges from 0 to 32000, and the default value is 150. |

### Defaults

A maximum of 150 MAC address update packets are sent per second.

### Command Mode

Global configuration mode.

### Usage Guide

When a link is switched, REUP sends a certain number of MAC address update packets to an uplink device in every second to recover downlink data transmission of the uplink device.

### Configuration Examples

The following example configures the maximum number of MAC address update packets sent per second:

```
Ruijie(config)# mac-address-table move update max-update-rate 20
```

### Related Commands

| Command | Description |

### Platform Description

N/A.

## 1.4 mac-address-table move update receive

Use this command to enable receiving the MAC address table updates. Use the **no** form of this command to disable receiving MAC address table updates.

**mac-address-table move update receive**

**no mac-address-table move update receive**

### Parameter Description

| Parameter | Description |
|-----------|-------------|
| N/A.      | N/A.        |

**Defaults** Disabled.

**Command Mode** Global configuration mode.

**Usage Guide** The dual link backup switchover will lead to the loss of downstream data flow, for the MAC address for the uplink switch has not been updated in time. Therefore, it is necessary to update the MAC address table of the uplink switch, to reduce the loss of L2 data flow. You need to enable the switch of receiving the MAC address updates on the uplink switch.

**Configuration** Ruijie(config)# mac-address-table move update receive

**Examples**

| Related Commands | Command                               | Description                                                     |
|------------------|---------------------------------------|-----------------------------------------------------------------|
|                  | mac-address-table move update transit | Enables REUP to transmit the mac-address-table update messages. |

**Platform** N/A.

**Description**

## 1.5 mac-address-table move update receive vlan

Use this command to configure VLANs for processing MAC address updates. Use the **no** form of this command to remove VLANs for processing MAC address updates.

**mac-address-table move update receive vlan** *vlan-range*

**no mac-address-table move update receive vlan** *vlan-range*

| Parameter Description | Parameter  | Description                                               |
|-----------------------|------------|-----------------------------------------------------------|
|                       | vlan-range | Range of the VLANs processing MAC address update packets. |

**Defaults** All VLANs process MAC address update packets.

**Command Mode** Global configuration mode.

**Usage Guide** This command can be used to disable some VLANs from processing MAC address update packets. VLANs disabled from processing MAC address update packets can still recover downlink data transmission of the uplink device using MAC address update packets, but the capability to provide convergence on link failure will be degraded.

**Configuration** The following example configures VLANs processing MAC address update packets:

**Examples**

```
Ruijie(config)# no mac-address-table move update receive vlan 20
```

**Related  
Commands**

| <b>mac-address-table move update transit vlan</b> | Enables REUP to transmit the mac-address-table update messages. |

**Platform** N/A.**Description**

## 1.7 mac-address-table move update transit vlan

Use this command to configure VLANs for transmitting MAC address updates. Use the **no** form of this command to removing VLANs for transmitting MAC address updates.

**mac-address-table move update transit vlan** *vid*

**no mac-address-table move update transit vlan**

| Parameter<br>Description | Parameter | Description                                             |
|--------------------------|-----------|---------------------------------------------------------|
|                          | vid       | ID of the VLAN transmitting MAC address update packets. |

**Defaults** Transmit the MAC-address update messages in the default VLAN on the port.

**Command Mode** Interface configuration mode.

**Usage Guide** When a link is switched, the VLAN enabled to transmit MAC address update packets will send MAC address update packets to its uplink device.

**Configuration Examples** The following example configures VLANs transmitting MAC address update packets:

```
Ruijie(config)# mac-address-table move update transit
```

| Related<br>Commands | Command                                      | Description                                                    |
|---------------------|----------------------------------------------|----------------------------------------------------------------|
|                     | <b>mac-address-table move update transit</b> | Enables REUP to receive the mac-address-table update messages. |

**Platform** N/A.  
**Description**

## 1.8 mac-address-table update group

Use this command to add an interface to a MAC address update group. Use the **no** form of this command to remove an interface from the MAC address update group.

**mac-address-table update group** [ *group-num* ]

**no mac-address-table update group**

| Parameter<br>Description | Parameter | Description                                                     |
|--------------------------|-----------|-----------------------------------------------------------------|
|                          | group-num | The MAC address update group ID. The default group number is 1. |

**Defaults** By default, no MAC address update group is configured.

**Command** Interface configuration mode  
**Mode**

**Usage Guide** In order to reduce the flood due to the MAC address update and the influence on the normal data transmission of the switch, Ruijie products add a configuration of MAC address update group. Only if all the interfaces are added to a MAC address update group, the downstream data transmission be restored rapidly.

**Configuration Examples**

```
Ruijie(config-if)# mac-address-table update group 2
```

| Related Commands | Command                                           | Description                                        |
|------------------|---------------------------------------------------|----------------------------------------------------|
|                  | <b>show mac-address-table update group detail</b> | Displays the MAC address update group information. |

**Platform** N/A.  
**Description**

## 1.9 switchport backup interface

Use this command to configure the REUP dual link backup interface. Use the **no** form of this command to remove the REUP dual link backup interface.

**switchport backup interface** *interface-id*  
**no switchport backup interface** *interface-id*

| Parameter Description | Parameter    | Description                      |
|-----------------------|--------------|----------------------------------|
|                       | interface-id | Interface ID of the backup link. |

**Defaults** N/A.

**Command** Interface configuration mode.  
**Mode**

**Usage Guide** Enter the primary interface configuration mode, the interface-id in the parameter is for the backup interface. When the active link fails, the backup link transmission is restored rapidly

**Configuration Examples** The following example sets the dual link backup, with fa 0/1 and fa 0/2 as primary interface and backup interface:

```
Ruijie(config)# interface fa 0/1  
Ruijie(config-if)# switchport backup interface fa 0/2
```

| Related Commands | Command                                 | Description                                                |
|------------------|-----------------------------------------|------------------------------------------------------------|
|                  | <b>show interface switchport backup</b> | Displays the dual link backup configuration on the switch. |

**Platform** N/A.

**Description**

## 1.10 switchport backup interface preemption

Use this command to configure the REUP link preemption function.

**switchport backup interface** *interface-id* **preemption mode** { **forced** | **bandwidth** | **off** }

**switchport backup interface** *interface-id* **preemption delay** *delay-time*

**no switchport backup interface** *interface-id* **preemption delay**

| Parameter Description | Parameter    | Description                          |
|-----------------------|--------------|--------------------------------------|
|                       | interface-id | The interface id of the backup link. |
|                       | delay-time   | The preemption delay time.           |

**Defaults** The preemption function is disabled by default.

The default preemption delay time is 35s.

**Command Mode** Interface configuration mode.

**Usage Guide** The preemption mode includes **forced**, **bandwidth** and **off**. In the **bandwidth** preemption mode, the interface with high bandwidth has priority over other interfaces to transmit the data. In the **forced** preemption mode, the primary has priority over backup interfaces to transmit the data. No preemption event occurs in the **off** preemption mode. By default, the preemption mode is off.

The preemption delay refers to the delay time of the link switchover after the restoration of the link failure.

**Configuration Examples** The following example sets the dual link backup, with fa 0/1 and fa 0/2 as the primary interface and backup interface, sets the bandwidth preemption mode and 40s preemption delay:

```
Ruijie(config)# interface fa 0/1
Ruijie(config-if)# switchport backup interface fa 0/2
preemption mode bandwidth
Ruijie(config-if)# switchport backup interface fa 0/2
preemption delay 40
```

|          | <b>show interface switchport backup</b> | Displays the dual link backup configuration. |

Platform N/A.

Description

## 1.11 switchport backup interface prefer

Use this command to configure VLAN load balancing on a link. Use the **no** form of this command to remove the VLAN load balancing settings.

**switchport backup interface** *interface-id* **prefer instance** *instance-range*

**no switchport backup interface** *interface-id* **prefer**

| Parameter<br>Description | Parameter      | Description                                        |
|--------------------------|----------------|----------------------------------------------------|
|                          | interface-id   | Interface ID of the backup link.                   |
|                          | instance-range | Instance range of loading on the backup interface. |

Defaults No VLAN load on the backup interface.

Command Interface configuration mode.

Mode

Usage Guide MSTP instance mapping can be used to modify the mapping between an instance and a VLAN.

Configuration The following example configures VLAN load balancing on dual links.

Examples

```
Ruijie(config)# interface gigabitEthernet 0/1
Ruijie(config-if)# switchport backup interface gigabitEthernet 0/2 prefer
instance 1
```

Platform N/A.

Description

## 1.12 show interfaces switchport backup

Use this command to display the dual link backup information on the interfaces.

**show interfaces [ *interface-id* ] switchport backup [ *detail* ]****Parameter  
Description**

| Parameter    | Description                                                   |
|--------------|---------------------------------------------------------------|
| interface-id | The interface id of the dual link backup.                     |
| detail       | Displays the detailed information about the dual link backup. |

**Defaults** Show the dual link backup information on all interfaces.

**Command  
Mode** Privileged EXEC mode.

**Usage Guide** N/A.

**Configuration**

```
Ruijie # show interfaces switchport backup detail
```

**Examples**

```
Switch Backup Interface Pairs:
```

```
Active Interface      Backup Interface      State
-----
Gi0/23                Gi0/24                Active Up/Backup Standby
Interface Pair : Gi0/23, Gi0/24
Preemption Mode : Off
Preemption Delay : 35 seconds
Bandwidth : Gi0/23(1000 Mbits), Gi0/24(1000 Mbits)
```

## 1.13 show link state group

Use this command to display the information of a link state track group.

**show link state group *num*****Parameter  
Description**

| Parameter | Description                     |
|-----------|---------------------------------|
| num       | ID of a link state track group. |

**Defaults** N/A.

**Command** Privileged EXEC mode.

**Mode****Usage Guide** N/A.**Configuration** The following example displays the link state track group:**Examples**

```

Ruijie # show link state group
Link State Group:1 Status: Enabled, UP
Upstream Interfaces :Gi0/1(Up)
Downstream Interfaces :Gi0/3(Dwn), Gi0/4(Dwn)
Link State Group:2 Status: Disabled, Down
Upstream Interfaces :
Downstream Interfaces :
(Up):Interface up (Dwn):Interface Down (Dis):Interface disabled

```

## 1.14 show mac-address-table move update

Use this command to display the statistics about the MAC address updates tranceived on the interface.

**show mac-address-table move update**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** N/A**Command  
Mode** Privileged EXEC mode.**Usage Guide** N/A.**Configuration****Examples**

```

Ruijie#show mac-address-table move update
Mac address table move update status:
Transit:disable
Receive:disable
Max-update-rate:150

```

```

Receive vlan:1-4094

Pair: Ag1,Ag2
Members          Status    Transit Count    Transit VLAN    Last Transit Time
-----
Ag1              Down      0
Ag2              Down      0
Pair: Ag3,Gi0/6
Members          Status    Transit Count    Transit VLAN    Last Transit Time
-----
Ag3              Down      0
Gi0/6            Down      0
Pair: Gi0/1,Gi0/2
Members          Status    Transit Count    Transit VLAN    Last Transit Time
-----
Gi0/1            Up        0
Gi0/2            Standby   0

```

## 2 RLDP Command

### 2.1 rldp detect-interval

Use this command to configure the interval at which the RLDP sends the detection message on the port. Use the **no** form of this command to restore the default value.

**rldp detect-interval** *interval*

**no rldp detect-interval**

| Parameter<br>Description | Parameter       | Description                                     |
|--------------------------|-----------------|-------------------------------------------------|
|                          | <i>interval</i> | Detection interval in the range 1 to 15 seconds |

**Defaults** 3 seconds.

**Command Mode** Global configuration mode.

**Usage Guide** In the environment where STP is enabled, it is recommended that the product of interval multiplying the maximum number of detections is less than the topology convergence time of STP.

**Configuration Examples** The following example shows how to set the detection interval as 5s:

```
Ruijie(config)# rldp detect-interval 5
```

| Related<br>Commands | Command                | Description                            |
|---------------------|------------------------|----------------------------------------|
|                     | <b>rldp detect-max</b> | Sets the maximum number of detections. |

**Platform Description** N/A.

### 2.2 rldp detect-max

Use this command to set the maximum number of sending detection packets on the port. If the neighboring port does not respond when this detection number is exceeded, the link is considered faulty. Use the **no** form of this command to restore it to the default value.

**rldp detect-max** *num*

**no rldp detect-max**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          |           |             |

|     |                                                   |
|-----|---------------------------------------------------|
| num | Maximum number of detections in the range 2 to 10 |
|-----|---------------------------------------------------|

**Defaults** 2.

**Command Mode** Interface configuration mode.

**Usage Guide** This command is used together with the detection interval to specify the maximum number of detections.

**Configuration Examples** The following example shows how to set the maximum number of detections as 5:

```
Ruijie(config)# rldp detect-max 5
```

**Related Commands**

| Command                     | Description                  |
|-----------------------------|------------------------------|
| <b>rldp detect-interval</b> | Sets the detection interval. |

**Platform Description** N/A.

## 2.3 rldp enable

Use this command to enable RLDP globally. Use the **no** form of this command to disable the function.

**rldp enable**

**no rldp enable**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A.      | N/A.        |

**Defaults** Disabled.

**Command Mode** Global configuration mode.

**Usage Guide** You can enable RLDP on the interface only when the global RLDP is enabled.

**Configuration Examples** The following example shows how to enable RLDP:

```
Ruijie(config)# rldp enable
```

**Related Commands**

| Command          | Description                            |
|------------------|----------------------------------------|
| <b>rldp port</b> | Enables the RLDP function on the port. |

**Platform** N/A.

**Description**

## 2.4 rldp error-recover interval

Use this command to configure the interval for the RLDP to regularly recover a failed port. This recovery function is disabled by default. Use the **no** form of this command to disable the regular recovery function. Use the **default** form of this command to restore default settings.

**rldp error-recover interval** *interval*

**no rldp error-recover interval**

**default rldp error-recover interval**

| Parameter Description | Parameter       | Description                                                               |
|-----------------------|-----------------|---------------------------------------------------------------------------|
|                       | <i>interval</i> | Interval in the unit of seconds, ranging from <b>30</b> to <b>86400</b> . |

**Defaults** N/A

**Command Mode** Global configuration mode

**Default Level** 14

**Command Mode** Global configuration mode

**Usage Guide** This command is used to automatically and regularly recover a failed RLDP port (in the error state). When the RLDP port recovers from the error, the RLDP on the port restarts link fault detection. If the fault is eliminated, the RLDP maintains the normal state. If the fault persists, the RLDP can still detect the fault.

**Configuration Example** The following example sets the interval for periodic recovery to 600s.

```
Ruijie(config)# rldp error-recover interval 600
```

**Prompt** N/A

**Common Errors** N/A

**Platform Description** N/A

## 2.5 rldp neighbor-negotiation

Use this command to enable RLDP neighbor negotiation. Use the **no** form or **default** form of this command to restore the default setting.

**rldp neighbor-negotiation**

**no rldp neighbor-negotiation**

**default rldp neighbor-negotiation**

### Parameter Description

| Parameter | Description |
|-----------|-------------|
| N/A.      | N/A.        |

**Defaults** RLDP neighbor negotiation is disabled by default.

**Command Mode** Global configuration mode.

**Usage Guide** With neighbor negotiation enabled, RLDP unidirectional-/bidirectional-link detection starts only after the neighbor negotiation is successful. (Receiving the Prob message from the neighbor indicates the neighbor negotiation is successful.)

**Configuration Examples** The following example shows how to enable RLDP neighbor negotiation:

```
Ruijie#config
Ruijie(config)#rldp neighbor-negotiation
```

### Related Commands

| Command          | Description                            |
|------------------|----------------------------------------|
| <b>rldp port</b> | Enables the RLDP function on the port. |

**Platform Description** N/A.

## 2.6 rldp port

Use this command to enable RLDP on the port and specify detection type and troubleshooting method. Use the **no** form of this command to disable the function.

**rldp port { unidirection-detect | bidirection-detect | loop-detect } { warning | shutdown-svi | shutdown-port | block | monitor }**

**no rldp port { unidirection-detect | bidirection-detect | loop-detect }**

### Parameter Description

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|                            |                                                         |
|----------------------------|---------------------------------------------------------|
| <b>unidirection-detect</b> | Sets unidirectional link detection.                     |
| <b>bidirection-detect</b>  | Sets bidirectional link detection.                      |
| <b>loop-detect</b>         | Sets loop detection type.                               |
| <b>warning</b>             | Warns the user.                                         |
| <b>shutdown-svi</b>        | Shutowns the SVI the port belongs to.                   |
| <b>shutdown-port</b>       | Shutowns the port.                                      |
| <b>block</b>               | Block the learning and forwarding function of the port. |
| <b>monitor</b>             | Monitors the port state.                                |

**Defaults** N/A

**Command** Interface configuration mode.

**Mode**

**Usage Guide** The RLDP detection on the port takes effect only when the global RLDP is enabled.

Ports on which RLDP is enabled to handle downlink loop failures are random. For example, RLDP downlink loop detection is configured on both downlink ports A and B, and the configured failure handling mode of port A is **warning** while that of port B is **shutdown-port**. When there is a downlink loop between port A and port B, port A may detect the downlink loop failure prior to port B. After port A completes failure handling according to the configuration, it no longer sends packets to detect the downlink loop status. Port B fails to detect the downlink loop failure because it does not receive a loop detection packet from port A, but the downlink loop actually persists. If a detected downlink loop needs to be actually removed in application scenarios, downlink ports in the same loop must be restricted to use a consistent loop failure handling mode and the loop failure handling mode cannot be **warning**.

The **monitor** policy can be configured for the unidirectional link detection in order to correlate with ERPS (Ethernet Ring Protection Switching).

**Configuration** The following example shows how to configure RLDP detection type and troubleshooting method.

**Examples**

```
Ruijie(config)# interface GigabitEthernet 2/0/9
Ruijie(config-if-GigabitEthernet 2/0/9)# rldp port loop-detect block
```

## 3 DLDP Commands

### 3.1 clear dldp

Use this command to clear statistics about the number of times that DLDP is down or up at a specified monitoring point for renewing statistics.

**clear dldp** [ **interface** *interface-name* [ *ip-address* ] ]

| Parameter   | Parameter             | Description                  |
|-------------|-----------------------|------------------------------|
| Description | <i>interface-name</i> | Name of an Layer 3 interface |
|             | <i>ip-address</i>     | IP address of a peer device  |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** DLDP records statistics about the number of times that DLDP is down or up. You can use this command to clear statistics about the number of times that DLDP is down or up at a specified monitoring point and renew statistics. If an L3 interface or a device IP address is specified, statistics about the number of times that DLDP is down or up on the interface at one or all monitoring points will be cleared. If no L3 interface or IP address is specified, statistics about the number of times that DLDP is down or up at all monitoring points on all interfaces will be cleared.

**Configuration Examples** The following example clears statistics about the number of times that DLDP is down or up at all monitoring points on all interfaces.

```
Ruijie#clear dldp
```

The following example clears statistics about the number of times that DLDP is down or up at all monitoring points on the interface GigabitEthernet 0/0.

```
Ruijie#clear dldp interface vlan 1
```

The following example clears statistics about the number of times that DLDP is down or up about the peer device 10.83.132.1 on the interface GigabitEthernet 0/0.

```
Ruijie# clear dldp interface GigabitEthernet 0/0 10.83.132.1
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 3.2 dldp

Use this command to enable DLDP detection.

Use the **no** form of this command to restore the default setting.

**dldp** *ip-address* [*next-hop-ip*] [**interval** *tick* | **retry** *retry-num* | **resume** *resume-num*]

**no dldp** *ip-address*

| Parameter   | Parameter                       | Description                                                                                                                                                                                  |
|-------------|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>ip-address</i>               | IP address of the peer device to be detected                                                                                                                                                 |
|             | <i>next-hop-ip</i>              | Next-hop IP address specified when the device to be detected belongs to another different network                                                                                            |
|             | <b>interval</b> <i>tick</i>     | Detection interval. The value range is from 1 to 6000 in the unit of ticks, where 1 tick is equal to 10 milliseconds. The value must be an integral multiple of five.                        |
|             | <b>retry</b> <i>retry-num</i>   | Number of retry times. The value range is from 1 to 3600.                                                                                                                                    |
|             | <b>resume</b> <i>resume-num</i> | Number of recovery times of the link to the peer device to be detected, indicating the number of consecutive packets received before a down link turns up. The value range is from 1 to 200. |

**Defaults** By default, *tick* is 100, indicating that the detection interval is 1 second.  
The value of *retry-num* is 4, and the value of *resume-num* is 3.

**Command Mode** Interface configuration mode

**Usage Guide** You can use this command to enable DLDP detection to quickly detect Ethernet link faults.

**Configuration Examples** The following example enables DLDP detection for the device 10.83.132.10.

```
Ruijie(config)#int gi0/0
Ruijie(config-if-GigabitEthernet 0/0)#ip address 10.83.132.1 24
Ruijie(config-if-GigabitEthernet 0/0)#dldp 10.83.132.10
Ruijie(config-if-GigabitEthernet 0/0)#
```

The following example enables DLDP detection for the device 10.83.132.10 in another different network segment.

```
Ruijie#config
Ruijie(config)#int gi0/0
Ruijie(config-if-GigabitEthernet 0/0)#ip address 10.83.132.1 255.255.255.0
Ruijie(config-if-GigabitEthernet 0/0)#dldp 10.83.131.10 10.83.132.2
```

The following example disables DLDP detection for the device 10.83.132.10.

```
Ruijie#config
Ruijie(config)#int gi0/0
```

```
Ruijie(config-if-GigabitEthernet 0/0)#no dldp 10.83.132.10
```

### 3.3 dldp passive

Use this command to set DLDP to the passive mode.

Use the **no** form of this command to restore the default setting.

**dldp passive**

**no dldp passive**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** The default is the active mode.

**Command Mode** Interface configuration mode

**Usage Guide** If DLDP is enabled on devices at both ends of a link on a network and ICMP Echo packets are sent to each other for link detection, excessive packets exist between the two devices. If only one device sends ICMP Echo packets to the peer device on which the same detection parameters are configured, the peer device can detect whether the packets arrive in time and whether the link between them is normal. This method saves bandwidth and CPU resources.

You can set DLDP to the active mode for one device to initiate ICMP Echo packets, and set DLDP to the passive mode for the other device to passively receive the packets.

The following example sets DLDP to the passive mode.

**Configuration Examples**

```
Ruijie#config
Ruijie(config)#int gi0/0
Ruijie(config-if-GigabitEthernet 0/0)#ip address 10.83.132.1 255.255.255.0
//Set an IP address for vlan1.
Ruijie(config-if-GigabitEthernet 0/0)#dldp passive
```

### 3.4 dldp interval

Use this command to set the DLDP detection interval.

Use the **no** form of this command to restore the default setting.

**dldp interval** *tick*

**no dldp interval**

| Parameter   | Parameter   | Description                                                                                                              |
|-------------|-------------|--------------------------------------------------------------------------------------------------------------------------|
| Description | <i>tick</i> | Detection interval (in ticks), in the range from 5 to 6000. The value must be a multiple of 5. (1tick = 10 milliseconds) |

**Defaults**

N/A

**Command Mode**

Global configuration mode

**Usage Guide** This command is used to set the DLDP detection interval.

If a device does not receive the reply packets from the peer device within the specific period (the time of this period is equal to that of the *detection packet retransmission interval* multiplied by the *retry count*), the device takes the L3 port as DOWN (though the physical link is up). Once the device receives the reply packets from the peer device, the device takes the L3 port as UP.

**Configuration Examples** The following example sets the DLDP detection interval to 20 ticks.

```
Ruijie#config
Ruijie(config)#dldp interval 20
```

Description

### 3.7 show dldp

Use this command to display DLDP configuration information or statistics at various monitoring points.

**show dldp** [ **interface** *interface-name* ] [ **statistic** ]

| Parameter   | Parameter             | Description             |
|-------------|-----------------------|-------------------------|
| Description | <i>interface-name</i> | Name of an L3 interface |
|             | <b>statistic</b>      | Statistics              |

Defaults N/A

Command Privileged EXEC mode  
Mode

**Usage Guide** You can use this command with the keyword **statistics** to display statistics at all monitoring points on all interfaces or a specific Layer 3 interface. If a Layer 3 interface is specified, this command displays DLDP configuration and statistics at all monitoring points on the Layer 3 interface.

**Configuration Examples** The following example displays DLDP configuration information at all monitoring points on all interfaces.

```
Ruijie#show dldp
Interface  Type      Ip      Next-hop  Interval  Retry  Resume  State
-----
-----
Gi0/0      Passive  192.168.6.3  192.168.2.2  10        5      3      Up
Gi0/1      Passive  192.168.7.3      10        5      3      Up
Gi0/2      Passive  192.168.3.3  192.168.4.2  10        5      3      Up
```

The following example displays DLDP configuration information at all monitoring points on the Layer 3 interface GigabitEthernet 0/0.

```
Ruijie#show dldp interface gigabitEthernet 0/0
Interface  Type      Ip      Next-hop  Interval  Retry  Resume  State
-----
-----
Gi0/0      Passive  192.168.6.3  192.168.2.2  10        5      3      Up
```

The following example displays DLDP statistics at all monitoring points on all interfaces.

```
Ruijie#show dldp statistic
```

| Interface | Type    | Ip          | record-time | Up-count | Down-count |
|-----------|---------|-------------|-------------|----------|------------|
| -----     | -----   | -----       | -----       | -----    | -----      |
| Gi0/0     | Passive | 192.168.6.3 | 2h34m5s     | 10       | 9          |
| Gi0/1     | Passive | 192.168.3.3 | 1d2h3m52s   | 10       | 9          |

The following example displays DLDP statistics at all monitoring points on the Layer 3 interface GigabitEthernet 0/0.

```
Ruijie#show dldp statistic interface Gi0/0
```

| Interface | Type    | Ip          | record-time | Up-count | Down-count |
|-----------|---------|-------------|-------------|----------|------------|
| -----     | -----   | -----       | -----       | -----    | -----      |
| Gi0/0     | Passive | 192.168.6.3 | 2h34m5s     | 10       | 9          |

| Field       | Description                                                                                                                                                                                                                                                                                                                                              |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| record-time | Time length for recording the number of times that DLDP is up or down. The time is displayed in *y***d**h**m**s format:<br>y: year<br>d: day<br>h: hour<br>m: minute<br>s: second<br><br>Using the <i>Up-count</i> and <i>Down-count</i> parameters, you can check statistics about the number of times that DLDP is up or down within this time length. |
| Up-count    | Number of times that DLDP is up at the specific monitoring point                                                                                                                                                                                                                                                                                         |
| Down-count  | Number times that DLDP is down at the specific monitoring point                                                                                                                                                                                                                                                                                          |

## 4 VRRP Commands

### 4.1 show vrrp

Use this command to display the VRRP information.

**show** [ **ipv6** ] **vrrp** [ **brief** | **group** ]

| Parameter   | Parameter    | Description                                      |
|-------------|--------------|--------------------------------------------------|
| Description | <b>ipv6</b>  | (Optional) Applies to IPv6 VRRP.                 |
|             | <b>brief</b> | (Optional) Displays the brief of the VRRP group. |
|             | <b>group</b> | Number of the VRRP group to be displayed         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** If no optional parameter is used, the information of all VRRP groups is displayed.

**Configuration** The following example displays the information of all VRRP groups:

**Examples**

```
Ruijie# show vrrp
FastEthernet 0/0 - Group 1
State is Backup
Virtual IP address is 192.168.201.1 configured
Virtual MAC address is 0000.5e00.0101
Advertisement interval is 3 sec
Preemption is enabled
min delay is 0 sec
Priority is 100
Master Device is 192.168.201.213 , pritority is 120
Master Advertisement interval is 3 sec
Master Down interval is 9 sec
FastEthernet 0/0 - Group 2
State is Master
Virtual IP address is 192.168.201.2 configured
Virtual MAC address is 0000.5e00.0102
Advertisement interval is 3 sec
Preemption is enabled
min delay is 0 sec
Priority is 120
Master Device is 192.168.201.217 (local), priority is 120
Master Advertisement interval is 3 sec
```

```
Master Down interval is 9 sec
Ruijie#
```

The following example displays the brief information of the VRRP group:

```
Ruijie# show vrrp brief
Interface      Grp Pri Time  Own Pre State  Master addr  Group addr
FastEthernet 0/0  1  100   -  -  P Backup  192.168.201.213 192.168.201.1
FastEthernet 0/0  2  120   -  -  P Master  192.168.201.217 192.168.201.2
Ruijie#
```

|---------------------|-------------------------------------------------------------|-------------------------------------------------------------------------|
|                     | <b>vrrp group ip</b> <i>ip address</i> [ <b>secondary</b> ] | Enables the VRRP function and set the IP address for the virtual device |

**Platform** N/A

**Description**

### 4.3 show vrrp packets statistics

Use this command to display the statistics of the VRRP packets transmission.

**show vrrp packet statistics** [ *interface-type interface-number* ]

| Parameter          | Parameter               | Description               |
|--------------------|-------------------------|---------------------------|
| <b>Description</b> | <i>interface-type</i>   | Interface type and number |
|                    | <i>interface-number</i> |                           |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration Examples** The following example displays the statistics of VRRP packets transmitting on all interfaces.

```
Ruijie# show vrrp packet statistics
```

```
Total
  InReceives: 966043 packets, InOctets: 38641824, InErrors: 38826
  OutTransmits: 306079, OutOctets: 7798564
GigabitEthernet 3/0/1
  InReceives: 799665 packets, InOctets: 31986600, InErrors: 19657
  OutTransmits: 272931, OutOctets: 6675320
GigabitEthernet 3/0/2
  InReceives: 0 packets, InOctets: 0, InErrors: 0
  OutTransmits: 681, OutOctets: 16344
```

The following example displays the statistics of VRRP packets on the interface gigabitEthernet 3/0/1.

```
Ruijie#show vrrp packet statistics gigabitEthernet 3/0/1
GigabitEthernet 3/0/1
  InReceives: 799911 packets, InOctets: 31996440, InErrors: 19657
  OutTransmits: 273053, OutOctets: 6677760
```

**Platform** N/A  
**Description**

## 4.4 vrrp accept\_mode

Use this command to enable the packet accepting function on the IPv6 VRRP virtual router.

Use the **no** form of this command to disable this function.

**vrrp ipv6 group accept\_mode**

**no vrrp ipv6 group accept\_mode**

| Parameter<br>Description | Parameter | Description       |
|--------------------------|-----------|-------------------|
|                          | group     | VRRP group number |

**Defaults** The master IPv6 VRRP is not allowed to accept packets whose destination IPv6 address is the IPv6 address of a virtual router. However, the NA and NS packets should be accepted regardless of the configuration of Accept\_Mode. Also, the master IPv6 VRRP virtual router in the owner state will accept and process any packets whose destination IPv6 address is the IPv6 address of a virtual router, regardless of the configuration of Accept\_Mode.

**Command Mode** Interface configuration mode

**Usage Guide** Configuration of the network interface is effective for the master virtual router.

 Only IPv6 VRRP has this configuration mode.

**Configuration** The following example enables the accept mode on the group 1:

**Examples**

```
vrrp ipv6 1 accept_mode
```

**Platform** N/A

**Description**

## 4.5 vrrp authentication

Use this command to enable VRRP authentication.

Use the **no** form of this command to disable this function.

**vrrp group authentication string**

**no vrrp group authentication**

| Parameter          | Parameter     | Description                                                                   |
|--------------------|---------------|-------------------------------------------------------------------------------|
| <b>Description</b> | <i>group</i>  | VRRP group number                                                             |
|                    | <i>string</i> | String for the VRRP group authentication (within 8 bytes, plaintext password) |

**Defaults** This function is disabled by default. Even if the VRRP function is enabled, no authentication password is configured by default.

**Command Mode** Interface configuration mode

**Usage Guide** The devices in the same VRRP group must have the same authentication password configured. The plaintext authentication password cannot provide security. It aims only to prevent/prompt the incorrect VRRP configuration.

**Configuration** The following example sets the authentication password for VRRP group 1.

**Examples**

```
vrrp 1 authentication x30dn78k
```

**Platform** N/A

**Description**

## 4.6 vrrp bfd (Global Configuration Mode)

Use this command to enable the global BFD correlation for the IPv4 VRRP backup group to detect the master router status.

Use the **no** form of this command to remove the BFD correlation for IPv4 VRRP.

**vrrip bfd** *interface-type interface-number ip-address*  
**no vrrip bfd**

Use this command to enable the global BFD correlation for the IPv6 VRRP backup group to detect the master router status.

Use the **no** form of this command to remove the BFD correlation for IPv6 VRRP.

**vrrip ipv6 bfd** *interface-type interface-number ipv6-address*  
**no vrrip ipv6 bfd**

| Parameter   | Parameter               | Description                         |
|-------------|-------------------------|-------------------------------------|
| Description | <i>interface-type</i>   | Interface type and interface number |
|             | <i>interface-number</i> |                                     |
|             | <i>ip-address</i>       | Neighbor IP address                 |
|             | <i>ipv6-address</i>     | Neighbor IPv6 address               |

**Defaults** By default, the global BFD correlation for IPv4 VRRP is disabled.

**Command Mode** Global configuration mode

**Usage Guide** After the global BFD correlation for VRRP is configured, the BFD correlation configuration for the VRRP groups will be removed.

The global BFD correlation for VRRP configured later will override the earlier configuration.

The IP address and BFD session of the interface must be configured before configuring the **vrrip bfd** command.

The global VRRP BFD session applies to the VRRP router which is consists of two devices only.

**Configuration Examples** The following example enables global BFD correlation for IPv4 VRRP.

```
Ruijie#configure terminal
Ruijie(config)#interface vlan 1
Ruijie(config-if-VLAN 1)#ip address 192.168.201.11 255.255.255.0
Ruijie(config-if-VLAN 1)#bfd interval 50 min_rx 50 multiplier 3
Ruijie(config-if-VLAN 1)#exit
Ruijie(config)# vrrip bfd vlan 1 192.168.201.10
```

The following example enables global BFD correlation for IPv6 VRRP.

```
Ruijie#configure terminal
Ruijie(config)#interface vlan 1
Ruijie(config-if-VLAN 1)# ipv6 address 2001::1/64
Ruijie(config-if-VLAN 1)#bfd interval 50 min_rx 50 multiplier 3
Ruijie(config-if-VLAN 1)#exit
Ruijie(config)# vrrip ipv6 bfd vlan 1 2001::2
```

| Related Commands | Command | Description |
|------------------|---------|-------------|

**Platform** N/A

**Description**

## 4.7 vrrp bfd (Interface Configuration Mode)

Use this command to enable BFD correlation for the specified IPv4 VRRP group.

Use the **no** form of this command to remove the BFD correlation for the specified IPv4 VRRP group.

**vrrp group bfd ip-address**

**no vrrp group bfd ip-address**

Use this command to enable BFD correlation for the specified IPv6 VRRP group.

Use the **no** form of this command to remove the BFD correlation for the specified IPv6 VRRP group.

**vrrp ipv6 group bfd ip-address**

**no vrrp ipv6 group bfd ip-address**

| Parameter          | Parameter           | Description           |
|--------------------|---------------------|-----------------------|
| <b>Description</b> | <i>group</i>        | VRRP group ID         |
|                    | <i>ip-address</i>   | Neighbor IP address   |
|                    | <i>ipv6-address</i> | Neighbor IPv6 address |

**Defaults** By default, no BFD correlation is configured for the IPv4 VRRP group on the interface.

**Command Mode** Interface configuration mode.

**Usage Guide** After the global BFD correlation for VRRP is configured, the BFD correlation configuration for the VRRP groups will be removed.

The IP address and BFD session of the interface must be configured before configuring the **vrrp bfd** command.

**Configuration Examples** The following example enables BFD correlation for the VRRP group.

On Switch 1:

```
Ruijie#configure terminal
Ruijie(config)#interface vlan 1
Ruijie(config-if-VLAN 1)#ip address 1.1.1.2 255.255.255.0
Ruijie(config-if-VLAN 1)#bfd interval 50 min_rx 50 multiplier 3
Ruijie(config-if-VLAN 1)#vrrp 1 ip 1.1.1.1
Ruijie(config-if-VLAN 1)#vrrp 1 bfd 1.1.1.3
```

On Switch 2:

```
Ruijie#configure terminal
```

```

Ruijie(config)#interface vlan 1
Ruijie(config-if-VLAN 1)#ip address 1.1.1.3 255.255.255.0
Ruijie(config-if-VLAN 1)#bfd interval 50 min_rx 50 multiplier 3
Ruijie(config-if-VLAN 1)#vrrp 1 ip 1.1.1.1
Ruijie(config-if-VLAN 1)#vrrp 1 bfd 1.1.1.2

```

**Description**

## 4.8 vrrp delay

Use this command to set the reload latency of the VRRP group on the interface.

Use the **no** form of this command to restore the default setting.

**vrrp delay** { **minimum** *min-seconds* | **reload** *reload-seconds* }

**no vrrp delay**

| Parameter          | Parameter                           | Description                                                                                                                                                       |
|--------------------|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <b>minimum</b> <i>min-seconds</i>   | When the interface is up, VRRP group shall be reloaded after at least min-seconds.                                                                                |
|                    | <b>reload</b> <i>reload-seconds</i> | The reload latency of the VRRP group. If the configured min-seconds is more than reload-seconds, the actual reload latency of the VRRP group will be min-seconds. |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode

**Usage Guide** Use this command to set the reload latency of the VRRP group on the interface, when it is required that the VRRP group shall not be reloaded immediately after the system reloads or the interface is up. The reload latency range is 0-60.

**Configuration Examples** The following example sets the VRRP reload latency on E0 to 10 seconds. When E0 is up, VRRP group 1 shall be reloaded in 10 seconds.

```

interface FastEthernet 0/0
shutdown
ip address 10.0.1.1 255.255.255.0
vrrp delay minimum 10
vrrp 1 ip 10.0.1.20
no shutdown

```

```
show vrrp 1
```

Description

## 4.9 vrrp description

Use this command to specify a descriptor for the VRRP.

Use the **no** form of this command to restore the default setting.

**vrrp [ ipv6 ] group description text**

**no vrrp [ ipv6 ] group description**

| Parameter<br>Description | Parameter    | Description           |
|--------------------------|--------------|-----------------------|
|                          | <b>ipv6</b>  | Applies to IPv6 VRRP. |
|                          | <i>group</i> | VRRP group number     |
|                          | <i>text</i>  | VRRP group descriptor |
|                          |              |                       |

**Defaults** This function is disabled by default. Even if the VRRP function is enabled, no VRRP group descriptor is configured by default.

**Command Mode** Interface configuration mode

**Usage Guide** This command will set the descriptor for the VRRP group to facilitate the identification of the VRRP group.

**Configuration Examples** The following example labels the VRRP group 1 on Ethernet interface E0 as Building A – Marketing and Administration.

```
interface FastEthernet 0/0
ip address 10.0.1.1 255.255.255.0
vrrp 1 ip 10.0.1.20
vrrp 1 description "Building A - Marketing and Administration"
```

| Related<br>Commands | Command                                                         | Description                                                             |
|---------------------|-----------------------------------------------------------------|-------------------------------------------------------------------------|
|                     | Ruijie(config-if)# <b>vrrp group ip ipaddress [ secondary ]</b> | Enables the VRRP function and set the IP address for the virtual device |

Platform N/A

Description

## 4.10 vrrp detection-vlan

Use this command to enable IPv4 VRRP packets to be sent to only the first or a specified Sub VLAN in a Super VLAN interface.

Use the **no** form of this command to enable IPv4 VRRP packets to be sent to all the Sub VLANs in a Super VLAN interface.

**vrrp detection-vlan** {first-subvlan | subvlan-id}

**no vrrp detection-vlan**

| Parameter   | Parameter            | Description                                                                      |
|-------------|----------------------|----------------------------------------------------------------------------------|
| Description | <b>first-subvlan</b> | IPv4 VRRP packets are sent to only the first Sub VLAN in a Super VLAN interface. |
|             | <i>subvlan-id</i>    | IPv4 VRRP packets are sent to a specified Sub VLAN in a Super VLAN interface.    |

**Defaults** By default, IPv4 VRRP packets are sent to only the first Sub VLAN in a Super VLAN interface.

**Command** Interface configuration mode  
**Mode**

**Usage Guide** Use this command to configure the mode in which IPv4 VRRP packets are sent to a Super VLAN interface. There are three modes in which IPv4 VRRP packets are sent to a Super VLAN interface: to only the first Sub VLAN, to a specified Sub VLAN, or all Sub VLANs.

 This command is configured on a VLAN interface and applies only to Super VLAN interfaces.

**Configuration** The following example enables IPv4 VRRP packets to be sent to all Sub VLANs in Super VLAN 3.

**Examples**

```
Ruijie#configure terminal
Ruijie(config)# vlan 3
Ruijie(config-vlan)# supervlan
Ruijie(config-vlan)# subvlan 5-10
Ruijie(config-vlan)#exit
Ruijie(config)#interface vlan 3
Ruijie(config-if)# no vrrp detection-vlan
```

| Related  | Command        | Description                                                   |
|----------|----------------|---------------------------------------------------------------|
| Commands | <b>vrrp ip</b> | Enables the VRRP function and set the IP address of the VRRP. |

**Platform** N/A  
**Description**

## 4.11 vrrp ip

Use this command to enable VRRP on the interface and specify the related virtual IP address. Use the **no** form of this command to restore the default setting.

**vrrp group ip** *ipaddress* [ **secondary** ]

**no vrrp group ip** *ipaddress* [ **secondary** ]

| Parameter   | Parameter        | Description                                               |
|-------------|------------------|-----------------------------------------------------------|
| Description | <i>group</i>     | VRRP group number of the virtual device                   |
|             | <i>ipaddress</i> | IP address of the virtual device                          |
|             | <b>secondary</b> | Specifies the secondary IP address of the virtual device. |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode

**Usage Guide** If the **secondary** parameter is not used, the IP address set here will become the master IP address of the virtual device. Note that if the VRRP group is using the IP address of the Ethernet interface, an error occurs when you remove the IP address of the VRRP group with the **no** command, because there are duplicated IP addresses in the LAN.

**Configuration Examples** The following example enables the VRRP function on Ethernet interface 0. The VRRP group number is 1, primary IP address of the virtual device is 10.0.1.20 and secondary IP address is 10.0.2.20.

```
interface FastEthernet 0/0
no switchport// Used on the switch only.
ip address 10.0.1.1 255.255.255.0
ip address 10.0.2.1 255.255.255.0 secondary
vrrp 1 ip 10.0.1.20
vrrp 1 ip 10.0.2.20 secondary
```

| Related Commands | Command                            | Description                      |
|------------------|------------------------------------|----------------------------------|
|                  | <b>show vrrp [ brief   group ]</b> | Displays the VRRP configuration. |

**Platform Description** N/A

## 4.12 vrrp ipv6

Use this command to enable IPv6 VRRP on the interface and specify the related virtual IPv6 address. Use the **no** form of the command to restore the default setting.

**vrrp group ipv6** *ipv6-address*

**no vrrp group ip** *ipv6-address*

| Parameter   | Parameter           | Description                             |
|-------------|---------------------|-----------------------------------------|
| Description | <i>group</i>        | VRRP group number of the virtual device |
|             | <i>ipv6-address</i> | IPv6 address of the virtual device      |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode

**Usage Guide** IPv6 VRRP and IPv4 VRRP share group numbers ranging from 1 to 255. One VRRP group number of an interface is applicable to both IPv4 VRRP and IPv6 VRRP at the same time. The first configured address should be the link's local address, which cannot be deleted until the other virtual addresses are deleted.

**Configuration Examples** The following example enables the IPv6 VRRP function on Ethernet interface FastEthernet 0/0 with VRRP group number 1 and virtual IPv6 address FE80::1 and 2001::1.

```
interface FastEthernet 0/0
no switchport
ipv6 enable
ip6 address 2001::2/64
vrrp 1 ipv6 FE80::1
vrrp 1 ipv6 2001::1
```

| Related Commands | Command                                 | Description                           |
|------------------|-----------------------------------------|---------------------------------------|
|                  | <b>show ipv6 vrrp [ brief   group ]</b> | Displays the IPv6 VRRP configuration. |

**Platform Description** N/A

## 4.13 vrrp preempt

Use this command to set the preemption mode of the VRRP group.

Use the **no** form of this command to restore the default setting.

**vrrp [ ipv6 ] group preempt [ delay seconds ]**

**no vrrp [ ipv6 ] group preempt [ delay ]**

| Parameter   | Parameter            | Description                                                                                    |
|-------------|----------------------|------------------------------------------------------------------------------------------------|
| Description | <b>ipv6</b>          | Applies to IPv6 VRRP.                                                                          |
|             | <i>group</i>         | VRRP group number                                                                              |
|             | <b>delay seconds</b> | (Optional) Specifies the delay before a device declares itself master. The default value is 0. |

**Defaults** This function is disabled by default. Once the VRRP function is enabled, the VRRP group will work in the preemption mode by default.

**Command Mode** Interface configuration mode

**Usage Guide** If the VRRP group is working in the preemption mode, once a device finds its priority is higher than the priority of the master, it will become the master device of the VRRP group. If the VRRP group is not working in the preemption mode, even if a device finds its priority is higher than the master's priority, it will not become the master device of the VRRP group. In case the VRRP group is using the Ethernet interface IP address, the setting of the preemption mode does not make sense, because that VRRP group has the highest priority and thus automatically becomes the master device in the VRRP group.

**Configuration Examples** The following example enables IPv4 VRRP on interface GigabitEthernet 0/0. When VRRP group 1 finds its priority (200) is higher than that of the current master device, it will declare its preemption of master after a delay of 15 seconds.

```
Ruijie#configure terminal
Ruijie(config)#interface GigabitEthernet 0/0
// 'no switchport'
Ruijie(config-if-GigabitEthernet 0/0)#no switchport
Ruijie(config-if-GigabitEthernet 0/0)#ip address 10.0.1.1 255.255.255.0
Ruijie(config-if-GigabitEthernet 0/0)#vrrp 1 ip 10.0.1.20
Ruijie(config-if-GigabitEthernet 0/0)#vrrp 1 preempt delay 15
Ruijie(config-if-GigabitEthernet 0/0)#vrrp 1 priority 200
```

The following example enables IPv4 VRRP on interface GigabitEthernet 0/0. When VRRP group 1 finds its priority (200) is higher than that of the current master device, it will declare its preemption of master after a delay of 15 seconds.

```
Ruijie#configure terminal
Ruijie(config)#interface GigabitEthernet 0/0
// 'no switchport'
Ruijie(config-if-GigabitEthernet 0/0)#no switchport
Ruijie(config-if-GigabitEthernet 0/0)#ipv6 enable
Ruijie(config-if-GigabitEthernet 0/0)#ipv6 address 2001::2/64
Ruijie(config-if-GigabitEthernet 0/0)#vrrp 1 ipv6 FE80::1

| <b>vrrp group ip</b> <i>ipaddress</i> [ <b>secondary</b> ] | Enables the VRRP function and set the IP address for the virtual device. |
| <b>vrrp group priority</b> <i>level</i>                    | Sets the VRRP group priority.                                            |

Platform N/A

Description

## 4.14 vrrp priority

Use this command to specify the priority of the VRRP group. Use the **no** form of this command to restore the default setting.

**vrrp [ ipv6 ] group priority level**

**no vrrp [ ipv6 ] group priority**

| Parameter   | Parameter    | Description                                    |
|-------------|--------------|------------------------------------------------|
| Description | <b>ipv6</b>  | Specifies the priority of the IPv6 VRRP group. |
|             | <i>group</i> | VRRP group number                              |
|             | <i>level</i> | VRRP group priority                            |

**Defaults** This function is disabled by default. Once the VRRP function is enabled, the default priority of the VRRP group is 100.

**Command** Interface configuration mode  
**Mode**

**Usage Guide** N/A

**Configuration** The following example sets the priority of VRRP group 1 as 254.

**Examples**

```
vrrp 1 priority 254
```

| Commands | <b>vrrp group ip ipaddress [ secondary ]</b> | Enables the VRRP function and set the IP address for the virtual device. |
|          | <b>vrrp group preempt [ delay seconds ]</b>  | Sets the VRRP in the preemption mode.                                    |

Platform N/A

Description

## 4.15 vrrp timers advertise

Use this command to specify the interval for the master device to send the VRRP advertisement.

Use the **no** form of this command to restore the default setting.

**vrrp [ ipv6 ] group timers advertise { advertise-interval | csec centisecond-interval }**

**no vrrp [ ipv6 ] group timers advertise**

| Parameter   | Parameter                               | Description                                                                                                                                                                                                                                |
|-------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <b>ipv6</b>                             | Applies to IPv6 VRRP.                                                                                                                                                                                                                      |
|             | <i>group</i>                            | VRRP group number                                                                                                                                                                                                                          |
|             | <i>advertise-interval</i>               | Sets the interval time in seconds between sending VRRP advertisement.                                                                                                                                                                      |
|             | <b>csec</b> <i>centisecond-interval</i> | Sets the interval time in milliseconds between sending advertisement frames from the master VRRP router in the backup group. The range is from 50 to 99. This value is not set by default.<br>This parameter takes effect only for VRRPv3. |

**Defaults** This function is disabled by default. Once the VRRP function is enabled, the default advertisement interval of the master device is one second.

**Command Mode** Interface configuration mode

**Usage Guide** If the current device becomes the master device in the VRRP group, it will notify its VRRP status, priority and other information by sending the VRRP advertisement in the set interval.  
Based on the RFC specification, the maximum advertisement interval of the IPv4/IPv6 VRRPv3 group is 40 seconds. The advertisement interval can be configured larger than 40 seconds, but the effective advertisement interval is 40 seconds.

**Configuration Examples** The following example sets the VRRP advertisement interval as 4 seconds.

```
vrrp 1 timers advertise 4
```

| Related Commands | Command                                                    | Description                                                              |
|------------------|------------------------------------------------------------|--------------------------------------------------------------------------|
|                  | <b>vrrp group ip</b> <i>ipaddress</i> [ <b>secondary</b> ] | Enables the VRRP function and set the IP address for the virtual device. |
|                  | <b>vrrp group timers learn</b>                             | Enables the timer learning function.                                     |

**Platform** N/A

**Description**

## 4.16 vrrp timers learn

Use this command to enable the timer learning function.

Use the **no** form of this command to restore the default setting.

**vrrp [ ipv6 ] group timers learn**

**no vrrp [ ipv6 ] group timers learn**

| Parameter   | Parameter    | Description           |
|-------------|--------------|-----------------------|
| Description | <b>ipv6</b>  | Applies to IPv6 VRRP. |
|             | <i>group</i> | VRRP group number     |

**Defaults** This function is disabled by default. Even if the VRRP function is enabled, the timer learning function is disabled by default.

**Command Mode** Interface configuration mode

**Usage Guide** Once the timer learning function is enabled, if the current device is a VRRP backup device, it will learn the VRRP advertisement interval from the VRRP advertisement of the master device, with which it calculates the master device's failure interval instead of the VRRP advertisement interval configured locally. This command may synchronize the VRRP advertisement timer with the master device.

**Configuration** The following example enables the timer learning function on the IPv4 VRRP group 1.

**Examples**

```
vrrp 1 timers learn
```

The following example to enables the timer learning function on the IPv6 VRRP group 1.

```
vrrp ipv6 1 timers learn
```

| <b>vrrp ipv6 group timers advertise</b> <i>interval</i>    | Sets the IPv6 VRRP advertising interval.                                   |

**Platform** N/A

**Description**

## 4.17 vrrp track

Use these commands to enable the IPv4/IPv6 VRRP track in the interface configuration mode. Use the no form of these commands to restore the default setting.

```
vrrp group track { interface-type interface-number | bfd interface-type interface-number
ipv4-address } [ priority ]
```

```
vrrp ipv6 group track { interface-type interface-number | bfd interface-type interface-number
ipv6-address } [ link ] [ priority ]
```

```
no vrrp [ ipv6 ] group track interface-type interface-number
```

Use these commands to enable VRRP IPv4/IPv6 address track. Use the **no** form of these commands to restore the default setting.

```
vrrp group track ipv4-address [ interval interval-value ] [ timeout timeout-value ] [ retry retry-value ]
[ priority ]
```

```

vrrp ipv6 group track { ipv6-global-address | ipv6-linklocal-address interface-type interface-number }
[ interval interval-value ] [ timeout timeout-value ] [ retry retry-value ] [ priority ]
no vrrp group track ipv4-address
no vrrp ipv6 group track { ipv6-global-address | ipv6-linklocal-address interface-type interface-number }

```

Use this command to disable the specified neighbor IP address track via BFD.

```

no vrrp group track bfd interface-type interface-number ipv4-address

```

| Parameter   | Parameter                                                                       | Description                                                                                                                                          |

| Description | <i>group</i>                                                                    | VRRP group number                                                                                                                                    |
|             | <i>interface-type</i><br><i>interface-number</i>                                | Type of monitored interface                                                                                                                          |
|             | <b>bfd</b> <i>interface-type</i><br><i>interface-number</i> <i>ipv4-address</i> | Enables the specified neighbor IP address track via BFD.                                                                                             |
|             | <b>ipv6</b>                                                                     | Applies to IPv6 VRRP.                                                                                                                                |
|             | <i>ipv4-address</i>                                                             | Monitored IPv4 address. With BFD configured, it refers to the neighbor IP address.                                                                   |
|             | <b>interval</b> <i>interval-value</i>                                           | The interval of time to probe whether the monitored ip address is reachable or not. If this parameter is not selected, the default value is 3s.      |
|             | <b>timeout</b> <i>timeout-value</i>                                             | The timeout time of the unreachable monitored ip address. If this parameter is not selected, the default value is 1s.                                |
|             | <i>priority</i>                                                                 | VRRP priority change range when the interface or ip address reachability status changes. If this parameter is not selected, the default value is 10. |
|             | <i>ipv6-global-address</i>                                                      | Global unicast IPv6 address                                                                                                                          |
|             | <i>ipv6-linklocal-address</i>                                                   | Local link IPv6 address                                                                                                                              |

**Defaults** This function is disabled by default. Even if the VRRP function is enabled, no interface or IP address is specified.

**Command Mode** Interface configuration mode

**Usage Guide** This command can be used to monitor the outlet links. Note that layer-3 routable logical interfaces can be monitored (such as Routed Port, SVI, Loopback and Tunnel). This command can also be used to monitor the reachability of the specified IP address.

**Configuration Examples** The following example enables the VRRP group 1 to monitor the routed port Fa1/1. If the Fa1/1 link is disconnected, the priority of the VRRP group decreases by 30. When the Fa1/1 link recovers, the priority of VRRP group 1 is restored.

```

vrrp 1 track FastEthernet 1/1 30

```

The following example sets the VRRP to track the specified neighbor IP address 192.168.1.3 through BFD:

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#interface FastEthernet 0/1
Ruijie(config-if)#no switchport //used on the switch.
Ruijie(config-if)#ip address 192.168.1.1 255.255.255.0
Ruijie(config-if)#bfd interval 50 min_rx 50 multiplier 3
Ruijie(config)#interface FastEthernet 0/2
Ruijie(config-if)#no switchport //used on the switch
Ruijie(config-if)#ip address 192.168.201.17 255.255.255.0
Ruijie(config-if)#vrrp 1 priority 120
Ruijie(config-if)#vrrp 1 ip 192.168.201.1
Ruijie(config-if)#vrrp 1 track bfd FastEthernet 0/1 192.168.1.3 30
Ruijie(config-if)#end
```

#### Related Commands

| Command                                                    | Description                                                              |

| <b>vrrp group ip</b> <i>ipaddress</i> [ <b>secondary</b> ] | Enables the VRRP function and set the IP address for the virtual device. |
| <b>vrrp group priority</b> <i>level</i>                    | Sets the VRRP group priority.                                            |

**Platform** N/A  
**Description**

## 4.18 vrrp version

Use this command to configure the version of sending the IPv4 VRRP multicast packets. For the IPv4 VRRP, there are two versions: VRRPv2 and VRRPv3. Use the no form of this command to restore the default setting.

**vrrp group version** { **2** | **3** }

**no vrrp group version**

#### Parameter Description

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| <b>2</b>  | Uses the VRRPv2 version to send the packets. |
| <b>3</b>  | Uses the VRRPv3 version to send the packets. |

**Defaults** The default is VRRPv2.

**Command Mode** Interface configuration mode

**Usage Guide** Considering the compatibility of VRRPv2 and VRRPv3 for the IPv4 VRRP, you can choose the version of VRRP packets based on the actual network environment. VRRPv2 is based on RFC3768 and VRRPv3 is based on RFC 5798. This command is applicable to IPv4 VRRP only.

**Configuration Examples** The following example configures the version of sending the IPv4 VRRP packets on the interface gi4/1.

```
vrrp 1 version 3
```

## 5 VRRP Plus Commands

### 5.1 show vrrp balance

Use this command to display the VRRP Plus brief or details.

**show [ ipv6 ] vrrp balance [ brief | group ]**

| Parameter Description | Parameter    | Description                                           |
|-----------------------|--------------|-------------------------------------------------------|
|                       | <b>brief</b> | (Optional) Displays the VRRP Plus brief.              |
|                       | <b>ipv6</b>  | (Optional) Displays the IPv6 VRRP Plus configuration. |
|                       | <b>group</b> | (Optional) Displays the VRRP Plus details.            |

**Defaults** N/A

**Command Mode** Privileged EXEC mode/Global configuration mode/Interface configuration mode

**Usage Guide** If no optional parameter is used, the details of all VRRP Plus group are displayed.

**Configuration** The following example displays the details of all VRRP Plus groups.

#### Examples

```
Ruijie#show vrrp balance
VLAN 1 - Group 1
  State is BVG
  Virtual IP address is 192.168.1.54
  Hello time 1 sec, hold time 3 sec
  Load balancing: host-dependent
  Redirect time 300 sec, forwarder time-out 14400 sec
  Weighting 90 (configured 100), thresholds: lower 1, upper 100
    Track object 1, state: down, decrement weight: 10
  There are 2 forwarders
  Forwarder 1 (local)
    MAC address:
      0000.5e00.0101
    Owner ID is 00d0.f822.33ab
  Forwarder 2
    MAC address:
      001a.a916.0201
  Owner ID is 00d0.f822.8800
The following example shows the brief of the VRRP Plus group.
Ruijie# show vrrp balance brief
Interface Grp  State      Group Addr      MAC addr
```

```
VLAN 1      1      BVG      192.168.1.1      0000.5e00.0101
```

| Command                                                                                           | Description                                                       |
|---------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| <b>vrrp group balance</b>                                                                         | Enables the VRRP Plus function.                                   |
| <b>vrrp group load-balancing</b> { <b>host-dependent</b>   <b>round-robin</b>   <b>weighted</b> } | Sets the load balancing policy of the VRRP Plus.                  |
| <b>show vrrp balance interface</b> <i>type number</i> [ <b>brief</b> ]                            | Displays the VRRP Plus running status of the specified interface. |

**Platform** N/A

**Description**

## 5.2 show vrrp balance interface

Use this command to display the actions of the VRRP Plus group on the specified interface.

**show** [ **ipv6** ] **vrrp balance interface** *type number* [ **brief** ]

#### Parameter Description

| Parameter                           | Description                                    |
|-------------------------------------|------------------------------------------------|
| <b>interface</b> <i>type number</i> | Specifies the interface type and number.       |
| <b>ipv6</b>                         | (Optional) Displays the IPv6 VRRP Plus groups. |
| <b>brief</b>                        | (Optional) Displays the brief information.     |

**Defaults** N/A

**Command Mode** Privileged EXEC mode/ Global configuration mode/Interface configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example displays the actions of the VRRP Plus on FastEthernet 0/0.

#### Examples

```
Ruijie# show vrrp balance interface FastEthernet 0/0
FastEthernet 0/0 - Group 1
  State is BVG
  Virtual IP address is 192.168.1.54
  Hello time 1 sec, hold time 3 sec
  Load balancing: host-dependent
  Redirect time 300 sec, forwarder time-out 14400 sec
  Weighting 90 (configured 100), thresholds: lower 1, upper 100
    Track object 1, state: down, decrement weight: 10
  There are 2 forwarders
  Forwarder 1 (local)
```

```

MAC address:
    0000.5e00.0101
Owner ID is 00d0.f822.33ab
Forwarder 2
MAC address:
    001a.a916.0201
Owner ID is 00d0.f822.8800

```

#### Related Commands

| <b>vrrp group balance</b>                                                    | Enables the VRRP Plus function.                                   |
| <b>vrrp group load-balancing { host-dependent   round-robin   weighted }</b> | Sets the load balancing policy of the VRRP Plus.                  |
| <b>show vrrp balance interface type number [ brief ]</b>                     | Displays the VRRP Plus running status of the specified interface. |

**Platform** N/A

#### Description

## 5.3 vrrp balance

Use this command to enable the VRRP Plus function.

Use the **no** form of this command to disable this function.

**vrrp [ ipv6 ] group balance**

**no vrrp [ ipv6 ] group balance**

#### Parameter Description

| Parameter    | Description                                                       |
|--------------|-------------------------------------------------------------------|
| <b>ipv6</b>  | Applies to IPv6.                                                  |
| <b>group</b> | Enables the VRRP Plus function on the VRRP of specified group ID. |

**Defaults** VRRP Plus is disabled by default.

**Command Mode** Interface configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example enables the VRRP Plus function on the Layer 3 interface FastEthernet0/0.

```

Ruijie#config
Ruijie(config)#interface GigabitEthernet 0/0
Ruijie(config-if-GigabitEthernet 0/0)#vrrp 1 ip 192.168.1.1
Ruijie(config-if-GigabitEthernet 0/0)#vrrp 1 balance

```

**Related  
Commands**

|------------------------------------|-------------------------------------------------------------------|
| <b>vrrp load-balancing</b>         | Sets the load balancing policy of the VRRP Plus.                  |
| <b>show vrrp balance</b>           | Displays the VRRP Plus running status.                            |
| <b>show vrrp balance interface</b> | Displays the VRRP Plus running status of the specified interface. |

**Platform** N/A**Description**

## 5.4 vrrp forwarder preempt

Use this command to enable the forwarding preemption on the VRRP Plus backup group.

Use the **no** form of this command to disable this function.

**vrrp [ ipv6 ] group forwarder preempt**

**no vrrp [ ipv6 ] group forwarder preempt**

**Parameter  
Description**

| Parameter    | Description                                    |
|--------------|------------------------------------------------|
| <b>ipv6</b>  | Applies to IPv6.                               |
| <i>group</i> | VRRP group number. The range is from 1 to 255. |

**Defaults** By default, forwarding preemption is enabled.**Command  
Mode** Interface configuration mode**Usage Guide** The VRRP Plus function should be configured before enabling forwarding preemption.**Configuration  
Examples** The following example enables the forwarding preemption function of the VRRP Plus backup group on the Layer3 interface FastEthernet0/0.

```
Ruijie#config
Ruijie(config)#interface GigabitEthernet 0/0
Ruijie(config-if-GigabitEthernet 0/0)#vrrp 1 ip 192.168.1.1
Ruijie(config-if-GigabitEthernet 0/0)#vrrp 1 balance
Ruijie(config-if-GigabitEthernet 0/0)#vrrp 1 forwarder preempt
```

| <b>show vrrp balance interface</b> <i>type number</i> [ <b>brief</b> ] | Displays the VRRP Plus running status of the specified interface. |

**Platform** N/A

**Description**

## 5.5 vrrp load-balancing

Use this command to set the VRRP Plus load balancing policy.

Use the **no** form of this command to restore the default setting.

**vrrp** [ **ipv6** ] *group* **load-balancing** { **host-dependent** | **round-robin** | **weighted** }

**no vrrp** [ **ipv6** ] *group* **load-balancing** { **host-dependent** | **round-robin** | **weighted** }

**Parameter Description**

| Parameter             | Description                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>group</i>          | Specifies the VRRP group ID.                                                                                                                          |
| <b>ipv6</b>           | Applies to IPv6.                                                                                                                                      |
| <b>host-dependent</b> | Sets the host-dependent load balancing policy, so as to use the different virtual MACs to reply the host's ARP request based on different hosts.      |
| <b>round-robin</b>    | Sets the round-robin balancing policy, so as to use the different virtual MACs to reply the host's ARP request in turn, which is the default setting. |
| <b>weighted</b>       | Sets the weight balancing policy, so as to perform the ARP reply based on the device weight of the backup group.                                      |

**Defaults** The default is round-robin.

**Command Mode** Interface configuration mode

**Usage Guide** The VRRP Plus function should be enabled before setting the VRRP Plus load balancing policy.

**Configuration Examples** The following example sets the load balancing policy of the VRRP Plus group1 as host-dependent.

```
Ruijie(config-if)# vrrp 1 ip 192.168.1.1
Ruijie(config-if)# vrrp 1 balance
Ruijie(config-if)# vrrp 1 load-balancing host-dependent
```

| <b>show vrrp balance</b> [ <b>brief</b>   <i>group</i> ]               | Displays the VRRP Plus running status.                           |
| <b>show vrrp balance interface</b> <i>type number</i> [ <b>brief</b> ] | Displays the VRRP Plus running status o the specified interface. |

**Platform** N/A

**Description**

## 5.6 vrrp timers redirect

Use this command to set the redirection interval and timeout of the proxy virtual MAC address for the VRRP Plus backup group.

Use the **no** form of this command to restore the default value.

**vrrp** [ **ipv6** ] *group* **timers redirect** *redirect timeout*

**no vrrp** [ **ipv6** ] *group* **timers redirect**

**Parameter Description**

| Parameter       | Description                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------|
| <i>group</i>    | VRRP Plus backup group ID, in the range of 1 to 255.                                               |
| <b>ipv6</b>     | Applies to IPv6.                                                                                   |
| <i>redirect</i> | The redirection time, 300 seconds (namely 5 minutes) by default, in the range of 0 to 3,600.       |
| <i>timeout</i>  | The timeout, 14,400 seconds (namely 4 hours) by default, in the range of (redirect+600) to 64,800. |

**Defaults** The default redirection interval is 300 seconds and redirection timeout is 14,400 seconds.

**Command Mode** Interface configuration mode

**Usage Guide** The VRRP Plus function should be enabled before setting the redirection interval and timeout of the proxy virtual MAC address for the VRRP Plus backup group.

**Configuration Examples** The following example sets the redirection interval and timeout of the proxy virtual MAC address for the VRRP Plus backup group.

```
Ruijie(config-if)# vrrp 1 ip 192.168.1.1
Ruijie(config-if)# vrrp 1 balance
Ruijie(config-if)# vrrp 1 timers redirect 300 6000
```

**Related Commands**

|----------------------------------------------------------|----------------------------------------|
| <b>vrrp group balance</b>                                | Enables the VRRP Plus function.        |
| <b>show vrrp balance</b> [ <b>brief</b>   <i>group</i> ] | Displays the VRRP Plus running status. |

**show vrrp balance interface** *type number* [ **brief** ]

Displays the VRRP Plus running status o the specified interface.

**Platform** N/A

**Description**

## 5.7 vrrp weighting

Use this command to set the weight and threshold of the VRPP Plus backup group.

Use the **no** form of this command to restore the default setting.

**vrrp** [ **ipv6** ] *group* **weighting** *maximum* [ **lower** *lower* ] [ **upper** *upper* ]

**no vrrp** [ **ipv6** ] *group* **weighting**

**Parameter  
Description**

| Parameter      | Description                                                     |
|----------------|-----------------------------------------------------------------|
| <b>ipv6</b>    | Applies to IPv6.                                                |
| <i>group</i>   | VRRP Plus backup group ID, in the range of 1 to 255.            |
| <i>maximum</i> | Weight, 100 by default, in the range of 2 to 254.               |
| <i>lower</i>   | Weight lower, 1 by default, in the range of 1 to (maximum-1)    |
| <i>upper</i>   | Weight upper, 100 by default, in the range of lower to maximum. |

**Defaults** VRRP Plus backup group weight: 100

Weight lower: 1

Weight upper: 100

**Command  
Mode** Interface configuration mode

**Usage Guide** The VRRP Plus function should be enabled before setting the weight and threshold of the VRRP Plus backup group

**Configuration** The following example sets the weight and threshold of the VRRP Plus group1.

**Examples**

```
Ruijie(config-if)# vrrp 1 ip 192.168.1.1
Ruijie(config-if)# vrrp 1 balance
Ruijie(config-if)# vrrp 1 weighting 50 lower 30 upper 50
```

| <b>vrrp group balance</b>                                              | Enables the VRRP Plus function.                                   |
| <b>show vrrp balance</b> [ <b>brief</b>   <i>group</i> ]               | Displays the VRRP Plus running status.                            |
| <b>show vrrp balance interface</b> <i>type number</i> [ <b>brief</b> ] | Displays the VRRP Plus running status of the specified interface. |

**Platform** N/A

**Description**

## 5.8 vrrp weighting track

Use this command to set the track object corresponding to the weight of the VRRP Plus backup group. Use the **no** form of this command to delete the corresponding track object.

**vrrp [ ipv6 ] group weighting track object-number [ decrement value ]**

**no vrrp [ ipv6 ] group weighting track object-number**

| Parameter Description | Parameter            | Description                                                                                              |
|-----------------------|----------------------|----------------------------------------------------------------------------------------------------------|
|                       | <b>ipv6</b>          | Applies to IPv6.                                                                                         |
|                       | <i>group</i>         | VRRP Plus backup group ID, in the range of 1 to 255.                                                     |
|                       | <i>object-number</i> | The ID of the track object created by the track module, in the range of 1 to 700.                        |
|                       | <i>value</i>         | Weight decrement performed when the track object is down, which is 10 by default and is in the 1 to 255. |

**Defaults** No track is configured by default.

**Command Mode** Interface configuration mode

**Usage Guide** The VRRP Plus function should be enabled before setting the track object corresponding to the weight of the VRRP Plus backup group.

**Configuration Examples** The following example sets the track object corresponding to the weight of the VRRP Plus backup group 1.

```
Ruijie(config)#track 1 interface gigabitEthernet 0/14 line-protocol
Ruijie(config)#interface GigabitEthernet 0/0
Ruijie(config-if)# vrrp 1 ip 192.168.1.1
Ruijie(config-if)# vrrp 1 balance
Ruijie(config-if)# vrrp 1 weighting track 1 decrement 50
```

| Related Commands | Command                                                  | Description                                                       |

**Description**

## 6 BFD Commands

### 6.1 bfd

Use this command to set the BFD session parameters.

Use the **no** form of this command to remove the setting.

**bfd interval** *milliseconds* **min\_rx** *milliseconds* **multiplier** *multiplier-value*

**no bfd interval**

| Parameter<br>Description | Parameter                   | Description                                                                                                                             |
|--------------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|                          | interval milliseconds       | Interval of sending the BFD control messages to the BFD session neighbor.<br>milliseconds: The range is from 50 to 10,000.              |
|                          | min_rx milliseconds         | Expected interval of receiving the BFD control messages from the BFD session neighbor.<br>milliseconds: The range is from 50 to 10,000. |
|                          | multiplier multiplier-value | Count of BFD control message not received from the peer in the configured interval.<br>multiplier-value: The range is from 3 to 50.     |

**Defaults** No BFD session parameter is configured by default.

**Command Mode** Interface configuration mode

**Usage Guide** Those parameters must be configured before enabling the BFD session.  
The express forwarding must be enabled before enabling BFD on the routers.

**Configuration Examples** The following example configures the BFD session parameter on routed port FastEthernet 0/2.

```
Ruijie(config)# interface fastEthernet 0/2
Ruijie(config)# no switchport
Ruijie(config-if)# bfd interval 100 min_rx 100 multiplier 3
```

## 6.2 bfd bind peer-ip

Use this command to create a BFD session to correlate with an interface.

Use the **no** form of this command to remove this setting.

**bfd bind peer-ip** *ip-address* [ **source-ip** *ip-address* ] **process-pst**

**no bfd bind peer-ip** *ip-address*

### Parameter Description

| Parameter                          | Description                                                                                                                                                                         |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>peer-ip</b> <i>ip-address</i>   | The peer IP address to be detected, which must be directly connected to the Layer3 interface.                                                                                       |
| <b>source-ip</b> <i>ip-address</i> | Source IP address for sending the BFD packets, which avoids the packets dropped by the URPF in case that this function is used with other functions such the URPF at the same time. |
| <b>process-pst</b>                 | Correlates BFD for the Layer3 interface.                                                                                                                                            |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode

**Usage Guide** Note that this command must be configured a Layer3 interface and the peer IP address detected must be the address directly-connected to the interface.

**Configuration Examples** The following example detects the peer 1.1.1.2 through BFD on the routed port to generate the BFD status of the interface.

```
Ruijie(config)# interface gigabitEthernet 0/2
Ruijie(config-if -GigabitEthernet 0/2)#no sw
Ruijie(config-if -GigabitEthernet 0/2)#ip address 1.1.1.1 255.255.255.0
Ruijie(config-if -GigabitEthernet 0/2)#bfd bind peer-ip 1.1.1.2 source-ip
1.1.1.1 process-pst
```

## 6.3 bfd cpp

Use this command to enable the BFD protection policy.

Use the **no** form of this command to disable this function.

**bfd cpp**

**no bfd cpp**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

This function is enabled by default.

**Command  
Mode**

Global configuration mode

**Usage Guide**

BFD protocol is so sensitive that if the device with BFD function enabled suffers from attack (for example, a large amount of Ping packets attack the device), which lead to the BFD session turbulence, the device can be protected by enabling the BFD protection policy. However, if the BFD function and the BFD protection policy are enabled at the same time, the loss of BFD packets on the attacked device occurs when the packets sent from the last-hop device go through this device, influencing the BFD session establishment between the last-hop device and other devices. This function is valid only for the switches.

**Configuration**

The following example enables the BFD protection policy.

**Examples**

```
Ruijie(config)# bfd cpp
```

**Description**

## 6.4 bfd echo

Use this command to enable echo mode.

Use the **no** form of this command to disable echo mode.

**bfd echo [ one-arm ]**

**no bfd echo**

**Parameter  
Description**

| Parameter      | Description                          |
|----------------|--------------------------------------|
| <b>one-arm</b> | Indicates the BFD one-arm echo mode. |

**Defaults**

The echo mode is disabled by default.

The one-arm echo mode is disabled by default.

**Command** Interface configuration mode  
**Mode**

**Usage Guide** By default, with BFD session parameter configured, the system enables the echo mode automatically and disables the one-arm echo mode. The minimum sending and receiving interval for the echo packets are the values of the configured **interval** *milliseconds* and **min\_rx** *milliseconds*.  
This command cannot be configured on the AP port.  
Before enabling BFD echo mode or BFD one-arm echo mode, it is necessary to use the **no ip redirects** command to disable the ICMP redirection messages sending on the neighbor device of the BFD session, use the **no ip deny land** to disable the DDOS (Land-based attack prevention) function.  
With both ends of the BFD session enabled, the echo mode takes effect.  
With one end of the BFD session enabled, the one-arm echo mode takes effect.  
In the process that the forwarding plane of the peer device returns echo packets transmitted by the local end to the local end, the echo packets may be lost due to congestion of the peer device, causing a session detection failure. In this case, configure Quality of Service (QoS) policies to ensure that echo packets are processed preferentially or disable the echo function.  
The echo detection function of BFD does not support multi-hop detection. Ensure that the echo function is disabled when configuring multi-hops.

**Configuration** The following example enables the echo mode on the routed port FastEthernet 0/2:

**Examples**

```
Ruijie(config)# interface fastEthernet 0/2
Ruijie(config)# no switchport
Ruijie(config-if)# bfd echo
```

The following example enables the one-arm echo mode on the routed port FastEthernet 0/2:

```
Ruijie(config)# interface fastEthernet 0/2
Ruijie(config)# no switchport
Ruijie(config-if)# bfd echo one-arm
```

**Related  
Commands**

|-----------------------|---------------------------------------|
| <b>bfd</b>            | Configures the BFD session parameter. |
| <b>bfd slow-timer</b> | Configures the slow-timer time.       |

**Platform** N/A  
**Description**

## 6.5 bfd slow-timer

Use this command to set the slow timer, which is used to send the BFD packets in the BFD asynchronous mode.

Use the **no** form of this command to restore the default setting.

**bfd slow-timer** [ *milliseconds* ]

**no bfd slow-timer**

**Parameter  
Description**

| Parameter    | Description                                                                      |
|--------------|----------------------------------------------------------------------------------|
| milliseconds | BFD slow-timer time. The range is from 1,000 to 30,000. The unit is millisecond. |

**Defaults** The default slow-timer is 2000 milliseconds.

**Command  
Mode** Global configuration mode

**Usage Guide** N/A

**Configuration** The following example sets the slow-timer to 14,000 milliseconds:

**Examples** Ruijie(config)# bfd slow-timer 14000

**Related

## 6.6 bfd up-dampening

Use this command to set the BFD up-dampening time.

Use the **no** form of this command to restore the default setting.

**bfd up-dampening** [ *milliseconds* ]

**no up-dampening**

**Parameter  
Description**

| Parameter    | Description                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------|
| milliseconds | (Optional) Sets the BFD up-dampening time. The range is from 0 to 300,000. The unit is millisecond. |

**Defaults** The default is 0 millisecond, which means that the notification is sent to the related application once the session state is UP.

**Command  
Mode** Interface configuration mode

**Usage Guide** N/A

**Configuration** The following example sets the BFD up-dampening time to 60,000 milliseconds:

**Examples** Ruijie(config)# bfd up-dampening 60000

**Related  
Commands**

| Command    | Description                           |

| <b>bfd</b> | Configures the BFD session parameter. |

**Platform** N/A

**Description**

## 6.7 bfd static-id

Use this command to configure a static BFD session.

**bfd static-id** *session-name* **bind peer-ip** *ip-address* *interface-type* *interface-number* [ **source-ip** *ip-address* ]

Use the **no** form of this command to delete the BFD session.

**no bfd static-id** *session-name* **bind peer-ip** *ip-address* *interface-type* *interface-number*

**Parameter  
Description**

| Parameter                                        | Description                                          |
|--------------------------------------------------|------------------------------------------------------|
| <b>static-id</b> <i>session-name</i>             | Indicates the name of a static BFD session.          |
| <b>peer-ip</b> <i>ip-address</i>                 | Indicates the IP address of the peer to be detected. |
| <i>interface-address</i><br><i>interface-num</i> | Indicates the egress interface for the BFD session.  |
| <b>source-ip</b> <i>ip-address</i>               | Indicates the source IP address of the BFD packets.  |

**Defaults** N/A

**Command  
Mode** Global configuration mode

**Default Level** 14

**Usage Guide** The static-id is used to uniquely identifies a static BFD session. The session name consists of up to 32 characters.

**Configuration  
Examples** The following example configures a static BFD session named test in global configuration mode, the IP address of the peer is 1.1.1.2, and the egress interface is Gi0/2.

Ruijie(config)# interface gigabitEthernet 0/2

```

Ruijie(config-if -GigabitEthernet 0/2)#no sw
Ruijie(config-if -GigabitEthernet 0/2)#ip address 1.1.1.1 255.255.255.0
Ruijie(config-if -GigabitEthernet 0/2)#bfd interval 100 min_rx 100 multiplier
3
Ruijie(config-if -GigabitEthernet 0/2)#exit
Ruijie(config)#bfd static-id test bind peer-ip 1.1.1.2 gigabitEthernet 0/2

```

## 6.8 show bfd neighbors

Use this command to display the BFD session parameters.

**show bfd neighbors** [ **vrf** *vrf-name* ] [ **client** { **ap** | **bgp** | **isis** | **ospf** | **ospfv3** | **rip** | **vrrp** | **static-route** | **pbr** | **vrrp-balance** | **bgp-lsp** | **ldp-lsp** | **static-lsp** | **backward-lsp-with-ip** | **pst** } ] [ **ipv4** *ip-address* | **ipv6** *ip-address* ] [ **details** ]

### Parameter Description

| Parameter                     | Description                                                                  |
|-------------------------------|------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>    | (Optional) sets the neighbor VRF name.                                       |
| <b>client</b>                 | (Optional) specifies the routing protocol.                                   |
| <b>ap</b>                     | Displays the BFD session configuration for Layer 3 aggregate ports.          |
| <b>bgp</b>                    | Displays the BFD session configuration for BGP.                              |
| <b>isis</b>                   | Displays the BFD session configuration for ISIS.                             |
| <b>ospf</b>                   | Displays the BFD session configuration for OSPF.                             |
| <b>ospfv3</b>                 | Displays the BFD session configuration for OSPFv3.                           |
| <b>rip</b>                    | Displays the BFD session configuration for RIP.                              |
| <b>vrrp</b>                   | Displays the BFD session configuration for VRRP.                             |
| <b>static-route</b>           | Displays the BFD session configuration for the static route.                 |
| <b>pbr</b>                    | Displays the BFD session configuration for PBR.                              |
| <b>vrrp-balance</b>           | Displays the BFD session configuration for the VRPP.                         |
| <b>bgp-lsp</b>                | Displays the BFD session configuration for the BGP-LSP.                      |
| <b>ldp-lsp</b>                | Displays the BFD session configuration for the LDP-LSP.                      |
| <b>backward-lsp-with-ip</b>   | Displays the BFD session configuration for the LSP backward IP co-operation. |
| <b>static-lsp</b>             | Displays the BFD session configuration for the static LSP co-operation.      |
| <b>pst</b>                    | Displays the BFD session configuration and the Layer3 interface status.      |
| <b>ipv4</b> <i>ip-address</i> | (Optional) Displays the session information of the specified IPv4 neighbor.  |
| <b>ipv6</b> <i>ip-address</i> | (Optional) Displays the session information of the specified IPv6 neighbor.  |
| <b>details</b>                | (Optional) Displays the configurations in detail.                            |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** In the information displayed by the **show bfd neighbors** command, the OurAddr field means the source address of the session. The “-” is displayed if the source address is not specified, and it occurs in the BFD session for the LSP backward IP correlation.

**Configuration Examples** The following example displays the BFD session configuration.

```
Ruijie# sh bfd neighbors
IPV4 sessions: 1, UP: 1
IPV6 sessions: 0, UP: 0
OurAddr      NeighAddr      LD/RD      RH Holddown(mult) State Int
192.168.24.2 192.168.24.1 8192/8192 Up    0(3)      Up GigabitEthernet 0/1
```

The following example displays the BFD session configuration in detail.

```
Ruijie#sh bfd neighbors
IPV4 sessions: 1, UP: 1
IPV6 sessions: 0, UP: 0
OurAddr      NeighAddr      LD/RD      RH/RS      Holddown(mult) State Int
192.168.24.2 192.168.24.1 8192/8192 Up    0(3 )      Up
GigabitEthernet 0/1
Session state is Up and using echo function with 50 ms interval.
Local Diag: 0, Demand mode: 0, Poll bit: 0
MinTxInt: 3000000, MinRxInt: 3000000, Multiplier: 3
Received MinRxInt 3000000, Multiplier: 3
Holdown (hits): 9000(0), Hello (hits): 3000(36)
Rx Count: 127, Rx Interval (ms) min/max/avg: 40/999/999
Tx Count: 135, Tx Interval (ms) min/max/avg: 1000/1000/999
Registered protocols: VRRP
Uptime: 0:01:19
Last packet:
Version      :      1      - Diagnostic      : 0
State bit    :      Up    - Demand bit     : 0
Poll bit     :      0     - Final bit      : 0
Multiplier   :      3     - Length         : 24
My Discr     :     8192    - Your Discr     : 8192
Min tx interval : 3000000 - Min rx interval: 3000000
Min Echo interval: 50000
```

The following example displays the BFD session configuration for aggregate ports.

```
Ruijie#show bfd neighbors client ap
IPV4 sessions: 1, UP: 0
IPV6 sessions: 0, UP: 0
```

|                            |              |        |       |                |       |     |
|----------------------------|--------------|--------|-------|----------------|-------|-----|
| OurAddr                    | NeighAddr    | LD/RD  | RH/RS | Holdown (mult) | State | Int |
| 192.168.23.1               | 192.168.23.2 | 8192/0 | Admin | 0 (3 )         | Down  |     |

## 7 IP Event Dampening

### 7.1 dampening

Use this command to enable the IP event dampening function on the interface. Use the **no** or **default** form of this command to disable this function.

**dampening** [ *half-life-period* [ *reuse-threshold* *suppress-threshold* *max-suppress* [ **restart** [ *restart-penalty* ] ] ] ]

**no dampening**

**default dampening**

| Parameter<br>Description | Parameter                 | Description                                                                                                                             |
|--------------------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|                          | <i>half-life-period</i>   | Configures the half-life period of suppression penalty. The range is from 1 to 30. The unit is seconds. The default value is 5 seconds. |
|                          | <i>reuse-threshold</i>    | Configures the penalty threshold to unsuppress the interface. The range is from 1 to 20,000. The default value is 1,000.                |
|                          | <i>suppress-threshold</i> | Configures the penalty threshold to suppress the interface. The range is from 1 to 20,000. The default value is 2,000.                  |
|                          | <i>max-suppress</i>       | Configures the maximum suppress time. The range is from 1 to 255. The default value is 4 times of the <i>half-life-period</i> .         |
|                          | <b>restart</b>            | Activates the restart penalty.                                                                                                          |
|                          | <i>restart-penalty</i>    | Configures the initial penalty value on the interface. The range is from 1 to 20,000. The default value is 2,000.                       |

**Defaults** IP event dampening is disabled by default.

**Command mode** Interface configuration mode.

**Usage Guide** This function will influence the modules of the directly-connected/host route, static route, dynamic route and VRRP. If one interface meets the configuration condition of this command, which is in the suppression status, the preceding influenced modules consider the status of this interface as DOWN, so as to delete the corresponding route and not transceive the data packets on this interface. Re-configuring the dampening command on the interface that has been configured this command makes all dampening information on this interface cleared. However, the interface flapping times will be remained unless use the clear counters command to clear the statistical information of the interface.

Too small max-suppress configured may cause the maximum penalty value obtained from the calculation smaller than the suppression threshold to make this interface will not be suppressed forever. Therefore, it belongs to the erroneous configuration. In this case, the following message will

prompt for the configuration error:

% Maximum penalty (10) is less than suppress penalty (2000). Increase maximum suppress time  
Besides, when configuring this command, it will prompt the following message as well if the system memory is not enough to save this configuration:

% No memory, configure dampening fail!

For the interface layer switching of the switches (Layer-3 interface to the Layer-2 interface), for example, if one routed port is switched to the switch port, the dampening command configured on this interface will be removed.

Note: For routers, this function can be configured on the master interface only. This function takes effect for all sub-interfaces of the master interface with this command configured, but this command cannot be configured on the sub-interface directly. This command cannot be configured on the virtual template.

**Configuration** The following example configures the IP event dampening function.

**Examples**

```
Ruijie(config)#interface gigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)# no switchport
Ruijie(config-if-GigabitEthernet 0/1)# dampening 30 1500 10000 100
```

**Defaults** N/A

**Command mode** Privileged EXEC mode/ global configuration mode/ interface configuration mode

**Usage Guide** If the interface-id is specified, only the dampening information of this specified interface is displayed.

**Configuration** The following example shows the details of IP event dampening configuration.

**Examples**

```
Ruijie# show interface dampening Ethernet1/0
Flaps  Penalty  Supp ReuseTm HalfL ReuseV SuppV MaxSTm MaxP Restart
0      0        FALSE 0      5    1000 2000  20    16000  0
```

| Domain  | Description                                 |
|---------|---------------------------------------------|
| Flaps   | Interface flapping times.                   |
| Penalty | The current penalty value on the interface. |
| Supp    | Suppressed or not.                          |

|         |                                               |
|---------|-----------------------------------------------|
| ReuseTm | Time to unsuppress the interface, in seconds. |
| HalfL   | Half-life period, in seconds.                 |
| ReuseV  | Unsuppressed threshold.                       |
| SuppV   | Start suppression threshold.                  |
| MaxSTm  | Maximum suppression time.                     |
| MaxP    | Maximum penalty value.                        |
| Restart | The initial penalty value on the interface.   |

**Related  
Commands**

## 8 VSU Commands

### 8.1 dad relay enable

Use this command to enable the Dual-Active Detection (DAD) relay function.

Use the **no** form of this command to restore the default setting.

**dad relay enable**

**no dad relay enable**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode

**Usage Guide** This command is only supported on the aggregate port (AP).

**Configuration Examples** The following example enables the AP-based DAD relay function.

```
Ruijie(config)# interface aggregateport 1
Ruijie(config-if)# dad relay enable
```

The following example disables the AP-based DAD relay function.

```
Ruijie(config)# interface aggregateport 1
Ruijie(config-if)# no dad relay enable
```

| Related<br>Commands | Command                                | Description                                                                         |
|---------------------|----------------------------------------|-------------------------------------------------------------------------------------|
|                     | <b>dual-active detection</b>           | Configures DAD.                                                                     |
|                     | <b>dual-active pair interface</b>      | Configures a pair of Bidirectional Forwarding Detection (BFD)-based DAD interfaces. |
|                     | <b>dual-active exclude interface</b>   | Configures an exclude interface of DAD.                                             |
|                     | <b>show switch virtual dual-active</b> | Displays the configuration and status of DAD.                                       |

**Platform** N/A

**Description**

### 8.2 dual-active auto-recovery enable

Use this command to enable the automatic recovery without restart function in recovery mode upon a master device abnormality. Use the **no** form of this command to disable the function.

**dual-active auto-recovery enable**

**no dual-active auto-recovery enable**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** The automatic recovery without restart function in recovery mode is disabled by default.

**Command Mode** config-vs-domain configuration mode

**Usage Guide** This command is available in VSU mode.

**Configuration Examples** The following example disables the automatic recovery without restart function in recovery mode.

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)#
Ruijie(config-vs-domain)#no dual-active auto-recovery enable
```

The following example enables the automatic recovery without restart function in recovery mode.

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)#
Ruijie(config-vs-domain)# dual-active auto-recovery enable
```

**Verification** Run the **show run** command to display the configurations. By default, the configurations are not displayed.

## 8.3 dual-active bfd interface

Use this command to configure a BFD port.

Use the **no** form of this command to remove the setting.

**dual-active bfd interface** *interface-name*

**no dual-active bfd interface** *interface-name*

| Parameter<br>Description | Parameter             | Description    |
|--------------------------|-----------------------|----------------|
|                          | <i>interface-name</i> | Interface name |

**Defaults** N/A.

**Command Mode** config-vs-domain mode

**Usage Guide** The BFD port must be a routing port on the peer end.

**Configuration** The following examples configures interface Gi 1/1/1 as a BFD port.

**Examples**

```
Ruijie(config)# interface GigabitEthernet 1/1/1
Ruijie(config-if- GigabitEthernet 1/1/1)# no switchport
Ruijie(config)# interface GigabitEthernet 2/1/1
Ruijie(config-if- GigabitEthernet 2/1/1)# no switchport
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# dual-active bfd interface GigabitEthernet 1/1/1
Ruijie(config-vs-domain)# dual-active bfd interface GigabitEthernet 2/1/1
```

**Related  
Commands**

**Platform** N/A  
**Description**

## 8.4 dual-active detection

Use this command to enable DAD.

Use the **no** form of this command to restore the default setting.

**dual-active detection { bfd | aggregateport }**

**no dual-active detection { bfd | aggregateport }**

**Parameter  
Description**

| Parameter            | Description   |
|----------------------|---------------|
| <b>bfd</b>           | BFD-based DAD |
| <b>aggregateport</b> | AP-based DAD  |

**Defaults** This function is disabled by default.

**Command Mode** config-vs-domain mode

**Usage Guide** Configure this command only in virtual switch unit (VSU) mode.

**Configuration** The following example enables BFD-based DAD.

**Examples**

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# dual-active detection bfd
```

The following example disables BFD-based DAD.

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# no dual-active detection bfd
```

The following example enables AP-based DAD.

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# dual-active detection aggregateport
```

The following example disables AP-based DAD.

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)#no dual-active detection aggregateport
```

#### Related Commands

| Command                                | Description                                   |
|----------------------------------------|-----------------------------------------------|
| <b>dual-active pair interface</b>      | Configures a DAD interface.                   |
| <b>dual-active exclude interface</b>   | Configures an exclude interface of DAD.       |
| <b>show switch virtual dual-active</b> | Displays the configuration and status of DAD. |

**Platform** N/A  
**Description**

## 8.5 dual-active exclude interface

Use this command to configure an exclude interface of DAD.

Use the **no** form of this command to remove the exclude interface setting.

**dual-active exclude interface** *interface-name*

**no dual-active exclude interface** *interface-name*

#### Parameter Description

| Parameter             | Description    |
|-----------------------|----------------|
| <i>interface-name</i> | Interface name |

**Defaults** N/A

**Command Mode** config-vs-domain mode

#### Usage Guide

Configure this command only in VSU mode.

After the VSU works in dual-active chassis mode, to remotely log in to the management device from an interface, you can run the **dual-active exclude interface** command to set this interface to an interface that is not disabled in recovery mode.

An exclude interface must be a routing interface instead of a virtual switch link (VSL) interface.

Multiple exclude interfaces are supported.

#### Configuration Examples

The following example configures interface Gi 1/1/3 as an exclude interface of DAD.

```
Ruijie(config)# interface GigabitEthernet 1/1/3
Ruijie(config-if)# no switchport
Ruijie(config-if)# ip address 3.1.1.1 255.255.255.0
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# dual-active exclude interface GigabitEthernet
1/1/3
```

**Platform**  
**Description**

N/A

## 8.6 dual-active interface

Use this command to configure an AP-based DAD interface.

Use the **no** form of this command to remove the setting.

**dual-active interface** *interface-name* [ **vlan** *vlan-id* ]

**no dual-active interface** *interface-name* [ **vlan** *vlan-id* ]

| <b>Parameter</b>   | <b>Parameter</b>      | <b>Description</b>                                                                |
|--------------------|-----------------------|-----------------------------------------------------------------------------------|
| <b>Description</b> | <i>interface-name</i> | Interface type and interface number. An AP-based DAD interface must be specified. |
|                    | <i>vlan-id</i>        | VLAN ID                                                                           |

**Defaults**

N/A

**Command Mode** config-vs-domain mode

**Usage Guide** Only one AP-based detection interface can be configured. Create an AP-based interface before setting it to a detection interface. The previous detection interface will be overwritten by the current detection interface. When the AP is a trunk port and the native VLAN is beyond the allowable VLAN range of the AP-based detection interface, a detection VLAN needs to be configured for the AP-based detection interface. The configured VLAN must be within the allowable VLAN range of the trunk port and has been correctly created on the device.

**Configuration** The following example configures AP 1 as the AP-based detection interface.

### Examples

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# dual-active interface aggregateport 1
```

The following example configures aggregateport 1 as a detection interface and runs the **switchport trunk allowed vlan only 1-2** command for the interface.

```
Ruijie(config)# interface aggregateport 1
Ruijie(config-if-AggregatePort 1)#switchport mode trunk
Ruijie(config-if-AggregatePort 1)#switchport trunk allowed vlan only 1-2
Ruijie(config-if-AggregatePort 1)#exit
Ruijie(config)#vlan 2
```

```
Ruijie(config-vlan)#exit
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# dual-active interface aggregateport 1 vlan 2
```

**Description**

## 8.7 port-member interface

Use this command to add a VSL-AP member interface.

Use the **no** form of this command to delete a VSL-AP member interface.

**port-member interface** *interfacename* [ **copper** | **fiber** ]

**no port-member interface** *interfacename*

**Parameter  
Description**

| Parameter            | Description                                                                 |
|----------------------|-----------------------------------------------------------------------------|
| <i>interfacename</i> | Interface name, for example, GigabitEthernet 0/1 and GigabitEthernet 1/0/1. |
| <b>copper</b>        | Copper port                                                                 |
| <b>fiber</b>         | Fiber port                                                                  |

**Defaults**

N/A

**Command Mode**

config-vsl-port mode

**Usage Guide**

Configure this command in VSU mode or in standalone mode.

**Configuration  
Examples**

The following example adds and deletes a VSL-AP member port in standalone mode.

```
Ruijie(config)# vsl-port
Ruijie(config-vsl-port)# port-member interface GigabitEthernet 0/1
Ruijie(config-vsl-port)# no port-member interface GigabitEthernet 0/2
```

The following example adds and deletes a VSL-AP member port in VSU mode.

```
Ruijie(config)# vsl-port
Ruijie(config-vsl-port)# port-member interface GigabitEthernet 1/1/1
Ruijie(config-vsl-port)# no port-member interface GigabitEthernet 1/1/1
```

## 8.8 led-blink

Use this command to configure LED blink function.

**led-blink {enable | disable} [device *device\_id*]**

| Parameter   | Parameter        | Description             |
|-------------|------------------|-------------------------|
| Description | <b>enable</b>    | Enables this function.  |
|             | <b>disable</b>   | Disables this function. |
|             | <i>device_id</i> | Device ID               |

**Defaults** This function is disabled by default.

**Command Mode** Privileged EXEC mode

**Usage Guide** In single-device mode, this function can be only enabled and disabled.  
In VSU mode, a device can be specified. If not specified, all devices in the VSU will be configured.  
If running for 30 minutes, this function is disabled automatically even without any operation.  
The configuration cannot be saved. In case of restart or active/standby switch-over, it will be removed.

**Configuration** The following example enables and disables LED blink function.

**Examples**

```
Ruijie#led-blink enable  
Ruijie#led-blink disable
```

The following example enables and disables LED blink function on Device 2.

```
Ruijie#led-blink enable device 2  
Ruijie#led-blink disable device 2
```

The following example enables and disables LED blink function in VSU.

```
Ruijie#led-blink enable  
Ruijie#led-blink disable
```

## 8.9 mgmt\_mode unique

Use this command to configure the function of creating only one MGMT interface for the system in VSU mode. Use the **no** form of this command to disable the function of creating only one MGMT interface for the system in VSU mode and create one MGMT interface for each chassis.

**mgmt\_mode unique**

**no mgmt\_mode**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

The function of creating only one MGMT interface for the system in VSU mode is disabled by default and one MGMT interface is created for each chassis.

**Command Mode**

Global configuration mode

**Default Level**

14

**Usage Guide**

After this command is configured, run the **write** command to save the configuration. The configuration takes effect only after the device is restarted. This command is available both in VSU mode and standalone mode, but takes effect only in VSU mode.

**Configuration  
Examples**

The following example configures the function of creating one MGMT interface for the system in VSU mode.

```
Ruijie(config)#mgmt_mode unique
Please write and reload system to take cfg effect!
```

The following example disables the function of creating only one MGMT interface for the system in VSU mode and creates one MGMT interface for each chassis.

```
Ruijie(config)#no mgmt_mode
Please write and reload system to take cfg effect!
```

## 8.10 session

Use this command to perform redirection to a host or a device console.

**session { device *switch\_id* | master }**

**Parameter  
Description**

| Parameter        | Description                                 |
|------------------|---------------------------------------------|
| <b>device</b>    | Redirects to the member device console.     |
| <i>switch_id</i> | Member device number, varying with products |
| <b>master</b>    | Redirects to the host console.              |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command takes effect in VSU mode.

**Configuration Examples** The following example redirects the serial port console of standby device 2 to the master device console.

```
Ruijie-STANDBY#session master
Ruijie#exit
Ruijie-STANDBY#
```

The following example redirects the master device console to the console of standby device 2 and exits.

```
Ruijie#session device 2
Ruijie-STANDBY#exit
Ruijie#
```

## 8.14 show switch virtual config

Use this command to display the VSU configuration of the device in standalone or VSU mode.

**show switch virtual config** [ *switch\_id* ]

|                    |                  |                                                         |
|--------------------|------------------|---------------------------------------------------------|
| <b>Parameter</b>   | <b>Parameter</b> | <b>Description</b>                                      |
| <b>Description</b> | <i>switch_id</i> | Displays the VSU configuration of the specified device. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays the VSU configuration of the device in standalone mode.

**Examples**

```
Ruijie#show switch virtual config
mac: 00d0.f810.3323
!
switch virtual domain 1
!
switch 1
switch 1 priority 200
!
vsl-port
port-member interface GigabitEthernet 0/1
port-member interface GigabitEthernet 0/2
!
switch convert mode standalone
!
```

The following example displays the VSU configuration of the device in VSU mode.

```
Ruijie#show switch virtual config
switch id: 1 (mac: 00d0.f810.1111)
!
switch virtual domain 1
!
switch 1
switch 1 priority 200
switch 1 description switch1
!
vsl-port
port-member interface GigabitEthernet 0/1
port-member interface GigabitEthernet 0/2
!
Switch convert mode virtual
!

switch_id: 2 (mac: 00d0.f810.2222)
!
switch virtual domain 1
!
```

```

switch 2
switch 2 priority 100
!
vsl-port
port-member interface GigabitEthernet Ethernet 0/1
port-member interface GigabitEthernet 0/2
!
Switch convert mode virtual
!

```

|----------------------------|--------------------------------------------------------------------|
| <b>show switch virtual</b> | Displays the domain ID as well as the ID and role of each chassis. |

**Platform  
Description**

N/A

## 8.15 show switch virtual dual-active

Use this command to display the configuration of DAD.

**show switch virtual dual-active { bfd | aggregateport | summary }**

**Parameter  
Description**

| Parameter            | Description                     |
|----------------------|---------------------------------|
| <b>bfd</b>           | Configuration of BFD-based DAD  |
| <b>aggregateport</b> | Configuration of AP-based DAD   |
| <b>summary</b>       | Configuration and status of DAD |

**Defaults**

N/A

**Command Mode**

Privileged EXEC mode

**Usage Guide**

N/A

**Configuration**

The following example displays the configuration and status of DAD.

**Examples**

```

Ruijie# show switch virtual dual-active summary
BFD dual-active detection enabled: Yes
Aggregateport dual-active detection enabled: NO
Interfaces excluded from shutdown in recovery mode:
GigabitEthernet 1/1/3
GigabitEthernet 1/1/4In dual-active recovery mode: No

```

The following example displays the configuration of BFD-based DAD.

```

Ruijie# show switch virtual dual-active bfd
BFD dual-active detection enabled: Yes

```

```
BFD dual-active interface pairs configured:
Pair interface GigabitEthernet 1/0/1 and interface GigabitEthernet 2/0/1:
UP
Pair interface GigabitEthernet 1/0/2 and interface GigabitEthernet 2/0/2:
UP
```

The following example displays the status of AP-based DAD.

```
Ruijie# show switch virtual dual-active aggregateport
Aggregateport dual-active detection enabled: Yes
Aggregateport dual-active interface configured:
AggregatePort 1:  UP
    GigabitEthernet 1/0/1:  UP
    GigabitEthernet 2/0/1:  UP
    GigabitEthernet 1/0/2:  UP
    GigabitEthernet 2/0/2:  UP
DAD relay enable AP list:
    AggregatePort 1
```

#### Related Commands

| Command                              | Description                      |
|--------------------------------------|----------------------------------|
| <b>dual-active detection</b>         | Enables DAD.                     |
| <b>dual-active pair interface</b>    | Configures a DAD interface.      |
| <b>dual-active exclude interface</b> | Configures an exclude interface. |

#### Platform Description

N/A

## 8.16 show switch virtual link

Use this command to display the status of a virtual switch link (VSL).

**show switch virtual link [ port ]**

#### Parameter Description

| Parameter   | Description                        |
|-------------|------------------------------------|
| <b>port</b> | Displays the port status of a VSL. |

#### Defaults

N/A

#### Command Mode

Privileged EXEC mode.

#### Usage Guide

N/A

#### Configuration

The following example displays VSL link information.

#### Examples

```
Ruijie# show switch virtual link
VSL-AP  State  Peer-VSL  Rx          Tx          Uptime
```

```

-----
1/1      UP      2/1      657976      694603      0d,1h,42m
2/1      UP      1/1      694856      658174      0d,1h,42m

```

The values of **VSL Status** are **DOWN** and **UP**.

The following example displays VSL port information.

```
Ruijie# show switch virtual link port
```

```
switch 1:
```

```

Port              AP  State  Peer-port              Rx    Tx
  Uptime
-----
GigabitEthernet 1/0/1  1  OK    GigabitEthernet 2/0/1  9000  9000
    0d,0h,20m
GigabitEthernet 1/0/2  2  OK    GigabitEthernet 2/0/2  9000  9000
    0d,0h,20m

```

```
Switch 2:
```

```

Port              AP  State  Peer-port              Rx    Tx
  Uptime
-----
GigabitEthernet 2/0/1  1  OK    GigabitEthernet 1/0/1  9000  9000
    0d,0h,20m
GigabitEthernet 2/0/2  2  OK    GigabitEthernet 1/0/2  9000  9000
    0d,0h,20m

```

A VSL interface can be in the UP, DOWN, or OK state.

| switch priority          | Configures the priority of a device in the VSU system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |           |             |                 |                                                        |                       |                                                        |                          |                           |  |  |  |  |  |    |  |  |  |  |  |       |       |           |    |        |          |       |       |           |    |           |          |       |       |           |    |         |          |
| switch virtual domain    | Modifies the domain ID of a device in standalone mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |           |             |                 |                                                        |                       |                                                        |                          |                           |  |  |  |  |  |    |  |  |  |  |  |       |       |           |    |        |          |       |       |           |    |           |          |       |       |           |    |         |          |
| show switch virtual link | Displays VSL information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |           |             |                 |                                                        |                       |                                                        |                          |                           |  |  |  |  |  |    |  |  |  |  |  |       |       |           |    |        |          |       |       |           |    |           |          |       |       |           |    |         |          |
| Platform Description     | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |           |             |                 |                                                        |                       |                                                        |                          |                           |  |  |  |  |  |    |  |  |  |  |  |       |       |           |    |        |          |       |       |           |    |           |          |       |       |           |    |         |          |

## 8.18 show switch virtual topology

Use this command to display the VSU topology connection status.

**show switch virtual topology**

|                     |                      |                    |
|---------------------|----------------------|--------------------|
| <b>Parameter</b>    | <b>Parameter</b>     | <b>Description</b> |
| <b>Description</b>  | N/A                  | N/A                |
| <b>Defaults</b>     | N/A                  |                    |
| <b>Command Mode</b> | Privileged EXEC mode |                    |
| <b>Usage Guide</b>  | N/A                  |                    |

**Configuration** The following example displays the topology status.

**Examples**

```
Ruijie# show switch virtual topology
Introduction: '[num]' means switch num, '(num/num)' means vsl-aggregateport
num.

Ring Topology:
[1] (1/2) --- (2/1) [2] (2/2) --- (1/1) [1]

Switch[1]: ACTIVE, MAC: 00d0.f822.33d6, Description: Switch1
Switch[2]: STANDBY, MAC: 1234.5678.9003, Description: Switch2
```

| Field         | Description         |

## 8.19 show mgmt\_mode

Use this command to display the MGMT interface creation mode in VSU mode.

**show mgmt\_mode**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Command  
Mode**

Privileged EXEC mode

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example displays the MGMT interface creation mode.

**Examples**

```
Ruijie#show mgmt_mode
Current mgmt_mode : unique
Reload mgmt_mode : unique
```

```
Load cfg mgmt_mode : unique
```

## Field description

| Field              | Description                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Current mgmt_mode  | Indicates the current MGMT interface creation mode.<br><b>unique:</b> Only one MGMT interface is created for the system.<br><b>normal:</b> One MGMT interface is created for each chassis.                                                                      |
| Reload mgmt_mode   | Indicates the MGMT interface creation mode used after restart.<br><b>unique:</b> Only one MGMT interface is created for the system.<br><b>normal:</b> One MGMT interface is created for each chassis.                                                           |
| Load cfg mgmt_mode | Indicates the MGMT interface creation mode configured in the configuration file at the startup of each management board.<br><b>unique:</b> Only one MGMT interface is created for the system.<br><b>normal:</b> One MGMT interface is created for each chassis. |

## 8.20 switch

Use this command to specify the ID of a device in the VSU system.

Use the **no** form of this command to restore the default setting.

**switch** *switch\_id*

**no switch**

| Parameter   | Parameter        | Description                      |
|-------------|------------------|----------------------------------|
| Description | <i>switch_id</i> | ID of a device in the VSU system |

**Defaults** The default is 1.

**Command Mode** config-vs-domain mode

**Usage Guide** The device ID identifies each virtual device member. In VSU mode, the interface name format changes to "switch/slot/port" from "slot/port", in which "switch" is the device ID.

If either chassis are active or if the role of the just started chassis is uncertain and both have the same priority, the chassis with a smaller ID is elected as the active one.

This command can be only used to modify the device ID in standalone mode. In VSU mode, run the **switch renumber** command to modify the device ID. The modified device ID takes effect only after you restart the device, regardless of in standalone mode or in VSU mode.

**Configuration Examples** The following example sets the ID of the device whose domain ID is 1 to 2 in the VSU system.

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# switch 2
```

|------------------|------------------------------|--------------------------------------------------------|
|                  | <b>switch virtual domain</b> | Modifies the domain ID of a device in standalone mode. |
|                  | <b>switch priority</b>       | Configures the priority of a device in the VSU system. |

|                            |                                                                    |
|----------------------------|--------------------------------------------------------------------|
| <b>show switch virtual</b> | Displays the domain ID as well as the ID and role of each chassis. |
|----------------------------|--------------------------------------------------------------------|

**Platform** N/A

**Description**

## 8.21 switch convert mode

Use this command to perform conversion between the standalone mode and the VSU mode.

**switch convert mode { virtual | standalone } [ switch\_id ]**

| Parameter          | Parameter         | Description     |
|--------------------|-------------------|-----------------|
| <b>Description</b> | <b>virtual</b>    | VSU mode        |
|                    | <b>standalone</b> | Standalone mode |
|                    | <i>switch_id</i>  | Device ID       |

**Defaults** The device is in standalone mode by default.

**Command Mode** Privileged EXEC mode

**Usage Guide** After you run the **switch convert mode virtual** command, the software automatically backs up the configuration file in standalone mode, saves it as a **standalone.text** file, and then deletes the **config.text** file. The software also prompts you whether to use the **virtual\_switch.text** file to overwrite the **config.text** file, write the VSU-related configurations to the **config\_vsu\_dat** file, and then restart the device.

After you run the **switch convert mode standalone** command, the active chassis automatically backs up the configuration file in VSU mode, saves it as a **virtual\_switch.text** file, and then deletes the **config.text** file. The active chassis also prompts you whether to use the **standalone.text** file to overwrite the **config.text** file and restart the device.

The **switch convert mode** command can be used in standalone mode or in VSU mode. In standalone mode, this command is used to switch the mode of the current chassis. In VSU mode, this command is used to switch the mode of the device specified by **switch\_id** if **switch\_id** is available and to switch the mode of the active device if **switch\_id** is not available.

You are advised to first switch the mode of the standby device and then the mode of the active mode.

**Configuration Examples** The following example sets the domain ID to **1**, device ID to **1**, as well as device priority to **200**, and converts the device mode from the standalone mode into the VSU mode.

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# switch 1
Ruijie(config-vs-domain)# switch 1 priority 200
Ruijie(config-vs-domain)# end
Ruijie# switch convert mode virtual
```

The following example switches the modes of the standby device (**switch\_id** set to **2**) and the active device (**switch\_id** set to **1**) from the VSU mode to the standalone mode.

```
Ruijie# switch convert mode standalone 2
Ruijie# switch convert mode standalone 1
```

| Command                      | Description                                                       |
|------------------------------|-------------------------------------------------------------------|
| <b>switch</b>                | Modify the device ID in standalone mode.                          |
| <b>switch virtual domain</b> | Modify the domain ID of a device in standalone mode.              |
| <b>switch priority</b>       | Configure the priority of a device in the VSU system.             |
| <b>show switch virtual</b>   | Display the domain ID as well as the ID and role of each chassis. |

#### Platform Description

N/A

## 8.22 switch crc

Use this command to configure parameters for frame error detection.

Use the **no** form of this command to restore the default setting.

**switch crc errors** *error\_num* **times** *time\_num*

**no switch crc**

#### Parameter Description

| Parameter        | Description                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>error_num</i> | Limits the number of error frames increasing from that in the last detection. If the increased number is greater than <i>error_num</i> , it is taken as an error. |
| <i>time_num</i>  | When the error count exceeds the <i>time_num</i> , the device will take actions (prompting a message or disabling the port).                                      |

#### Defaults

The default *error\_num* is 3.

The default *time\_num* is 10.

#### Command Mode

config-vs-domain mode

#### Usage Guide

N/A

#### Configuration Examples

The following example sets the *error\_time* and *time\_num* parameters to 10 and 5 respectively.

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)#
Ruijie(config-vs-domain)#switch crc errors 10 times 5
```

## 8.23 switch description

Use this command to configure the description for a VSU switch.

Use the **no** form of this command to remove the setting.

**switch** *switch\_id* **description** *dev-name*

**no switch** *switch\_id* **description**

| Parameter          | Parameter        | Description                                        |
|--------------------|------------------|----------------------------------------------------|
| <b>Description</b> | <i>switch_id</i> | Device ID                                          |
|                    | <i>dev_name</i>  | Device description, no greater than 12 characters. |

**Defaults**

N/A

**Command Mode**

config-vs-domain mode

**Usage Guide**

This command is configured on a device in whether standalone or VSU mode and takes effect immediately after configuration,

**Configuration** The following example configures the description for a VSU switch.

**Examples**

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# switch 1 description buildingA
Ruijie(config-vs-domain)# exit
```

|                      |                                            |
|----------------------|--------------------------------------------|
| <i>new_domain_id</i> | New domain ID, in the range from 1 to 255. |
|----------------------|--------------------------------------------|

**Defaults** The default *new\_domain\_id* is 100 by default.

**Command Mode** config-vs-domain mode

**Usage Guide** Use this command only in VSU mode. In addition, the setting can take effect only after the device is restarted.

**Configuration Examples** The following example sets the domain ID of device 1 to **10** in VSU mode.

```
Ruijie(config-vs-domain)# switch 1 domain 10
Changing the domain ID may cause VSU establishment failure after the next
startup. Are you sure to continue? [N/Y]y
```

The following example sets the domain ID of device 2 to the default value in VSU mode.

```
Ruijie(config-vs-domain)# no switch 2 domain
Changing the domain ID may cause VSU establishment failure after the next
startup. Are you sure to continue? [N/Y]y
```

| Related<br>Commands | Command                      | Description                                                        |
|---------------------|------------------------------|--------------------------------------------------------------------|
|                     | <b>switch virtual domain</b> | Modifies the domain ID in standalone mode.                         |
|                     | <b>show switch virtual</b>   | Displays the domain ID as well as the ID and role of each chassis. |

**Platform**  
**Description** N/A

## 8.25 switch priority

Use this command to configure the priority of a device in the VSU system.

Use the **no** form of this command to restore the default setting.

**switch** *switch\_id* **priority** *priority\_num*

**no switch** *switch\_id* **priority**

| Parameter<br>Description | Parameter           | Description                                                    |
|--------------------------|---------------------|----------------------------------------------------------------|
|                          | <i>switch_id</i>    | ID of a device in the VSU system.                              |
|                          | <i>priority_num</i> | Priority of a device in the VSU system, ranging from 1 to 255. |

**Defaults** The default *priority\_num* is 100.

**Command Mode** config-vs-domain mode.

**Usage Guide** A larger value means a higher priority. The chassis with a higher priority is elected as the active chassis.  
You can use this command in standalone mode or in VSU mode. The modified priority takes

effect only after you restart the device.

This command is not used to modify the value of **switch\_id**.

In VSU mode, **switch\_id** indicates the ID of the running device. If the ID does not exist, the configuration does not effect.

## Configuration

The following example sets the priority of device 1 to **200**.

## Examples

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# switch 1 priority 200
Ruijie(config-vs-domain)# exit
```

The following example sets the priority of device 1 to **200** and restores the priority of device 2 to the default value in VSU mode.

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# switch 1 priority 200
Changing the priority of the switch may cause the master switch and the slave
switch different from the current ones after the next startup. Are you sure
to continue? [N/Y]y
Ruijie(config-vs-domain)# no switch 2 priority
Changing the priority of the switch may cause the master switch and the slave
switch different from the current ones after the next startup. Are you sure
to continue? [N/Y]y
Ruijie(config-vs-domain)# exit
```

## 8.26 switch renumber

Use this command to modify the ID of any device in VSU mode.

Use the **no** form of this command to restore the default setting.

**switch** *switch\_id* **renumber** *new\_switch\_id* [**force**]

**no switch** *switch\_id*

## Parameter Description

| Parameter            | Description                                                                                                                                                                                                                                                                |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>switch_id</i>     | ID of the running device in VSU mode, which can be <b>1</b> (by default) or <b>2</b> .                                                                                                                                                                                     |
| <i>new_switch_id</i> | New device ID.                                                                                                                                                                                                                                                             |
| <b>force</b>         | Indicates whether the ID of a device needs to be forcibly modified.<br><br> After this parameter is configured, the VSU configuration is saved immediately and the device is restarted. |

**Defaults** N/A

**Command Mode** config-vs-domain mode

**Usage Guide** This command is configured in VSU mode. In addition and takes affect after device restart.

**Configuration Examples** The following example modifies the ID of device 1 that is running to **2** in VSU mode.

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# switch 1 renumber 2
```

The following example restores the ID of device 2 that is running to the default value in VSU mode.

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# no switch 2
```

The following example modifies the ID of currently running device 1 to 2 in VSU mode, and saves the configuration and restarts the device after the modification is completed.

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)# switch 1 renumber 2 force
```

## 8.28 switch virtual domain

Use this command to modify the domain ID of a device in standalone mode. Use the **no** form of this command to restore the default setting.

**switch virtual domain** *domain\_id*

**no switch virtual domain**

| Parameter<br>Description | Parameter        | Description                                       |
|--------------------------|------------------|---------------------------------------------------|
|                          | <i>domain_id</i> | Domain ID of the VSU, in the range from 1 to 255. |

**Defaults** The default is 100.

**Command Mode** Global configuration mode.

**Usage Guide** Only two devices with the same domain ID can form a virtual device. The domain ID must be unique within the local area network (LAN).

**Configuration** The following example sets the domain ID of the VSU to 1.

**Examples**

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)#
```

| Related<br>Commands | Command                    | Description                                                        |

|                     | <b>show switch virtual</b> | Displays the domain ID as well as the ID and role of each chassis. |
|                     | <b>switch domain</b>       | Modifies the domain ID in VSU mode.                                |

**Platform**  
**Description** N/A

## 8.29 switch virtual ecmp lff enable

Use this command to enable the locally-preferred forwarding function on the ECMP interface in

VSU mode and disable cross-chassis ECMP traffic balancing. Use the **no** form of this command to restore the default setting.

**switch virtual ecmp lff enable**

**no switch virtual ecmp lff enable**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** This function is enabled by default..

**Command Mode** config-vs-domain mode

**Usage Guide** N/A.

**Configuration Examples** The following example enables the locally-preferred forwarding function on the ECMP interface in VSU mode.

```
Ruijie(config)# switch virtual domain 1
Ruijie(config-vs-domain)#switch virtual ecmp lff enable
```

| Related Commands | Command                            | Description                             |

## 8.30 vsl-port

Use this command to enter VSL-PORT mode

**vsl-port**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** This command is configured on a device in whether standalone mode or VSU mode.

**Configuration Examples** The following example enters VSL-AP configuration mode on a device in standalone mode.

```
Ruijie(config)# vsl-port
Ruijie(config-vsl-port)#
```

The following example enters VSL-PORT configuration mode on a device in VSU mode.

```
Ruijie(config)# vsl-port  
Ruijie(config-vsl-port)#
```

## 8.31 recovery auto-restart enable

Use this command to enable the automatic restart function in recovery mode. Use the **no** form of this command to disable the function.

**recovery auto-restart enable****no recovery auto-restart enable****Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

The automatic restart and recovery function in recovery mode is enabled by default.

**Command Mode**

config-vs-domain configuration mode

**Usage Guide**

This command is configured on a device in whether standalone mode or VSU mode.

**Configuration  
Examples**

The following example disables the automatic restart and recovery function in recovery mode.

```
Ruijie(config)# switch virtual domain 1  
Ruijie(config-vs-domain)#  
Ruijie(config-vs-domain)#no recovery auto-restart enable
```

The following example enables the automatic restart and recovery function in recovery mode.

```
Ruijie(config)# switch virtual domain 1  
Ruijie(config-vs-domain)#  
Ruijie(config-vs-domain)#recovery auto-restart enable
```

## 9 RNS &Track Commands

### 9.1 delay

Use this command to specify a period of time after which the tracked object status will change if the interface status changes.

**delay** { **up** *seconds* [ **down** *seconds* ] | [ **up** *seconds* ] **down** *seconds* }

| Parameter<br>Description | Parameter      | Description                              |
|--------------------------|----------------|------------------------------------------|
|                          | <i>seconds</i> | Sets the delay time. The unit is second. |

**Defaults** There is no delay by default.

**Command Mode** Track configuration mode

**Usage Guide** The continual oscillation of the tracked object status may cause the client of this tracked object changing also. This command can be used to delay advertising the change of the tracked object status. For example, the status of a tracked object changes from up to down, if the delay down 180 is configured, the down status will be advertised after 180 seconds. If the tracked object status changes to the up again in this period, it won't be advertised. For the client of the tracked object, the status of the tracked object is always up.

**Configuration Examples** The following example sets the delay time to 30 seconds when the tracked object changes to up from down.

```
Ruijie(config)# track 5 rns 10
Ruijie(config-track)# delay up 30
Ruijie(config-track)# end
```

| Related<br>Commands | Command | Description |
|---------------------|---------|-------------|
|                     | N/A     | N/A         |

**Platform Description** N/A

### 9.2 dns

Use this command to set an IP RNS object to send the DNS packets and to enter the IP RNS DNS mode.

```
dns { oob destination-hostname name-server a.b.c.d }
```

**Parameter  
Description**

| Parameter                   | Description                                                          |
|-----------------------------|----------------------------------------------------------------------|
| <b>oob</b>                  | Enables management port detection.                                   |
| <i>destination-hostname</i> | Sets the destination IP address or the destination host domain name. |
| <i>a.b.c.d</i>              | Sets the IP address for the DNS server.                              |

**Defaults** N/A

**Command  
Mode** IP RNS configuration mode

**Usage Guide** Use this command to set an IP RNS object to send the DNS packets and to enter the IP RNS DNS mode. If you want to change the probe type, you should delete the probe first by using the **no ip rns** command and then perform new configuration.

**Configuration Examples** Ruijie(config-ip-rns)# dns www.ruijie.com.cn name-server 61.154.22.41

**Related  
Commands**

| Command | Description |
|---------|-------------|
| N/A     | N/A         |

**Platform  
Description** N/A

## 9.3 frequency

Use this command to set the interval of sending the packets, which must be no smaller than the timeout time. Use the **no** form of this command to restore the default setting.

**frequency** *milliseconds*

**no frequency**

**Parameter  
Description**

| Parameter           | Description                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------------------|
| <i>milliseconds</i> | Sets the interval of sending the packets, in the range from 10 to 604800000 in the unit of milliseconds. |

**Defaults** The default is 60 seconds.

**Command  
Mode** IP RNS ICMP echo configuration mode  
IP RNS DNS configuration mode

## IP RNS UDP echo configuration mode

**Usage Guide** Use this command to set the interval of sending the ICMP echo or DNS packets, which must be more than or equal to the timeout time configured. It is recommended not to set this value too small, which may put great pressure to the CPU.

**Configuration** The following example configures an ICMP echo probe whose destination address is 192.168.21.1.

**Examples** The frequency, timeout time and threshold are set to 30000, 8000 and 6000 milliseconds respectively.

```
Ruijie(config)# ip rns 1
Ruijie(config-ip-rns)#icmp-echo 192.168.21.1
Ruijie(config-ip-rns-icmp-echo)#frequency 30000
Ruijie(config-ip-rns-icmp-echo)#timeout 8000
Ruijie(config-ip-rns-icmp-echo)#threshold 6000
```

**Related  
Commands**

| Command        | Description                                      |
|----------------|--------------------------------------------------|
| <b>timeout</b> | Defines the timeout time of sending the packets. |

**Platform** N/A

**Description**

## 9.4 icmp-echo

Use this command to configure an ICMP echo RNS probe.

```
icmp-echo { oob { destination-ip-address | destination-hostname [ name-server ip-address ] }
[ source-ipaddr ip-address ] via type num next-hop ip-address } | { { destination-ip-address |
destination-hostname [ name-server ip-address ] } [ source-ipaddr ip-address ] [ out-interface type
num [ next-hop A.B.C.D ] ] }
```

**Parameter  
Description**

| Parameter                       | Description                                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>oob</b>                      | Enables management port detection.                                                                               |
| <i>destination-hostname</i>     | Sets the destination IP address for the ICMP echo packets.                                                       |
| <i>destination-hostname</i>     | Sets the destination host name within 127 characters. The exceeding characters are truncated automatically.      |
| <b>name-server ip-address</b>   | Sets the domain name server. The default domain name server is configured via the <b>ip name-server</b> command. |
| <b>source-ipaddr ip-address</b> | Sets the source IP address for the ICMP echo packets.                                                            |
| <b>source-interface</b>         | Sets the source interface for the ICMP echo packets.                                                             |
| <b>out-interface type num</b>   | Sets the outgoing port for the probe packet.                                                                     |
| <b>via type num</b>             | Specifies the management port as the egress interface                                                            |

|                                |                                          |
|--------------------------------|------------------------------------------|
|                                | (non-management port) for probe packets. |
| <b>next-hop</b> <i>A.B.C.D</i> | Sets the next hop IP address.            |

**Defaults** N/A

**Command Mode** IP RNS configuration mode

**Usage Guide** This command is used to enable the IP RNS object to send ICMP echo packets containing the specified destination IP address. The default payload size of an ICMP echo packet is 36 bytes. The **request-data-size** command is used to modify the packet size.

You can modify the probe parameter after specifying the type of the IP RNS probe (such as ICMP echo probe). If you want to change the probe type, you should delete the probe first by using the **no ip rns** command and then perform new configuration.

**Configuration Examples** The following example enables the IP RNS object to send the ICMP echo packets containing the destination IP address 10.1.1.1.

```
Ruijie(config)# ip rns 1
Ruijie(config-ip-rns)# icmp-echo 10.1.1.1
Ruijie(config-ip-rns-icmp-echo)# exit
Ruijie(config)# ip rns schedule 1 start-time now life forever
```

## 9.5 ip rns

Use this command to define an IP RNS operation object and to enter the ip-rns configuration mode.

Use the **no** form of this command to delete an IP RNS operation object.

**ip rns** *operation-number*

**no ip rns** *operation-number*

| Parameter Description | Parameter               | Description                                                          |
|-----------------------|-------------------------|----------------------------------------------------------------------|
|                       | <i>operation-number</i> | Sets the IP RNS operation object number, in the range from 1 to 500. |

**Defaults** N/A

**Command** Global configuration mode

**Mode**

**Usage Guide** Use this command to define an IP RNS operation object and to enter the IP DNS configuration mode.

**Configuration** The following example defines the IP RNS object 1.

**Examples** Ruijie(config)# ip rns 1

**Related Commands**

| <b>show ip rns statistics</b> | Displays the statistical data on the IP RNS object. |

**Platform** N/A

**Description**

## 9.6 ip rns reaction-configuration

Use this command to configure proactive threshold monitoring and trigger for the RNS probe. Use the no form of this command to restore the default setting.

```
ip rns reaction-configuration operation-number react monitored-element [ action-type option ]
[ threshold-type { average [ number-of-measurements ] | consecutive [ occurrences ] | immediate |
never | xofy [ x-value y-value ] } ] [ threshold-value upper-threshold lower-threshold ]
no ip rns reaction-configuration operation-number [ react monitored-element ]
```

**Parameter Description**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| operation-number          | Operation index, in the range from 1 to 500.                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>monitored-element</i>  | Monitored element. The available parameters are listed as follows: <ul style="list-style-type: none"> <li>● <b>allfail</b>: Failed to monitor all elements. The default action-type is <b>track</b>. This parameter is applied on the track module for communication.</li> <li>● <b>rtt</b>: Packet round trip time (RTT) exceeds the threshold range.</li> <li>● <b>•timeout</b>: Timeout in whatever direction.</li> </ul> |
| <b>action-type</b> option | The available parameters include: <ul style="list-style-type: none"> <li>● <b>none</b>: No action, which is the default setting</li> <li>● <b>trigger</b>: Only supports the <b>trigger</b> action.</li> <li>● <b>track</b>: Only supports the <b>track</b> action. Only when <i>monitored-element</i> is <b>allfail</b> is this parameter supported, which is available exclusively.</li> </ul>                             |
| <b>average</b>            | Triggers operation when the average value of                                                                                                                                                                                                                                                                                                                                                                                 |

|                                                              |                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [ number-of-measurements ]                                   | number-of-measurements consecutive times exceeds the threshold range. For example, number-of-measurements is set to three. Upper and lower thresholds are 5000 and 4000 respectively. The average value for three consecutive measurement 6000. 6000. 5000 is $(6000+6000+5000)/3=5667$ , exceeding the upper threshold 5000. The valid range is from 1 to 16 and the default is 5, |
| <b>consecutive</b> [ occurrences ]                           | Triggers operation when the value of monitored element exceeds the threshold range for <i>occurrences</i> consecutive times. The valid range is from 1 to 16. The default is 5.                                                                                                                                                                                                     |
| <b>immediate</b>                                             | Triggers operation immediately when the value of monitored element exceeds the threshold range.                                                                                                                                                                                                                                                                                     |
| <b>never</b>                                                 | Never triggers operation.                                                                                                                                                                                                                                                                                                                                                           |
| <b>xofy</b> [ x-value y-value ]                              | X probes among the latest Y ones exceed the threshold range. The valid X range is from 1 to 16 and the default is 5. The valid Y range is from 1 to 16 and the default is 5.                                                                                                                                                                                                        |
| <b>threshold-value</b><br>upper-threshold<br>lower-threshold | Configures upper and lower thresholds.<br>When <i>monitored-element</i> is <b>rtt</b> , this parameter indicates time, in the range from 0 to 60000 milliseconds. See <b>Usage Guide</b> for the default setting.<br>When react type is timeout, you don't need to configure this parameter.                                                                                        |

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** One RNS object can be configured with multiple threshold monitoring, each for one element. Monitored elements that are supported vary with different probe types.

| monitored-element | icmp-echo | dns | udp-echo |
|-------------------|-----------|-----|----------|
| timeout           | ✓         | ✓   | ✓        |
| rtt               | ✓         | ✓   | ✓        |

The default thresholds for monitored elements are listed as follows:

| Monitored Element | Upper Threshold | Lower Threshold |
|-------------------|-----------------|-----------------|
| timeout           | -               | -               |
| rtt               | 5000 ms         | 0 ms            |

**Configuration Examples** The following example configures RNS1 and its threshold monitoring.

```
Ruijie(config)# ip rns 1
Ruijie(config-ip-rns)# icmp-echo 192.168.23.1
Ruijie(config-ip-rns-icmp-echo)# exit
Ruijie(config)# ip rns schedule 1 start-time now life forever
Ruijie(config)# ip rns reaction-configuration 1 react timeout threshold-type
```

```
immediate action-type triggerOnly
```

**Description**

## 9.7 ip rns reaction-trigger

Use this command to enable the RNS probe which exceeds the monitoring threshold to trigger another RNS probe which is in the pending state. Use the **no** form of this command to restore the default setting.

**ip rns reaction-trigger** *operation-number target-operation*

**no ip rns reaction-trigger** *operation-number target-operation*

**Parameter  
Description**

| Parameter               | Description                                             |
|-------------------------|---------------------------------------------------------|
| <i>operation-number</i> | The source operation number, in the range from 1 to 500 |
| <i>target-operation</i> | The target operation number, in the range from 1 to 500 |

**Defaults** N/A

**Command  
Mode** Global configuration mode

**Usage Guide** The trigger function is applied in network fault diagnosis scenario

**Configuration** The following example enables IP RNS1 to trigger IP RNS 2.

**Examples**

```
Ruijie(config)# ip rns 1
Ruijie(config-ip-rns)# icmp-echo www.baidu.com
Ruijie(config-ip-rns-icmp-echo)# exit
Ruijie(config)# ip rns schedule 1 start-time now life forever
Ruijie(config)# ip rns reaction-configuration 1 react timeout threshold-type
immediate action-type trigger
Ruijie(config)# ip rns 2
Ruijie(config-ip-rns)# dns www.baidu.com name-server 8.8.8.8
Ruijie(config-ip-rns-dns)# exit
Ruijie(config)# ip rns reaction-trigger 1 2
```

## 9.8 ip rns reset

Use this command to clear all RNS configuration.

**ip rns reset**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** N/A

**Command** Global configuration mode  
**Mode**

**Usage Guide** This command is used to clear all RNS configuration. This command is used only in extreme cases (for example, RNS probe configuration is wrong).

**Configuration** The following example clears all IP RNS configuration.

**Examples** Ruijie(config)# ip rns reset

**Description**

## 9.9 ip rns restart

Use this command to restart the RNS probe.

**ip rns restart** *operation-number*

| Parameter<br>Description | Parameter               | Description                                                       |
|--------------------------|-------------------------|-------------------------------------------------------------------|
|                          | <i>operation-number</i> | Sets the RNS operation object number, in the range from 1 to 500. |

**Defaults** N/A

**Command** Global configuration mode  
**Mode**

**Usage Guide** This command is used to restart the RNS probe whose schedule is in the pending state. This command is invalid for the RNS probe not configured with the scheduling policy.

**Configuration** The following example restarts IP RNS 1.

**Examples** Ruijie(config)# ip rns restart 1

## 9.10 ip rns schedule

Use this command to configure the scheduling strategy for the RNS probe. Use the **no** form of this command to restore the default setting.

**ip rns schedule** operation-number [ **life** { **forever** | seconds } ] [ **start-time** { hh:mm [ :ss ] [ month day | day month ] | **pending** | **now** | **after** hh:mm:ss } ] [ **recurring** ]

**no ip rns schedule** operation-number

**Parameter  
Description**

| Parameter             | Description                                                                                                                 |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------|
| operation-number      | RNS operation index, in the range from 1 to 500                                                                             |
| <b>life forever</b>   | The RNS operation is valid forever.                                                                                         |
| <b>life</b> seconds   | The RNS survival time, measured in seconds                                                                                  |
| hh:mm [ :ss ]         | Defines the time when the operation starts,                                                                                 |
| month                 | The month when the operation starts, in the range from January (Jan.) to December (Dec.). The default is the current month. |
| <b>day</b>            | The day when the operation starts, in the range from 1 to 31. The default is the current day.                               |
| <b>pending</b>        | The start time is pending.                                                                                                  |
| <b>now</b>            | The operation starts right now.                                                                                             |
| <b>after</b> hh:mm:ss | The operation starts after hh hours, mm minutes and ss seconds.                                                             |
| <b>recurring</b>      | The operation starts automatically as scheduled every day.                                                                  |

**Defaults** The RNS probe is in the pending state by default. In other words, the probe is not performed unless it is triggered by another RNS probe.

**Command** Global configuration mode  
**Mode**

**Usage Guide** The **ip rns schedule** command is used to configure the IP RNS probe with scheduling policy. Once the scheduling policy is configured, the RNS probe cannot be modified. You can modify the RNS probe after deleting the schedule with the **no ip rns schedule** command, Life {seconds} refers to the survival time of the IP RNS probe. The probe will end after the survival time.

**Configuration** The following example configures the RNS probe with scheduling policy.

**Examples**

```
Ruijie(config)# ip rns 1
Ruijie(config-ip-rns)# icmp-echo 10.1.1.1
Ruijie(config-ip-rns-icmp-echo)# exit
Ruijie(config)# ip rns schedule 1 start-time now life forever
```

Once the scheduling policy is configured, the RNS probe cannot be modified. The RNS probe can be modified after the schedule is deleted.

```
Ruijie(config)# ip rns 1
Entry already running and cannot be modified
    (only can delete (no) and start over)
    (check to see if the probe has finished exiting)
Ruijie(config)# no ip rns schedule 1
Ruijie(config)# ip rns 1
Ruijie(config-ip-rns-icmp-echo)# exit
```

**Description**

## 9.11 object

Use this command to add a tracked object to the object track list. Use the **no** form of this command to restore the default setting.

**object** *object-number* [ **not** ]

**no object** *object-number*

**Parameter  
Description**

| Parameter            | Description                                       |
|----------------------|---------------------------------------------------|
| <i>object-number</i> | Tracked object number, in the range from 1 to 700 |

**Defaults** No tracked object is configured by default.

**Command** Track configuration mode

**Mode**

**Usage Guide** This command is used to add a tracked object to the object track list. The number of tracked objects is only restricted by the track list capacity.

object *object-number*: The tracked object must be in the up state for the track list to be in the up state.

object *object-number* not: track: The tracked object must be in the up state for the track list to be in the up state,

- This command is configured only in track configuration mode for the track list.
- The object cannot track itself.
- The objects cannot track each other. For example, if A tracks B, B cannot track A. Otherwise, both A and B are in oscillation.

**Configuration Examples** The following example adds tracked object 4 to the object track list. When object 1 is in the up state, 2 down, 3 up, object 4 is in the up state.

```
Ruijie(config)# track 4 list boolean and
Ruijie(config-track)# object 1
Ruijie(config-track)# object 2 not
Ruijie(config-track)# object 3
Ruijie(config-track)# end
```

## 9.12 request-data-size

Use the following example to set the protocol payload size of RNS probe packet. Use the **no** form of this command to restore the default setting.

**request-data-size** *bytes*

**no request-data-size**

**Parameter Description**

| Parameter    | Description                                                                                  |
|--------------|----------------------------------------------------------------------------------------------|
| <i>bytes</i> | The number of payload bytes. The minimum/maximum number of bytes varies with the probe type. |

**Defaults** The default is the minimum payload byte, which varies with the probe type.

**Command** IP RNS ICMP echo configuration mode

**Mode** IP RNS UDP echo configuration mode

**Usage Guide** This command is used to fill bytes in the probe packet to probe for the bigger packet.

| Probe Type | Range        | Default |
|------------|--------------|---------|
| icmp-echo  | [ 36, 1472 ] | 36      |
| Udp-echo   | [36, 1472]   | 36      |

**Configuration** The following example sets the protocol payload size of the IP RNS probe packet to 50.

**Examples**

```
Ruijie(config)# ip rns 1
Ruijie(config-ip-rns)# icmp-echo 10.1.1.1
Ruijie(config-ip-rns-icmp-echo)# request-data-size 50
Ruijie(config-ip-rns-icmp-echo)# exit
```

**Description**

## 9.13 show ip rns configuration

Use this command to display the RNS instance configuration.

**show ip rns configuration** [ *operation-number* ]

**Parameter  
Description**

| Parameter               | Description                                               |
|-------------------------|-----------------------------------------------------------|
| <i>operation-number</i> | Sets the RNS instance number, in the range from 1 to 500. |

**Command** Privileged EXEC mode

**Mode**

**Usage Guide** This command is used to display the RNS instance configuration. The configuration varies with different packet types.

**Configuration** The following example displays the RNS 1 configuration.

**Examples**

```
Ruijie# show ip rns configuration 1
Entry number: 1
Tag: ruijie555
Type of operation to perform: icmp-echo
Operation timeout (milliseconds): 5000
```

```

Operation frequency (milliseconds): 10000
Threshold (milliseconds): 5000
Recurring (Starting Everyday): FALSE
Life (seconds): 3500
Next Scheduled Start Time:Start Time already passed
Target address/Source address: 2.2.2.3/0.0.0.0
Request size (ARR data portion): 36

```

Description

## 9.15 show ip rns operational-state

Use this command to display operational state.

**show ip rns operational-state** [ *operation-number* ]

| Parameter<br>Description | Parameter               | Description                                                                                                    |
|--------------------------|-------------------------|----------------------------------------------------------------------------------------------------------------|
|                          | <i>operation-number</i> | Sets the RNS operation object number, in the range from 1 to 500.<br>The default is all RNS operation objects. |

Defaults N/A

Command Privileged EXEC mode  
Mode

Usage Guide This command is used to display the state information about an RNS probe.

Configuration The following example displays the state information about all RNS probes.

### Examples

```
Ruijie# show ip rns operational-state
Entry number: 1
Modification time: *2014-01-10 10:26:14
Current seconds left in Life: Forever
Operational state of entry: Active
Number of Octets Used by this Entry: 2272
Number of operations attempted: 232
Number of operations skipped: 0
Connection loss occurred: FALSE
Timeout occurred: FALSE
Over thresholds occurred: FALSE
Latest RTT (milliseconds): 4
Latest operation start time: 2014-01-10 10:26:55
Latest operation return code: OK
```

| Field             | Description                                                                          |
|-------------------|--------------------------------------------------------------------------------------|
| Entry number      | RNS operation index                                                                  |
| Modification time | Probe result recounting time (every time schedule is enabled, the result is counted) |

|                                     |                                                      |
|-------------------------------------|------------------------------------------------------|
|                                     | again).                                              |
| Number of Octets Used by this Entry | Number of octets contained in the probe packet.      |
| Number of operations attempted      | Number of attempted operation.                       |
| Number of operations skipped        | Number of failed operation.                          |
| Current seconds left in Life        | Probes for the left life.                            |
| Operational state of entry          | Probes for the operational state (Active/Disactive). |
| Connection loss occurred            | Connection loss occurred.                            |
| Timeout occurred                    | Send request timeout occurred,                       |
| Over thresholds occurred            | Threshold violation occurred.                        |
| Latest RTT (milliseconds)           | Latest RTT.                                          |
| Latest operation start time         | Latest operation start time.                         |
| Latest operation return code        | Latest operation return code.                        |

## 9.17 show ip rns reaction-trigger

Use this command to display the reaction trigger information for all RNS objects.

**show ip rns reaction-trigger** [ *operation-number* ]

| Parameter<br>Description | Parameter               | Description                                                                                                     |
|--------------------------|-------------------------|-----------------------------------------------------------------------------------------------------------------|
|                          | <i>operation-number</i> | The number of IP RNS operation object, in the range from 1 to 500.<br>The default is all RNS operation objects. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command is used to display the reaction trigger information for all RNS objects.

**Configuration** The following example displays the reaction trigger information for all RNS objects.

**Examples**

```
Ruijie#show ip rns reaction-trigger
Entry number: 1
Target rns index: 2
Status of Entry (SNMP RowStatus): active
Operational State: pending
```

| Field                            | Description            |
|----------------------------------|------------------------|
| Entry number                     | RNS index              |
| Target rns index                 | Target RNS index       |
| Status of Entry (SNMP RowStatus) | Status of RNS entry    |
| Operational State                | Reaction-trigger state |

## 9.18 show ip rns statistics

Use this command to display the RNS object statistics.

**show ip rns statistics** [ *operation-number* ]

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

|                    |                         |                                                                     |
|--------------------|-------------------------|---------------------------------------------------------------------|
| <b>Description</b> |                         |                                                                     |
|                    | <i>operation-number</i> | Sets the IP RNS operation object number, in the range from 1 to 500 |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** The statistics vary with different packet types.

**Configuration** The following example displays the RNS object statistics.

**Examples**

```
Ruijie#show ip rns statistics 1
Round trip time(RTT) Index 1
Operation time to live: Forever
Latest RTT: 1 ms
Latest operation start time: 2014-01-20 10:21:38
Latest operation return code: OK
Number of successes: 386
Number of failures: 12
```

## 9.19 show track

Use this command to display statistics of the tracked object.

**show track** [ *track-number* ]

| <b>Parameter Description</b> | Parameter           | Description                                                 |
|------------------------------|---------------------|-------------------------------------------------------------|
|                              | <i>track-number</i> | Sets the tracked object number, in the range from 1 to 700. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays statistics of all tracked objects.

**Examples**

```
Ruijie#show track
Track 1
  Reliable Network Service 5
  The state is Up
    1 change, current state last: 120 secs
  Delay up 30 secs, down 50 secs
Track 3
  Interface FastEthernet 1/0
  The state is Down, delayed Up (5 secs remaining)
    3 change, current state last: 300 secs
  Delay up 60 secs, down 60 secs
Track 4
  List boolean and
  Object 1
  Object 2 not
  The state is Up
    1 change, current state last: 100 secs
  Delay up 0 secs, down 0 secs
```

| Field                                        | Description                                                         |
|----------------------------------------------|---------------------------------------------------------------------|
| Track x                                      | Tracked object ID                                                   |
| Reliable Network Service x                   | Tracked RNS object                                                  |
| The state is x                               | Tracked object state                                                |
| x change                                     | Tracked object change count                                         |
| current state last: x secs                   | The time for which the current state lasts                          |
| Delay up x secs, down x secs                 | The delay state of the tracked object                               |
| Interface x x                                | Tracked interface                                                   |
| The state is x, delayed y (c secs remaining) | The tracked object state is x, and will turn to y in c seconds.     |
| List boolean and                             | The Boolean expression enables calculation by using "and" operator. |
| Object x                                     | Object x is in the up state.                                        |
| Object x not                                 | Object x is in the down state.                                      |

## 9.20 show track client

Use this command to display the track client statistics.

**show track client**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command is used to display the statistics of the client connecting to track.

**Configuration** The following example displays the statistics of the client connecting to track.

**Examples**

```
Ruijie# show track client
Track client 2: socket 4
client_path: /tmp/vsd/0/track/.client_nsm
Connection time: Fri Dec 28 17:04:43 2012
```

| Field                                     | Description                                |
|-------------------------------------------|--------------------------------------------|
| Track client x: socket x                  | Track client number and socket             |
| client_path: /tmp/vsd/0/track/.client_nsm | The path from the client to track          |
| Connection time: xx xx xx xx:xx:xx xx     | The time when the client connects to track |

|                         | <i>text</i>                                                                                                                                                              | Sets the tag for IP RNS probe, which is composed of up to 79 printable characters. |
| <b>Defaults</b>         | N/A                                                                                                                                                                      |                                                                                    |
| <b>Command</b>          | IP RNS DNS configuration mode                                                                                                                                            |                                                                                    |
| <b>Mode</b>             | IP RNS ICMP echo configuration mode                                                                                                                                      |                                                                                    |
|                         | IP RNS UDP echo configuration mode                                                                                                                                       |                                                                                    |
| <b>Usage Guide</b>      | Tag is used to identify the probe. When the tag exceeds 79 characters, the surplus characters are truncated.                                                             |                                                                                    |
| <b>Configuration</b>    | The following example sets the tag for IP RNS probe to telecom gateway.                                                                                                  |                                                                                    |
| <b>Examples</b>         | <pre>Ruijie(config)# ip rns 1 Ruijie(config-ip-rns)# icmp-echo 10.1.1.1 Ruijie(config-ip-rns-icmp-echo)# tag telecom_gateway Ruijie(config-ip-rns-icmp-echo)# exit</pre> |                                                                                    |
| <b>Related Commands</b> | <b>Command</b>                                                                                                                                                           | <b>Description</b>                                                                 |
|                         | N/A                                                                                                                                                                      | N/A                                                                                |
| <b>Platform</b>         | N/A                                                                                                                                                                      |                                                                                    |
| <b>Description</b>      |                                                                                                                                                                          |                                                                                    |

## 9.22 threshold

Use this command to configure the upper threshold value for RNS probe. Use the **no** form of this command to restore the default setting.

**threshold** *milliseconds*

**no threshold**

|                              |                                     |                                                                                           |
|------------------------------|-------------------------------------|-------------------------------------------------------------------------------------------|
| <b>Parameter Description</b> | <b>Parameter</b>                    | <b>Description</b>                                                                        |
|                              | <i>milliseconds</i>                 | Sets the upper threshold value, in the range from 0 to 60000 in the unit of milliseconds. |
| <b>Defaults</b>              | The default is 5000 milliseconds.   |                                                                                           |
| <b>Command</b>               | IP RNS DNS configuration mode       |                                                                                           |
| <b>Mode</b>                  | IP RNS ICMP echo configuration mode |                                                                                           |
|                              | IP RNS P echo configuration mode    |                                                                                           |

**Usage Guide** The threshold value must be no greater than the timeout value. See **Usage Guide** of the **frequency** command for the relationship among timeout, frequency and threshold.

**Configuration** The following example sets the upper threshold value for RNS probe to 8000 milliseconds.

**Examples**

```
Ruijie(config)# ip rns 1
Ruijie(config-ip-rns)# icmp-echo 10.1.1.1
Ruijie(config-ip-rns-icmp-echo)# threshold 8000
Ruijie(config-ip-rns-icmp-echo)# exit
```

| N/A     | N/A         |

**Platform** N/A

**Description**

## 9.23 timeout

Use this command to set the timeout time of an RNS probe.

Use the **no** form of this command to restore the default setting.

**timeout** *milliseconds*

**no timeout**

**Parameter  
Description**

| Parameter           | Description                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>milliseconds</i> | Sets the timeout time, in the range from 10 to 604800000 in the unit of milliseconds. The default is 5000 milliseconds. |

**Defaults** The default timeout of an IP RNS probe varies with the detection type, which can be displayed by using **show ip rns configuration** command.

**Command** IP RNS ICMP echo configuration mode

**Mode** IP RNS DNS configuration mode

IP RNS configuration mode

**Usage Guide** The timeout value must be no smaller than the threshold value. See **Usage Guide** of the **frequency** command for the relationship among timeout, frequency and threshold.

**Configuration** The following example sets the timeout time of an IP RNS probe to 10000 milliseconds.

**Examples**

```
Ruijie(config)# ip rns 1
Ruijie(config-ip-rns)# icmp-echo 10.1.1.1
Ruijie(config-ip-rns-icmp-echo)# timeout 10000
```

```
Ruijie(config-ip-rns-icmp-echo)# exit
```

**Related  
Commands**

| Command                              | Description                               |
|--------------------------------------|-------------------------------------------|
| <b>frequency</b> <i>milliseconds</i> | Sets the interval of sending the packets. |

**Platform**

N/A

**Description**

## 9.24 tos

Use this command to set the Type of Service (ToS) field in the IPv4 header of an RNS probe packet.

Use the **no** form of this command to restore the default setting.

**tos** *number*

**no tos**

**Parameter  
Description**

| Parameter     | Description                                                                                  |
|---------------|----------------------------------------------------------------------------------------------|
| <i>number</i> | Sets the ToS field in the IPv4 header of an IP RNS probe packet, in the range from 0 to 255. |

**Defaults**

The default is 0.

**Command**

IP RNS DNS configuration mode

**Mode**

IP RNS ICMP echo configuration mode

**Usage Guide**

ToS is an 8-bit field of an IPv4 packet. ToS can be used to set probe packet priority. Different ToS corresponds to different priority.

**Configuration**

The following example sets the ToS field in the IPv4 header of an RNS probe packet to 128.

**Examples**

```
Ruijie(config)# ip rns 1
Ruijie(config-ip-rns)# icmp-echo 10.1.1.1
Ruijie(config-ip-rns-icmp-echo)# tos 128
Ruijie(config-ip-rns-icmp-echo)# exit
```

**Description**

## 9.25 track interface line-protocol

Use this command to configure a tracked object to track the interface status and enter the track mode. The **no** form of this command is used to delete a tracked object.

**track** *object-number* **interface** *type number* **line-protocol**

**no track** *object-number*

### Parameter Description

| Parameter            | Description                                            |
|----------------------|--------------------------------------------------------|
| <i>object-number</i> | Sets the tracked object number, in the range of 1-700. |
| <i>type number</i>   | Sets the interface type and the interface number.      |

**Defaults** N/A

**Command  
Mode** Global configuration mode

**Usage Guide** This command is used to configure a tracked object to track the link state of the interface. If the link state of the interface is up, the state of the corresponding tracked object is up too.

**Configuration** The following example configures the object "track 3" to track the link state of ethernet 0/1.

**Examples** Ruijie(config)# track 3 interface ethernet 0/1 line-protocol

### Related Commands

| Command           | Description                                                                 |
|-------------------|-----------------------------------------------------------------------------|
| <b>track rns</b>  | Configures a tracked object to track the operating status of an rns object. |
| <b>show track</b> | Displays the tracked object related information.                            |

**Platform  
Description** N/A

## 9.26 track list

Use this command to configure a tracked list object and specify the state of the tracked list based on a Boolean calculation. Use the **no** form of this command to restore the default setting.

**track** *object-number* **list** **boolean** { **and** | **or** }

**no track** *object-number*

### Parameter Description

| Parameter            | Description                                                        |
|----------------------|--------------------------------------------------------------------|
| <i>object-number</i> | Sets the number of the tracked object, in the range from 1 to 700. |

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** This command is used to configure a tracked list object and specify the state of the tracked list based on a Boolean calculation

- **track *object-number* list boolean and**: Configure a tracked list with a Boolean expression using “AND” operator.
- **track *object-number* list boolean or**: Configure a tracked list with a Boolean expression using “OR” operator.

**Configuration Examples** The following example configures tracked list object “4” and specifies the state of the tracked list based on a Boolean calculation using operator “AND”.

```
Ruijie(config)# track 4 list boolean and
```

**Related Commands**

| Command | Description |
|---------|-------------|

**Platform Description** N/A

## 9.27 track rns

Use this command to configure a tracked object to track the operating status of an RNS object and enter the track mode. The **no** form of this command is used to delete a tracked object.

**track *object-number* rns *entry-number***

**no track *object-number***

**Parameter Description**

| Parameter            | Description                                                 |
|----------------------|-------------------------------------------------------------|
| <i>object-number</i> | Sets the tracked object number, in the range from 1 to 700. |
| <i>entry-number</i>  | Sets the RNS object number, in the range from 1 to 500.     |

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** The RNS object status is determined by whether the response packets are received. If so, the RNS

object status is up and the status of the corresponding tracked object that tracks this RNS is also up.

**Configuration** The following example configures the object “track 5” to track the RNS instance “rns 7”.

**Examples** Ruijie(config)# track 123 rns 1

| Related<br>Commands | Command                                   | Description                                                  |
|---------------------|-------------------------------------------|--------------------------------------------------------------|
|                     | <b>track interface line-protocol</b>      | Tracks the status of one interface and enter the track mode. |
|                     | <b>show track</b> [ <i>track-number</i> ] | Displays the tracked object related information.             |

**Platform** N/A

**Description**

## 9.28 vrf

Use this command to set the VRF where the RNS probe resides.

Use the **no** form of this command to restore the default setting.

**vrf** *vrf-name*

**no vrf**

| Parameter<br>Description | Parameter       | Description        |
|--------------------------|-----------------|--------------------|
|                          | <i>vrf-name</i> | Sets the VRF name. |

**Defaults** N/A

**Command** IP RNS ICMP echo configuration mode

**Mode** IP RNS DNS configuration mode

**Usage Guide** N/A

**Configuration** The following example sets the VRF where the RNS probe resides to VPN1.

**Examples**

```
Ruijie(config)# ip rns 1
Ruijie(config-ip-rns)# icmp-echo 192.168.23.1
Ruijie(config-ip-rns-icmp-echo)# vrf VPN1
Ruijie(config-ip-rns-icmp-echo)# exit
Ruijie(config)# ip rns schedule 1 start-time now life forever
```

## 10 PCAP Commands

### 10.1 packet capture file

Use this command to specify the name of the file to be saved.

**packet capture file** *filename* [**buffer-size** *buf-size*] [**packet-num** *pkt-num*] [**timeout** *timeout*]

Use this command to clear configurations for file saving and restore the configurations for outputting logs.

**clear packet capture file**

| Parameter Description | Parameter       | Description                                                                                                                                                                                                                                                                |
|-----------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>filename</i> | Name of the file to be saved                                                                                                                                                                                                                                               |
|                       | <i>buf-size</i> | Buffer size. The buffer size is 2 MB by default if this field is not specified. Packet capture automatically stops when the buffer is full.                                                                                                                                |
|                       | <i>pkt-num</i>  | Number of captured packets. Packet capture automatically stops when the number of captured packets reaches the specified value. The packet capture will continue by default unless otherwise specified.                                                                    |
|                       | <i>timeout</i>  | Indicates packet capture timeout. Packet capture automatically stops when the time of captured packets reaches the specified number. The default packet capture time is 10 minutes unless otherwise specified. The longest continually packet capture time is 120 minutes. |

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration Example** The following example sets the name of the file to be saved to **capture.pcap**, and sets the number of captured packets to 100.

```
Ruijie# packet capture file flash:capture.pcap packet-num 100
```

**Verification** Run the **show packet capture status** command to check whether the configuration succeeds.

### 10.2 packet capture point

Use this command to create capture points.

**packet capture point** *capture-point-name* **rule** *rule-name* **location** {**interface** *interface-name* |

**control-plane** {in | out | both}

Use this command to clear capture points.

**clear packet capture point** *capture-point-name*

**Parameter  
Description**

| Parameter                 | Description                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------|
| <i>capture-point-name</i> | Name of a capture point                                                                 |
| <i>rule-name</i>          | Name of matching rule, which is defined by using the <b>packet capture rule</b> command |
| <i>interface-name</i>     | Name of the interface for capturing packets                                             |
| <b>control-plane</b>      | Packet capture on the control plane                                                     |
| <b>in   out   both</b>    | Packet capture direction: inbound, outbound, or bidirectional.                          |

**Defaults** N/A

**Command  
Mode** Privileged EXEC mode

**Usage Guide** Users can define multiple capture points (a maximum of 8 capture points are supported currently) at the same location as required, to match different capture rules or packet directions. The capture points can work simultaneously without affecting each other.

Please do not create a capture point on the forwarding plane.

**Configuration** The following example creates a capture point for capturing CPU packets on the Gi0/1 interface.

**Example** Ruijie# packet capture point cap-1 rule tcp location interface gi0/1 both

**Verification** Run the **show packet capture status** command to check whether the configuration succeeds.

## 10.3 packet capture rule

### 10.3.1 Control Plane

Use this command to define a capture matching rule.

**packet capture rule** *rule-name* **filter** [**src-mac** *smac*] [**dst-mac** *dmac*] [**etype** *type* | **ip** | **arp** ]  
**[ipv4\_sip** *sip sip-mask*] [**ipv4\_dip** *dip dip-mask*] [**ipv6\_sip** *sipv6 sipv6-prefix*] [**ipv6\_dip** *dipv6 dipv6-prefix*]  
**[v6\_protocol** *protocol* | **tcp** | **udp**] [**ipv6\_sport** *sport* ] [**ipv6\_dport** *dport*] [**v4\_protocol** *protocol* | **tcp** |  
**udp**] [**ipv4\_sport** *sport* ] [**ipv4\_dport** *dport*]

Use this command to clear a capture matching rule.

**clear packet capture rule** *rule-name*

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|                                           |                          |
|-------------------------------------------|--------------------------|
| <i>rule-name</i>                          | Name of a matching rule  |
| <i>smac</i>                               | Source MAC address       |
| <i>dmac</i>                               | Destination MAC address  |
| <i>type</i>   <b>ip</b>   <b>arp</b>      | Layer-2 protocol type    |
| <i>sip</i>                                | Source IP address        |
| <i>sip-mask</i>                           | Source IP mask           |
| <i>dip</i>                                | Destination IP address   |
| <i>dip-mask</i>                           | Destination IP mask      |
| <i>sip6</i>                               | Source IPv6 address      |
| <i>sip6-prefix</i>                        | Source IPv6 prefix       |
| <i>dip6</i>                               | Destination IPv6 address |
| <i>dip6-prefix</i>                        | Destination IPv6 prefix  |
| <i>protocol</i>   <b>tcp</b>   <b>udp</b> | Layer-3 protocol type    |
| <i>sport</i>                              | TCP/UDP source port      |
| <i>dport</i>                              | TCP/UDP destination port |

**Command** Privileged EXEC mode  
**Mode**

**Usage Guide**

1. Users can define multiple rules for packet capture and differentiate them by different names. After a rule is defined, the rule needs to be referenced by the capture point to actually take effect.
2. Before deleting the capture rule, all capture points referencing the rule need to be deleted.

**Configuration** The following example defines a TCP capture matching rule.

**Example** Ruijie# packet capture rule tcp etype ip protocol tcp

**Verification** Run the **show packet capture status** command to check whether the configuration succeeds.

### 10.3.2 Forwarding Plane

Use this command to define a capture matching rule.

**packet capture rule** *rule-name* **filter acl** *aclid* | *aclname* [ **interface** *interface-name* ]

Use this command to clear a capture matching rule.

**clear packet capture rule** *rule-name*

**Parameter**  
**Description**

| Parameter                     | Description              |
|-------------------------------|--------------------------|
| <i>rule-name</i>              | Name of a matching rule. |
| <i>aclid</i>   <i>aclname</i> | ACL ID or name.          |
| <i>interface-name</i>         | Name of an interface.    |

**Command** Privileged EXEC mode  
**Mode**

**Usage Guide** Users can define multiple rules for packet capture and differentiate them by different names.

**Configuration** The following example defines a capture matching rule.

**Example**

```
Ruijie#packet capture rule rule1 filter acl 100 interface tenGigabitEthernet 0/1
```

**Verification** Run the **show packet capture status** command to check whether the configuration succeeds.

## 10.4 packet capture start

Use this command to start capturing packets.

**packet capture start**

Use this command to stop capturing packets.

**packet capture stop**

**Parameter  
Description**

| Parameter    | Description               |
|--------------|---------------------------|
| <b>start</b> | Starts capturing packets. |
| <b>stop</b>  | Stops capturing packets.  |

**Command  
Mode** Privileged EXEC mode

**Usage Guide**

1. If the **packet capture stop** command is not entered after packet capture starts, the packet capture will automatically stop at the capture point when the number of captured packets reaches the specified number. If the packet capture stop condition is not met, run the **packet capture stop** command to immediately stop the packet capture.
2. Use the packet capture start command to capture packets at all capture points simultaneously.

**Configuration** The following example starts capturing packet.

**Example**

```
Ruijie# packet capture start
```

**Verification** Run the **show packet capture status** command to check whether the configuration succeeds.

## 10.5 show packet capture status

Use this command to display the packet capture information.

**show packet capture status**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

N/A

N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** Use this command to display the packet capture information.

**Configuration Example** N/A

The following example displays the packet capture information as follows:

```
Ruijie#show packet capture status
```

```
Capture rules:
```

```
  Capture rules tcp:
```

```
    etype: 0x0800
    source MAC: 2222.2222.2222
    destination MAC: 1111.1111.1111
    protocol: 0x6
    source IP: 10.10.10.3
    destination IP: 10.10.10.10
    source port: 5
    destination port: 10
```

```
Capture points:
```

```
  Capture point controlplane:
```

```
    Capture rules: tcp
    location: control-plane
    direction: all
    status: stopped
    packets captured(in): 200
    packets captured(out): 200
```

```
Capture file:
```

```
  filename: /tmp/test.pcap
  buffer size: 2(MB)
  packets limit: 500
```

```
Ruijie#
```

Field description:

| Field           | Description             |
|-----------------|-------------------------|
| Capture rule    | Name of a capture rule  |
| etype           | Layer-2 protocol type   |
| source MAC      | Source MAC address      |
| destination MAC | Destination MAC address |

|                  |                                    |
|------------------|------------------------------------|
| protocol         | Layer-3 protocol type              |
| source IP        | Source IP address                  |
| destination IP   | Destination IP address             |
| source port      | Source port                        |
| destination port | Destination port                   |
| Capture point    | Name of a capture point            |
| location         | Location of a capture point        |
| direction        | Packet capture direction           |
| buffer size      | Buffer size                        |
| packets limit    | Quantity limit of captured packets |
| filename         | Name of an output file             |
| status           | Packet capture status              |
| packets captured | Number of captured packets         |

N/A

## 11 HAM Commands

### 11.1 ham single-process-ha auto-restart enable

Use this command to enable the HA service of a process that restarts frequently. Use the **no** form of this command to disable the HA service of a process that restarts frequently. Use the **default** form of this command to restore the default configuration for the HA service of a process that restarts frequently.

**ham single-process-ha auto-restart enable**

**no ham single-process-ha auto-restart enable**

**default ham single-process-ha auto-restart enable**

| Parameter   | Parameter | Description                                                                                |
|-------------|-----------|--------------------------------------------------------------------------------------------|
| Description | default   | Indicates that the HA service of a process that restarts frequently is enabled by default. |

**Defaults** The HA service of a process that restarts frequently is enabled by default.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** This command is used to enable the HA service of a process that restarts frequently. Before patches are used for an upgrade, you can disable the HA service of a single process that restarts frequently. After the patch-based upgrade is completed, confirm that no process restarts frequently and then enable the HA service of the process that restarts frequently.

 Disabling this HA service can lead to a longer failure time when a process frequently restarts. Therefore, you are not recommended to disable the configuration in scenarios other than patch-based upgrades.

**Configuration Examples** The following example disables the HA service of a process that restarts frequently.

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# no ham single-process-ha auto-restart enable
Ruijie(config)#
```

The following example enables the HA service of a process that restarts frequently.

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# ham single-process-ha auto-restart enable
Ruijie(config)#
```

**Verification**

Run the **show running-config | include ham** command to check whether the HA service of a process that restarts frequently is enabled or disabled.

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# no ham single-process-ha auto-restart enable
Ruijie(config)# show running-config | include ham
no ham single-process-ha auto-restart enable
Ruijie(config)# ham single-process-ha auto-restart enable
Ruijie(config)# show running-config | include ham
Ruijie(config)#
```

## 12 VAP Commands

### 12.1 clear vap data-sync

Use this command to clear data records of the data synchronization channel.

**clear vap data-sync**

|                      |                                                                                 |                    |
|----------------------|---------------------------------------------------------------------------------|--------------------|
| <b>Parameter</b>     | <b>Parameter</b>                                                                | <b>Description</b> |
| <b>Description</b>   | N/A                                                                             | N/A                |
| <b>Defaults</b>      | N/A                                                                             |                    |
| <b>Command Mode</b>  | Privileged EXEC mode                                                            |                    |
| <b>Default Level</b> | 14                                                                              |                    |
| <b>Usage Guide</b>   | This command is used to clear data records of the data synchronization channel. |                    |
| <b>Configuration</b> | The following example clears data records of the data synchronization channel.  |                    |
| <b>Examples</b>      | <pre>Ruijie# clear vap data-sync</pre>                                          |                    |

### 12.2 clear vap keepalive

Use this command to clear data records of the heartbeat channel.

**clear vap keepalive**

|                      |                                                                      |                    |
|----------------------|----------------------------------------------------------------------|--------------------|
| <b>Parameter</b>     | <b>Parameter</b>                                                     | <b>Description</b> |
| <b>Description</b>   | N/A                                                                  | N/A                |
| <b>Defaults</b>      | N/A                                                                  |                    |
| <b>Command Mode</b>  | Privileged EXEC mode                                                 |                    |
| <b>Default Level</b> | 14                                                                   |                    |
| <b>Usage Guide</b>   | This command is used to clear data records of the heartbeat channel. |                    |

**Configuration** The following example clears data records of the heartbeat channel.

**Examples** Ruijie# clear vap keepalive

## 12.3 clear vap mac

Use this command to clear MAC operation records.

**clear vap mac record**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** This command is used to clear MAC operation records.

**Configuration** The following example clears MAC operation records.

**Examples** Ruijie# clear vap mac record

## 12.4 clear vap xmac

Use this command to clear VXLAN MAC operation records.

**clear vap xmac record**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** This command is used to clear VXLAN MAC operation records.

**Configuration** The following example clears VXLAN MAC operation records.

**Examples** Ruijie# clear vap xmac record

## 12.5 data-sync

Use this command to configure a data synchronization channel. Use the **no** form of this command to delete the data synchronization channel.

**data-sync local** {ip-address | ipv6-address} **peer** {ip-address | ipv6-address}

**no data-sync**

| Parameter<br>Description | Parameter           | Description                                                           |
|--------------------------|---------------------|-----------------------------------------------------------------------|
|                          | <b>Local</b>        | Configures the local IP address for the data synchronization channel. |
|                          | <b>peer</b>         | Configures the peer IP address for the data synchronization channel.  |
|                          | <i>ip-address</i>   | Indicates an IPv4 address.                                            |
|                          | <i>ipv6-address</i> | Indicates an IPv6 address.                                            |

**Defaults** No data synchronization channel is configured by default.

**Command Mode** VAP domain configuration mode

**Default Level** 14

**Usage Guide** Data is synchronized between VAP devices through a layer-3 IP network and this configuration is required on each VAP device.  
Either IPv4 or IPv6 addresses can be configured.

**Configuration Examples** The following example configures a data synchronization channel with the local IP address of 192.168.1.1 and peer IP address of 192.168.1.2.

```
Ruijie(config)# vap domain 1
Ruijie(config-vap)# data-sync local 192.168.1.1 peer 192.168.1.2
```

The following examples configures a data synchronization channel with the local IP address of 2001::1/64 and peer IP address of 2001::2/64.

```
Ruijie(config)# vap domain 1
Ruijie(config-vap)# data-sync local 2001::1/64 peer 2001::2/64
```

**Verification** Run the **show running-config** command to display the configuration.

|                       |                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Prompt Message</b> | <p>1. If an IPv4 address has been configured in this command, no IPv6 address can be configured.</p> <pre>Can not configure IPv6 due to IPv4 already exist.</pre> <p>2. If an IPv6 address has been configured in this command, no IPv4 address can be configured.</p> <pre>Can not configure IPv4 due to IPv6 already exist.</pre> |
| <b>Common Errors</b>  | Either IPv4 addresses or IPv6 addresses can be configured.                                                                                                                                                                                                                                                                          |

## 12.6 domain-match delay

Use this command to configure the domain matching delay. Use the **no** form of this command to restore the domain matching delay.

**domain-match delay** *interval*

**no domain-match delay**

| Parameter   | Parameter       | Description                                                         |
|-------------|-----------------|---------------------------------------------------------------------|
| Description | <i>interval</i> | Indicates the delay, in seconds. The value ranges from 10 to 1,000. |

**Defaults** The default delay is 360s.

**Command Mode** VAP domain configuration mode

**Default Level** 14

**Usage Guide** Interfaces added to a VAP need to use the same MAC address and priority during LACP negotiation. Therefore, the two devices need to use negotiation packets of the VAP for negotiation. If the devices work in standalone mode and APs on the devices are added to a VAP, the devices cannot start negotiation. In this case, the VAP instructs LACP to start negotiation after a delay of 360 seconds by default, and the local MAC address and priority are used for LACP negotiation. For standalone devices, they start LACP negotiation immediately after APs are removed from the VAP.

**Configuration Examples** The following example sets the delay to 100s.

```
Ruijie(config)# vap domain 1
Ruijie(config-vap)# domain-match delay 100
```

**Verification** Run the **show running-config** command to display the configuration.

## 12.7 dual-active auto recovery

Use this command to configure the dual-active automatic recovery mode. Use the **no** form of this command to cancel the dual-active automatic recovery mode.

**dual-active auto recovery**

**no dual-active auto recovery**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** The dual-active automatic recovery mode is not configured by default.

**Command Mode** VAP configuration mode

**Default Level** 14

**Usage Guide** When the dual-active mode is detected, interfaces on the slave device are shut down. If dual-active automatic recovery is enabled, after the master device malfunctions, service ports on the slave device are restored.

When the MGMT port is configured to detect the dual-active mode, dual-active automatic recovery is enabled automatically. When a service port is configured to detect the dual-active mode, dual-active automatic recovery is disabled by default. You can determine whether to enable this function based on the deployment scenario:

- 1) When the dual-active detection port is a port that directly connects two devices, configure the directly connected port as an exceptional port for dual-active detection (by running the `vap dad-down except` command), and then enable dual-active automatic recovery.
- 2) If the dual-active detection port is not a directly connected port of two devices (for example, uplink port), dual-active automatic recovery cannot be enabled. Otherwise, repeated flapping will occur during dual-active detection.

**Configuration** The following example enables the dual-active automatic recovery mode.

**Examples**

```
Ruijie(config)# vap domain 1
Ruijie(config-vap)# dual-active auto recovery
```

**Verification** Run the **show running-config** command to display the configuration.

## 12.8 fast-convergence

Use this command to configure VAP fast convergence. Use the **no** form of this command to cancel VAP fast convergence.

**fast-convergence**

**no fast-convergence**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** Fast convergence is enabled by default.

**Command Mode** VAP configuration mode

**Default Level** 14

**Usage Guide** After fast convergence is configured, the VAP fault convergence time is minimized. However, there may be considerable packets instantaneously.

**Configuration** The following example disables fast convergence.

**Examples**

```
Ruijie(config)# vap domain 1
Ruijie(config-vap)# no fast-convergence
```

**Verification** Run the **show running-config** command to display the configuration.

## 12.9 peer-keepalive

Use this command to configure a VAP heartbeat link. Use the **no** form of this command to delete the heartbeat configuration.

**peer-keepalive local** { *ip-address* | *ipv6-address* } **peer** { *ip-address* | *ipv6-address* }  
[ *interface-type interface-number* ]

**no peer-keepalive**

| Parameter   | Parameter         | Description                                            |
|-------------|-------------------|--------------------------------------------------------|
| Description | <b>local</b>      | Configures the local IP address of the heartbeat link. |
|             | <b>peer</b>       | Configures the peer IP address of the heartbeat link.  |
|             | <i>ip-address</i> | Indicates an IPv4 address.                             |

|                         |                                                                   |
|-------------------------|-------------------------------------------------------------------|
| <i>ipv6-address</i>     | Indicates an IPv6 address.                                        |
| <i>interface-type</i>   | Indicates the interface type. Only MGMT interfaces are supported. |
| <i>interface-number</i> | Indicates an interface number. All MGMT interfaces are supported. |

**Defaults** No heartbeat link is configured by default.

**Command Mode** VAP domain configuration mode

**Default Level** 14

**Usage Guide** When the peer-link fails but the heartbeat link is normal, interfaces other than the MGMT interface, heartbeat interface, peer-link interface, and stacked interface on the slave device are triggered to enter the error down state. The interfaces return to the normal state after the peer-link is restored.

Either IPv4 or IPv6 addresses can be configured.

**Configuration Examples** The following example configures a heartbeat link with the local IP address of 192.168.1.1 and peer IP address of 192.168.1.2.

```
Ruijie(config)# vap domain 1
Ruijie(config-vap)# peer-keepalive local 192.168.1.1 peer
192.168.1.2
```

The following example configures a heartbeat link with the local IP address of 2001::1/64 and peer IP address of 2001::2/64.

```
Ruijie(config)# vap domain 1
Ruijie(config-vap)# peer-keepalive local 2001::1/64 peer
2001::2/64
```

**Verification** Run the **show running-config** command to display the configuration.

**Prompt Message** 1. If an IPv4 address has been configured for dual-active detection, no IPv6 address can be configured for it.

```
Can not configure IPv6 due to IPv4 already exist.
```

2. If an IPv6 address has been configured for dual-active detection, no IPv4 address can be configured for it.

```
Can not configure IPv4 due to IPv6 already exist.
```

**Common Errors** Either IPv4 addresses or IPv6 addresses can be configured.

## 12.10 peer-keepalive hold-time

Use this command to configure the heartbeat holding time. Use the **no** form of this command to restore the default heartbeat holding time.

**peer-keepalive hold-time** *interval*

**no peer-keepalive hold-time**

| Parameter   | Parameter       | Description                                                                      |
|-------------|-----------------|----------------------------------------------------------------------------------|
| Description | <i>Interval</i> | Indicates the heartbeat holding time, in seconds. The value ranges from 3 to 60. |

**Defaults** The default value is 3 seconds.

**Command Mode** VAP domain configuration mode

**Default Level** 14

**Usage Guide** After the peer-link fails, the heartbeat link is retained for a period of time by default. After the time expires, if the heartbeat link is still normal, service interfaces on the slave device will enter error down state.

**Configuration** The following example sets the heartbeat holding time to 30 seconds.

**Examples**

```
Ruijie(config)# vap domain 1
Ruijie(config-vap)# peer-keepalive hold-time 30
```

**Verification** Run the **show running-config** command to display the configuration.

## 12.11 peer-link

Use this command to configure an AP as the peer-link. Use the **no** form of this command cancel the peer-link configuration of an AP.

**peer-link**

**no peer-link**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** An AP is not the peer-link by default.

|                               |                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command Mode</b>           | Interface configuration mode                                                                                                                                                                                                                                                                                                               |
| <b>Default Level</b>          | 14                                                                                                                                                                                                                                                                                                                                         |
| <b>Usage Guide</b>            | When the remote member interface of a VAP works properly, traffic from the peer-link is not forwarded through the local member interface, in an effort to prevent loops. When the remote member interface of the VAP fails, traffic is switched to the peer-link and the traffic needs to be forwarded through the local member interface. |
| <b>Configuration Examples</b> | <p>The following example configures AP 10 as the peer-link.</p> <pre>Ruijie(config)# interface Aggregateport 10 Ruijie(config-if- if-Aggregateport 10)# peer-link</pre>                                                                                                                                                                    |
| <b>Verification</b>           | Run the <b>show running-config</b> command to display the configuration.                                                                                                                                                                                                                                                                   |
| <b>Prompt</b>                 | An AP added to a VAP cannot be configured as the peer-link.                                                                                                                                                                                                                                                                                |
| <b>Message</b>                | % Can not set peer link due to this interface already join group                                                                                                                                                                                                                                                                           |
| <b>Common Errors</b>          | Non-APs cannot be configured as the peer-link.                                                                                                                                                                                                                                                                                             |

## 12.12 priority

Use this command to configure the priority. Use the **no** form of this command to restore the default priority.

**priority** *priority*

**no priority**

| Parameter Description | Parameter       | Description                                           |
|-----------------------|-----------------|-------------------------------------------------------|
|                       | <i>priority</i> | Indicates the priority. The value ranges from 0 to 7. |

**Defaults** The default priority is 4.

**Command Mode** VAP domain configuration mode

**Default Level** 14

**Usage Guide** VAP devices negotiate to determine their master/slave state after establishing communication. The master/slave negotiation rules are as follows:

- 1) The device with a higher priority is elected as the master device.
- 2) If the devices share the same priority, the device with a smaller MAC address is elected as the master device.

**Configuration** The following example sets the priority to 7.

**Examples**

```
Ruijie(config)# vap domain 1
Ruijie(config-vap)# priority 7
```

**Verification** Run the **show running-config** command to display the configuration.

## 12.13 vap error-down except

Use this command to configure an error down exceptional port. Use the **no** form of this command to delete an error down exceptional port.

**vap error-down except**

**no vap error-down except**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** No error down exceptional port is configured by default.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide** After the VAP detects the dual-active mode, it brings physical ports on the slave device to the error down state. To prevent an interface from entering error down state, you can run this command to configure it as an exceptional port.

Within the interface recovery delay, physical ports are still in error down state.

**Configuration Examples** The following example configures interface Ten 0/1 as an error down exceptional interface.

```
Ruijie(config)# interface TenGigabitEthernet 0/1
Ruijie(config-if-TenGigabitEthernet 0/1)# vap error-down except
```

**Verification** Run the **show running-config** command to display the configuration.

**Prompt** An AP that has been added to a VAP cannot be configured as an error down exceptional interface.

**Message**

```
% Can not set dad-down except due to this interface already join group.
```

## 12.14 vap domain

Use this command to configure a domain ID. Use the **no** form of this command to delete the configured domain ID.

**vap domain** *domain-id*

**no vap domain**

| Parameter<br>Description | Parameter        | Description                                            |
|--------------------------|------------------|--------------------------------------------------------|
|                          | <i>domain-id</i> | Indicates a domain ID. The value ranges from 1 to 255. |

**Defaults** No domain ID is configured by default.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** Only one domain ID can be configured on one device. VAP negotiation succeeds only when domain IDs on two devices are the same.

**Configuration Examples** The following example sets the domain ID of the device to 1.

```
Ruijie(config)# vap domain 1
Ruijie(config-vap)#
```

**Verification** Run the **show running-config** command to display the configuration.

**Prompt** A domain ID has been configured.

**Message** % Can not create a new domain due to only one domain supported.

**Common Errors** The domain IDs of two VAP devices do not match.

## 12.15 vap

Use this command to add an AP to a VAP. Use the **no** form this command to delete an AP from a VAP.

**vap** *vap-id*

**no vap**

| Parameter   | Parameter     | Description                                                   |
|-------------|---------------|---------------------------------------------------------------|
| Description | <i>vap-id</i> | Indicates the ID of a VAP. The value ranges from 1 to 65,535. |

**Defaults** An AP is not added to a VAP by default.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide** APs on the two VAP devices providing dual-homing access must be added to the same VAP. One AP can be added to only one VAP.

**Configuration** The following example adds AP 1 to VAP 1.

**Examples**

```
Ruijie(config)# interface Aggregateport 1
Ruijie(config-if -Aggregateport 1)# vap 1
```

**Verification** Run the **show vap** command to display the VAP, to which an AP belongs.

**Prompt** An AP configured as the peer-link cannot be added to a VAP.

**Message** % Can not join group due to already peer link set.

## 12.16 recover up-delay

Use this command to configure the interface recovery delay. Use the **no** form of this command to restore the interface recovery delay to the default value.

**recover up-delay** *interval* [**none-vap** *none-vap-interval*]

**no recover up-delay**

| Parameter   | Parameter       | Description                                                                                                       |
|-------------|-----------------|-------------------------------------------------------------------------------------------------------------------|
| Description | <i>Interval</i> | Indicates the delay for a VAP interface to recover to the up state, in seconds. The value ranges from 0 to 3,600. |

|                          |                                                                                                                       |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>none-vap-interval</i> | Indicates the delay for a non-VAP interface to recover to the up state, in seconds. The value ranges from 0 to 3,600. |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------|

**Defaults** The default recovery delay of VAP interfaces is 120s.

There is no delay in the recovery of non-VAP interfaces by default.

**Command Mode** VAP domain configuration mode

**Default Level** 14

**Usage Guide** When dual master devices are restored and devices are restored via restart, VAP interfaces are restored with a delay of 120s while non-VAP interfaces are restored without delay.

**Configuration Examples** The following example sets the recovery delay to 30 seconds for VAP interfaces and to 10 seconds for non-VAP interfaces.

```
Ruijie(config)# vap domain 1
Ruijie(config-vap)# recover up-delay 30 none-vap 10
```

**Verification** Run the **show running-config** command to display the configuration.

## 12.17 show vap

Use this command to display information about a VAP.

**show vap** [*id*]

| Parameter Description | Parameter | Description                                                   |
|-----------------------|-----------|---------------------------------------------------------------|
|                       | <i>id</i> | Indicates the ID of a VAP. The value ranges from 1 to 65,535. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** This command is used to display information about a VAP, including the local member interface and remote member interface.

**Configuration** The following example displays information about all VAPs.

**Examples**

```
Ruijie# show vap
Vap domain: 1, Dev id: 1
Vap groups: 2

Vap 1
Local Aggregateport 1:
  GigabitEthernet 0/1 is up
  GigabitEthernet 0/2 is up
Remote Aggregateport 1:
  GigabitEthernet 0/1 is up
  GigabitEthernet 0/2 is up

Vap 2
Local Aggregateport 2:
  GigabitEthernet 0/3 is up
Remote Aggregateport 2:
  GigabitEthernet 0/3 is up
```

Field description:

| Field                     | Description                         |
|---------------------------|-------------------------------------|
| Vap domain                | Domain ID                           |
| Dev id                    | Device ID                           |
| Vap groups                | Number of VAPs                      |
| Vap                       | VAP                                 |
| Local Aggregateport       | Local AP of the VAP                 |
| Remote Aggregateport      | Remote AP of the VAP                |
| GigabitEthernet 0/1 is up | Member port of an AP and its status |

## 12.18 show vap data-sync

Use this command to display information about a data synchronization channel.

**show vap data-sync**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** N/A

|                               |                                                                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Command Mode</b>           | Privileged EXEC mode                                                                                                    |
| <b>Default Level</b>          | 14                                                                                                                      |
| <b>Usage Guide</b>            | This command is used to display information about packets transmitted and received by the data synchronization channel. |
| <b>Configuration Examples</b> | The following example displays information about packets transmitted and received by the data synchronization channel.  |

```
Ruijie# show vap data-sync
Data-sync peer 192.168.1.101, role master
Message MAC send 5
Message HELLO send 100
Message MAC recv 4
Message HELLO recv 100
```

Field description:

| Field                        | Description                                         |
|------------------------------|-----------------------------------------------------|
| Data-sync peer 192.168.1.101 | Peer IP address of the data synchronization channel |
| role master                  | The peer is the master device.                      |
| Message MAC send 5           | Number of sent MAC packets                          |
| Message HELLO send 100       | Number of sent Hello packets                        |
| Message MAC recv 4           | Number of received MAC packets                      |
| Message HELLO recv 100       | Number of received Hello packets                    |

## 12.19 show vap error-down

Use this command to display the error down interface list and exceptional interface list.

**show vap error-down [ except ]**

| <b>Parameter Description</b> | <table><tr><th>Parameter</th><th>Description</th></tr><tr><td><b>except</b></td><td>Displays a list of error down exceptional interfaces.</td></tr></table> | Parameter | Description | <b>except</b> | Displays a list of error down exceptional interfaces. |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|-------------|---------------|-------------------------------------------------------|
| Parameter                    | Description                                                                                                                                                 |           |             |               |                                                       |
| <b>except</b>                | Displays a list of error down exceptional interfaces.                                                                                                       |           |             |               |                                                       |
| <b>Defaults</b>              | N/A                                                                                                                                                         |           |             |               |                                                       |
| <b>Command Mode</b>          | Privileged EXEC mode                                                                                                                                        |           |             |               |                                                       |

**Default Level** 14

**Usage Guide** When the VAP detects the dual-active mode and the startup of a device, it brings interfaces on the device to the error down state. After the dual-active mode is cleared, the VAP delays the recovery of these interfaces. An interface configured as an exceptional interface will not be brought to the error down state and can recover normally. This command can be used to display a list of interfaces in the error down state and a list of exceptional interfaces.

**Configuration** The following example displays a list of interfaces in the error down state.

**Examples**

```
Ruijie# show vap error-down
Error-down interfaces:
  TenGigabitEthernet 0/2
  FortyGigabitEthernet 0/52
```

Field description:

| Field                     | Description                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------|
| Error-down interfaces:    | List of error down interfaces. The list is not displayed if no interface is in the error down state. |
| TenGigabitEthernet 0/2    | The 10G interface 0/2 is in the error down state.                                                    |
| FortyGigabitEthernet 0/52 | The 40G interface 0/52 is in the error down state.                                                   |

The following example displays a list of error down exceptional interfaces.

```
Ruijie# show vap error-down except
Except interfaces:
  TenGigabitEthernet 0/2
  FortyGigabitEthernet 0/52
```

Field description:

| Field                     | Description                                                                                                           |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Except interfaces:        | List of error down exceptional interfaces. The list is not displayed if there is no error down exceptional interface. |
| TenGigabitEthernet 0/2    | The 10G interface 0/2 is an exceptional interface.                                                                    |
| FortyGigabitEthernet 0/52 | The 40G interface 0/52 is an exceptional interface.                                                                   |

## 12.20 show vap keepalive

Use this command to display information about the heartbeat channel.

**show vap keepalive**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** This command is used to display information about packets sent and received by the heartbeat channel.

**Configuration Examples** The following example displays information about packets sent and received by the heartbeat channel.

```
Ruijie# show vap keepalive
Keepalive peer 192.168.2.101
Message HELLO send 421
Message HELLO rcv 417
```

Field description:

| Field                        | Description                              |
|------------------------------|------------------------------------------|
| Keepalive peer 192.168.2.101 | Peer IP address of the heartbeat channel |
| Message HELLO send 421       | Number of sent Hello packets             |
| Message HELLO rcv 417        | Number of received Hello packets         |

## 12.21 show vap mac

Use this command to display MAC entry information.

**show vap mac [count | local | remote | vlan *vlan-id* [mac-address *address*] | record [vlan *vlan-id* [mac-address *address*]]]**

| Parameter   | Parameter | Description                               |
|-------------|-----------|-------------------------------------------|
| Description | count     | Displays the MAC entry statistical value. |

|                    |                                                               |
|--------------------|---------------------------------------------------------------|
| <b>local</b>       | Displays the local MAC entry.                                 |
| <b>remote</b>      | Displays the remotely synchronized MAC entry.                 |
| <b>record</b>      | Displays MAC operation records.                               |
| <b>vlan</b>        | Displays the MAC entry information about a specified VLAN ID. |
| <i>vlan-id</i>     | VLAN ID                                                       |
| <b>mac-address</b> | Displays the MAC entry information about a specified address. |
| <i>address</i>     | Indicates the MAC address.                                    |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** This command is used to display MAC entry information.

**Configuration** The following example displays MAC entry information.

**Examples**

```
Ruijie# show vap mac
Vlan      MAC Address      Location      Address Type      Sequence
Group      Interface
1          00d0.f822.3441    Local         Dynamic           0              2
AggregatePort 2
1          00d0.f822.3432    Remote         Dynamic           1              2
AggregatePort 2
```

Field description:

| Field        | Description                                                                                                                                                                   |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vlan         | VLAN ID                                                                                                                                                                       |
| MAC Address  | MAC address                                                                                                                                                                   |
| Location     | Source device of a learned MAC entry<br>Local: Indicates that the MAC entry is learned locally.<br>Remote: Indicates that the MAC entry is synchronized from the peer device. |
| Address Type | Type of the MAC address<br>Dynamic: Indicates a dynamic MAC address.<br>Local: Indicates a local MAC address.                                                                 |
| Sequence     | Serial number                                                                                                                                                                 |
| Group        | VAP                                                                                                                                                                           |
| Interface    | Egress of the MAC entry                                                                                                                                                       |

The following example displays MAC address statistics.

```
Ruijie# show vap mac count
Total Address Count: 12
  Local Address Count: 6
  Remote Address Count: 6
```

Field description:

| Field                | Description                    |
|----------------------|--------------------------------|
| Total Address Count  | Total number of MAC addresses  |
| Local Address Count  | Number of local MAC addresses  |
| Remote Address Count | Number of remote MAC addresses |

## 12.22 show vap peer-link

Use this command to display information about the peer-link.

**show vap peer-link**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

|                               |                                                                  |
|-------------------------------|------------------------------------------------------------------|
| <b>Command Mode</b>           | Privileged EXEC mode                                             |
| <b>Default Level</b>          | 14                                                               |
| <b>Usage Guide</b>            | This command is used to display information about the peer-link. |
| <b>Configuration Examples</b> | The following example displays information about the peer-link.  |

```
Ruijie# show vap peer-link
Peer-link AggregatePort 1 is UP
TenGigabitEthernet 0/1 is UP
```

Field description:

| Field                     | Description                                      |
|---------------------------|--------------------------------------------------|
| AggregatePort 1 is UP     | Status of a peer-link AP                         |
| GigabitEthernet 0/1 is up | Member interface of the peer-link and its status |

## 12.23 show vap xmac

Use this command to display VXLAN MAC entry information.

**show vap xmac** [**count** | **local** | **remote** | **vxlan** *vxlan-id* [**mac-address** *address*] | **record** [**vxlan** *vxlan-id* [**mac-address** *address*]]]

| <b>Parameter Description</b> | Parameter          | Description                                                         |
|------------------------------|--------------------|---------------------------------------------------------------------|
|                              | <b>Count</b>       | Displays the VXLAN MAC entry statistical value.                     |
|                              | <b>local</b>       | Displays the local VXLAN MAC entry.                                 |
|                              | <b>remote</b>      | Displays the remotely synchronized VXLAN MAC entry.                 |
|                              | <b>record</b>      | Displays VXLAN MAC operation records.                               |
|                              | <b>vxlan</b>       | Displays the MAC entry information about a specified VXLAN ID.      |
|                              | <i>vxlan-id</i>    | Indicates a VXLAN ID.                                               |
|                              | <b>mac-address</b> | Displays the VXLAN MAC entry information about a specified address. |
|                              | <i>address</i>     | Indicates the MAC address.                                          |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** This command is used to display VXLAN MAC entry information.

**Configuration Examples** The following example displays VXLAN MAC entry information.

```
Ruijie# show vap xmac
Vxlan   MAC Address      Location      Address Type  Sequence
Group   Interface
1       00d0.f822.3441    Local        Dynamic       0           2
AggregatePort 2
1       00d0.f822.3432    Remote       Dynamic       1           2
AggregatePort 2
```

Field description:

| Field        | Description                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vxlan        | VXLAN ID                                                                                                                                                                    |
| MAC Address  | MAC address                                                                                                                                                                 |
| Location     | Source device of a learned MAC entry<br>Local: Indicates that the MAC entry is a local entry.<br>Remote: Indicates that the MAC entry is synchronized from the peer device. |
| Address Type | Type of the MAC address<br>Dynamic: Indicates a dynamic MAC address.<br>Local: Indicates a local MAC address.                                                               |
| Sequence     | Serial number                                                                                                                                                               |
| Group        | VAP                                                                                                                                                                         |
| Interface    | Egress of the MAC entry                                                                                                                                                     |

The following example displays VXLAN MAC address statistics.

```
Ruijie# show vap xmac count
Total Address Count: 12
  Local Address Count: 6
  Remote Address Count: 6
```

Field description:

| Field                | Description                          |
|----------------------|--------------------------------------|
| Total Address Count  | Total number of VXLAN MAC addresses  |
| Local Address Count  | Number of local VXLAN MAC addresses  |
| Remote Address Count | Number of remote VXLAN MAC addresses |

## 13 SEM Commands

### 13.1 action cli

Use this command to configure a policy action in SEM configuration mode to execute device commands. Use the **no** form of this command to delete the action of a specified label.

**action** *label* **cli** **command** *cli-string* [ **pattern** *pattern-string* ]

**no action** *label*

| Parameter Description | Parameter                            | Description                                     |
|-----------------------|--------------------------------------|-------------------------------------------------|
|                       | <i>label</i>                         | Label of an action                              |
|                       | <b>command</b> <i>cli-string</i>     | Content of command to be executed               |
|                       | <b>pattern</b> <i>pattern-string</i> | Interactive response in the command interaction |

**Defaults** No action is configured by default.

**Command Mode** SEM configuration mode

**Default Level** 15

**Usage Guide** Policy execution commands are executed in user mode. Therefore, the first executed command is usually the **enable** command to enable the system to enter the privileged EXEC mode. The **enable** command executed in **action cli** is authenticated without user password.

The value of *pattern-string* is a plurality of responses separated by spaces. When there is a space in a response, double quotation marks (") are used to combine the responses.

Command output arising from the execution of CLI actions in a policy can be recorded into the device file system. You can run the **policy record** command to enable the recording function and set the size of a record file. You can also run the **smart manager policy record clean** command to clear generated command output records. For details, see the **policy record** command.

**Configuration Examples** The following example clears the ARP table and IP routing table at the Unix time of 1257831095.

```
Ruijie(config)#smart manager applet clear_cache
Ruijie(config-applet)#event tag monitor_timer timer absolute time 1257831095
Ruijie(config-applet)#action 00 cli command "enable"
Ruijie(config-applet)#action 10 cli command "clear arp-cache"
Ruijie(config-applet)#action 20 cli command "clear ip route *"
Ruijie(config-applet)#commit
Ruijie(config-applet)#exit
```

**Verification** Run the **show smart manager policy all** command to display relevant configuration.

## 13.2 action counter

Use this command to configure a policy action in SEM configuration mode to control the SEM naming counter. Use the **no** form of this command to delete the action of a specified label.

**action** *label* **counter name** *counter-name* **value** *counter-value* **op** { **dec** | **inc** | **nop** | **set** }

**no action** *label*

### Parameter Description

| Parameter                                                       | Description                          |
|-----------------------------------------------------------------|--------------------------------------|
| <i>label</i>                                                    | Label of an action                   |
| <b>name</b> <i>counter-name</i>                                 | Name of a SEM counter to be operated |
| <b>value</b> <i>counter-value</i>                               | Counter-operating value              |
| <b>op</b> { <b>dec</b>   <b>inc</b>   <b>nop</b>   <b>set</b> } | Counter-operating method             |

### Defaults

No action is configured by default.

### Command Mode

SEM configuration mode

### Default Level

15

### Usage Guide

The counter specified in **name** *counter-name* can be directly used without definition.

### Configuration Examples

The following example adds 1 to counter count\_a every 7,200s.

```
Ruijie(config)#smart manager applet Test_1
Ruijie(config-applet)#event tag monitor_timer timer watchdog time 7200
Ruijie(config-applet)#action 00 counter name count_a op inc value 1
Ruijie(config-applet)#commit
Ruijie(config-applet)#exit
```

### Verification

Run the **show smart manager policy all** command to display relevant configuration.

## 13.3 action syslog

Use this command to configure a policy action in SEM configuration mode to record logs. Use the **no** form of this command to delete the action of a specified label.

**action** *label* **syslog** [ **priority** *priority-level* ] **msg** *msg-text* [ **facility** *string* ]

**no action** *label*

### Parameter Description

| Parameter                             | Description        |
|---------------------------------------|--------------------|
| <i>label</i>                          | Label of an action |
| <b>priority</b> <i>priority-level</i> | Log level          |

|                               |                     |
|-------------------------------|---------------------|
| <b>msg</b> <i>msg-text</i>    | Log content         |
| <b>facility</b> <i>string</i> | Log mnemonic symbol |

**Defaults** No action is configured by default.

**Command Mode** SEM configuration mode

**Default Level** 15

**Usage Guide** N/A

**Configuration** The following example logs the event when the link of port TenGigabitEthernet10/14 is disconnected.

**Examples**

```
Ruijie(config)#smart manager applet Test_2
Ruijie(config-applet)#event tag monitor_link interface name
TenGigabitEthernet10/14 parameter down
Ruijie(config-applet)#action 00 syslog msg "link down!"
Ruijie(config-applet)#commit
Ruijie(config-applet)#exit
```

**Verification** Run the **show smart manager policy all** command to display relevant configuration.

**Common Errors** The log mnemonic symbol is a string of 4–32 characters composed of uppercase letters and underlines (\_). If the configured mnemonic symbol is out of the preceding range, configuring the **Action syslog** command fails.

## 13.4 commit

Use this command to submit the configuration of the current policy in SEM configuration mode.

**commit**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** No policy configuration is submitted by default.

**Command Mode** SEM configuration mode

**Default Level** 15

**Usage Guide** N/A

**Configuration** The following example submits policy configuration.

**Examples**

```
Ruijie(config)#smart manager applet Test_1
Ruijie(config-applet)#event tag monitor_timer timer watchdog time 7200
Ruijie(config-applet) #action 00 syslog msg "timer arrival"
Ruijie(config-applet)#commit
Ruijie(config-applet)#exit
```

**Verification** Run the **show smart manager policy all** command to display relevant configuration.

## 13.5 debug smart manager action

Use this command to debug action items of SEM. Use the **no** form of this command to disable the debugging function.

**debug smart manager action { cli | syslog | counter }**  
**no debug smart manager action { cli | syslog | counter }**

| Parameter<br>Description | Parameter                         | Description                                             |
|--------------------------|-----------------------------------|---------------------------------------------------------|
|                          | { cli   <b>syslog</b>   counter } | Debugs the CLI, syslog, or counter action items of SEM. |

**Defaults** The debugging function is disabled by default.

**Command Mode** Privileged EXEC mode

**Default Level** 15

## 13.6 debug smart manager all

Use this command to debug SEM. Use the **no** form of this command to disable the debugging function of SEM.

**debug smart manager all**  
**no debug smart manager all**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** The debugging function is disabled by default.

**Command Mode** Privileged EXEC mode

**Default Level** 15

**Usage Guide** N/A

**Configuration** N/A  
**Examples**

## 13.7 debug smart manager detector

Use this command to debug detection items of SEM. Use the **no** form of this command to disable the debugging function.

**debug smart manager detector { intf | timer | counter }**

**no debug smart manager detector { intf | timer | counter }**

| Parameter<br>Description | Parameter                  | Description                                          |
|--------------------------|----------------------------|------------------------------------------------------|
|                          | { intf   timer   counter } | Debugs the intf, timer, or counter detection module. |

**Defaults** The debugging function is disabled by default.

**Command Mode** Privileged EXEC mode

**Default Level** 15

**Usage Guide** N/A

**Configuration** N/A  
**Examples**

## 13.8 debug smart manager environment

Use this command to debug the environment variable modules of SEM. Use the **no** form of this command to disable the debugging function.

**debug smart manager environment { all | event | global | policy }**

**no debug smart manager environment { all | event | global | policy }**

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

|                               |                                                               |                                                                                                      |
|-------------------------------|---------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>Description</b>            |                                                               |                                                                                                      |
|                               | { <b>all</b>   <b>event</b>   <b>global</b>   <b>policy</b> } | Debugs all environment variable modules, the event module, global variable module, or policy module. |
| <b>Defaults</b>               | The debugging function is disabled by default.                |                                                                                                      |
| <b>Command Mode</b>           | Privileged EXEC mode                                          |                                                                                                      |
| <b>Default Level</b>          | 15                                                            |                                                                                                      |
| <b>Usage Guide</b>            | N/A                                                           |                                                                                                      |
| <b>Configuration Examples</b> | N/A                                                           |                                                                                                      |

## 13.9 debug smart manager policy

Use this command to debug the policy control modules of SEM. Use the **no** form of this command to disable the debugging function.

**debug smart manager policy { all | config | running }**

**no debug smart manager policy { all | config | running }**

|                               |                                                 |                                                                                                  |
|-------------------------------|-------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>Parameter Description</b>  | <b>Parameter</b>                                | <b>Description</b>                                                                               |
|                               | { <b>all</b>   <b>config</b>   <b>running</b> } | Debugs all current policy control modules, configured policy modules, or running policy modules. |
| <b>Defaults</b>               | The debugging function is disabled by default.  |                                                                                                  |
| <b>Command Mode</b>           | Privileged EXEC mode                            |                                                                                                  |
| <b>Default Level</b>          | 15                                              |                                                                                                  |

|                          | { <b>all</b>   <b>policy_trg</b>   <b>scheduler</b> } | Debugs all the policy management server modules, the execution of triggered policies, or the policy scheduler. |

**Defaults** The debugging function is disabled by default.

**Command Mode** Privileged EXEC mode

**Default Level** 15

**Usage Guide** N/A

**Configuration Examples** N/A

N/A

N/A

N/A

## 13.11 description

Use this command to configure a description for a SEM policy in SEM configuration mode. Use the **no** form of this command to delete the description of the SEM policy.

**description** *string*

**no description**

| Parameter<br>Description | Parameter     | Description                      |
|--------------------------|---------------|----------------------------------|
|                          | <i>string</i> | Text that describes a SEM policy |

|                               |                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>               | No description is configured for a SEM policy by default.                                                                                                                                                                                                                                                        |
| <b>Command Mode</b>           | SEM configuration mode                                                                                                                                                                                                                                                                                           |
| <b>Default Level</b>          | 15                                                                                                                                                                                                                                                                                                               |
| <b>Usage Guide</b>            | The description of a SEM policy can be modified immediately without submission.                                                                                                                                                                                                                                  |
| <b>Configuration Examples</b> | <p>The following example sets the description of the current SEM policy "Description_For_SEM_Applet".</p> <pre>Ruijie(config-applet)#description Description_For_SEM_Applet</pre> <p>The following example clears the description of the current SEM policy.</p> <pre>Ruijie(config-applet)#no description</pre> |
| <b>Verification</b>           | Run the <b>show smart manager policy all</b> command to display relevant configuration.                                                                                                                                                                                                                          |

## 13.12 event counter

Use this command to configure a detector to monitor the SEM counter in SEM configuration mode.

Use the **no** form of this command to delete the event of a specified name.

**event tag** *event-name* [ **correlate** { **andnot** | **and** | **or** } ] **counter name** *counter-name* **entry-op** *operator* **entry-val** *entry-value* **exit-op** *operator* **exit-val** *exit-value*

**no event tag** *event-name*

### Parameter Description

| Parameter                                                   | Description                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>event-name</i>                                           | Name of an event                                                                                                                                                                                                                                                                     |
| <b>correlate</b> { <b>andnot</b>   <b>and</b>   <b>or</b> } | A conditional relationship between the current event and a combination of all the previous events in the case of multiple events. The value <b>and</b> indicates the AND relationship, <b>or</b> indicates the OR relationship, and <b>andnot</b> indicates the ANDNOT relationship. |
| <b>name</b> <i>counter-name</i>                             | Name of a monitored counter                                                                                                                                                                                                                                                          |
| <b>entry-op</b> <i>operator</i>                             | Comparison method used to trigger an event comparison:<br><b>eq</b> : equal to<br><b>ge</b> : greater than or equal to<br><b>gt</b> : greater than<br><b>le</b> : less than or equal to<br><b>lt</b> : less than<br><b>ne</b> : not equal to                                         |

|                                     |                                                                                                                                                                                                                                              |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>entry-val</b> <i>entry-value</i> | Comparison value used to trigger an event comparison                                                                                                                                                                                         |
| <b>exit-op</b> <i>operator</i>      | Comparison method used to restore an event comparison:<br><b>eq</b> : equal to<br><b>ge</b> : greater than or equal to<br><b>gt</b> : greater than<br><b>le</b> : less than or equal to<br><b>lt</b> : less than<br><b>ne</b> : not equal to |
| <b>exit-val</b> <i>exit-value</i>   | Comparison value used to restore an event comparison                                                                                                                                                                                         |

**Defaults** No event is configured by default.

**Command Mode** SEM configuration mode

**Default Level** 15

**Usage Guide** The **event counter** command monitors the naming counter in SEM and the value of the naming counter is usually changed via the **action counter** command.

An event is triggered when the value of the naming counter meets the comparison condition generated from the combination of **entry-op** and **entry-val**.

**exit-op** and **exit-val** can be configured to prevent an event from being frequently triggered. A triggered event fails, and is not triggered. When the value of the naming counter meets such comparison condition, the event recovers from the failed state and the combination of **entry-op** and **entry-val** can trigger an event again.

Available event variables are as follows:

| Variable       | Description                 |
|----------------|-----------------------------|
| _counter_name  | Name of a naming counter    |
| _counter_value | Value of the naming counter |

**Configuration Examples** The following example configures a policy monitoring counter Test\_Counter. When the value of Test\_Counter is greater than or equal to **10**, the policy is triggered to record logs. Set Test\_Counter to **0**. When the value of Test\_Counter is greater than **5**, monitoring is restored.

```
Ruijie(config)#smart manager applet Test_1
Ruijie(config-applet)#event tag monitor_counter counter name Test_Counter
entry-op ge entry-val 10 exit-op gt exit-val 5
Ruijie(config-applet)#action 10 counter name Test_Counter op set value 0
Ruijie(config-applet)#commit
Ruijie(config-applet)#exit
```

**Verification** Run the **show smart manager policy all** command to display relevant configuration.

N/A

## 13.13 event interface

Use this command to configure a detector to monitor various statistics of an interface in SEM configuration mode. Use the **no** form of this command to delete the event of a specified name.

**event tag** *event-name* [ **correlate** { **andnot** | **and** | **or** } ] **interface name** *interface-type interface-number* **parameter** { **down** | **up** }

**no event tag** *event-name*

### Parameter Description

| Parameter                                                   | Description                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>event-name</i>                                           | Name of an event                                                                                                                                                                                                                                                                     |
| <b>correlate</b> { <b>andnot</b>   <b>and</b>   <b>or</b> } | A conditional relationship between the current event and a combination of all the previous events in the case of multiple events. The value <b>and</b> indicates the AND relationship, <b>or</b> indicates the OR relationship, and <b>andnot</b> indicates the ANDNOT relationship. |
| <b>name</b> <i>interface-type interface-number</i>          | Name of a monitored interface                                                                                                                                                                                                                                                        |
| <b>parameter</b> { <b>down</b>   <b>up</b> }                | Method for triggering a comparison: A comparison is triggered when the physical link is down or up.                                                                                                                                                                                  |

**Defaults** No event is configured by default.

**Command Mode** SEM configuration mode

**Default Level** 15

**Usage Guide** N/A

**Configuration Examples** The following example logs the event when the link of port TenGigabitEthernet10/14 is disconnected.

```
Ruijie(config)#smart manager applet Test_2
Ruijie(config-applet)#event tag monitor_link interface name
TenGigabitEthernet10/14 parameter down
Ruijie(config-applet)#action 00 syslog msg "link down!"
Ruijie(config-applet)#commit
Ruijie(config-applet)#exit
```

**Verification** Run the **show smart manager policy all** command to display relevant configuration.

## 13.14 event syslog

Use this command to configure a detector to monitor logs in SEM configuration mode. Use the **no** form of this command to delete the event of a specified name.

**event tag** *event-name* [ **correlate** { **andnot** | **and** | **or** } ] **syslog pattern** *regular-expression* [ **priority** *priority-level* ] [ **occurs** *num-occurrences* ] [ **period** *period-value* ] [ **skip** { **yes** | **no** } ]

**no event tag** *event-name*

**Parameter  
Description**

| Parameter                                                   | Description                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>event-name</i>                                           | Name of an event                                                                                                                                                                                                                                                                     |
| <b>correlate</b> { <b>andnot</b>   <b>and</b>   <b>or</b> } | A conditional relationship between the current event and a combination of all the previous events in the case of multiple events. The value <b>and</b> indicates the AND relationship, <b>or</b> indicates the OR relationship, and <b>andnot</b> indicates the ANDNOT relationship. |
| <b>pattern</b> <i>regular-expression</i>                    | String for matching log content                                                                                                                                                                                                                                                      |
| <b>priority</b> <i>priority-level</i>                       | Level of the to-be-matched log                                                                                                                                                                                                                                                       |
| <b>occurs</b> <i>num-occurrences</i>                        | The number of matches used to trigger an event                                                                                                                                                                                                                                       |
| <b>period</b> <i>period-value</i>                           | Period for invalidating <b>occurs</b> in the command. When the operation duration exceeds the value of <i>period-value</i> , the <b>occurs</b> operation times out. This parameter is invalid when the value of <b>occurs</b> is 1.                                                  |
| <b>skip</b> { <b>yes</b>   <b>no</b> }                      | Whether to ignore syslog. When it is set to <b>yes</b> , matched logs are ignored. The default value is <b>no</b> .                                                                                                                                                                  |

**Defaults** No event is configured by default.

**Command Mode** SEM configuration mode

**Default Level** 15

**Usage Guide** To prevent event loops in SEM, logs sent by SEM, such as logs suspended by the SEM scheduler and logs sent by Action Syslog, are ignored by the syslog detector and not checked.

The **pattern** parameter does not support question marks in regular expressions due to CLI limitations. Use **&/** to replace **?** and **&&** to replace **&** in the configuration input, display, and storage. For example, **a&/bc&&d** can represent **a?bc&d**.

The **pattern** parameter can add a substring for matching (with the event variable name of **pattern\_name** and value of **regex**) to a policy in the **?<pattern\_name>regex** pattern. The **pattern** parameter supports a maximum of 16 substrings for matching.

Available event variables are as follows:

| Variable                | Description    |
|-------------------------|----------------|
| <b>_syslog_msg</b>      | Syslog message |
| <b>_syslog_priority</b> | Syslog level   |

**Configuration Examples** The following example forces the device to perform active/standby switchover when "memory fail" appears in monitoring logs.

```
Ruijie(config)#smart manager applet Test_1
```

```
Ruijie(config-applet)#event tag monitor_log syslog pattern "memory fail"
Ruijie(config-applet)#action 00 switchover
Ruijie(config-applet)#commit
Ruijie(config-applet)#exit
```

The following example captures a log keyword and adds an event to a policy.

```
Ruijie(config)#smart manager applet Test_2
Ruijie(config-applet)#event tag monitor_log syslog pattern "%LINK-3-UPDOWN:
Interface (</>intf_name>.*), changed state to (</>intf_status>.*)."
Ruijie(config-applet)#action 00 syslog msg "Interface $intf_name
$intf_status"
Ruijie(config-applet)#commit
Ruijie(config-applet)#exit
```

When the interface changes and captures **"\*Aug 30 10:14:16: %LINK-3-UPDOWN: Interface GigabitEthernet 1/0/1, changed state to up,"** SEM executes the policy and outputs the following syslog:

```
*Aug 30 10:14:16: %SEM-6-COMM: Test_2: Interface GigabitEthernet 1/0/1 up
```

#### Verification

Run the **show smart manager policy all** command to display relevant configuration.

## 13.15 event timer

Use this command to configure a time-based event in SEM configuration mode. Use the **no** form of this command to delete the event of a specified name.

**event tag** *event-name* [ **correlate** { **andnot** | **and** | **or** } ] **timer** { **absolute** { **unix** *time-value* | **date** *date-value* } | **countdown time** *time-value* | **cron cron-entry** | **watchdog time** *time-value* } [ **name** *timer-name* ]

**no event tag** *event-name*

#### Parameter Description

| Parameter                                                   | Description                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>event-name</i>                                           | Name of an event                                                                                                                                                                                                                                                                     |
| <b>correlate</b> { <b>andnot</b>   <b>and</b>   <b>or</b> } | A conditional relationship between the current event and a combination of all the previous events in the case of multiple events. The value <b>and</b> indicates the AND relationship, <b>or</b> indicates the OR relationship, and <b>andnot</b> indicates the ANDNOT relationship. |
| <b>absolute unix</b> <i>time-value</i>                      | Date time in Unix format for triggering an event.                                                                                                                                                                                                                                    |
| <b>absolute date</b> <i>date-value</i>                      | Date time in date format for triggering an event.                                                                                                                                                                                                                                    |
| <b>countdown time</b> <i>time-value</i>                     | One one-time timer for triggering an event.                                                                                                                                                                                                                                          |
| <b>cron cron-entry</b>                                      | Cron configuration for triggering an event.                                                                                                                                                                                                                                          |
| <b>watchdog time</b> <i>time-value</i>                      | One cyclic timer for triggering an event.                                                                                                                                                                                                                                            |
| <b>name</b> <i>timer-name</i>                               | Name of a designated timer                                                                                                                                                                                                                                                           |

**Defaults** No event is configured by default.

**Command Mode** SEM configuration mode

**Default Level** 15

**Usage Guide** Time-based events fall into:

- (1) Events based on a specific date time
- (2) Events based on a time point at which the configuration takes effect
- (3) Events based on the time in cron format
- (4) Events triggered by a cyclic timer

For events based on a specific date time, the time is specified in two formats: date time format and Unix time format.

Available event variables are as follows:

| Variable      | Description                                                               |
|---------------|---------------------------------------------------------------------------|
| _timer_type   | Timer type                                                                |
| _timer_time   | Timer timeout time                                                        |
| _timer_remain | Next timeout time of the timer (cron timers do not support this variable) |

**Configuration Examples** The following example configures SEM to output logs at the Unix time of 1257831095.

```
Ruijie(config)#smart manager applet Test_1
Ruijie(config-applet)#event tag monitor_timer timer absolute time 1257831095
Ruijie(config-applet)#action 00 syslog msg "timer arrival"
Ruijie(config-applet)#commit
Ruijie(config-applet)#exit
```

The following example sends the log "3600 second arrival" after 3,600 seconds.

```
Ruijie(config)#smart manager applet Test_2
Ruijie(config-applet)#event tag monitor_timer timer countdown time 3600
Ruijie(config-applet)#action 00 syslog msg "3600 second arrival"
Ruijie(config-applet)#commit
Ruijie(config-applet)#exit
```

The following example clears the ARP cache every 7,200 seconds.

```
Ruijie(config)#smart manager applet Test_3
Ruijie(config-applet)#event tag monitor_timer timer watchdog time 7200
Ruijie(config-applet)#action 00 cli command "enable"
Ruijie(config-applet)#action 10 cli command "clear arp-cache"
Ruijie(config-applet)#commit
Ruijie(config-applet)#exit
```

The following example clears the routing table at 00:00 every day.

```
Ruijie(config)#smart manager applet Test_4
Ruijie(config-applet)#event tag monitor_timer timer cron cron-entry "0 0 * *
```

```
* "
Ruijie(config-applet)#action 00 cli command "enable"
Ruijie(config-applet)#action 10 cli command "clear ip route *"
Ruijie(config-applet)#commit
Ruijie(config-applet)#exit
```

**Verification** Run the **show smart manager policy all** command to display relevant configuration.

## 13.16 list-config

Use this command to display the configuration of the current policy in SEM configuration mode.

**list-config**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** No policy is configured by default.

**Command Mode** SEM configuration mode

**Default Level** 15

**Usage Guide** N/A

**Configuration**

—

**Examples**

## 13.17 policy record

Use this command to configure SEM to record the output of CLI actions and configure the capacity of CLI action output in SEM configuration mode. Use the **no** form of this command to cancel the configuration.

**policy record** [ **per-instance** *record-size-per-policy* ] [ **per-policy** *record-size-per-policy* ]

**no policy record**

| Parameter<br>Description | Parameter                                         | Description                                                                                                                |
|--------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
|                          | <b>per-instance</b> <i>record-size-per-policy</i> | Capacity (in KB) of CLI records arising from the running of a policy triggered each time. The default value is <b>50</b> . |

**per-policy** *record-size-per-policy*Total capacity (in KB) of CLI records arising from the running of a triggered policy. The default value is **1000**.**Defaults** The output of CLI actions is not recorded by default.**Command Mode** SEM configuration mode**Default Level** 15

**Usage Guide** By default, the output of CLI actions in a SEM policy is not recorded. After the **policy record** command is configured, the output of an executed CLI action will be recorded into the device file system. The path to a record file is in the following format: **/sem\_record/policy\_name/yyyy-mm-dd\_hh-mm-ss\_mspolicytriggerid.txt**. In this path, **/sem\_record/** indicates the general directory of output records of all CLI actions and is located in the root directory of the file system. **policy\_name** indicates the name of a policy and is located in the **/sem\_record/** directory. There is a separate directory for each policy. **yyyy-mm-dd\_hh-mm-ss\_mspolicytriggerid.txt** indicates the name of a record file. The name is a combination of the record generation date time (accurate to milliseconds) and policy trigger sequence number.

Run the **more** command to display record content.

When the size of the output of executed CLI action items in a policy exceeds the value of **per-instance record-size-per-policy**, the record file will be overwritten from the beginning.

When the total size of files for recording the output of executed CLI action items in a specific policy exceeds the value of **per-policy record-size-per-policy**, earlier record files will be cleared until the total size of record files meets the settings of **per-policy record-size-per-policy**.

You can run the **smart manager policy record clean** command to clear files that record the output of CLI action items in the file system.

**Configuration Examples** The following example records policy configuration.

```
Ruijie(config)#smart manager applet Test_1
Ruijie(config-applet)#event tag monitor_timer timer watchdog time 7200
Ruijie(config-applet)#action 00 cli command "enable"
Ruijie(config-applet)#action 10 cli command "show arp"
Ruijie(config-applet)#policy record
Ruijie(config-applet)#commit
Ruijie(config-applet)#exit
Ruijie(config)# exit
Ruijie# more /sem_record/Test_1/2010-01-01_01-00-00_1001.txt
                        SEM CLI RECORD FILE
SEM policy name: Test_1
SEM policy trigger id :1
SEM policy cli record time : Fri Jan 01 01:00:00 2010
=====
```

```
Ruijie#enable
Ruijie#show arp
Protocol  Address      Age(min)  Hardware      Type  Interface
Internet  6.6.6.6        21       0027.1994.e59b  arpa  VLAN 1
Internet  6.6.6.1        --       00d0.f822.33b3  arpa  VLAN 1
Total number of ARP entries: 2
Ruijie#
```

**Verification** Run the **show smart manager policy all** command to display relevant configuration.

## 13.18 rollback

Use this command to roll back the configuration of the current policy in SEM configuration mode.  
**rollback**

**Parameter**  
**Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** Policy configuration is not rolled back by default.

**Command** SEM configuration mode  
**Mode**

**Default Level** 15

**Usage Guide** N/A

**Configuration** The following example rolls back policy configuration.

**Examples**

```
Ruijie(config)#smart manager applet Test_1
Ruijie(sem-applet)#event tag monitor_timer timer watchdog time 7200
Ruijie(sem-applet)#action 00 syslog msg "timer arrival"
Ruijie(sem-applet)#list-config

smart manager applet Test_1
  event tag monitor_timer timer watchdog time 7200
  action 00 syslog msg "timer arrival"

Ruijie(sem-applet)#rollback
Ruijie(sem-applet)#list-config

smart manager applet Test_1
```

```
Ruijie(sem-applet) #exit
Ruijie(config) #
```

**Verification** Run the **list-config** command to display relevant configuration.

## 13.19 show smart manager detector

Use this command to display detector information in privileged EXEC mode.

**show smart manager detector** [ **all** | *detector-name* ] [ **detailed** | **statistics** ]

| Parameter<br>Description | Parameter                         | Description                                                      |
|--------------------------|-----------------------------------|------------------------------------------------------------------|
|                          | <b>all</b>   <i>detector-name</i> | Displays information about all detectors or a specific detector. |
|                          | <b>detailed</b>                   | Displays details.                                                |
|                          | <b>statistics</b>                 | Displays detector statistics.                                    |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 15

**Usage Guide** N/A

**Configuration Examples** The following command displays the output of the **show smart manager detector all** command.

```
Ruijie# show smart manager detector all
No.  Name                Version
1    application          01.00
2    syslog                01.00
3    cli                  01.00
4    counter              01.00
5    interface            01.00
6    sysmon               01.00
7    none                 01.00
8    oir                  01.00
9    snmp                  01.00
10   snmp-notification    01.00
11   timer                 01.00
12   snmp-object          01.00
```

Field description:

| Field | Description |
|-------|-------------|
| No.   | Display No. |

|         |                  |
|---------|------------------|
| Name    | Detector name    |
| Version | Detector version |

The following example displays the output of the **show smart manager detector cli** command.

```
Ruijie# show smart manager detector cli
No.  Name          Version
1    cli           01.00
```

Field description:

| Field   | Description      |
|---------|------------------|
| No.     | Display No.      |
| Name    | Detector name    |
| Version | Detector version |

The following example displays the output of the **show smart manager detector cli detailed** command. The output includes the configuration command of an event and local variables specified for the event.

```
Ruijie# show smart manager detector cli detailed
No.      Name      Version
1        cli      01.00
Applet Configuration Syntax for cli detector :
    event tag <event-name> [correlate {and | or | andnot}] cli pattern
<regular-expression> sync {yes [default <wait-time>] | no skip {yes | no}} [mode
<mode val>] [occurs <num-occurrences>] [period <period-value>]
    no event tag <event-name>
Applet Built-in Environment Variables:
    _event_id
    _event_type
    _event_type_string
    _event_pub_time
    _event_pub_sec
    _event_pub_msec
    _cli_msg
    _cli_msg_count
    _cli_mode
```

Field description:

| Field                                 | Description                                    |
|---------------------------------------|------------------------------------------------|
| No.                                   | Display No.                                    |
| Name                                  | Detector name                                  |
| Version                               | Detector version                               |
| Applet Configuration Syntax           | Detector configuration command                 |
| Applet Built-in Environment Variables | Environment variable supported by the detector |

## 13.20 show smart manager environment

Use this command to display global variables in privileged EXEC mode.

**show smart manager environment** [ **all** | *variable-name* ]

| Parameter<br>Description | Parameter            | Description                         |
|--------------------------|----------------------|-------------------------------------|
|                          | <b>all</b>           | Displays all global variables.      |
|                          | <i>variable-name</i> | Displays specific global variables. |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 15

**Usage Guide** This command displays only global variables.

**Configuration Examples** The following command displays the output of the **show smart manager environment** command.

```
Ruijie# show smart manager environment
No.  Name                Value
1    var_a                value_a
2    var_b                value_b
```

Field description:

| Field | Description                       |
|-------|-----------------------------------|
| No.   | Display No.                       |
| Name  | Name of an environment variable   |
| Value | Value of the environment variable |

The following command displays the output of the **show smart manager environment all** command.

```
Ruijie# show smart manager environment all
No.  Name                Value
1    var_a                value_a
2    var_b                value_b
```

Field description:

| Field | Description                       |
|-------|-----------------------------------|
| No.   | Display No.                       |
| Name  | Name of an environment variable   |
| Value | Value of the environment variable |

The following command displays the output of the **show smart manager environment var\_a** command. It allows you to display the value of a specific variable in the case of multiple global variables.

```
Ruijie# show smart manager environment var_a
```

```
value_a
```

The following command displays the output of the **show smart manager environment** *var\_none* (no global variable) command.

```
Ruijie# show smart manager environment var_none
No such environment variable defined.
```

## 13.21 show smart manager history events

Use this command to display SEM historical events in privileged EXEC mode.

**show smart manager history events** [ **detailed** ] [ **maximum number** ]

| Parameter<br>Description | Parameter             | Description                                   |
|--------------------------|-----------------------|-----------------------------------------------|
|                          | <b>detailed</b>       | Displays details.                             |
|                          | <b>maximum number</b> | Maximum number of historical events displayed |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 15

**Usage Guide** N/A

**Configuration Examples** The following command displays the output of the **show smart manager history events** command.

### Examples

```
Ruijie# show smart manager history events
```

| No. | Job Id | Event Type | Time                     | Policy name |
|-----|--------|------------|--------------------------|-------------|
| 1   | 927    | timer      | Thu Oct 21 13:59:54 2010 | Test_1      |
| 2   | 926    | timer      | Thu Oct 21 13:59:53 2010 | Test_1      |
| 3   | 925    | timer      | Thu Oct 21 13:59:52 2010 | Test_1      |
| 4   | 924    | timer      | Thu Oct 21 13:59:51 2010 | Test_1      |
| 5   | 923    | timer      | Thu Oct 21 13:59:50 2010 | Test_1      |

Field description:

| Field       | Description                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------|
| No.         | Display No.                                                                                                  |
| Job Id      | Task ID allocated by the SEM scheduler to a policy instance for the running of the policy instance each time |
| Event Type  | Type of the first event in the policy                                                                        |
| Time        | Policy triggering time                                                                                       |
| Policy name | Policy name                                                                                                  |

The following command displays the output of the **show smart manager history events detailed** command.

```

Ruijie# show smart manager history events detailed
Ruijie# show smart manager history events detailed

## 13.22 show smart manager policy all

Use this command to displays all policies and the submission status of the policies in privileged EXEC mode.

**show smart manager policy all**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 15

**Usage Guide** This command can be used to display all configured policies.

**Configuration** The following command displays the output of the **show smart manager policy all** command.

**Examples**

```
Ruijie#show smart manager policy all
```

| No. | Status     | Policy Name |
|-----|------------|-------------|
| 1   | commit     | Test_1      |
| 2   | not commit | Test_2      |

Field description:

| Field       | Description                   |
|-------------|-------------------------------|
| No.         | Display No.                   |
| Status      | Submission status of a policy |
| Policy name | Policy name                   |

## 13.23 show smart manager policy active

Use this command to display activated policy instances in privileged EXEC mode.

**show smart manager policy active** [ *class class-options* ] [ **detailed** ]

**Parameter****Description**

| Parameter                         | Description             |
|-----------------------------------|-------------------------|
| <b>class</b> <i>class-options</i> | Selects a policy class. |
| <b>detailed</b>                   | Displays details.       |

**Command**

Privileged EXEC mode, global configuration mode, and interface configuration mode

**Mode**

**Default Level** 15

**Usage Guide** This command can be used to display running policy instances.

**Configuration** The following command displays the output of the **show smart manager policy active** command.

**Examples**

```
Ruijie#show smart manager policy active
```

Key: P - Priority :L - Low, H - High, N - Normal

S - Scheduling mode :A - Active, P -Pending

| Event Type    | Type of the first event in the policy                                                                        |
| Policy Name   | Policy name                                                                                                  |
| Maxrun        | Maximum duration in which a policy is allowed to run                                                         |

## 13.25 show smart manager policy registered

Use this command to display registered policies in privileged EXEC mode.

```
show smart manager policy registered [ statistics ] [ policy policy-name ] [ event-type event-name ]
[ class class-options ] [ time-ordered | name-ordered ]
```

Parameter  
Description

| Parameter                                 | Description                                    |
|-------------------------------------------|------------------------------------------------|
| <b>statistics</b>                         | Displays statistics about registered policies. |
| <b>policy</b> <i>policy-name</i>          | Specifies the name of a policy.                |
| <b>event-type</b> <i>event-name</i>       | Specifies the event type of the policy.        |
| <b>class</b> <i>class-options</i>         | Selects a policy class.                        |
| <b>time-ordered</b>   <b>name-ordered</b> | Selects a display order.                       |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 15

**Usage Guide** N/A

**Configuration** The following command displays the output of the **show smart manager policy registered** command.

**Examples**

```
Ruijie# show smart manager policy registered
No.  Name      Class  Type   Event Type      Time Registered
 1   Test_1    A      applet timer      Thu Oct 21 13:46:16 2010
event_1: timer: watchdog time 1
  action 00 syslog msg "Action_00"
  action 10 syslog msg "Action_10"
  action 20 syslog msg "Action_20"
```

Field description:

| Field           | Description                                     |
|-----------------|-------------------------------------------------|
| No.             | Display No.                                     |
| Name            | Policy name                                     |
| Class           | Policy class                                    |
| Type            | Policy type                                     |
| Event Type      | Type of the first event in the policy           |
| Time Registered | Policy registration time                        |
| event_1         | Type and other information of a policy event    |
| action          | Type and information of an action in the policy |

## 13.26 show smart manager scheduler

Use this command to display the running status of the SEM scheduler by thread pool in privileged EXEC mode.

**show smart manager scheduler thread [ detailed ]**

**Parameter Description**

| Parameter       | Description       |
|-----------------|-------------------|
| <b>detailed</b> | Displays details. |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 15

**Usage Guide** N/A

**Configuration** The following command displays the output of the **show smart manager scheduler thread** command.

**Examples**

```
Ruijie# show smart manager scheduler thread
1 Applet threads service class default :
  total: 1 running: 0 idle: 1
2 Applet threads service class A B C :
  total: 32 running: 0 idle: 32
```

Field description:

| Field                        | Description                                  |
|------------------------------|----------------------------------------------|
| Applet threads service class | Policy classes contained in this thread pool |
| total                        | Total number of threads in the thread pool   |
| running                      | Number of running threads                    |
| idle                         | Number of idle threads                       |

The following command displays the output of the **show smart manager scheduler thread detailed** command.

```
Ruijie# show smart manager scheduler thread detailed
1 Applet threads service class default :
  total: 1 running: 0 idle: 1
2 Applet threads service class A B C :
  total: 32 running: 3 idle: 29
class A : 1
class B : 2
```

Field description:

| Field                        | Description                                                    |
|------------------------------|----------------------------------------------------------------|
| Applet threads service class | Policy classes contained in this thread pool                   |
| total                        | Total number of threads in the thread pool                     |
| running                      | Number of running threads                                      |
| idle                         | Number of idle threads                                         |
| class                        | Number of running policies of a specific type in a thread pool |

## 13.27 show smart manager version

Use this command to display the SEM version in privileged EXEC mode.

**show smart manager version**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Command  
Mode**

Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 15

**Usage Guide** N/A

**Configuration** The following displays the output of the **show smart manager version** command. From the output, you can learn about the current versions of SEM and detectors as well as the functions of the versions.

**Examples**

```
Ruijie#show smart manager version
Smart Embedded Manager Version 1.0
Event Detectors:
name                version
application          1.0
syslog               1.0
cli                  1.0
counter              1.0
cpp                  1.0
grtd                 1.0
interface            1.0
none                 1.0
oir                  1.0
snmp                 1.0
snmp-object          1.0
snmp-notification    1.0
sysmon               1.0
timer                1.0
```

Field description:

| Field                          | Description            |
|--------------------------------|------------------------|
| Smart Embedded Manager Version | Current version of SEM |
| name                           | Detector name          |
| version                        | Detector version       |

## 13.28 smart manager applet

Use this command to define a SEM policy in global configuration mode. Use the **no** form of this command to delete a SEM policy.

**smart manager applet** *applet-name* [ **class** *class-options* ]

**no smart manager applet** *applet-name* [ **reserve-record** | **clean-record** ]

**Parameter  
Description**

| Parameter          | Description                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------|
| <i>applet-name</i> | Defines the name of a SEM policy. The name must contain digits, letters, and underlines (_). |

|                                   |                                                                        |
|-----------------------------------|------------------------------------------------------------------------|
| <b>class</b> <i>class-options</i> | Specifies the class of a policy. The default value is <b>default</b> . |
| <b>reserve-record</b>             | Retains CLI records arising from policy execution.                     |
| <b>clean-record</b>               | Cleans up CLI records arising from policy execution.                   |

**Defaults** No CLI-based policy is configured by default.

**Command Mode** Global configuration mode

**Default Level** 15

**Usage Guide** A policy can contain:

- (1) One or more events
- (2) One or more actions
- (3) Policy description
- (4) Trigger control information of the policy

After the **smart manager applet** command is executed, the system enters the SEM configuration mode, in which you can complete the following operations:

- (1) Configure an event for the policy.
- (2) Configure an action for the policy.
- (3) Configure the policy description.
- (4) Configure trigger control parameters for the policy.
- (5) Submit the policy configuration.
- (6) Roll back the policy configuration.
- (7) View the current policy configuration.

Each event must have a unique name specified by the **tag** parameter. SEM automatically sorts events in alphabet order of the **tag** parameter values. A unique label must be specified for each action, and SEM automatically sorts the actions in the alphabet order of the **label** parameter values. When a policy is activated, SEM executes the actions in this order.

In SEM configuration mode, users can use environment variables in the actions of a policy. The variables fall into:

- (1) Global variables
- (2) Local variables

Local variables can be defined by the event detector in the system when an event is generated or by actions during the running of a user policy. System variables produced by each event are described in the instructions.

In addition:

- Each policy belongs to a class (the **default** class by default). Multiple policies can be placed under the same class. The **class** parameter allocates thread resources to policies of a class, and to specify running priorities for the policies of the class.
- The policy configuration does not take effect immediately. After a policy is configured, the **commit** command is run in SEM configuration mode to submit the policy configuration.
- Policy validity is checked during policy submission. If a policy does not pass the check, policy

registration fails and the policy configuration is not submitted.

- A policy with no event configured does not pass the validity check, and thus is not submitted.
- A policy with no action configured can pass the validity check. After it is triggered, however, the policy is terminated without any action. Therefore, an alarm is generated during its submission.
- To abandon a modification to the policy configuration, run the **rollback** command to roll back the policy configuration.
- SEM policies do not take effect immediately upon device startup. They take effect after the configuration becomes available on the device console. For detailed configuration, see **smart manager policy bootup-delay**.
- When multiple events are configured in a policy, SEM automatically sorts the events in alphabet order of the **tag** parameter values, with parallel relationship between the events. Events other than the first event are additional conditions of the first event. The relationship of events other than the first event represents the relationship between the current event and a combination of all the previous events. Therefore, the parallel relationship with the first event is ignored and is considered as AND by default during configuration.

The table below lists event variables used in all policies.

| Variable                  | Description                                               |
|---------------------------|-----------------------------------------------------------|
| <b>_event_id</b>          | Event trigger ID for triggering a policy                  |
| <b>_event_type</b>        | Type of the event detector of the triggered policy        |
| <b>_event_type_string</b> | Description of the event detector of the triggered policy |
| <b>_event_pub_time</b>    | Event occurrence time                                     |
| <b>_event_pub_sec</b>     | Event occurrence time (Unix time)                         |
| <b>_event_pub_msec</b>    | Event occurrence time, in milliseconds                    |

### Configuration Examples

The following example creates a CLI-based policy with the name of Test\_A.

```
Ruijie(config)# smart manager applet Test_A
Ruijie(config-applet)#
```

The following example creates a CLI-based policy with the name of Test\_B and policy class of class D.

```
Ruijie(config)# smart manager applet Test_B class D
Ruijie(config-applet)#
```

### Verification

Run the **show smart manager policy all** command to display relevant configuration.

## 13.29 smart manager history

Use this command to configure the maximum number of SEM historical events that are stored in global configuration mode. Use the **no** form of this command to restore the maximum number of historical events that are stored to the default value.

**smart manager history size events** *size*

**no smart manager history size events**

| Parameter<br>Description      | Parameter                                                                                                                                                               | Description                                                                                 |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
|                               | <b>events</b>                                                                                                                                                           | Specifies the maximum number of historical events that are stored.                          |
|                               | <i>size</i>                                                                                                                                                             | Specifies the quantity. The maximum value is <b>50</b> and the default value is <b>50</b> . |
| <b>Defaults</b>               | A maximum of 50 events are stored by default.                                                                                                                           |                                                                                             |
| <b>Command Mode</b>           | Global configuration mode                                                                                                                                               |                                                                                             |
| <b>Default Level</b>          | 15                                                                                                                                                                      |                                                                                             |
| <b>Usage Guide</b>            | You are advised not to set the maximum number of historical events to <b>0</b> . Otherwise, SEM does not record historical events.                                      |                                                                                             |
| <b>Configuration Examples</b> | The following example sets the maximum number of SEM historical events that are stored to <b>30</b> .<br><pre>Ruijie(config)#smart manager history size events 30</pre> |                                                                                             |

## 13.30 smart manager policy record

Use this command to clean up CLI records arising from running of a SEM policy in privileged EXEC mode.

**smart manager policy record clean** [ **no-registered** | **policy** *registered-policy-name* | **dir** *record-directory* | **all** ]

| Parameter<br>Description | Parameter                                | Description                                                                     |
|--------------------------|------------------------------------------|---------------------------------------------------------------------------------|
|                          | <b>no-registered</b>                     | Clears all CLI records of policies that are not registered with the SEM system. |
|                          | <b>policy</b> <i>registd-policy-name</i> | Clears CLI records generated by specific registered policies.                   |
|                          | <b>dir</b> <i>record-directory</i>       | Clears a specific CLI record directory in SEM records.                          |
|                          | <b>all</b>                               | Clears all CLI record directories in SEM records.                               |

|                      |                                                    |
|----------------------|----------------------------------------------------|
| <b>Defaults</b>      | Clean-up of CLI records is not allowed by default. |
| <b>Command Mode</b>  | Privileged EXEC mode                               |
| <b>Default Level</b> | 15                                                 |

**Usage Guide** N/A

**Configuration Examples** The following example clears CLI output records of all unregistered policies, for example, retained CLI output records of deleted policies.

```
Ruijie#smart manager policy record clean no-registered
```

The following example clears CLI output records arising from the running of all SEM policies.

```
Ruijie#smart manager policy record clean all
```

## 13.31 trigger

Use this command to configure the trigger attribute of a policy in SEM configuration mode. Use the **no** form of this command to delete the trigger configuration.

**trigger** [ **occurs-value** ] [ **occurs-period** *occurs-period-value* ] [ **correlate-start** *period-start-value* ] [ **correlate-period** *correlate-period-value* ] [ **delay** *delay-value* ] [ **maxrun** *maxruntime-number* ]  
**no trigger**

**Parameter Description**

| Parameter                                             | Description                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>occurs-value</b> <i>occurs-value</i>               | Match count required for triggering a policy. The default value is <b>1</b> .                                                                                                                                                                                                |
| <b>occurs-period</b> <i>occurs-period-value</i>       | Period for invalidating <b>occurs</b> in the command. When the operation duration exceeds the value of <i>period-value</i> , the <b>occurs</b> operation times out. This parameter is invalid when the value of <b>occurs</b> is <b>1</b> . The default value is <b>30</b> . |
| <b>correlate-start</b> <i>period-start-value</i>      | Period start time, described in cron mode. The period start time is not limited by default.                                                                                                                                                                                  |
| <b>correlate-period</b> <i>correlate-period-value</i> | Timeout period of a parallel relationship in seconds. The default value is <b>60</b> .                                                                                                                                                                                       |
| <b>delay</b> <i>delay-value</i>                       | A delay in policy running after the policy is triggered. The default value is <b>0</b> .                                                                                                                                                                                     |
| <b>maxrun</b> <i>maxruntime-number</i>                | Maximum running period of the policy in seconds. The policy is forcibly terminated when the period expires. The default value is <b>20</b> .                                                                                                                                 |

**Defaults** No trigger attribute is configured by default.

**Command Mode** SEM configuration mode

**Default Level** 15

**Usage Guide** N/A

**Configuration** The following example runs a policy named Test\_1 with a delay of 10s after the policy is triggered.

**Examples**

```
Ruijie(config)#smart manager applet Test_1
Ruijie(config-applet)# event tag monitor_interface interface name
GigabitEthernet3/0 parameter down
Ruijie(config-applet)#trigger delay 10
Ruijie(config-applet)#commit
Ruijie(config-applet)#exit
```

**Verification**

Run the **list-config** command to display relevant configuration.

# 1 SNMP Commands

## 1.1 no snmp-server

Use this command to disable the SNMP agent function.

**no snmp-server**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** SNMP agent is enabled by default.

**Command mode** Global configuration mode.

**Usage Guide** This command disables the SNMP agent services of all versions supported on the device.

**Configuration Examples** The following example disables the SNMP agent.

```
Ruijie(config)# no snmp-server
```

**Related  
Commands**

| Command | Description |
|---------|-------------|
| N/A     | N/A         |

**Platform  
Description** N/A

## 1.2 show snmp

Use this command to display the SNMP configuration.

**show snmp [mib | user | view | group] host [process-mib-time]**

**Parameter  
Description**

| Parameter    | Description                               |
|--------------|-------------------------------------------|
| <b>mib</b>   | Displays the SNMP MIBs supported.         |
| <b>user</b>  | Displays the SNMP user information.       |
| <b>view</b>  | Displays the SNMP view information.       |
| <b>group</b> | Displays the SNMP user group information. |
| <b>host</b>  | Displays the explicit host configuration. |

|                         |                                                              |
|-------------------------|--------------------------------------------------------------|
| <b>process-mib-time</b> | Displays the MIB node requiring the longest processing time. |
|-------------------------|--------------------------------------------------------------|

**Defaults** N/A

**Command mode** Privileged EXEC mode.

**Usage Guide** N/A

**Configuration** The example below displays the SNMP configuration:

**Examples**

```
Ruijie# show snmp
Chassis: 60FF60
0 SNMP packets input
    0 Bad SNMP version errors
    0 Unknown community name
    0 Illegal operation for community name supplied
    0 Encoding errors
    0 Number of requested variables
    0 Number of altered variables
    0 Get-request PDUs
    0 Get-next PDUs
    0 Set-request PDUs
0 SNMP packets output
    0 Too big errors (Maximum packet size 1472)
    0 No such name errors
    0 Bad values errors
    0 General errors
    0 Response PDUs
    0 Trap PDUs
SNMP global trap: disabled
SNMP logging: disabled
SNMP agent: enabled
```

**Related Commands**

|-------------------------------|--------------------------------------------|
| <b>snmp-server chassis-id</b> | Specifies the SNMP system sequence number. |

**Platform** N/A

**Description**

## 1.3 snmp trap link-status

Use this command to enable the interface to send link traps. Use the **no** form of this command to

disable the interface to send link traps.

**snmp trap link-status**

**no snmp trap link-status**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** Sending link traps on the interface is enabled by default. If the interface link status changes, SNMP link traps will be sent.

**Command mode** Interface configuration mode

**Usage Guide** This command can be configured on the Ethernet interface, aggregate ports and SVI interfaces.

**Configuration** The following example disables the interface to send link traps.

**Examples**

```
Ruijie(config)# interface gigabitEthernet 1/1
Ruijie(config-if-GigabitEthernet 1/1)# no snmp trap link-status
```

The following example enables the interface to send link traps.

```
Ruijie(config)# interface gigabitEthernet 1/1
Ruijie(config-if-GigabitEthernet 1/1)# snmp trap link-status
```

| Related<br>Commands | Command | Description |
|---------------------|---------|-------------|
|                     | N/A     | N/A         |

**Platform** N/A  
**Description**

## 1.4 snmp-server authentication attempt

Use this command to configure the maximum number of continuous SNMP authentication failures, and specified the action policy for the authentication failure. Use the **no** form of this command to remove the limit of continuous SNMP authentication failures and the related action policies.

**snmp-server authentication attempt *times* exceed { lock | lock-time *minutes* | unlock }**

**no snmp-server authentication attempt *times* exceed { lock | lock-time *minutes* | unlock }**

| Parameter<br>Description | Parameter    | Description                                                                                  |
|--------------------------|--------------|----------------------------------------------------------------------------------------------|
|                          | <i>times</i> | The maximum number of continuous SNMP authentication failures.<br>The range is from 1 to 10. |

|                                 |                                                                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>exceed</b>                   | Indicates the action policy in the case that the maximum number of continuous SNMP authentication failures is exceeded.                                        |
| <b>lock</b>                     | Indicates that the source IP address is permanently locked to be authenticated and can be unlocked only by the administrator's manual configuration.           |
| <b>lock-time</b> <i>minutes</i> | Indicates that the source IP address is locked for a period of time. The <i>minutes</i> indicates the lock time, ranging from 1 to 65,535. The unit is minute. |
| <b>unlock</b>                   | Indicates that no action policy is configured for the authentication failed user, that is, the SNMP authentication for this user is allowed.                   |

**Defaults** SNMP attack prevention is enabled by default.

**Command mode** Global configuration mode

**Usage Guide** The IP address of the SNMP authentication failed user is added to the blacklist. When the maximum number of continuous SNMP authentication failures is exceeded, the system will perform the related authentication limit actions according the configured policy.:

1. For the permanently locked IP addresses: The source IP addresses can be authenticated only after the administrator unlock them manually.
2. For the IP addresses locked for a period time: The source IP addresses can be authenticated only after the lock time expires or the administrator unlock them manually.
3. For the unlocked IP addresses: The source IP address can pass the authentication as long as the correct community (for SNMPv1 and SNMPv2) or username (for SNMPv3) is used.

**Configuration Examples** The following example configures the maximum number of continuous SNMP authentication failures to 4, and sets the IP address lock time to 30 seconds.

```
Ruijie(config)# snmp-server authentication attempt 4 exceed lock-time 30
```

## 1.5 snmp-server chassis-id

Use this command to specify the SNMP chassis ID. Use the **no** form of this command to restore the default chassis ID.

**snmp-server chassis-id** *text*  
**no snmp-server chassis-id**

|                               |                                                                                                                                                                           |                                          |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| <b>Parameter Description</b>  | <b>Parameter</b>                                                                                                                                                          | <b>Description</b>                       |
|                               | <i>text</i>                                                                                                                                                               | SNMP chassis ID: numerals or characters. |
| <b>Defaults</b>               | The default is 60FF60.                                                                                                                                                    |                                          |
| <b>Command mode</b>           | Global configuration mode.                                                                                                                                                |                                          |
| <b>Usage Guide</b>            | The SNMP chassis ID is generally the serial number of the device to facilitate identification. The SNMP chassis ID can be displayed through the <b>show snmp</b> command. |                                          |
| <b>Configuration Examples</b> | The following example specifies the SNMP chassis ID as 123456:                                                                                                            |                                          |
|                               | <pre>Ruijie(config)# <b>snmp-server chassis-id</b> 123456</pre>                                                                                                           |                                          |
| <b>Related Commands</b>       | <b>Command</b>                                                                                                                                                            | <b>Description</b>                       |
|                               | <b>show snmp</b>                                                                                                                                                          | Displays the SNMP configuration.         |
| <b>Platform Description</b>   | N/A                                                                                                                                                                       |                                          |

## 1.6 snmp-server community

Use this command to specify the SNMP community access string. Use the **no** form of this command to remove the SNMP community access string.

**snmp-server community** { [ 0 | 7 ] *string* [ **view** *view-name* ] [ **secret** [ 0 | 8 ] *string* ] [ [ **ro** | **rw** ] [ **host** *ipaddr* ] ] [ **ipv6** *ipv6-aclname* ] [ *aclnum* | *aclname* ]

**no snmp-server community** { [ 0 | 7 ] *string* [ **secret** [ 0 | 8 ] *string* ]

|                              |                  |                                                                                                                                   |
|------------------------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter Description</b> | <b>Parameter</b> | <b>Description</b>                                                                                                                |
|                              | <b>0</b>         | Indicates that the community string is in plaintext.                                                                              |
|                              | <b>7</b>         | Indicates that the community string is in ciphertext.                                                                             |
|                              | <i>string</i>    | Community string, which is the communication password between the NMS and the SNMP agent                                          |
|                              | <b>secret</b>    | Indicates that the community string is encrypted. The default encryption algorithm is SHA256.                                     |
|                              | <b>0</b>         | Indicates that the input community string is in plaintext and is encrypted with the default encryption algorithm, namely, SHA256. |
|                              | <b>8</b>         | Indicates that the input community string is in ciphertext of the SHA256 encryption algorithm.                                    |

|                     |                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------|
| <i>view-name</i>    | View name                                                                                                                 |
| <b>ro</b>           | Indicates that the NMS can only read the variables of the MIB.                                                            |
| <b>rw</b>           | Indicates that the NMS can read and write the variables of the MIB.                                                       |
| <i>aclnum</i>       | Access list number (1 to 199, and 1300 to 2699), which specifies the IPv4 addresses that are permitted to access the MIB. |
| <i>aclname</i>      | Access list name, which specifies the IPv4 addresses that are permitted to access the MIB.                                |
| <i>ipv6-aclname</i> | IPv6 access list name, which specifies the IPv6 addresses that are permitted to access the MIB.                           |
| <i>ipaddr</i>       | Specifies the IP address of the NMS to access the MIB.                                                                    |

**Defaults** All communities are read only by default.

**Command mode** Global configuration mode.

**Usage Guide** This command is an essential command to enable the SNMP agent function, such as specifying the community attribute and IP addresses of NMS to access the MIB.  
To disable the SNMP agent function, use the **no snmp-server** command.

**Configuration Examples** The following example defines a SNMP community access string named public, which can be read-only.

```
Ruijie(config)# snmp-server community public ro
```

**Related Commands**

**mode**

**Usage Guide** N/A

**Configuration** The following example specifies the SNMP system contract i-net800@i-net.com.cn:

**Examples** Ruijie(config)# **snmp-server contact** i-net800@i-net.com.cn

**Related  
Commands**

| Command                 | Description                       |
|-------------------------|-----------------------------------|
| <b>show snmp-server</b> | Displays the SNMP configuration.  |
| <b>no snmp-server</b>   | Disables the SNMP agent function. |

**Platform** N/A

**Description**

## 1.8 snmp-server enable traps

Use this command to enable the SNMP agent to send the SNMP trap message to NMS. Use the **no** form of this command to disable the SNMP agent to send the SNMP trap message to NMS.

**snmp-server enable traps** [ *notification-type* ]

**no snmp-server enable traps**

**Parameter  
Description**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>notification-type</i> | Specifies the type of trap messages.<br>snmp: SNMP trap message<br>bgp: BGP trap message.<br>bridge: Bridge trap message.<br>isis: ISIS trap message.<br>mac-notification: MAC trap message.<br>ospf: OSPF trap message.<br>urpf: uRPF trap message.<br>vrrp: VRRP trap message.<br>web-auth: Web authentication trap message. |

**Defaults** Sending trap message to the NMS is disabled by default.

**Command** Global configuration mode.  
**mode**

**Usage Guide** This command must be used together with the **snmp-server host** command to send the trap

message. Specifying no trap type indicates all trap messages are sent.

**Configuration** The following example enables the SNMP agent to send the SNMP trap message.

**Examples**

```
Ruijie(config)# snmp-server enable traps snmp
Ruijie(config)# snmp-server host 192.168.12.219 public snmp
```

**Related  
Commands**

| Command                 | Description                                            |
|-------------------------|--------------------------------------------------------|
| <b>snmp-server host</b> | Specifies the SNMP host to send the SNMP trap message. |

**Platform** N/A

**Description**

## 1.9 snmp-server enable version

Use this command to configure the SNMP version. Use the **no** form of this command to disable the SNMP version.

**snmp-server enable version {v1 | v2c | v3}**

**no snmp-server enable version {v1 | v2c | v3}**

**Parameter  
Description**

| Parameter  | Description                    |
|------------|--------------------------------|
| <b>v1</b>  | Indicates the SNMP version 1.  |
| <b>v2c</b> | Indicates the SNMP version 2c. |
| <b>v3</b>  | Indicates the SNMP version 3.  |

**Defaults** By default, SNMPv3 is enabled, while SNMPv1 and SNMPv2c are disabled.

**Command  
mode** Global configuration mode.

**Usage Guide** N/A

**Configuration** The following example disables SNMP v1.

**Examples**

```
Ruijie(config)# no snmp-server enable version v1
```

**Related  
Commands**

| Command                  | Description                |

| <b>show snmp version</b> | Displays the SNMP version. |

**Platform** N/A

**Description**

## 1.10 snmp-server flow-control

Use this command to configure the SNMP flow control. Use the **no** form of this command to remove restore the default setting.

**snmp-server flow-control pps** [ *count* ]

**no snmp-server flow-control pps**

| Parameter Description | Parameter    | Description                                                                            |
|-----------------------|--------------|----------------------------------------------------------------------------------------|
|                       | <i>count</i> | Indicates the number of SNMP requests processed per second, ranging from 50 to 65,535. |

**Defaults** The default count is 300.

**Command mode** Global configuration mode.

**Usage Guide** N/A

**Configuration Examples** The following example configures the number of SNMP requests processed per second to 200.

```
Ruijie(config)# snmp-server flow-control pps 200
```

## 1.11 snmp-server group

Use this command to configure a new SNMP group. Use the **no** form of this command to remove a specified SNMP group.

**snmp-server group** *groupname* { **v1** | **v2c** | **v3** { **auth** | **noauth** | **priv** } } [ **read** *readview* ] [ **write** *writeview* ] [ **access** { [ **ipv6** *ipv6\_aclname* | *aclnum* | *aclname* } } ]

**no snmp-server group** *groupname* { **v1** | **v2c** | **v3** { **auth** | **noauth** | **priv** } }

| Parameter Description | Parameter                          | Description                                                                              |
|-----------------------|------------------------------------|------------------------------------------------------------------------------------------|
|                       | <b>v1</b>   <b>v2c</b>   <b>v3</b> | Specifies the SNMP version                                                               |
|                       | <b>auth</b>                        | Specifies authentication of a packet without encrypting it. This applies to SNMPv3 only. |

|                     |                                                                                                                         |
|---------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>noauth</b>       | Specifies no authentication a packet. This applies to SNMPv3 only.                                                      |
| <b>priv</b>         | Specifies authentication of a packet with encryption. This applies to SNMPv3 only.                                      |
| <i>readview</i>     | Specifies a read-only view for the SNMP group. This view enables you to view only the contents of the agent.            |
| <i>writeview</i>    | Specifies a write view for the SNMP group. This view enables you to enter data and configure the contents of the agent. |
| <i>aclnum</i>       | Access list number, which specifies the IPV4 addresses that are permitted to access the MIB.                            |
| <i>aclname</i>      | Name of the access list, which specifies the IPV4 addresses that are permitted to access the MIB.                       |
| <i>ipv6_aclname</i> | Name of the IPv6 access list, which specifies the IPv6 addresses that are permitted to access the MIB.                  |

**Defaults** No SNMP groups are configured by default.

**Command mode** Global configuration mode.

**Usage Guide** N/A

**Configuration** The following example configures a new SNMP group.

**Examples** Ruijie(config)# snmp-server group mib2user v3 priv read mib2

**Description**

## 1.12 snmp-server host

Use this command to specify the SNMP host (NMS) to send the trap message. Use the **no** form of this command to remove the specified SNMP host.

```
snmp-server host [ oob ] { host-addr | ipv6 ipv6-addr / domain domain-name } [ vrf vrfname ]
[ traps | informs ] [ version { 1 | 2c | 3 { auth | noauth | priv } } ] community-string [ udp-port
port-num ] [ via mgmt-name ] [ notification-type ]
no snmp-server host [ oob ] { host-addr | ipv6 ipv6-addr / domain domain-name } [ vrf vrfname ]
[ traps | informs ] [ version { 1 | 2c | 3 { auth | noauth | priv } } ] community-string [ udp-port
port-num ] [ via mgmt-name ]
```

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

| Description |                             |                                                                                                                                                                                                       |
|-------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             | <b>oob</b>                  | Indicates the out of band communication, that is, the trap messages are sent to the alarm server through the MGMT port. This option is available only when the device is equipped with the MGMT port. |
|             | <i>host-addr</i>            | SNMP host address                                                                                                                                                                                     |
|             | <i>ipv6-addr</i>            | SNMP host address(ipv6)                                                                                                                                                                               |
|             | <i>domain-name</i>          | Domain name of the SNMP host                                                                                                                                                                          |
|             | <i>vrfname</i>              | Set the name of vrf forwarding table                                                                                                                                                                  |
|             | <b>trap   informs</b>       | Enables the host to send the SNMP notification as traps or informs.                                                                                                                                   |
|             | <b>version</b>              | SNMP version: V1, V2C or V3                                                                                                                                                                           |
|             | <b>auth   noauth   priv</b> | Security level of SNMPv3 users                                                                                                                                                                        |
|             | <i>community-string</i>     | Community string or username (SNMPv3 version)                                                                                                                                                         |
|             | <i>port-num</i>             | Port of the SNMP host                                                                                                                                                                                 |
|             | <b>via mgmt-name</b>        | Specifies the MGMT port.                                                                                                                                                                              |
|             | <i>notification-type</i>    | The type of the SNMP trap message, such as <b>snmp</b> .<br>If no type of the SNMP trap message is specified, all types of the SNMP trap message will be included.                                    |

**Defaults** No SNMP host is specified by default.

**Command mode** Global configuration mode.

**Usage Guide** This command must be used together with the **snmp-server enable traps** command to send the SNMP trap messages to NMS.

Multiple SNMP hosts can be configured to receive the SNMP trap messages. One host can use different combinations of the types of the SNMP trap message, but the last configuration for the same host will overwrite the previous configurations. In other words, to send different SNMP trap messages to the same host, different combination of SNMP trap messages can be configured.

The **via** parameter can take effect only when the **oob** parameter is configured.

The **vrf** parameter cannot be used together with the **oob** parameter.

**Configuration** The following example specifies an SNMP host to receive the SNMP event trap:

**Examples** Ruijie(config) # **snmp-server host 192.168.12.219 public snmp**

**Description**

## 1.13 snmp-server inform

Use this command to configure the resend times for inform requests and the inform request timeout.

Use the **no** form of this command to restore the default settings.

**snmp-server inform** [ **retries** *retry-time* | **timeout** *time* ]

**no snmp-server inform**

| Parameter<br>Description | Parameter        | Description                                                            |
|--------------------------|------------------|------------------------------------------------------------------------|
|                          | <i>retry-num</i> | Specifies the resend times for inform requests, ranging from 0 to 255. |
|                          | <i>time</i>      | Specifies the inform request timeout, ranging from 0 to 21,474,836.    |

**Defaults** The default *retry-num* is 3, and the default **timeout** *time* is 15 seconds.

**Command mode** Global configuration mode.

**Usage Guide** N/A

**Configuration** The following example configures the resend times of inform requests to 5.

**Examples** Ruijie(config)# snmp-server inform retries 5

The following example configures the inform request timeout to 20 seconds.

Ruijie(config)# snmp-server inform timeout 20

**Description**

## 1.15 snmp-server logging

Use this command to enable the system to log the GET, GET-NETX and SET operations of NMS.

Use the **no** form of this command to disable the SNMP logging function.

**snmp-server logging { get-operation | set-operation }**

**no snmp-server logging { get-operation | set-operation }**

| Parameter Description | Parameter            | Description                                           |
|-----------------------|----------------------|-------------------------------------------------------|
|                       | <b>get-operation</b> | Logging function for the GET and GET-NEXT operations. |
|                       | <b>set-operation</b> | Logging function for the SET operation.               |

**Defaults** The SNMP logging function is enabled by default.

**Command mode** Global configuration mode.

**Usage Guide** This command is used to enable the logging function for the GET, GET-NETX and SET operations of NMS.

With the **get-operation** enabled, the SNMP agent logs the IP address of NMS, operation type and operation node OID during the GET and GET-NEXT operations.

With the **set-operation** enabled, the SNMP agent logs the IP address of NMS, operation type and operation node OID and related values during the SET operation.

A larger number of logs may affect the device performance. Under normal condition, it is recommended to disable the SNMP logging function.

**Configuration** The following example enables the logging function for the GET and SET operations:

**Examples**

```
Ruijie(config)#snmp-server logging get-operation
Ruijie(config)#snmp-server logging set-operation
```

The operation logs are displayed as below:

```
Ruijie#*Feb 7 15:31:16: %SNMP-6-GET_OPER: NMS source-ip(13.12.11.7)
operation(GET) object(id=1.3.6.1.2.1.1.5.0)
```

```
Ruijie#*Feb 7 15:32:16: %SNMP-6-GETN_OPER: NMS source-ip(13.12.11.7)
operation(GET-NEXT) object(id=1.3.6.1.2.1.1.5.0)
```

```
Ruijie#*Feb 7 15:33:23: %SNMP-6-SET_OPER: NMS source-ip(13.12.11.7)
operation(SET) object(id=1.3.6.1.2.1.1.5.0, value=ruijie)
```

The following example disables the logging function for the GET and SET operations:

```
Ruijie(config)#no snmp-server logging get-operation
Ruijie(config)#no snmp-server logging set-operation
```

## 1.16 snmp-server net-id

Use this command to configure the network element coding information of the device. Use the **no** form of this command to remove the network element coding information.

**snmp-server net-id** *text*

**no snmp-server net-id**

**Parameter  
Description**

| Parameter   | Description                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>text</i> | Configures the network element coding information of the device. The text length ranges from 1 to 255. The text is case-sensitive, and may contain spaces. |

**Defaults** No network element coding information is configured by default.

**Command** Global configuration mode.

**mode****Usage Guide** N/A**Configuration** The following example configures the network element coding text to FZ\_CDMA\_MSC1.**Examples**

```
Ruijie(config)# snmp-server net-id FZ_CDMA_MSC1
```

## 1.17 snmp-server packetsize

Use this command to specify the largest size of the SNMP packet. Use the **no** form of this command to restore the default value.

**snmp-server packetsize** *byte-count***no snmp-server packetsize****Parameter  
Description**

| Parameter         | Description                                        |
|-------------------|----------------------------------------------------|
| <i>byte-count</i> | Packet size. The range is from 484 to 17,876 bytes |

**Defaults** The default is 1,472 bytes.**Command  
mode** Global configuration mode.**Usage Guide** The following example specifies the largest size of SNMP packet as 1,492 bytes:

```
Ruijie(config)# snmp-server packetsize 1492
```

**Configuration** N/A**Examples****Related  
Commands**

| Command                         | Description                                                        |
|---------------------------------|--------------------------------------------------------------------|
| <b>snmp-server queue-length</b> | Specifies the length of the message queue for each SNMP trap host. |

**Platform** N/A

**Description**

## 1.18 snmp-server queue-length

Use this command to specify the length of the message queue for each SNMP trap host. Use the **no** form of this command to restore the default value.

**snmp-server queue-length** *length*

**no snmp-server queue-length**

| Parameter<br>Description | Parameter     | Description                                |
|--------------------------|---------------|--------------------------------------------|
|                          | <i>length</i> | Queue length. The range is from 1 to 1000. |

**Defaults** The default is 10.

**Command mode** Global configuration mode.

**Usage Guide** Use this command to adjust the length of message queue for each SNMP trap host for the purposes of controlling the speed of sending the SNMP trap messages.

**Configuration Examples** The following example specifies the length of message queue as 100.

```
Ruijie(config)# snmp-server queue-length 100
```

| Related<br>Commands | Command                       | Description                                    |
|---------------------|-------------------------------|------------------------------------------------|
|                     | <b>snmp-server packetsize</b> | Specifies the largest size of the SNMP packet. |

**Platform** N/A

**Description**

## 1.19 snmp-server system-shutdown

Use this command to enable the SNMP message reload function. Use the **no** form of this command to disable the SNMP message reload function.

**snmp-server system-shutdown**

**no snmp-server system-shutdown**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** The SNMP message reload function is disabled by default.

**Command** Global configuration mode.  
**mode**

**Usage Guide** Use this command to enable the SNMP message reload function which may enable the system to send the device reload traps to the NMS before the device is reloaded or rebooted.

**Configuration** The following example enables the SNMP message reload function:

**Examples** Ruijie(config)# snmp-server system-shutdown

## 1.20 snmp-server trap-format private

Use this command to configure the SNMP traps with private fields. Use the **no** form of this command to restore the default trap format.

**snmp-server trap-format private**

**no snmp-server trap-format private**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** The private field is not carried in the SNMP trap by default.

**Command** Global configuration mode.  
**mode**

**Usage Guide** Use this command to configure the SNMP trap format with the private field. Currently, the supported data in the private field is alarm occurrence time. For the specific data type and range of each field, refer to RUIJIE-TRAP-FORMAT-MIB.mib file.  
This command does not work if the traps are sent with SNMPv1.

**Configuration** The following example configures the SNMP trap format with the private field.

**Examples** Ruijie(config)# snmp-server trap-format private

## 1.21 snmp-server trap-source

Use this command to specify the source interface of the SNMP trap message. Use the **no** form of this command to restore the default value.

**snmp-server trap-source** *interface*

**no snmp-server trap-source**

| Parameter<br>Description | Parameter        | Description                                               |
|--------------------------|------------------|-----------------------------------------------------------|
|                          | <i>interface</i> | Specifies the source interface of the SNMP trap messages. |

**Defaults** By default, the IP address of the interface from which the SNMP packet is sent is just the source address.

**Command mode** Global configuration mode.

**Usage Guide** For easy management and identification, you can use this command to fix a local IP address as the SNMP source address.

**Configuration Examples** The following example specifies the IP address of Ethernet interface 0/1 as the source address of the SNMP trap message:

```
Ruijie(config)# snmp-server trap-source fastethernet 0/1
```

| Related<br>Commands | Command                         | Description                                                  |
|---------------------|---------------------------------|--------------------------------------------------------------|
|                     | <b>snmp-server enable traps</b> | Enables the SNMP agent to send the SNMP trap message to NMS. |
|                     | <b>snmp-server host</b>         | Specifies the NMS host to send the SNMP trap message.        |

**Platform** N/A

**Description**

## 1.22 snmp-server trap-timeout

Use this command to define the retransmission timeout time of the SNMP trap message. Use the **no** form of this command to restore the default value.

**snmp-server trap-timeout** *seconds*

**no snmp-server trap-timeout**

**Parameter  
Description**

| Parameter      | Description                                                                             |
|----------------|-----------------------------------------------------------------------------------------|
| <i>seconds</i> | Timeout (in seconds) of retransmit the SNMP trap message. The range is from 1 to 1,000. |

**Defaults** The default is 30 seconds.

**Command mode** Global configuration mode.

**Usage Guide** N/A

**Configuration** The following example specifies the timeout period as 60 seconds.

**Examples** Ruijie(config)# snmp-server trap-timeout 60

**Related  
Commands**

| Command                         | Description                                                   |
|---------------------------------|---------------------------------------------------------------|
| <b>snmp-server queue-length</b> | Specifies the length of message queue for the SNMP trap host. |
| <b>snmp-server host</b>         | Specifies the NMS host to send the SNMP trap message.         |
| <b>snmp-server trap-source</b>  | Specifies the source address of the SNMP trap message.        |

**Platform** N/A

**Description**

## 1.23 snmp-server udp-port

Use this command to specify a port to receive SNMP packets. Use the **no** form of this command to restore the default setting.

**snmp-server udp port** *port-number*

**no snmp-server udp port**

| <b>Parameter Description</b>  | Parameter                                                               | Description                                   |
|-------------------------------|-------------------------------------------------------------------------|-----------------------------------------------|
|                               | <i>port-number</i>                                                      | Specifies a port to receive the SNMP packets. |
| <b>Defaults</b>               | The default is 161.                                                     |                                               |
| <b>Command mode</b>           | Global configuration mode.                                              |                                               |
| <b>Usage Guide</b>            | N/A                                                                     |                                               |
| <b>Configuration Examples</b> | The following example specifies port 15000 to receive the SNMP packets. |                                               |
|                               | <pre>Ruijie(config)# snmp-server udp-port 15000</pre>                   |                                               |
| <b>Related Commands</b>       | Command                                                                 | Description                                   |
|                               | N/A                                                                     | N/A                                           |
| <b>Platform</b>               | N/A                                                                     |                                               |
| <b>Description</b>            |                                                                         |                                               |

## 1.24 snmp-server user

Use this command to configure a new user to an SNMP group. Use the **no** form of this command to remove a user from an SNMP group.

```
snmp-server user username groupname { v1 | v2c | v3 { [ encrypted ] [ auth { md5 | sha | sha2-256 | sha2-512 } auth-password ] [ priv { des56 | aes128 } priv-password ] [ access { ipv6 ipv6-aclname | aclnum | aclname } ] | interactive [ auth { md5 | sha | sha2-256 | sha2-512 } ] [ priv { des56 | aes128 } ] } [ access { ipv6 ipv6-aclname | aclnum | aclname } ] }
no snmp-server user username groupname { v1 | v2c | v3 }
```

| <b>Parameter Description</b> | Parameter        | Description                                              |
|------------------------------|------------------|----------------------------------------------------------|
|                              | <i>username</i>  | Name of the user on the host that connects to the agent. |
|                              | <i>groupname</i> | Name of the group to which the user belongs.             |

|                      |                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>v1   v2c   v3</b> | Specifies the SNMP version. But only SNMPv3 supports the following security parameters.                                                                                                                                                                                                                                                                                                    |
| <b>encrypted</b>     | Specifies whether the password appears in cipher text.<br>In cipher text format, you need to enter continuous hexadecimal numeric characters. Note that MD5 has an authentication password with length of 16 bytes, SHA has 20 bytes, SHA256 has 32 bytes, and SHA512 has 64 bytes. Two characters make a byte. The encrypted key can be used only by the local SNMP engine on the switch. |
| <b>auth</b>          | Specifies which authentication level should be used.                                                                                                                                                                                                                                                                                                                                       |
| <i>auth-password</i> | Password string (no more than 32 characters) used by the authentication protocol. The system will change the password to the corresponding authentication key.                                                                                                                                                                                                                             |
| <b>priv</b>          | Encryption mode. des56 refers to the 56-bit DES encryption protocol. aes128 refers to the 128-bit AES encryption protocol.<br><i>priv-password</i> : password string (no more than 32 characters) used for encryption. The system will change the password to the corresponding encryption key.                                                                                            |
| <b>md5</b>           | Enables the MD5 authentication protocol.                                                                                                                                                                                                                                                                                                                                                   |
| <b>sha</b>           | Enables the SHA authentication protocol.                                                                                                                                                                                                                                                                                                                                                   |
| <b>sha2-256</b>      | Enables the SHA256 authentication protocol.                                                                                                                                                                                                                                                                                                                                                |
| <b>sha2-512</b>      | Enables the SHA512 authentication protocol.                                                                                                                                                                                                                                                                                                                                                |
| <i>aclnumber</i>     | Access list number, which specifies the IPV4 addresses that are permitted to access the MIB.                                                                                                                                                                                                                                                                                               |
| <i>aclname</i>       | Name of the access list, which specifies the IPV4 addresses that are permitted to access the MIB.                                                                                                                                                                                                                                                                                          |
| <i>ipv6_aclname</i>  | Name of the IPv6 access list, which specifies the IPv6 addresses that are permitted to access the MIB.                                                                                                                                                                                                                                                                                     |
| <b>interactive</b>   | Configures the authentication and encrypted password string via the interactive method.                                                                                                                                                                                                                                                                                                    |

**Defaults** N/A

**Command mode** Global configuration mode.

**Usage Guide** N/A

**Configuration** The following example configures an SNMPv3 user with MD5 authentication and DES encryption:

**Examples**

```
Ruijie(config)# snmp-server user user-2 mib2user v3 auth md5 authpassstr priv
des56 despassstr
```

The following example uses the interactive method to configure an SNMPv3 user with MD5 authentication and DES encryption:

```
Ruijie(config)# snmp-server user mib2user mib2group v3 interactive auth md5
priv des56
Please configure the authentication password (1-32)
Enter Password:*****
Confirm Password:*****

Please configure the privacy password (1-32)
Enter Password:*****
Confirm Password:*****
```

## 1.25 snmp-server view

Use this command to configure an SNMP view. Use the **no** form of this command to remove an SNMP view.

**snmp-server view** *view-name oid-tree { include | exclude }*

**no snmp-server view** *view-name [ oid-tree ]*

**Parameter  
Description**

| Parameter        | Description                                             |
|------------------|---------------------------------------------------------|
| <i>view-name</i> | View name                                               |
| <i>oid-tree</i>  | Specifies the MIB object to associate with the view.    |
| <b>include</b>   | Includes the sub trees of the MIB object in the view.   |
| <b>exclude</b>   | Excludes the sub trees of the MIB object from the view. |

**Defaults** By default, a view is set to access all MIB objects.**Command  
mode** Global configuration mode.**Usage Guide** N/A**Configuration** The following example sets a view that includes all MIB-2 sub-trees (oid is 1.3.6.1).**Examples**

```
Ruijie(config)# snmp-server view mib2 1.3.6.1 include
```

**Description**

## 1.26 snmp-server enable version

Use this command to configure the SNMP version. Use the **no** form of this command to disable the SNMP version.

**snmp-server enable version {v1 | v2c | v3}**

**no snmp-server enable version {v1 | v2c | v3}**

**Parameter  
Description**

| Parameter  | Description                    |
|------------|--------------------------------|
| <b>v1</b>  | Indicates the SNMP version 1.  |
| <b>v2c</b> | Indicates the SNMP version 2c. |
| <b>v3</b>  | Indicates the SNMP version 3.  |

**Defaults** By default, SNMPv3 is enabled, while SNMPv1 and SNMPv2c are disabled.

**Command  
mode** Global configuration mode.

**Usage Guide** N/A

**Configuration** The following example disables SNMP v1.

**Examples** Ruijie(config)# no snmp-server enable version v1

**Description**

## 2 RMON Configuration Commands

### 2.1 rmon alarm

Use this command to monitor a MIB variable. Use the **no** form of this command to remove the alarm entry.

**rmon alarm** *number variable interval {absolute | delta} rising-threshold value [event-number] falling-threshold value [event-number] [owner ownername]*

**no rmon alarm** *number*

| Parameter   | Parameter                      | Description                                                                                                                                                                                                      |
|-------------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description | <i>number</i>                  | Alarm number. The value ranges from 1-65,535.                                                                                                                                                                    |
|             | <i>variable</i>                | Alarm variable. The value is a character string consisting of 1 to 255 characters in OID dotted format (the format is entry.integer.instance or a leaf node named .instance, for example. 1.3.6.1.2.1.2.1.10.1). |
|             | <i>interval</i>                | Sampling interval. The value ranges from 1 to 2,147,483,647 in the unit of second.                                                                                                                               |
|             | <b>absolute</b>                | Absolute sampling. In this mode, when the sampling time arrives, the system directly invokes the variable value.                                                                                                 |
|             | <b>delta</b>                   | Delta sampling. In this mode, when the sampling time arrives, the system invokes the delta value of the variable within the sampling interval.                                                                   |
|             | <b>rising-threshold value</b>  | Rising threshold and the corresponding event number when the threshold is reached. The threshold ranges from -2,147,483,648 to +2,147,483,647.                                                                   |
|             | <i>event-number</i>            | The event number ranges from 1 to 65,535.                                                                                                                                                                        |
|             | <b>falling-threshold value</b> | Falling threshold and the corresponding event number when the threshold is reached. The threshold ranges from -2,147,483,648 to +2,147,483,647.                                                                  |
|             | <b>owner ownername</b>         | Owner of an entry. The value is a character string consisting of 1 to 63 characters that are case sensitive.                                                                                                     |

**Default** N/A.

**Command mode** Global configuration mode.

**Usage guidelines** The RGOS allows you to modify the configured history information of the Ethernet network, including variable, absolute/delta, owner, rising-threshold/falling-threshold, and the corresponding events. However, the modification does not take effect immediately until the system triggers the monitoring event at the next time.

**Examples** The example below monitors the MIB variable instance ifInNUcastPkts.6.

```
Ruijie(config)# rmon alarm 10 1.3.6.1.2.1.2.2.1.12.6 30 delta
rising-threshold 20 1 falling-threshold 10 1 owner zhangsan
```

| Related commands | Command                                                                                                                                                  | Description               |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
|                  | <b>rmon event</b> <i>number</i> [ <b>log</b> ] [ <b>trap</b> <i>community</i> ]<br><b>description</b> <i>string</i> [ <b>owner</b> <i>owner-string</i> ] | Adds an event definition. |

## 2.2 rmon collection history

Use this command to enable history statistics on the Ethernet interface. Use the **no** form of this command to remove the history entry.

**rmon collection history** *index* [**owner** *ownername*] [**buckets** *bucket-number*] [**interval** *seconds*]

**no rmon collection history** *index*

| Parameter description | Parameter                              | Description                                                                                                                               |
|-----------------------|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>index</i>                           | Index of a history entry. The value ranges from 1 to 65,535.                                                                              |
|                       | <b>owner</b><br><i>ownername</i>       | Owner of an entry. The value is a character string consisting of 1 to 63 characters that are case sensitive.                              |
|                       | <b>buckets</b><br><i>bucket-number</i> | Capacity of a history entry (that is, the maximum number of history entries). The value ranges from 1 to 65,535. The default value is 10. |
|                       | <b>interval</b><br><i>seconds</i>      | Statistics period. The unit is second. The value ranges from 1 to 3,600. The default value is 1,800 seconds.                              |

**Default** N/A.

**Command mode** Interface configuration mode.

**Usage guidelines** The configured history control entry parameters cannot be modified. And the history entry can be removed from the interface where the entry configured.

**Examples** The example below enables log statistics on interface GigabitEthernet 0/1.

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#interface gigabitEthernet 0/1
Ruijie(config-GigabitEthernet0/1)#rmon collection history 1 owner UserA
buckets 5 interval 60
```

| Related commands | Command                                                                         | Description                                         |
|------------------|---------------------------------------------------------------------------------|-----------------------------------------------------|
|                  | <b>rmon collection stats</b> <i>index</i><br>[ <b>owner</b> <i>owner-name</i> ] | Adds a statistical entry on the Ethernet interface. |

## 2.3 rmon collection stats

Use this command to monitor an Ethernet interface. Use the **no** form of this command to remove the configuration.

**rmon collection stats** *index* [**owner** *owner-string*]

**no rmon collection stats** *index*

| Parameter   | Parameter                     | Description                                                                                                                            |
|-------------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| description | <i>index</i>                  | Index of the statistic table. The value ranges from 1 to 65,535.                                                                       |
|             | <b>owner</b> <i>ownername</i> | Owner of an entry. The value is a character string consisting of 1 to 63 characters that are case sensitive and do not contain spaces. |

**Default** N/A.

**Command mode** Interface configuration mode.

**Usage guidelines** N/A.

**Examples**

The example below enables monitoring the statistics of interface GigabitEthernet 0/1.

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#interface gigabitEthernet 0/1
Ruijie(config-GigabitEthernet0/1)# rmon collection stats 1 owner UserA
```

| Related commands | Command                                                                                                                                                     | Description                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
|                  | <b>rmon collection history</b> <i>index</i> [ <b>owner</b> <i>owner-name</i> ]<br><b>[buckets</b> <i>bucket-number</i> ] [ <b>interval</b> <i>seconds</i> ] | Adds a history control entry. |

## 2.4 rmon event

Use this command to define an event. Use the **no** form of this command to remove the event entry.

**rmon event** *number* [**log**] [**trap** *community*] [*description-string*] [**description** *description-string*] [**owner** *owner-name*]

**no rmon event** *number*

| Parameter   | Parameter                                    | Description                                                                                                    |
|-------------|----------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| description | <i>number</i>                                | Event number. The value ranges from 1 to 65,535.                                                               |
|             | <b>log</b>                                   | (Optional) Log event. When a log event is triggered, the system records a log.                                 |
|             | <b>trap</b> <i>community</i>                 | (Optional) Trap event. When a trap event is triggered, the system sends trap with the group named "community". |
|             | <b>description</b> <i>description-string</i> | (Optional) Description of the event. The value is a character string consisting of 1 to 127 characters.        |

|                                   |                                                                                                                         |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>owner</b><br><i>owner-name</i> | (Optional) Owner of an entry. The value is a character string consisting of 1 to 63 characters that are case sensitive. |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------|

**Default** N/A.

**Command mode** Global configuration mode.

**Usage guidelines** N/A.

**Examples**

The example below defines the event actions: log event and send trap message.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#rmon event 1 log trap public description "ifInNUcastPkts
is abnormal" owner UserA
```

**Related  
commands**

| Command                                                                                                                                                                      | Description          |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| <b>rmon alarm</b> <i>number variable interval {absolute   delta }<br/>rising-threshold value [event-number] falling-threshold<br/>value [event-number] [owner ownername]</i> | Adds an alarm entry. |

## 2.5 show rmon

Use this command to display the RMON configuration.

**show rmon**

**Default** N/A.

**Command mode** Privileged EXEC mode.

**Usage guidelines** N/A.

**Examples**

The example below displays the RMON configuration.

```
Ruijie#show rmon
ether statistic table:
    index = 1
    interface = GigabitEthernet 0/1
    owner = admin
    status = 0
    dropEvents = 61
    octets = 170647461
```

```
pkts = 580375
broadcastPkts = 2135
multiPkts = 3615
crcAlignErrors = 0
underSizePkts = 0
overSizePkts = 0
fragments = 0
jabbers = 0
collisions = 0
packets64Octets = 3254668
packets65To127Octets = 1833370
packets128To255Octets = 2098146
packets256To511Octets = 126716
packets512To1023Octets = 363621
packets1024To1518Octets = 1077865

rmon history control table:
    index = 1
    interface = GigabitEthernet 0/1
    bucketsRequested = 5
    bucketsGranted = 5
    interval = 60
    owner = UserA
    stats = 1

rmon history table:
    index = 1
    sampleIndex = 2485
    intervalStart = 7d:22h:56m:38s
    dropEvents = 0
    octets = 5840
    pkts = 27
    broadcastPkts = 0
    multiPkts = 0
    crcAlignErrors = 0
    underSizePkts = 0
    overSizePkts = 0
    fragments = 0
    jabbers = 0
    collisions = 0
    utilization = 0

rmon alarm table:
    index: 1
    interval: 60
```

```
oid = 1.3.6.1.2.1.2.2.1.12.6
sampleType: 2
alarmValue: 0
startupAlarm: 3
risingThreshold: 20
fallingThreshold: 10
risingEventIndex: 1
fallingEventIndex: 1
owner: UserA
status: 1

rmon event table:
    index = 1
    description = ifInNUcastPkts is abnormal
    type = 4
    community = public
    lastTimeSent = 0d:0h:0m:0s
    owner =UserA
    status = 1

rmon log table:
    eventIndex = 1
    index = 1
    logTime = 6 d:19 h:21 m:48 s
    logDescription = ifInNUcastPkts is abnormal
```

## 2.6 show rmon alarm

Use this command to display the RMON alarm table.

**show rmon alarm**

**Default** N/A.

**Command mode** Privileged EXEC mode.

**Usage guidelines** N/A.

**Examples** The example below displays the RMON alarm table.

```
Ruijie#show rmon alarm
rmon alarm table:
      index: 1
      interval: 60
      oid = 1.3.6.1.2.1.2.2.1.12.6
      sampleType: 2
      alarmValue: 0
      startupAlarm: 3
      risingThreshold: 20
      fallingThreshold: 10
      risingEventIndex: 1
      fallingEventIndex: 1
      owner: UserA
      status: 1
```

#### Related commands

| Command                                                                                                                                                                                                                                       | Description          |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| <b>rmon alarm</b> <i>number variable</i><br><i>interval {absolute   delta }</i><br><b>rising-threshold</b> <i>value</i><br><i>[event-number]</i> <b>falling-threshold</b> <i>value</i><br><i>[event-number]</i> <b>owner</b> <i>ownername</i> | Adds an alarm entry. |

## 2.7 show rmon event

Use this command to display the event configuration.

#### show rmon event

**Default** N/A.

**Command mode** Privileged EXEC mode.

**Usage guidelines** N/A.

The example below displays the event configuration.

```
Ruijie#show rmon event
rmon event table:
      index = 1
      description = ifInNUcastPkts is abnormal
      type = 4
      community = public
      lastTimeSent = 0d:0h:0m:0s
```

#### Examples

```

        owner =UserA
        status = 1

rmon log table:
        eventIndex = 1
        index = 1
        logTime = 6d:19h:21m:48s
        logDescription = ifInNUcastPkts is abnormal

```

### Related commands

| Command                                                                                                                                                            | Description          |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| <b>rmon event</b> <i>number</i> [ <b>log</b> ] [ <b>trap</b> <i>community</i> ] [ <b>description</b> <i>description-string</i> ] [ <b>owner</b> <i>ownername</i> ] | Adds an event entry. |

## 2.8 show rmon history

Use this command to display the history information.

**show rmon history**

**Default** N/A.

**Command mode** Privileged EXEC mode.

**Usage guidelines** N/A.

The example below displays the history information.

```

Ruijie#show rmon history
rmon history control table:
        index = 1
        interface = GigabitEthernet 0/1
        bucketsRequested = 5
        bucketsGranted = 5
        interval = 60
        owner = UserA
        stats = 1

rmon history table:
        index = 1
        sampleIndex = 2485
        intervalStart = 7d:22h:56m:38s
        dropEvents = 0
        octets = 5840
        pkts = 27

```

### Examples

```
broadcastPkts = 0
multiPkts = 0
crcAlignErrors = 0
underSizePkts = 0
overSizePkts = 0
fragments = 0
jabbers = 0
collisions = 0
utilization = 0
```

**Related  
commands**

| Command                                                                                                                                                   | Description                   |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| <b>rmon collection history</b> <i>index</i><br>[owner <i>ownername</i> ] [ <b>buckets</b><br><i>bucket-number</i> ] [ <b>interval</b><br><i>seconds</i> ] | Adds a history control entry. |

## 2.9 show rmon statistics

Use this command to display the RMON statistics.

**show rmon statistics**

**Default** N/A.

**Command mode** Privileged EXEC mode.

**Usage guidelines** N/A.

The example below displays the RMON statistics.

**Examples**

```
Ruijie#show rmon statistics
ether statistic table:
    index = 1
    interface = GigabitEthernet 0/1
    owner = admin
    status = 0
    dropEvents = 61
    octets = 170647461
    pkts = 580375
    broadcastPkts = 2135
    multiPkts = 3615
    crcAlignErrors = 0
    underSizePkts = 0
```

```
overSizePkts = 0
fragments = 0
jabbers = 0
collisions = 0
packets64Octets = 3254668
packets65To127Octets = 1833370
packets128To255Octets = 2098146
packets256To511Octets = 126716
packets512To1023Octets = 363621
packets1024To1518Octets = 1077865
```

|--------------------------------------------------------------------------------|---------------------------|
| <b>rmon collection stats</b> <i>index</i> [ <b>owner</b> <i>owner-string</i> ] | Adds a statistical entry. |

## 3 NTP Commands

### 3.1 no ntp

Use this command to disable Network Time Protocol (NTP), and clear all NTP configuration.

**no ntp**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** NTP is disabled by default.

**Command mode** Global configuration mode.

**Usage Guide** By default, NTP is disabled. However, once the NTP server or the NTP authentication is configured, the NTP service will be enabled.

**Configuration** The following example disables NTP.

**Examples** Ruijie(config)#**no ntp**

| Related<br>Commands | Command    | Description              |
|---------------------|------------|--------------------------|
|                     | ntp server | Specifies an NTP server. |

**Platform** N/A  
**Description**

### 3.2 ntp access-group

Use this command to configure an access group to control NTP access. Use the **no** form of this command to remove the peer access group.

**ntp access-group { peer | serve | serve-only | query-only } access-list-number | access-list-name**

**no ntp access-group { peer | serve | serve-only | query-only } access-list-number | access-list-name**

| Parameter<br>Description | Parameter | Description                                                           |
|--------------------------|-----------|-----------------------------------------------------------------------|
|                          | peer      | Allows the device to receive time requests and NTP control queries to |

|                           |                                                                                                                                                                          |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                           | synchronize itself to the servers specified in the access list.                                                                                                          |
| <b>serve</b>              | Allows the device to receive time requests and NTP control queries from the servers specified in the access list but not to synchronize itself to the specified servers. |
| <b>serve-only</b>         | Allows the device to receive only time requests from the servers specified in the access list.                                                                           |
| <b>query-only</b>         | Allows the device to receive only NTP control queries from servers specified in the access list.                                                                         |
| <i>access-list-number</i> | Access control list number, ranging from 1 to 99 and 1300 to 1999.                                                                                                       |
| <i>access-list-name</i>   | Access control list name.                                                                                                                                                |

**Defaults** No access rule to control NTP access is configured by default, namely, NTP access is granted to all devices.

**Command mode** Global configuration mode.

**Usage Guide** Use this command to configure an access group to control NTP access, providing a minimal security measures (more secure way is to use the NTP authentication mechanism).  
The NTP service enables the access group options to be scanned in the following order, from least restrictive to most restrictive: **peer**, **serve**, **serve-only**, **query-only**.  
If you do not configure any access groups, NTP access is granted to all devices. However, once you configure the access rule, NTP access is granted only to the devices specified in the access list.

 NTP control query is not supported in the current system. Although it matches with the order in accordance with the above rules, the related requests about the control and query are not supported.

**Configuration Examples** The following example shows how to allow the device to only receive time requests from the device of 192.168.1.1.

```
Ruijie(config)# access-list 1 permit 192.168.1.1
Ruijie(config)# ntp access-group serve-only 1
```

**Related Commands**

| Command               | Description                        |
|-----------------------|------------------------------------|
| <b>ip access-list</b> | Creates an IP access control list. |

**Platform Description** N/A

### 3.3 ntp authenticate

Use this command to enable NTP authentication. Use the **no** form of this command to disable NTP authentication.

**ntp authenticate**

**no ntp authenticate**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** Disabled.

**Command mode** Global configuration mode.

**Usage Guide** If NTP authentication is disabled, the synchronization communication is not encrypted. To enable encrypted communication on the server, enable the NTP authentication and configure other keys globally.

NTP authentication is implemented through the trusted key specified by the **ntp authentication-key** and **ntp trusted-key** commands.

**Configuration Examples** After an authentication key is configured and specified as the global trusted key, enable NTP authentication.

```
Ruijie(config)#ntp authentication-key 6 md5 woooooop
Ruijie(config)#ntp trusted-key 6
Ruijie(config)#ntp authenticate
```

| Related<br>Commands | Command                       | Description                         |
|---------------------|-------------------------------|-------------------------------------|
|                     | <b>ntp authentication-key</b> | Sets the global authentication key. |
|                     | <b>ntp trusted-key</b>        | Configures the global trusted key.  |

**Platform** N/A

**Description**

### 3.4 ntp authentication-key

Use this command to configure an NTP authentication key. Use the **no** form of this command to remove the NTP authentication key.

**ntp authentication-key** *key-id* **md5** *key-string* [*enc-type*]

**no ntp authentication-key** *key-id*

| Parameter<br>Description | Parameter         | Description                                                                                                                                                          |
|--------------------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <i>key-id</i>     | Key ID, ranging from 1 to 4294967295.                                                                                                                                |
|                          | <i>key-string</i> | Key string                                                                                                                                                           |
|                          | <i>enc-type</i>   | (Optional) Whether this key is encrypted, where, 0 indicates the key is not encrypted, 7 indicates the key is encrypted simply. The key is not encrypted by default. |

**Defaults** NTP authentication key is not configured by default.

**Command mode** Global configuration mode.

**Usage Guide** Use this command to configure an NTP authentication key and enables the **md5** algorithm for authentication. Each key presents a unique key ID, which can be configured as a trusted key using the **ntp trusted-key** command.

You can configure up to 1024 NTP authentication keys. However, each server can support only one key.

**Configuration Examples** The following example configures an NTP authentication key.

```
Ruijie(config)#ntp authentication-key 6 md5 woooooop
```

| Related<br>Commands | Command                 | Description                    |
|---------------------|-------------------------|--------------------------------|
|                     | <b>ntp authenticate</b> | Enables NTP authentication.    |
|                     | <b>ntp trusted-key</b>  | Configures an NTP trusted key. |
|                     | <b>ntp server</b>       | Specifies an NTP server.       |

**Platform** N/A

**Description**

### 3.5 ntp disable

Use this command to disable the device to receive NTP packets on the specified interface.

**ntp disable**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** All NTP packets can be received by default.

**Command**      Interface configuration mode.

**mode**

**Usage Guide**      The NTP message received on any interface can be provided to the client to carry out the clock adjustment. The function can be set to shield the NTP message received from the corresponding interface.

By default, the device receives NTP packets on all interfaces, and adjust clock for the client. You can use this command to disable the device to receive NTP packets on the specified interface.

 This command is configured only the interface that can receive and send IP packets.

**Configuration**      The following example disables the device to receive the NTP packets.

**Examples**      Ruijie(config-if)# no ntp disable

**Related  
Commands**

| Command | Description |
|---------|-------------|

**Platform**      N/A

**Description**

## 3.6 ntp master

Use this command to configure the device to act as an authoritative NTP server, synchronizing time to other devices. Use the **no** form of this command to remove the device as an authoritative NTP server.

**ntp master** [ *stratum* ]

**no ntp master**

**Parameter  
Description**

| Parameter      | Description                                                 |
|----------------|-------------------------------------------------------------|
| <i>stratum</i> | Stratum level. The range is from 1 to 15. The default is 8. |

**Defaults**      N/A

**Command**      Global configuration mode.

**mode**

**Usage Guide**      In general, the local device synchronizes time from the external time source directly or indirectly. However, if the time synchronization fails due to network connection trouble, you can use this command to configure the local device to act as an authoritative NTP server to synchronize time to other devices. Once configured, the device will not perform time synchronization with the time source which is of a higher stratum.

 Configuring the device to act as an authoritative NTP server (in particular, specify a lower stratum level), may be likely to overwrite the effective time. If multiple devices in the same network are configured with this command, the time synchronization may be instable due to the time difference between the devices.

 Before configuring this command, you need to manually correct the system clock to avoid too much bias if the device has never performed time synchronization with the external clock source.

**Configuration Examples** The following example configures the device to act as an authoritative NTP server, and sets the stratum level to 12:

```
Ruijie(config)# ntp master 12
```

**Related Commands**

**Platform** N/A  
**Description**

### 3.7 ntp server

Use this command to specify a NTP server for the NTP client. Use the **no** form of this command to delete the specified NTP server.

**ntp server** [ **oob** | **vrf** *vrf-name* ] { *ip-addr* | **domain** | **ip** *domain* | **ipv6** *domain* } [ **version** *version* ]  
 [ **source** *if-name* ] [ **key** *keyid* ] [ **prefer** ] [ **via** *mgmt-name* ]  
**no ntp server** *ip-addr*

**Parameter Description**

| Parameter                  | Description                                                                                                                                    |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | Specifies the virtual routing and forwarding (VRF) name. By default, this parameter is disabled.                                               |
| <b>oob</b>                 | (Optional) Accesses the NTP server from the MGMT interface. By default, this option is disabled.                                               |
| <i>ip-addr</i>             | Sets the IP address of the NTP server. The address can be in IPv4 or IPv6 format.                                                              |
| <i>domain</i>              | Sets the domain name of the NTP server, supporting IPv4 and IPv6.                                                                              |
| <i>version</i>             | (Optional) Specifies the NTP version (1-3). The default is NTPv3.                                                                              |
| <i>if-name</i>             | (Optional) Specifies the source interface from which the NTP message is sent (L3 interface).                                                   |
| <i>keyid</i>               | (Optional) Specifies the encryption key adopted when communication with the corresponding server. The key ID range is from 1 to 4,294,967,295. |

|                  |                                                                             |
|------------------|-----------------------------------------------------------------------------|
| <b>prefer</b>    | (Optional) Specifies the given NTP server as the preferred one.             |
| <i>mgmt-name</i> | (Optional) Specifies the egress MGMT interface for the packets in oob mode. |

**Defaults** No NTP server is configured by default.

**Command mode** Global configuration mode.

**Usage Guide** At present, RGOS system only supports clients other than servers. Up to 20 servers can be synchronized.

To carry out the encrypted communication with the server, set the global encryption key and global trusted key firstly, and then specify the corresponding key as the trusted key of the server to launch the encrypted communication of the server. It requires the server presents identical global encryption key and global trust key to complete the encrypted communication with the server.

In the same condition (for instance, precision), the prefer clock is used for synchronization.

 The source interface of NTP packets must be configured with the IP address and can be communicated with the peer.

**Configuration** The following example configures an NTP server.

**Examples** For IPv4: `Ruijie(config)# ntp server 192.168.210.222`  
 For IPv6: `Ruijie(config)# ntp server 10::2`

| <b>Related Commands</b> | Command       | Description   |
|-------------------------|---------------|---------------|
|                         | <b>no ntp</b> | Disables NTP. |

**Platform** N/A

**Description**

## 3.8 ntp service disable

Use this command to disable the time synchronization service provided by NTP. Use the **no** form of this command to enable the time synchronization service provided by NTP.

**ntp service disable**

**no ntp service disable**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** NTP provides the time synchronization service by default.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** NTP works in client/server mode. After the NTP device synchronizes time from an external reliable clock source, it serves as the time server to provide the time synchronization service. If the device just needs to be served as an NTP client, configure this command to disable the time synchronization service.

This command and the **ntp master** command are mutually exclusive. When **ntp master** is enabled, the time synchronization service cannot be disabled on the NTP server. If this command is configured, the **ntp master** command cannot be configured.

**Configuration Example** The following example disables the NTP time synchronization service.

**Example** Ruijie(config)# ntp service disable

**Verification** Run the **show run | in ntp** command to display the NTP configuration.

**Platform Description** Supported only by some products.

### 3.9 ntp trusted-key

Use this command to set a global trusted key. Use the **no** form of this command to remove the global trusted key.

**ntp trusted-key** *key-id*

**no ntp trusted-key** *key-id*

| Parameter Description | Parameter     | Description                                          |
|-----------------------|---------------|------------------------------------------------------|
|                       | <i>key-id</i> | Global trusted key ID, ranging from 1 to 4294967295. |

**Defaults** N/A

**Command mode** Global configuration mode.

**Usage Guide** The NTP communication parties must use the same trusted key. The key is identified by ID and is not transmitted to improve security.

**Configuration** The following example configures an authentication key and sets it as a trusted key.

**Examples**

```
Ruijie(config)#ntp authentication-key 6 md5 woooooop
Ruijie(config)#ntp trusted-key 6
Ruijie(config)#ntp server 192.168.210.222 key 6
```

**Description**

### 3.10 ntp update-calendar

Use this command to enable the NTP client to periodically update the device clock with the time synchronized from the external source clock. Use the **no** form of this command to remove this function.

**ntp update-calendar****no ntp update-calendar****Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

By default, update the calendar periodically is not configured.

**Command  
mode**

Global configuration mode.

**Usage Guide**

By default, the NTP update-calendar is not configured. After configuration, the NTP client updates the calendar at the same time when the time synchronization of external time source is successful. It is recommended to enable this function for keeping the accurate calendar.

**Configuration**

The following example configures the NTP update calendar periodically.

**Examples**

```
Ruijie(config)# ntp update-calendar
```

### 3.11 show ntp server

Use this command to display the NTP server configuration.

**show ntp server**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command mode** Privileged EXEC mode, global configuration mode, interface configuration mode, VLAN configuration mode

**Usage Guide** N/A

**Configuration** The following example displays the NTP server.

**Examples**

```
Ruijie# show ntp server
ntp-server                               source      keyid      prefer    version
-----
10::2                                   None        None        FALSE     3
192.168.210.222                         None        None        FALSE     3
```

**Description**

### 3.12 show ntp status

Use this command to display the NTP configuration.

**show ntp status**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command mode** Privileged EXEC mode, global configuration mode, interface configuration mode, VLAN configuration mode

**Usage Guide** Use this command to display the NTP configuration. No configuration is displayed before the synchronization server is configured for the first time.

**Configuration** The following example displays the NTP configuration.

**Examples**

```
Ruijie# show ntp status
Clock is synchronized, stratum 8, reference is 127.127.1.1
nominal freq is 250.0000 Hz, actual freq is 250.0000 Hz, precision is 2**24
reference time is D4BD819B.433892EE (01:27:55.000 UTC )
clock offset is 0.00000 sec, root delay is 0.00000 sec
root dispersion is 0.00002 msec, peer dispersion is 0.00002 msec
```

## 4 SNTP Commands

### 4.1 sntp enable

Use this command to enable the SNTP function. Use the **no** form of this command to restore the default value.

**sntp enable**  
**no sntp enable**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** SNTP is disabled by default.

**Command mode** Global configuration mode.

**Usage Guide** N/A

**Configuration Examples** The following example enables SNTP.

```
Ruijie(config) # sntp enable
```

| Related<br>Commands | Command          | Description                      |
|---------------------|------------------|----------------------------------|
|                     | <b>show sntp</b> | Displays the SNTP configuration. |

**Platform Description** N/A

### 4.2 sntp interval

Use this command to set the interval for the SNTP client to synchronize its clock with the NTP/SNTP server. Use the **no** form of this command to restore the default synchronization interval.

**sntp interval** *seconds*  
**no sntp interval**

| Parameter<br>Description | Parameter      | Description                                                                       |
|--------------------------|----------------|-----------------------------------------------------------------------------------|
|                          | <i>seconds</i> | Synchronization interval. The unit is second, and the range is from 60 to 65,535. |

- Defaults** The default synchronization interval is 1,800 seconds.
- Command mode** Global configuration mode.
- Usage Guide** To make the synchronization interval configuration effective, run the **sntp enable** command.

**Configuration** The following example configures the synchronization interval to 3,600 seconds.

**Examples**

```
Ruijie(config)# sntp interval 3600
```

| Related Commands | Command            | Description                      |
|------------------|--------------------|----------------------------------|
|                  | <b>sntp enable</b> | Enables SNTP.                    |
|                  | <b>show sntp</b>   | Displays the SNTP configuration. |
|                  |                    |                                  |

**Platform** N/A

**Description**

## 4.3 sntp server

Use this command to specify an SNTP server. Use the **no** form of this command to remove the SNTP/NTP server.

**sntp server** [ **oob** ] *ip-address* [ **via** *mgmt-name* ]

**no sntp server**

| Parameter Description | Parameter         | Description                                                                 |
|-----------------------|-------------------|-----------------------------------------------------------------------------|
|                       | <i>ip-address</i> | IP address of the SNTP server.                                              |
|                       | <b>oob</b>        | (Optional) Accesses the SNTP server from the MGMT interface.                |
|                       | <i>mgmt-name</i>  | (Optional) Specifies the egress MGMT interface for the packets in oob mode. |

- Defaults** No SNTP server is configured by default.
- Command mode** Global configuration mode.
- Usage Guide** As SNTP is fully compatible with NTP, the SNTP server can be used as an NTP server in Internet.

**Configuration** The following example specifies an SNTP server in Internet.

**Examples**

```
Ruijie(config)# sntp server 192.168.4.12
```

## 5 SPAN-RSPAN Commands

### 5.1 mac-loopback

Use this command to enable MAC loopback. Use the **no** form of this command to disable MAC loopback.

**mac-loopback [ remove-itag ]**

**no mac-loopback [ remove-itag ]**

| Parameter Description | Parameter          | Description                 |
|-----------------------|--------------------|-----------------------------|
|                       | <b>remove-itag</b> | Removes the inner VLAN tag. |

**Defaults** MAC loopback is disabled by default.

**Command mode** Interface configuration mode.

**Usage Guide** The MAC loopback feature must be enabled on the interfaces for purposes of local one-to-many mirroring. (Please enable the MAC loopback feature on the down interface, and do not add other configurations to the interface.)

**Configuration Examples** The following example configures a remote VLAN.

```
Ruijie(config)#vlan 100
Ruijie(config-vlan)#remote-span
Ruijie(config-vlan)#exit
```

The following example configures a session and specifies the mirrored port.

```
Ruijie(config)#monitor session 1 remote-source
Ruijie(config)#monitor session 1 source interface gigabitEthernet 4/1 both
```

The following example configures the mirroring port, and enables MAC loopback on the port.

```
Ruijie(config)#monitor session 1 destination remote vlan 100 interface
gigabitEthernet 4/2 switch
Ruijie(config)#interface gigabitEthernet 4/2
Ruijie(config-if-GigabitEthernet 4/2)#switchport access vlan 100
Ruijie(config-if-GigabitEthernet 4/2)#mac-loopback
```

The following example adds interfaces GigabitEthernet 4/3-4 to the remote VLAN.

```
Ruijie(config)#interface range gigabitEthernet 4/3-4
Ruijie(config-if-range)#switchport access vlan 100
```

Description

## 5.2 monitor session

Use this command to configure the SPAN session and specify the source port (monitored port).

**monitor session** *session-num* **source interface** *interface-id* [ **both** | **rx** | **tx** ]

Use this command to configure the SPAN session mirroring only the traffic permitted by the access list

**monitor session** *session-num* **source interface** *interface-id* **rx acl** *acl-name*

Use this command to configure the SPAN session and specify the destination port (monitoring port).

**monitor session** *session-num* **destination interface** *interface-id* [ **encapsulation replicate** | **switch** ]

Use this command to configure the SPAN session monitoring the CPU packets.

**monitor session** *session-num* **source interface** *interface-id* **tx cpu**

Use this command to configure the remote SPAN session ID on the source device.

**monitor session** *session-num* **remote-source**

Use this command to configure the remote SPAN session ID on the destination device.

**monitor session** *session-num* **remote-destination**

Use this command to configure the remote SPAN session and specify the remote SPAN destination VLAN.

**monitor session** *session-num* **destination remote vlan** *remote-vlan-id* **interface** *interface-id* [ **switch** ]

Use this command to configure the SPAN session and specify the source VLAN to monitor. Note that the source VLAN should not be a remote VLAN.

**monitor session** *session-num* **source vlan** *vlan-id* [ **rx** ]

Use this command to limit the SPAN source traffic to specific VLANs.

**monitor session** *session-num* **filter vlan** *vlan-id-list*

Use this command to remove the specified SPAN session, or remove the source port or destination port of the specified SPAN session.

**no monitor session** *session-num* [ **source interface** *interface-id* | **destination interface** *interface-id* ]

Use this command to remove the specified remote SPAN session, or remove the destination port of the remote SPAN session.

**no monitor session** *session-num* [ **destination remote vlan** *remote-vlan-id* **interface** *interface-id* ]

Use this command to remove all SPAN sessions.

**no monitor session all**

**default monitor session all**

Use this command to remove the specified remote SPAN session, or remove the destination port of the remote SPAN session.

**default monitor session** *session-num* { **destination remote vlan** *remote-vlan-id* **interface** *interface-id* }

Use this command to remove the specified SPAN session, or remove the source port or destination port of the SPAN session.

**default monitor session** *session-num* { **source interface** *interface-id* | **destination interface** *interface-id* }

**Parameter  
Description**

| Parameter                      | Description                                                                                                                                                          |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>session_number</i>          | SPAN session number                                                                                                                                                  |
| <i>interface-id</i>            | Interface name                                                                                                                                                       |
| <b>acl</b> <i>acl-name</i>     | Access list name                                                                                                                                                     |
| <i>remote-vlan-id</i>          | Remote VLAN ID                                                                                                                                                       |
| <i>vlan-id</i>                 | VLAN ID (remote VLAN excluded)                                                                                                                                       |
| <i>vlan-id-list</i>            | VLAN list (remote VLAN excluded)                                                                                                                                     |
| <b>rx</b>                      | Monitors the only received traffic.                                                                                                                                  |
| <b>tx</b>                      | Monitors the only transmitted traffic.                                                                                                                               |
| <b>both</b>                    | Monitors both received and transmitted traffic. This is the default.                                                                                                 |
| <b>encapsulation replicate</b> | Specifies that the destination port replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged). |
| <b>switch</b>                  | Enables switching on the destination port. Switching function is disabled by default.                                                                                |
| <b>cpu</b>                     | Monitors the CPU packets. This is disabled by default.                                                                                                               |

**Defaults** Port monitoring is disabled by default.

**Command** Global configuration mode.

**mode**

**Usage Guide** Use this command to configure SPAN or remote SPAN, and specify the source port or destination port.

If the **both**, **rx** or **tx** is not specified for the source port, the **both** parameter is the default.

Configuring an access list for the source port indicates that only the traffic permitted by the access list is monitored.

The **switch** and **encapsulation replicate** features are disabled on the destination port.

CPU packet monitoring, which is enabled through the **cpu** parameter, is disabled by default.

**Configuration** The following example configures the source port and destination port of the SPAN session.

**Examples**

```
Ruijie(config)# monitor session 1 source interface gigabitEthernet 0/1
Ruijie(config)# monitor session 1 destination interface gigabitEthernet 0/2
```

The following example configures the SPAN session mirroring only the traffic permitted by the access list.

```
Ruijie(config)# monitor session 3 source interface gigabitEthernet 0/3 rx acl
90
```

The following example configures a remote SPAN session.

```
Ruijie(config)# monitor session 10 remote-source
```

The following example configures the destination port of the remote SPAN session.

```
Ruijie(config)# monitor session 4 destination remote vlan 10 interface
gigabitEthernet 0/5
```

The following example configures the source VLAN of the SPAN session.

```
Ruijie(config)# monitor session 1 source vlan 1
```

The following example removes the SPAN session.

```
Ruijie(config)# no monitor session 1
```

The following example removes the source port and destination port of the SPAN session.

```
Ruijie(config)# no monitor session 1 source interface gigabitEthernet 0/18
Ruijie(config)# no monitor session 1 destination interface gigabitEthernet
0/18
```

The following example configures the SPAN session monitoring only the traffic sent from CPU.

```
Ruijie(config)# monitor session 3 source interface gigabitEthernet 0/3 tx cpu
```

The following example configures the SPAN session monitoring traffic, including the traffic sent from CPU.

```
Ruijie(config)# monitor session 3 source interface gigabitEthernet 0/3 tx cpu
Ruijie(config)# monitor session 3 source interface gigabitEthernet 0/3 tx
```

Description

## 5.3 remote-span

Use this command to configure a remote SPAN VLAN in VLAN configuration mode. Use the **no** form of this command to disable the remote SPAN VLAN.

**remote-span**

**no remote-span**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

Defaults Remote SPAN VLAN is disabled by default.

Command mode VLAN configuration mode.

Usage Guide N/A

Configuration The following example configures a remote SPAN VLAN.

Examples

```
Ruijie(config)# vlan 100
Ruijie(config-vlan)# remote-span
```

Description

## 5.4 show monitor

Use this command to display the SPAN configurations.

**show monitor** [ **session** *session\_number* ]

| Parameter<br>Description | Parameter             | Description                          |
|--------------------------|-----------------------|--------------------------------------|
|                          | <i>session_number</i> | Displays the specified SPAN session. |

**Defaults** N/A

**Command mode** Privileged EXEC mode, global configuration mode and interface configuration mode

**Usage Guide** N/A

**Configuration** This following example displays all SPAN sessions.

**Examples**

```
Ruijie(config)# show monitor
sess-num: 2
span-type: LOCAL_SPAN
src-intf:
TenGigabitEthernet 0/5      frame-type Both
dest-intf:
TenGigabitEthernet 0/6
sess-num: 1
span-type: LOCAL_SPAN
src-intf:
TenGigabitEthernet 0/3      frame-type Both
dest-intf:
```

The following example displays SPAN session 1.

```
Ruijie(config)# show monitor session 1
sess-num: 1
span-type: LOCAL_SPAN
src-intf:
TenGigabitEthernet 0/3      frame-type Both
dest-intf:
TenGigabitEthernet 0/4
```

## 6 ERSPAN Commands

### 6.1 capture-mode

Use this command to Configures the capture mode for mirroring the original packet. Use the **no** form of this command to restore the default capture mode.

**capture-mode** [ **all** | **truncate** ]

**no capture-mode** [ **all** | **truncate** ]

| Parameter<br>Description | Parameter       | Description                                                                                                                                            |
|--------------------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <b>all</b>      | Indicates that the entire original packet is mirrored                                                                                                  |
|                          | <b>truncate</b> | Indicates that the header byte of the original packet is mirrored. A specific number of header bytes to be mirrored is determined by the product chip. |

**Defaults** The default capture mode is **all**.

**Command mode** ERSPAN configuration mode

**Usage Guide** To return to privileged EXEC mode, enter the **end** command or the **Ctrl-C** key combination.  
To return to global configuration mode, enter the **exit** command.

**Configuration** The following example configures the capture mode to **truncate**.

**Examples**

```
Ruijie(config)# monitor session 2 erspan-source  
Ruijie(config-mon-erspan-src)#capture-mode truncate
```

## 6.3 ip dscp

Use this command to configure the DSCP value of the IP packets. Use the **no** form of this command to restore the default setting.

**ip dscp** *dscp-value*

**no ip dscp**

|                          |                                                                                                                                                                                     |                                                                  |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
| Parameter<br>Description | Parameter                                                                                                                                                                           | Description                                                      |
|                          | <i>dscp-value</i>                                                                                                                                                                   | The DSCP value of the IP packets. The value ranges from 0 to 64. |
| Defaults                 | The default DSCP value is 0.                                                                                                                                                        |                                                                  |
| Command<br>mode          | ERSPAN configuration mode                                                                                                                                                           |                                                                  |
| Usage Guide              | To return to privileged EXEC mode, enter the <b>end</b> command or use the <b>Ctrl-C</b> key combination.<br>To return to global configuration mode, enter the <b>exit</b> command. |                                                                  |

**Configuration** The following example configures the DSCP value of the IP packets.

**Examples**

```
Ruijie(config)# monitor session 2 erspan-source  
Ruijie(config-mon-erspan-src)#ip dscp 56
```

**Description**

## 6.4 ip ttl

Use this command to configure the TTL value of the IP packets. Use the **no** form of this command to restore the default setting.

**ip ttl** *ttl-value*

**no ip ttl**

| Parameter<br>Description | Parameter        | Description                                                      |
|--------------------------|------------------|------------------------------------------------------------------|
|                          | <i>ttl-value</i> | The TTL value of the IP packets. The value ranges from 1 to 255. |

**Defaults** The default TTL value is 64.

**Command mode** ERSPAN configuration mode

**Usage Guide** To return to privileged EXEC mode, enter the **end** command or use the **Ctrl-C** key combination.  
To return to global configuration mode, enter the **exit** command.

**Configuration** The following example configures the TTL value of IP packets.

**Examples**

```
Ruijie(config)# monitor session 2 erspan-source  
Ruijie(config-mon-erspan-src)#ip ttl 65
```

**Platform** N/A

**Description**

## 6.5 monitor session

Use this command to create an ERSPAN session. Use the **no** form of this command to delete the session.

**monitor session** *session\_num* { **erspan-source** }

**no monitor session** *session\_num*

| Parameter<br>Description | Parameter          | Description |
|--------------------------|--------------------|-------------|
|                          | <i>session-num</i> | Session ID  |

**Defaults** N/A

**Command mode** Global configuration mode

**Usage Guide** To return to privileged EXEC mode, enter the **end** command or the **Ctrl-C** key combination.  
To return to global configuration mode, enter the **exit** command.

**Configuration** The following example creates an ERSPAN session.

**Examples** Ruijie(config)# monitor session 2 erspan-source

| Related<br>Commands | Command             | Description                              |
|---------------------|---------------------|------------------------------------------|
|                     | <b>show monitor</b> | Displays the mirror session information. |

**Platform** N/A  
**Description**

## 6.6 origin ip address

Use this command to configure the source IP address for GRE encapsulation. Use the **no** form of this command to delete the source IP address.

**origin ip address** *ip\_address*

**no origin ip address**

| Parameter<br>Description | Parameter         | Description                                 |
|--------------------------|-------------------|---------------------------------------------|
|                          | <i>ip_address</i> | The source IP address of GRE encapsulation. |

**Defaults** N/A

**Command**      ERSPAN configuration mode  
**mode**

**Usage Guide**    To return to privileged EXEC mode, enter the **end** command or use the **Ctrl-C** key combination.  
To return to global configuration mode, enter the **exit** command.

**Configuration**    The following example configures the source IP address.

**Examples**

```
Ruijie(config)# monitor session 2 erspan-source  
Ruijie(config-mon-erspan-src)#origin ip address 11.1.1.2
```

| Related<br>Commands | Command             | Description                   |
|---------------------|---------------------|-------------------------------|
|                     | <b>show monitor</b> | Displays the mirror sessions. |

**Platform**        N/A  
**Description**

## 6.7 sampling-rate

Use this command to Configures the sampling frequency for mirroring. Use the **no** form of this command to restore the default value.

**sampling-rate** *rate*

**no sampling-rate**

| Parameter<br>Description | Parameter   | Description                                                                                                                                                                                        |
|--------------------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <i>rate</i> | Indicates the sampling frequency value, ranging from 1 to 1000000.<br>For example, if the sampling frequency is 100, one packet is sampled from 100 packets, that is, the sampling ratio is 100:1. |

**Defaults**        The default sampling frequency is 1:1, that is, each packet is sampled.

**Command**        ERSPAN configuration mode  
**mode**

**Usage Guide**    This function is valid only when the sampling frequency is configured on the SPAN source port.  
To return to privileged EXEC mode, enter the **end** command or use the **Ctrl-C** key combination.  
To return to global configuration mode, enter the **exit** command.

**Configuration**    The following example configures the sampling frequency to 1000.

**Examples**

```
Ruijie(config)# monitor session 2 erspan-source  
Ruijie(config-mon-erspan-src)#sampling-rate 1000
```

Description

## 6.8 shutdown

Use this command to shut down the session. Use the **no** form of this command to restore the default setting.

**Shutdown**

**no shutdown**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** The ERSPAN session is enabled by default.

**Command mode** ERSPAN configuration mode

**Usage Guide** To return to privileged EXEC mode, enter the **end** command or the **Ctrl-C** key combination.  
To return to global configuration mode, enter the **exit** command.

**Configuration** The following example shuts down ERSPAN session 2.

**Examples**

```
Ruijie(config)# monitor session 2 erspan-source
Ruijie(config-mon-erspan-src)#shutdown
```

Description

## 6.9 source interface

Use this command to configure the ERSPAN source interface. Use the **no** form of this command to delete this source interface.

**source interface** [ *single-interface* | **all** ] [ **rx** | **tx** | **both** ]

**no source interface** [ *single-interface* | **all** ] [ **rx** | **tx** | **both** ]

Use this command to configure the flow-based ERSPAN source interface and enable sampling. Use the **no** form of this command to delete this source interface.

**source interface** *single-interface* **rx acl** *acl-name* [ **sample** ]

**no source interface** *single-interface* **rx acl** *acl-name*

**Parameter  
Description**

| Parameter                  | Description                                              |
|----------------------------|----------------------------------------------------------|
| <i>single-interface</i>    | Source interface of the mirror.                          |
| <b>all</b>                 | Indicates global interfaces that support mirroring.      |
| <b>rx</b>                  | Receives only the traffic of Rx direction.               |
| <b>tx</b>                  | Receives only the traffic of Tx direction.               |
| <b>both</b>                | (Default ) Receives the traffic of Tx and Rx directions. |
| <b>acl</b> <i>acl-name</i> | ACL name.                                                |
| <b>sample</b>              | Indicates whether the sampling is enabled.               |

**Defaults** N/A

**Command mode** ERSPAN configuration mode

**Usage Guide** To return to privileged EXEC mode, enter the **end** command or use the **Ctrl-C** key combination.  
To return to global configuration mode, enter the **exit** command.

**Configuration Examples** The following example configures an ERSPAN source interface.

```
Ruijie(config)# monitor session 2 erspan-source
Ruijie(config-mon-erspan-src)#source interface gigabitethernet 0/1 both
```

The following example configures a flow-based ERSPAN source interface and enables sampling.

```
Ruijie(config)# monitor session 2 erspan-source
ruijie(config-mon-erspan-src)#source interface gigabitEthernet 0/3 rx acl 90
sample
```

## 6.10 vrf

Use this command to configure VRF. Use the **no** form of this command to restore the default setting.

**vrf** *vrf-name*

**no vrf**

### Parameter Description

| Parameter       | Description |
|-----------------|-------------|
| <i>vrf-name</i> | VRF name    |

### Defaults

VRF name is null by default.

### Command mode

ERSPAN configuration mode

### Usage Guide

To return to privileged EXEC mode, enter the **end** command or use the **Ctrl-C** key combination.  
To return to global configuration mode, enter the **exit** command.

**Configuration** The following example configures the VRF name.

### Examples

```
Ruijie(config)# monitor session 2 erspan-source  
Ruijie(config-mon-erspan-src)# vrf vrf-name
```

## 7 sFlow Commands

### 7.1 sflow agent

Use this command to configure the address of the sFlow Agent.

**sflow agent** { **address** { *ip-address* | **ipv6** *ipv6-address* } } | { **interface** { *interface-name* | **ipv6** *interface-name* } }

Use this command to delete the address of the sFlow Agent.

**no sflow agent** { **address** | **interface** }

Use this command to restore the default setting.

**default sflow agent** { **address** | **interface** }

| Parameter<br>Description | Parameter                         | Description                                   |
|--------------------------|-----------------------------------|-----------------------------------------------|
|                          | <b>address</b>                    | Configures the IP address of the sFlow Agent. |
|                          | <i>ip-address</i>                 | sFlow Agent IPv4 address.                     |
|                          | <b>ipv6</b> <i>ipv6-address</i>   | sFlow Agent IPv6 address.                     |
|                          | <b>interface</b>                  | Configures the interface of the sFlow Agent.  |
|                          | <i>interface-name</i>             | Interface of IPv4 address.                    |
|                          | <b>ipv6</b> <i>interface-name</i> | Interface of IPv6 address.                    |
|                          |                                   |                                               |

**Defaults** No sFlow Agent address is configured by default.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** This command is used to configure the Agent IP address field in the output sFlow datagram. The datagram not configured with this field cannot be output. The sFlow Agent address shall be a host address. When a non-host address (for example, a multicast or broadcast address) is configured as the sFlow Agent address, a message indicating configuration failure is displayed. It is recommended that the IP address of the sFlow Agent device be configured as the sFlow Agent address.

**Configuration Examples** The following example configures 192.168.2.1 as the sFlow Agent address.

```
Ruijie(config)# sflow agent address 192.168.2.1
```

**Verification** Use the **show sflow** command to display the sFlow configuration.

**Prompt** Prompt an error message when the address is invalid.

## 7.2 sflow collector *collector-id* destination

Use this command to configure the address of the sFlow Collector.

```
sflow collector collector-id destination { ip-address | ipv6 ipv6_address } udp-port [ [ vrf vrf-name ] | [ oob [ via mgmt mgmt-name ] ] ] [ description collector-name ]
```

Use this command to delete the address of the sFlow Collector.

```
no sflow collector collector-id destination { ip-address | ipv6 ipv6_address } udp-port [ [ vrf vrf-name ] | [ oob [ via mgmt mgmt-name ] ] ] [ description collector-name ]
```

Use this command to delete the address of the sFlow Collector.

```
default sflow collector collector-id destination { ip-address | ipv6 ipv6_address } udp-port [ [ vrf vrf-name ] | [ oob [ via mgmt mgmt-name ] ] ] [ description collector-name ]
```

| Parameter Description | Parameter                                | Description                                                                                                           |
|-----------------------|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
|                       | <i>collector-id</i>                      | sFlow Collector ID. The range is from 1 to 2.                                                                         |
|                       | <i>ip-address</i>                        | sFlow Collector IPv4 address                                                                                          |
|                       | <b>ipv6</b> <i>ipv6-address</i>          | sFlow Collector IPv6 address                                                                                          |
|                       | <i>udp-port</i>                          | sFlow Collector listening port number                                                                                 |
|                       | <b>vrf</b> <i>vrf-name</i>               | VRF instance name. It is not configured by default.                                                                   |
|                       | <b>oob</b>                               | The sampled traffics are output through the management interface. By default, this parameter is not configured.       |
|                       | <b>via mgmt</b> <i>mgmt-name</i>         | The management interface which the sampled traffics are output through. By default, this parameter is not configured. |
|                       | <b>description</b> <i>collector-name</i> | Description of the sFlow Collector.                                                                                   |

|                      |                                                                                                                                                                                                           |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>      | No sFlow Collector address is configured by default.                                                                                                                                                      |
| <b>Command Mode</b>  | Global configuration mode                                                                                                                                                                                 |
| <b>Default Level</b> | 14                                                                                                                                                                                                        |
| <b>Usage Guide</b>   | This command is used to configure the sFlow Collector address. The sFlow Collector address shall be a host address. When a non-host address (for example, a multicast or broadcast address) is configured |

as the sFlow Collector address, a message indicating configuration failure is displayed. The sFlow Collector monitors the sFlow datagram on the specified port. When the vrf parameter is configured, the corresponding VRF instance must exist. When you remove a VRF instance, the sFlow Collector address will be removed if this VRF instance is also configured for an sFlow Collector address. When the oob parameter is configured, a datagram is sent to the sFlow Collector through the management interface.

**Configuration Examples** The following example configures 192.168.1.100 as the address of sFlow Collector 1, 6343 as the port number and vrf 1 as the VRF instance.

```
Ruijie(config)# sflow collector 1 destination 192.168.2.100 6343 vrf vrf1
```

**Verification** Use the **show sflow** command to display the sFlow Collector.

**Prompt Messages** Prompt an error message when the address is invalid.

```
invalid host address.
```

```
No VPN exists.
```

```
vpn is not exist
```

**Common Errors** N/A

**Platforms** N/A

### 7.3 sflow collector *collector-id* max-datagram-size

Use this command to configure the maximum length of the output sFlow datagram.

**sflow collector *collector-id* max-datagram-size *datagram-size***

Use this command to restore the default maximum length of the output sFlow datagram.

**no sflow collector *collector-id* max-datagram-size**

Use this command to restore the default maximum length of the output sFlow datagram.

**default sflow collector *collector-id* max-datagram-size**

**Parameter Description**

| Parameter                                        | Description                                                                      |

## 7.4 sflow counter collector

Use this command to enable the sFlow Agent to send counter samples to the sFlow Collector.

**sflow counter collector** *collector-id*

Use this command to disable the sFlow Agent to send counter samples to the sFlow Collector.

**no sflow counter collector**

Use this command to disable the sFlow Agent to send counter samples to the sFlow Collector.

**default sflow counter collector**

| Parameter Description | Parameter           | Description                                   |
|-----------------------|---------------------|-----------------------------------------------|
|                       | <i>collector-id</i> | sFlow Collector ID. The range is from 1 to 2. |

**Defaults** Sending counter samples to the sFlow Collector is disabled by default.

**Command Mode** Interface configuration mode

**Default Level** 14

|                               |                                                                                                                                                                                                             |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guide</b>            | This command can be used for physical ports, SVI ports and sub routed ports and aggregate ports. sFlow datagrams can be output only when an IP address is configured for the corresponding sFlow Collector. |
| <b>Configuration Examples</b> | The following example enables interface TenGigabitEthernet 0/5 to send counter samples to sFlow Collector 2.<br><pre>Ruijie(config-if-TenGigabitEthernet 0/5)# sflow counter collector 2</pre>              |
| <b>Verification</b>           | Use the <b>show sflow</b> command to display the sFlow counter sampling configuration.                                                                                                                      |
| <b>Prompt Messages</b>        | N/A                                                                                                                                                                                                         |
| <b>Common Errors</b>          | N/A                                                                                                                                                                                                         |
| <b>Platforms</b>              | N/A                                                                                                                                                                                                         |

## 7.5 sflow counter interval

Use this command to configure the sFlow counter sampling interval.

**sflow counter interval** *seconds*

Use this command to restore the default sFlow counter sampling interval.

**no sflow counter interval**

Use this command to restore the default sFlow counter sampling interval.

**default sflow counter interval**

| Parameter Description | Parameter      | Description                                                                                |
|-----------------------|----------------|--------------------------------------------------------------------------------------------|
|                       | <i>seconds</i> | sFlow counter sampling interval. The range is form 3 to 2,147,483,647. The unit is second. |

**Defaults** The default sFlow counter sampling interval is 30 seconds.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** This command is used to configure the global sFlow counter sampling interval, and sFlow Counter sampling of all interfaces uses this sampling interval.

**Configuration** The following example configures the sFlow counter sampling interval to 60 seconds.

**Examples**

```
Ruijie(config)# sflow counter interval 60
```

**Verification** Use the **show sflow** command to display the sFlow counter sampling interval.

**Prompt Messages** N/A

**Common Errors** N/A

**Platforms** N/A

## 7.6 sflow flow collector

Use this command to enable the sFlow Agent to send flow samples to the sFlow Collector.

**sflow flow collector** *collector-id*

Use this command to disable the sFlow Agent to send flow samples to the sFlow Collector.

**no sflow flow collector**

Use this command to disable the sFlow Agent to send flow samples to the sFlow Collector.

**default sflow flow collector**

| Parameter Description | Parameter           | Description                                   |
|-----------------------|---------------------|-----------------------------------------------|
|                       | <i>collector-id</i> | sFlow Collector ID. The range is from 1 to 2. |

**Defaults** Sending the flow samples to the sFlow Collector is disabled by default.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide** This command can be used for physical ports, SVI ports, sub routed ports and aggregate ports. sFlow datagrams can be output only when an IP address is configured for the corresponding sFlow Collector.

**Configuration Examples** The following example enables interface TenGigabitEthernet 0/5 to send flow samples to sFlow Collector 2.

```
Ruijie(config-if-TenGigabitEthernet 0/5)# sflow flow collector 2
```

**Verification** Use the **show sflow** command to display the sFlow flow sampling configuration.

**Prompt Messages** N/A

**Common Errors** N/A

**Platforms** N/A

## 7.7 sflow flow max-header

Use this command to configure the maximum length of the packet header copied during flow sampling.  
**sflow flow max-header** *length*

Use this command to restore the default maximum length of the packet header copied during flow sampling.

**no sflow flow max-header**

Use this command to restore the default maximum length of the packet header copied during flow sampling.

**default sflow flow max-header**

| Parameter Description | Parameter     | Description                                                                                      |
|-----------------------|---------------|--------------------------------------------------------------------------------------------------|
|                       | <i>length</i> | Maximum length of the packet header to be copied. The range is from 18 to 256. The unit is byte. |

**Defaults** The default length is 64 bytes.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** Configure the maximum number of bytes of the packet content copied from the header of the original packet. The copied content is recorded in the generated sample.

**Configuration Examples** The following example sets the maximum length of the packet header copied during sFlow flow sampling to 128 bytes.

```
Ruijie(config)# sflow flow max-header 128
```

|                        |                                                                                                                         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Verification</b>    | Use the <b>show sflow</b> command to display the maximum length of the packet header copied during sFlow flow sampling. |
| <b>Prompt Messages</b> | N/A                                                                                                                     |
| <b>Common Errors</b>   | N/A                                                                                                                     |
| <b>Platforms</b>       | N/A                                                                                                                     |

## 7.8 sflow sampling-rate

Use this command to configure the sampling rate of sFlow flow sampling.

**sflow sampling-rate** *rate*

Use this command to restore the default the sampling rate of sFlow flow sampling.

**no sflow sampling-rate**

Use this command to restore the default sampling rate of sFlow flow sampling.

**default sflow sampling-rate**

| Parameter Description | Parameter   | Description                                                                                                                                                     |
|-----------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>rate</i> | Sampling rate of sFlow sampling. One packet is sampled from every <i>n</i> packets ( <i>n</i> equals the value of rate). The range is from 4,096 to 16,777,215. |

**Defaults** The default sFlow flow sampling rate is 8,192.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** This command is used to configure the global sampling rate of sFlow flow sampling, and sFlow flow sampling of all interfaces uses this sampling rate.

**Configuration Examples** The following example sets the sFlow flow sampling rate to 4,096.

```
Ruijie(config)# sflow sampling-rate 4096
```

**Verification** Use the **show sflow** command to display the sFlow flow sampling rate.

|                        |     |
|------------------------|-----|
| <b>Prompt Messages</b> | N/A |
| <b>Common Errors</b>   | N/A |
| <b>Platforms</b>       | N/A |

## 7.9 sflow source

Use this command to configure the source address of the output packets.

**sflow source { address { *ip-address* | ipv6 *ipv6-address* } } | { interface { *interface-name* | ipv6 *interface-name* } }**

Use this command to remove the source address of the output packets.

**no sflow source { address | interface }**

Use this command to restore the default source address of the output packets.

**default sflow source { address | interface }**

| Parameter Description | Parameter                         | Description                                              |
|-----------------------|-----------------------------------|----------------------------------------------------------|
|                       | <b>address</b>                    | Configures the source IP address of sFlow output packets |
|                       | <i>ip-address</i>                 | sFlow Source IPv4 address                                |
|                       | <b>ipv6</b> <i>ipv6-address</i>   | sFlow Source IPv6 address                                |
|                       | <b>interface</b>                  | Configures the source interface of sFlow output packets  |
|                       | <i>interface-name</i>             | sFlow Source interface (configured with an IPv4 address) |
|                       | <b>ipv6</b> <i>interface-name</i> | sFlow Source interface (configured with an IPv6 address) |

**Defaults** The default sFlow Source address is the local device IP address which is used to ping the destination IP

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** This command is used to configure the source IP address of the output packets. If a source interface is specified, the primary address of the interface will be the source IP address of the outputs packets. If the source interface is not specified, for example, the interface is shutdown, the default source address will be used.

**Configuration Examples** The following example configures the source address of the sFlow output packets as 192.168.2.1.

```
Ruijie(config)# sflow source address 192.168.2.1
```

**Verification** Use the **show sflow** command to display the status of the sFlow sampling function.

**Prompt Messages** N/A

**Common Errors** N/A

**Platforms** N/A

## 7.10 sflow enable

Use this command to enable flow sampling and counter sampling on the interface.

**sflow enable [ ingress [ acl *id* | *name* ] | egress ]**

Use this command to disable flow sampling and counter sampling on the interface.

**no sflow enable**

Use this command to disable flow sampling and counter sampling on the interface.

**default sflow enable**

**Parameter Description**

| Parameter      | Description                                  |
|----------------|----------------------------------------------|
| <b>ingress</b> | Enables sFlow sampling in ingress direction. |
| <b>egress</b>  | Enables sFlow sampling in egress direction.  |
| <i>id</i>      | ACL number.                                  |
| <i>name</i>    | ACL name.                                    |

**Defaults** The sFlow sampling function on an interface is disabled by default.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide** This command can be used to enable counter sampling and flow sampling for physical ports, SVI ports, sub routed ports and aggregate ports. sFlow datagram can be output only when an IP address is configured for the corresponding sFlow Collector.

If the direction parameter is not specified, sampling on both directions are enabled.

The SVI ports and sub routed ports support only the **ingress** parameter.

The ACL should be configured and applied on the interface before the flow sampling based on ACL matching is enabled.

Up to two commands for ingress ACL-based flow sampling are supported on an interface.

**Configuration Examples** The following example enables the sFlow sampling on interface TFGigabitEthernet 0/5 and enables ACL-based sFlow sampling on interface TFGigabitEthernet 0/3.

```
Ruijie(config-if-TenGigabitEthernet 0/5)# sflow enable
Ruijie(config-if-TFGigabitEthernet 0/5)# exit
Ruijie(config)#ip access-list extended test_v4
Ruijie(config-ext-nacl)#permit tcp any any
Ruijie(config-ext-nacl)# exit
Ruijie(config)#interface tfGigabitEthernet 0/3
Ruijie(config-if-TFGigabitEthernet 0/3)#sflow enable ingress acl test_v6
Ruijie(config-if-TFGigabitEthernet 0/3)#sflow enable ingress acl test_v4
Ruijie(config-if-TFGigabitEthernet 0/3)#show this
Building configuration...
!
no switchport
sflow enable ingress acl test_v6
sflow enable ingress acl test_v4
!
end
Ruijie(config-if-TFGigabitEthernet 0/3)#
```

**Verification** Use the **show sflow** command to display the status of the sFlow sampling function.

**Prompt Messages** N/A

**Common Errors** N/A

**Platforms** N/A

## 7.11 show sflow

Use this command to display the sFlow configuration.

**show sflow**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Command Mode** Privileged EXEC mode/global configuration mode/interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example displays the sFlow configuration.

**Examples**

```
Ruijie# show sflow
sFlow datagram version 5
Global information:
Agent IP: 10.10.10.10
sflow counter interval:10
sflow flow max-header:128
sflow sampling-rate:4096
Collector information:
ID   IP                               Port Size VRF
1    192.168.2.100                   6343 1400
2    NULL                            0    1400
Port information
Interface                               CID  FID  Enable
TenGigabitEthernet 0/1                  0    1    B
TenGigabitEthernet 0/2                  0    1    I
TenGigabitEthernet 0/3                  0    1    E
```

Field Description:

| Field                  | Description                                                                                                                                    |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| sFlow datagram version | sFlow datagram version.<br>Currently, Ruijie supports V5 only.                                                                                 |
| Agent IP               | IP address of the sFlow Agent. It can be configured by using the sflow Agent address { <i>ip-address</i>   <i>ipv6 ipv6-address</i> } command. |
| sflow counter interval | Counter sampling interval                                                                                                                      |
| sflow flow max-header  | The maximum length of bytes of the packet header to be copied                                                                                  |
| sflow sampling-rate    | Flow sampling rate                                                                                                                             |
| ID                     | sFlow Collector ID                                                                                                                             |
| IP                     | The IP address of the sFlow Collector to receive sFlow datagram                                                                                |
| Port                   | Port No. of the sFlow Collector to receive sFlow datagram                                                                                      |
| Size                   | The maximum length of the output sFlow datagram                                                                                                |
| VRF                    | VRF instance name of sFlow Collector                                                                                                           |
| Interface              | An interface configured with sFlow function                                                                                                    |
| CID                    | The destination sFlow Collector ID to which the sFlow Agent sends the counter samples.                                                         |
| FID                    | The destination sFlow Collector ID to which the sFlow Agent sends the flow samples.                                                            |
| Enable                 | The status of the sFlow sampling function                                                                                                      |

## 7.12 show sflow stats

Use this command to display the statistics of sFlow packets. (This command is provided for debugging.)  
**show sflow stats**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Command Mode** Privileged EXEC mode/global configuration mode/interface configuration mode

**Default Level** 14

**Usage Guide** This command is provided for debugging. The outputs of this command are for expert's analysis. The **sflow export packet num** field, which indicates the output packet count, is provided for simple query.

**Configuration** The following example displays sFlow statistics.

**Examples**

```
Ruijie#show sflow stats
sflow drop flow num:0
sflow drop invalid flow num:0
sflow receive flow num:0
sflow drop counter num:0
sflow receive counter num:0
sflow malloc fail num:0
sflow get counter fail num:0
sflow export packet num:0
sflow export fail num:0
sflow export flow num:0
sflow export counter num:0
sflow export sampler fail num:0
sflow current msg list len:0
```

Field Description:

| Field                       | Description                                              |
|-----------------------------|----------------------------------------------------------|
| sflow drop flow num         | The number of sFlow samples dropped by the sFlow agent.  |
| sflow drop invalid flow num | The number of invalid sFlow samples dropped by the sFlow |

|                               |                                                                                |
|-------------------------------|--------------------------------------------------------------------------------|
|                               | agent.                                                                         |
| sflow receive flow num        | The number of sFlow samples received by the sFlow agent.                       |
| sflow drop counter num        | The number of counter samples dropped by the sFlow agent.                      |
| sflow receive counter num     | The number of counter samples received by the sFlow agent.                     |
| sflow malloc fail num         | The number of failures about memory application.                               |
| sflow get counter fail num    | The number of failed counter samples obtained by the sFlow agent.              |
| sflow export packet num       | The number of packets output by the sFlow agent.                               |
| sflow export fail num         | The number of failed packets output by the sFlow agent.                        |
| sflow export flow num         | The number of sFlow samples output by the sFlow agent.                         |
| sflow export counter num      | The number of counter samples output by the sFlow agent.                       |
| sflow export sampler fail num | The number of failed samples, including the counter samples and sFlow samples. |
| sflow current msg list len    | The length of the message queue of the sFlow agent.                            |

## 8 IPFIX Commands

### 8.1 clear { ip | ipv6 } flow stats

Use this command to clear flow table information.

clear { ip | ipv6 } flow stats

| Parameter              | Parameter                                                                                                                                                                            | Description |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| Description            | N/A                                                                                                                                                                                  | N/A         |
| Command Mode           | Privileged EXEC mode                                                                                                                                                                 |             |
| Default Level          | 14                                                                                                                                                                                   |             |
| Usage Guide            | This command is used to clear flow table information, and then all entries will be aged.                                                                                             |             |
| Configuration Examples | The following example clears IP information.<br><pre>Ruijie# clear ip flow stats</pre><br>The following example clears IPv6 information.<br><pre>Ruijie# clear ipv6 flow stats</pre> |             |
| Prompt Message         | N/A                                                                                                                                                                                  |             |

### 8.2 [ ipv6 ] flow-sampler

Use this command to configure the sampling rate for an interface.

[ ipv6 ] flow-sampler *sampler-map-name* [ acl { id | name } | egress ]

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

|                    |                         |                                                                                                                                    |
|--------------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <b>ipv6</b>             | Configures the IPv6 packet sampling rate. By default, the sampling rate is valid to IPv4 packets if no protocol type is specified. |
|                    | <i>sampler-map-name</i> | Indicates the name of a sampling rate rule applied to an interface.                                                                |
|                    | <b>egress</b>           | Indicates the outbound direction. The configuration takes effect on the inbound direction if no direction is specified.            |
|                    | <b>id</b>               | Indicates the ACL ID.                                                                                                              |
|                    | <b>name</b>             | Indicates the ACL name.                                                                                                            |

**Defaults** No sampling rate rule is applied to an interface by default.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide**

1. A sampling rate rule needs to be configured before a sampling rate is configured for an interface.
2. This command cannot be used together with the **ip flow ingress** and **ip flow egress** commands. If they are configured together, the **flow-sampler [egress]** command has a higher priority than the **ip flow { ingress | egress }** command.
3. This command can be configured only on physical ports and Aggregate Ports (APs).
4. An ACL is applied only to inbound sampling by default. That is, if an ACL is configured or **egress** is not specified, the configured sampling rate rule is applied to inbound sampling. Configure an ACL before applying a sampling rate rule. After the ACL is applied to an interface, sampling is conducted on packets matching the ACL.

**Configuration** The following example configures the sampling rate for port 2/2.

**Examples**

```
Ruijie# config terminal
Ruijie(config)# flow-sampler-map my_sampler
Ruijie(config-sampler)# mode random one-out-of 666
Ruijie(config-sampler)# exit
Ruijie(config)# interface gi 2/2
Ruijie(config-if)# flow-sampler my_sampler
Ruijie(config-if)# exit
```

**Verification** Run the **show ip flow interface** command to check whether the configuration is successful.

**Prompt** 1. The sampling function fails to be enabled on an interface.

**Message**

```
Enable flow sampler failure.
```

2. The sampling rate rule does not exist.

```
sampler not exist.
```

## 8.3 flow-sampler-map

Use this command to enter the sampling rate rule configuration mode. Use the **no** form of this command to delete the sampling rate rule configuration mode.

**flow-sampler-map** *sampler-map-name*

**no flow-sampler-map** *sampler-map-name*

**Parameter  
Description**

| Parameter               | Description                                 |
|-------------------------|---------------------------------------------|
| <i>sampler-map-name</i> | Indicates the name of a sampling rate rule. |

**Defaults** No sampling rate rule is configured by default.

**Command  
Mode** Global configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example configures a sampling rate rule.

**Examples**

```
Ruijie# config terminal
Ruijie(config)# flow-sampler-map my_sampler
Ruijie(config-sampler)# mode random one-out-of 666
Ruijie(config-sampler)# exit
```

**Verification** Run the **show flow-sampler** command to check whether the configuration is successful.

## 8.4 { ip | ipv6 } flow egress

Use this command to enable IPFIX sampling on outbound packets on an interface. Use the **no** form of this command to restore the default settings.

**{ ip | ipv6 } flow egress**

**no { ip | ipv6 } flow egress**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** IPFIX sampling on outbound packets of an interface is disabled by default.

**Command  
Mode** Interface configuration mode

**Default Level** 14

- Usage Guide**
1. This command is used to enable the IPFIX flow statistics function on an interface of the switch. The IPFIX function can be enabled globally only after the { **ip** | **ipv6** } **flow egress** or { **ip** | **ipv6** } **flow ingress** command is configured on at least one interface.
  2. This command can be configured only on physical ports and APs.

**Configuration** The following example enables the IP flow statistics function in the outbound direction of port 0/1.

**Examples**

```
Ruijie(config)# interface gigabitEthernet 0/1
Ruijie(config-if)# ip flow egress
Ruijie(config-if)# exit
```

**Verification** Run the **show ip flow interface** command to check whether the configuration is successful.

**Prompt** The sampling fails to be enabled in the outbound direction.

**Message**

```
Enable flow egress failure.
```

## 8.5 { ip | ipv6 } flow ingress

Use this command to enable IPFIX sampling on inbound packets on an interface. Use the **no** form of this command to restore the default settings.

**{ ip | ipv6 } flow ingress**

**no { ip | ipv6 } flow ingress**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** IPFIX sampling on inbound packets of an interface is disabled by default.

**Command  
Mode** Interface configuration mode

**Default Level** 14

- Usage Guide**
1. This command is used to enable the IPFIX flow statistics function on an interface of the switch. The IPFIX function can be enabled globally only after the { **ip** | **ipv6** } **flow egress** or { **ip** | **ipv6** } **flow ingress** command is configured on at least one interface.
  2. This command can be configured only on physical ports and APs.

**Configuration** The following example enables the IP flow statistics function in the inbound direction of port 0/1.

**Examples**

```
Ruijie(config)# interface gigabitEthernet 0/1
Ruijie(config-if)# ip flow ingress
Ruijie(config-if)# exit
```

**Verification** Run the **show ip flow interface** command to check whether the configuration is successful.

**Prompt** The sampling function fails to be enabled in the inbound direction.

**Message**

```
Enable flow ingress failure.
```

## 8.6 { ip | ipv6 } flow-cache timeout

Use this command to set aging time for main mode flows. Use the **no** form of this command to restore the default settings.

{ **ip** | **ipv6** } **flow-cache timeout** { **active** *minutes* | **inactive** *seconds* }

**no** { **ip** | **ipv6** } **flow-cache timeout** { **active** | **inactive** }

**Parameter  
Description**

| Parameter                      | Description                                                                                                                                                                                                        |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>active</b> <i>minutes</i>   | Indicates the active aging time, in minutes, that is, the time that an active entry can exist in the main mode cache before export or deletion. The valid value range is from 1 to 60 and the default value is 30. |
| <b>inactive</b> <i>seconds</i> | Indicates the inactive aging time, in which no flow record about an entry is detected before the main mode entry is aged. The value ranges from 10 seconds to 600 seconds. The default value is 15 seconds.        |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>               | <p>The default active aging time of main mode entries is 30 minutes.</p> <p>The default inactive aging time of main mode entries is 15 seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Command Mode</b>           | Global configuration mode                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Usage Guide</b>            | <p>This command is used to set the active and inactive aging time for record entries in the main cache. If packets belonging to a flow are continuously detected, the flow is deemed active. If no packet belonging to a flow is detected within a period of time (inactive aging time), the flow is inactive and should be aged.</p> <hr/> <ul style="list-style-type: none"><li> Flows can be aged in three ways:</li><li> The aging time expires.</li><li> Flow aging can be triggered by the FIN or RST flag of TCP packets.</li><li> Commands can be executed to forcibly age all entries.</li></ul> <hr/> |
| <b>Configuration Examples</b> | <p>The following example sets the active aging time.</p> <pre>Ruijie(config)# ip flow-cache timeout active 20</pre> <p>Or:</p> <pre>Ruijie(config)# ipv6 flow-cache timeout active 20</pre> <p>The following example sets the inactive aging time.</p> <pre>Ruijie(config)# ip flow-cache timeout inactive 10</pre> <p>Or:</p> <pre>Ruijie(config)# ipv6 flow-cache timeout inactive 10</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Verification</b>           | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Prompt Message</b>         | <p>The following prompt is displayed when a configuration failure occurs:</p> <pre>Set ip flow cache timeout failure.</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 8.7 { ip | ipv6 } flow-export

Use this command to configure the server, to which main mode flow records are to be exported. Use the **no** form of this command to restore the default settings.

```
{ ip | ipv6 } flow-export { destination { ipv6 ipv6_addr | ip-address | hostname } udp-port [ [ vrf
vrf-name ] ] [ oob [ via mgmt mgmt-name ] ] } | version { 5 | 9 | 10 } | source interface-name |
template { refresh-rate packets | timeout-rate minutes | options { export-stats | refresh-rate
packets | timeout-rate minutes } | model model-id } | interface-type { port | vlan } }
```

```
no { ip | ipv6 } flow-export { destination { ipv6 ipv6_addr | ip-address | hostname } udp-port [ vrf
vrf-name ] | version | source | template { { refresh-rate | timeout-rate } | options { export-stats |
refresh-rate | timeout-rate } | model } | interface-type }
```

### Parameter Description

|-------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination</b> { <b>ipv6</b> <i>ipv6_addr</i>   <i>ip-address</i>   <i>hostname</i> } <i>udp-port</i> } | Indicates the host name or IP/IPv6 address of the server, to which main mode flow records should be sent, and the listening port number of the collector.                                                                                                                                                                                                                      |
| <b>vrf</b> <i>vrf-name</i>                                                                                  | Indicates the name of the VRF instance, to which the collector IP address belongs.                                                                                                                                                                                                                                                                                             |
| <b>oob</b>                                                                                                  | Indicates that sampled packets are exported from the management port. It is not configured by default.                                                                                                                                                                                                                                                                         |
| <b>via mgmt</b> <i>mgmt-name</i>                                                                            | Indicates the name of the management port for exporting sampled packets. It is not configured by default.                                                                                                                                                                                                                                                                      |
| <b>version</b> { 5   9   10 }                                                                               | Indicates the packet export format. <b>version 5</b> indicates that packets are exported in compliance with the Netflow V5 standard, <b>version 9</b> indicates that packets are exported in compliance with the Netflow V9 standard, and <b>version 10</b> indicates that packets are exported in compliance with the IETF standard. The default value is <b>version 10</b> . |
| <b>source</b> <i>interface-name</i>                                                                         | Uses the IP address of a configured interface as the source IP address for exporting packets.                                                                                                                                                                                                                                                                                  |
| <b>template</b>                                                                                             | Enables template output. If this field is configured, <b>refresh-rate</b> or <b>timeout-rate</b> or both can be configured.                                                                                                                                                                                                                                                    |
| <b>refresh-rate</b> <i>packets</i>                                                                          | Specifies the template retransmission frequency, with the unit of packets. The value ranges from 1 to 600 and the default value is 20.                                                                                                                                                                                                                                         |
| <b>timeout-rate</b> <i>minutes</i>                                                                          | Specifies the template retransmission interval, with the unit of                                                                                                                                                                                                                                                                                                               |

|                                                     |                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                     | minutes. The value ranges from 1 to 3600 and the default value is 10.                                                                                                                                                                                                                                                                                         |
| <b>options</b>                                      | Enables the keywords <b>export-stats</b> , <b>refresh-rate</b> , and <b>timeout-rate</b> to configure data output options.                                                                                                                                                                                                                                    |
| <b>export-stats</b>                                 | Enables the export of option data packets, including the number of exported IPFIX packets and number of exported IPFIX flow records.                                                                                                                                                                                                                          |
| <b>refresh-rate</b> <i>packets</i>                  | Sets the retransmission frequency of option data, with the unit of packets. The value ranges from 1 to 600. The default value is 20.                                                                                                                                                                                                                          |
| <b>timeout-rate</b> <i>minutes</i>                  | Sets the retransmission interval of option data, with the unit of minutes. The value ranges from 1 minute to 3600 minutes. The default value is 10 minutes.                                                                                                                                                                                                   |
| <b>interface-type</b> { <b>port</b>   <b>vlan</b> } | Indicates the type of the device interface for exporting flow statistics to the IPFIX server.<br><br>port Displays the physical port.<br><br>vlan Displays the VLAN interface.<br><br>The default interface type is <b>port</b> .                                                                                                                             |
| <b>model</b> <i>model-id</i>                        | Indicates the template mode ID. The value can be 0 or 1 and the default value is 0. Template mode 0 indicates that an inbound sampling template and an outbound sampling template exist. Template mode 1 indicates that the sampling direction is not differentiated and statistics in the inbound and outbound directions are recorded in the same template. |

**Defaults**

No destination address and port for exporting flow records are configured by default.

The default data template retransmission frequency is 20 packets and the default retransmission interval is 10 minutes.

No output option is enabled by default.

The default packet output format is **version 10**.

The default interface type is **port**.

**Command  
Mode**

Global configuration mode

**Default Level** 14

**Usage Guide**

After the IPFIX function is enabled, you can run the { **ip | ipv6** } **flow-export destination** command to configure the server, to which IPFIX flow records are to be exported. Generally, the flow record processing software runs on the server to process flow records exported from the device. This command supports at most two combinations of destination IP/IPv6 addresses and ports. The purpose is to export flow records to two different servers to achieve redundancy. Therefore, two different destination IP addresses are generally configured. You can also configure the same destination IP address with different destination ports. In this case, you will receive a warning, indicating that you have configured two servers with the same IP/IPv6 addresses.

When the source interface is specified, the source address of the IPFIX packets to be exported is the main address of the interface (the IPv6 address is the first global IPv6 address of the interface).

When no source interface is specified, the source address of the IPFIX packets to be exported is the local address that best-matches the server address. The server address can be an IPv4 or IPv6 address or both. If the source interface is specified and the server address is set to an IPv6 address, ensure that an IPv6 address is configured for the source interface. If the server address is set to an IPv4 address, ensure that an IPv4 address is configured for the source interface. Otherwise, the system obtains the best-matched local address as the source address based on the server address. You must ensure that the source interface and the server, to which flow records are to be exported, belong to the same VRF instance. Otherwise, the system obtains the best-matched local address as the source address based on the server address.

 The server address can be an IPv4 or IPv6 address or both. A maximum of two addresses can be configured. If the source interface is specified and the server address is set to an IPv6 address, ensure that an IPv6 address is configured for the source interface. If the server address is set to an IPv4 address, ensure that an IPv4 address is configured for the source interface. Otherwise, the system obtains the best-matched local address as the source address based on the server address.

When the flow statistics function is enabled on a physical port that is a member interface of SVI, the statistics port can be an SVI or layer-2 physical port. Users can use this command to configure the port type (physical port or SVI) to be displayed (sent to the server). If a physical port is a routing port, the physical port cannot belong to any VLAN. Therefore, the port for exporting IP packet flows to the IPFIX server is a physical port regardless of whether the **ip flow-export interface-type** command is configured.

**Configuration Examples**

The following example configures the destination address, to which IPFIX main mode flow records are to be exported.

```
Ruijie(config)# ip flow-export destination 10.42.42.1 9991
Ruijie(config)# ipv6 flow-export destination
```

The following example configures multiple destination addresses, to which IPFIX main mode flow

records are to be exported (two addresses are supported currently).

```
Ruijie(config)# ip flow-export destination 10.42.42.1 9991
Ruijie(config)# ip flow-export destination 10.0.101.254 9991
Ruijie(config)# ipv6 flow-export destination ipv6 1111::1111 9991
```

The following example configures multiple destination addresses, to which IPFIX main mode flow records are to be exported.

```
Ruijie(config)# ip flow-export destination 10.42.42.1 9991
Ruijie(config)# ip flow-export destination 10.42.42.2 9992
```

The following example configures the retransmission rate of the main mode data template.

```
Ruijie(config)# ip flow-export template refresh-rate 100
Ruijie(config)# ip flow-export template timeout-rate 60
Ruijie(config)# ipv6 flow-export template refresh-rate 100
Ruijie(config)# ipv6 flow-export template timeout-rate 60
```

The following example configures the type of interface that exports traffic statistics to the IPFIX server.

```
Ruijie(config)# ip flow-export interface-type port
Ruijie(config)# no ip flow-export interface-type
```

## Verification

Run the **show { ip | ipv6 } flow export** command to display output information.

## Prompt Message

The following prompt is displayed when the address and port of the server, to which flow records are to be exported, fail to be configured.

```
Set ip flow export destination failure.
```

If two servers are configured to have the same address but different port numbers, the following prompt is displayed.

```
%%Warning:Destination address is the same as previous address [ ip-address |
ipv6_addr ] udp port [ udp-port ]
```

The following prompt is displayed, indicating a configuration failure when the third server address is configured.

```
%%Error:Exceeded maximum export destinations
```

The following domain name resolution prompt is displayed when a domain name is configured.

```
Translating "[ hostname ]"...
```

The domain name resolution is successful.

```
"[ hostname ]" Translated to an invalid address [ ip-address | ipv6_addr ]
```

The domain name resolution fails.

```
"[ hostname ]" Translating fail!
```

## 8.8 mode

Use this command to configure a random sampling rate rule.

**mode random one-out-of** *packet-interval*

The **no** form of this command does not exist. The random sampling rate rule configuration is deleted when the sampling rate rule configuration mode is deleted.

| Parameter<br>Description | Parameter              | Description                                                                                  |
|--------------------------|------------------------|----------------------------------------------------------------------------------------------|
|                          | <i>packet-interval</i> | Indicates that one packet is randomly sampled in consecutive <b>packet-interval</b> packets. |

**Defaults** No random sampling rate rule is defined by default.

**Command Mode** IPFIX sampling rate rule configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Examples** The following example configures the sampling rate for port 2/2.

```
Ruijie# config terminal
```

```

Ruijie(config)# flow-sampler-map my_sampler
Ruijie(config-sampler)# mode random one-out-of 666
Ruijie(config-sampler)# exit
Ruijie(config)# interface gi 2/2
Ruijie(config-if)# flow-sampler my_sampler
Ruijie(config-if)# exit

```

**Verification** Run the **show flow-sampler** command to check whether the configuration is successful.

## 8.9 show flow-sampler

Use this command to display a random sampling rate rule and sampling statistics.

**show flow-sampler** [ *sampler-map-name* ]

### Parameter Description

| Parameter               | Description                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>sampler-map-name</i> | Indicates the name of a random sampling rate rule. If it is not specified, all random sampling rate rules will be displayed. |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

### Usage Guide

**Configuration** The following example displays a random sampling rate rule.

### Examples

```

Ruijie# show flow-sampler my_sampler
Sampler : my_sampler, id : 1, mode : random sampling mode
sampling interval is : 666

```

Field description:

| Field   | Description                         |
|---------|-------------------------------------|
| Sampler | Name of a random sampling rate rule |

|                   |                                                                       |
|-------------------|-----------------------------------------------------------------------|
| id                | ID of a random sampling rate rule                                     |
| mode              | Random sampling rate rule. The value is <b>random sampling mode</b> . |
| sampling interval | Sampling interval                                                     |

## 8.10 show { ip | ipv6 } flow cache

Use this command to display information about the main mode flow table.

**show { ip | ipv6 } flow cache**

### Parameter Description

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

### Command Mode

Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** This command is used to display information about the main mode flow table and flow records.

**Configuration** The following example displays the main mode flow table.

### Examples

```
Ruijie# show ip fl cache
IPFIX NMM(slot-2):
    IPV4 Flow Switching Cache, 1160 bytes
    5 active, 65531 inactive, 87118 added
    0 flow alloc failures
    Exporting flows to 10.0.0.0 (9996)
    39009 ipv4 flows exported in 19199 udp datagrams, 0 failed
    Last clearing of statistics 11 Days 21:55:19

|-----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| active                      | Number of flow records in the current flow table                                                                           |
| inactive                    | Number of flow records that can be created in the current flow table. The symbol "-" is displayed if no value is obtained. |
| added                       | Number of flow records created from the last flow table clearing time to current display time                              |
| flow alloc failures         | Number of flows that fail to be created                                                                                    |
| Exporting flows to          | Address and port number of the server, to which flow records are exported                                                  |
| ipv4 flows exported         | Number of exported flows, packet format, and number of packets that fail to be exported                                    |
| Last clearing of statistics | Time elapsed from the last flow table clearing operation to the current display                                            |

|                   |                                                                           |
|-------------------|---------------------------------------------------------------------------|
| SrcIf             | Source interface                                                          |
| SrcIPAddress      | Source IP address/IPv6 address                                            |
| DstIf             | Destination interface                                                     |
| DstIPAddress      | Destination IP address/IPv6 address                                       |
| Pr                | Protocol ID                                                               |
| Tos               | ToS field in packets                                                      |
| Flgs              | TCP flag or operation result of all packets in the flow records           |
| Pkts              | Number of packets                                                         |
| Port              | Source port and destination port                                          |
| Msk               | Length of subnet mask of the source IP address and destination IP address |
| AS                | Source AS number and destination AS number                                |
| NextHop           | IP address of the next-hop AS                                             |
| B/Pk              | Average number of bytes in each packet                                    |
| Active            | Active time of a flow                                                     |
| Protocol          | Protocol type                                                             |
| Total Flows       | Total number of flows of a protocol type                                  |
| Flows /Sec        | Average number of flows per second                                        |
| Packets/Flow      | Average number of packets in each flow                                    |
| Bytes/Pkt         | Average number of bytes in each packet                                    |
| Packets/Sec       | Average number of packets per second                                      |
| Active(Sec) /Flow | Average active time of each flow                                          |
| Idle(Sec) /Flow   | Average idle time of each flow                                            |
| Pos:Lbl-Exp-S     | Label position: label-EXP label-whether the label is a stack bottom label |
| LDP/2.2.2.2       | Top label type and address                                                |
| RD                | Routing domain                                                            |
| VRF Name          | VRF instance name                                                         |

**Prompt** The main mode is not enabled.

**Message** Cache Disabled

## 8.11 show { ip | ipv6 } flow export

Use this command to display information about the server, to which flow records are exported.

**show { ip | ipv6 } flow export**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Command  
Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** This command is used to display exported information of all modes.

**Configuration** The following example displays information about the server, to which flow records are exported.

**Examples**

```
Ruijie# show ip flow export
IPV4 main Cache:
    Exporting flows to 1.1.1.3 (9996)
    Exporting using source IP address 1.1.1.1
    Version 10 flow records
    IPV4 Template ID = 256
        Template timeout = 10 Minute(s)
        Template refresh rate = 20
    0 flows exported in 0 udp datagrams
    0 flows failed to export
    0 messages failed to export
```

Field description:

| Field                               | Description                                                        |
|-------------------------------------|--------------------------------------------------------------------|
| IPv4 main Cache                     | Display mode                                                       |
| Exporting flows to                  | IP address and port number of the server                           |
| Exporting using source IP address   | Source IP address of exported packets                              |
| Version                             | IPFIX version of exported packets                                  |
| IPv4 Template ID                    | Template ID of exported packets                                    |
| Template timeout                    | Template packet retransmission interval, with the unit of minutes  |
| Template refresh rate               | Template packet retransmission frequency, with the unit of packets |
| 0 flows exported in 0 udp datagrams | Number of exported flows and packets                               |
| flows failed to export              | Number of flows that fail to be exported                           |
| messages failed to export           | Number of packets that fail to be exported                         |

## 8.12 show ip flow interface

Use this command to display the IPFIX configuration of an interface.

**show ip flow interface**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** This command can be used to display the IPFIX configuration, including IPFIX IPv4 configuration and IPFIX IPv6 configuration of all interfaces.

**Configuration** The following example displays the IPFIX configuration of an interface.

**Examples**

```
Ruijie# show ip flow interface
Ruijie# show ip flow interface
GigabitEthernet 0/1
    ip flow ingress
```

Field description:

| Field           | Description                                                         |
|-----------------|---------------------------------------------------------------------|
| ip flow ingress | The <b>ip flow interface</b> command is configured on an interface. |

## 9 NETCONF Commands

### 9.1 netconf capability candidate

Use this command to enable the candidate and confirmed-commit capabilities of NETCONF. Use the **default** form of this command to restore the default settings. Use the **no** form of this command to disable the candidate and confirmed-commit capabilities of NETCONF.

**netconf capability candidate**

**default netconf capability candidate**

**no netconf capability candidate**

| Parameter Description        | Parameter                                                                                                                                                                                                                                                        | Description |

| <b>Common Errors</b>         | N/A                                                                                                                                                                                                                                                              |             |
| <b>Platform Description</b>  | N/A                                                                                                                                                                                                                                                              |             |

## 9.2 netconf capability rollback

Use this command to enable the rollback-on-error capability of NETCONF. Use the **default** form of this command to restore the default settings. Use the **no** form of this command to disable the rollback-on-error capability of NETCONF.

**netconf capability rollback**

**default netconf capability rollback**

**no netconf capability rollback**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults**

The rollback-on-error capability of NETCONF is disabled by default.

**Command Mode**

Global configuration mode

**Default Level**

14

**Usage Guide**

Only sessions connected after this command is configured take effect.

**Configuration Example**

The following example enables the rollback-on-error capability of NETCONF.

**Example**

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# netconf capability rollback
Ruijie(config)#
```

**Verification**

N/A

**Prompt**

N/A

**Common Errors**

N/A

**Platform****Description**

N/A

## 9.3 netconf capability validate

Use this command to enable the validate capability of NETCONF. Use the **default** form of this command to restore the default settings. Use the **no** form of this command to disable the validate capability of NETCONF.

**netconf capability validate**

**default netconf capability validate**

**no netconf capability validate**

| Parameter<br>Description     | Parameter                                                                                                                                                                                                                               | Description |

## 9.4 netconf dscp

Use this command to configure the DSCP value of NETCONF communication packets. Use the **default** form of this command to restore the default settings.

**netconf dscp [ ip | ipv6 ] ssh *value***

**default netconf dscp [ ip | ipv6 ] ssh**

| Parameter<br>Description | Parameter    | Description                                                                                                                                                                         |
|--------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <i>value</i> | indicates the DSCP value. The range is from 0 to 63. By default, the TOS value of the TCP packets for SSH session is 0 and the TOS value of the NETCONF communication packets is 8. |

**Defaults** By default, the TOS value of the TCP packets for SSH session is 0 and the TOS value of the

NETCONF communication packets is 8.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example configures the DSCP of NETCONF Communication packets.

**Example**

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# netconf dscp ip ssh 48
Ruijie(config)#
```

**Verification** N/A

**Prompt** N/A

**Common Errors** N/A

**Platform** N/A  
**Description**

## 9.5 netconf enable

Use this command to enable the NETCONF framework. Use the **no** form of this command to disable the NETCONF framework. Use the **default** form of this command to restore the default settings.

**netconf enable**

**no netconf enable**

**default netconf enable**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** NETCONF framework is enabled by default.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example enables the NETCONF framework.

**Example**

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# netconf enable
Ruijie(config)#
```

**Verification** N/A

**Prompt** N/A

**Common Errors** N/A

**Platform** N/A  
**Description**

## 9.6 netconf feature-disable

Use this command to disable the feature function of NETCONF. Use the **default** form of this command to restore the default settings. Use the **no** form of this command to enable the feature function of NETCONF.

**netconf feature-disable**

**default netconf feature-disable**

**no netconf feature-disable**

**Parameter**  
**Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** The feature function of NETCONF is enabled by default.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example disables the feature function of NETCONF.

**Example**

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# netconf feature-disable
Ruijie(config)#
```

## 9.7 netconf filter nodes-limit

Use this command to configure the maximum number of nodes which can be searched by the NETCONF session. Use the **default** form or **no** form of this command to restore the default settings.

**netconf filter nodes-limit** *num*

**default netconf filter nodes-limit**

**no netconf filter nodes-limit**

| Parameter Description | Parameter  | Description                                                                                                      |
|-----------------------|------------|------------------------------------------------------------------------------------------------------------------|
|                       | <i>num</i> | Specifies the maximum number of nodes. The default value is 100000, and the value ranges from 100 to 2147483647. |

**Defaults** By default, the maximum number of nodes which can be searched by the NETCONF session is 100000.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** This configuration takes effect only on the search result whose target is running.

**Configuration Example** The following example configures the maximum number of nodes which can be searched by the NETCONF session.

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# netconf filter nodes-limit 101
Ruijie(config)#
```

**Verification** N/A

## 9.8 netconf max-sessions

Use this command to configure the maximum number of the NETCONF session. Use the **default** form or **no** form of this command to restore the default settings.

**netconf max-sessions** *num*

**default netconf max-sessions**

**no netconf max-sessions**

| Parameter   | Parameter  | Description                                                                                                     |
|-------------|------------|-----------------------------------------------------------------------------------------------------------------|
| Description | <i>num</i> | Specifies the maximum number of the NETCONF session. The default value is 5, and the value ranges from 1 to 36. |

**Defaults** By default, the maximum number of the NETCONF session is 5.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Example** The following example configures the maximum NETCONF session number.

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# netconf max-sessions 15
Ruijie(config)#
```

**Verification** N/A

**Prompt** N/A

**Common Errors** N/A

## 9.9 netconf port

Use this command to configure the NETCONF monitoring port. Use the **default** form or **no** form of

this command to restore the default settings.

**netconf port** *num*

**default netconf port**

**no netconf port**

| Parameter<br>Description     | Parameter                                                                                                                                                                                                                 | Description                                                                                      |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
|                              | <i>num</i>                                                                                                                                                                                                                | Specifies the monitoring port. The default port is 830, and the value ranges from 1025 to 65535. |
| <b>Defaults</b>              | By default, port 830 is used for monitoring.                                                                                                                                                                              |                                                                                                  |
| <b>Command Mode</b>          | Global configuration mode                                                                                                                                                                                                 |                                                                                                  |

## 9.11 netconf yang suite openconfig

Use this command to enable the NETCONF to preferentially support the OpenConfig YANG model. Use the **default** form of this command to restore the default settings. Use the **no** form of this command to enable the NETCONF to preferentially support the self-defined YANG model by Ruijie.

**netconf yang suite openconfig**

**default netconf yang suite openconfig**

**no netconf yang suite openconfig**

## 9.12 show netconf yang-suite

Use this command to display the NETCONF YANG model configuration.

**show netconf yang-suite**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

|                      |                                                                   |
|----------------------|-------------------------------------------------------------------|
| <b>Defaults</b>      | N/A                                                               |
| <b>Command Mode</b>  | Privileged EXEC mode, Global configuration mode                   |
| <b>Default Level</b> | 14                                                                |
| <b>Usage Guide</b>   | Use this command to display the NETCONF YANG model configuration. |

**Configuration Example** The following example displays the NETCONF YANG model configuration.

```
Ruijie#show netconf yang-suite
YANG suite:
  current configuration: rg-yang
  current               active: rg-yang
```

**Verification**      N/A

**Prompt**            N/A

**Common Errors**   N/A

**Platform  
Description**        N/A

## 10 gRPC Commands

### 10.1 authen aaa-config

Use this command to configure the retry count and timeout time for AAA server authentication. Use the **no** form of this command to restore the default retry count and timeout time of AAA server authentication.

**authen aaa-config** {*retry times* | *timeout second*}

**no authen aaa-config** {*retry* | *timeout*}

| Parameter Description | Parameter      | Description                                                                                                                                                                                                         |
|-----------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>retry</b>   | Sets the retry count for AAA server authentication.                                                                                                                                                                 |
|                       | <i>times</i>   | Indicates the number of retries. The value ranges from <b>1</b> to <b>100</b> .                                                                                                                                     |
|                       | <b>timeout</b> | Sets the timeout time for AAA server authentication.                                                                                                                                                                |
|                       | <i>second</i>  | Indicates the timeout time, in seconds. The value ranges from <b>0</b> to <b>300</b> and the value <b>0</b> indicates that the authentication is considered failed after an AAA server timeout message is received. |

**Defaults** The default retry count is 1 and the default timeout time is 4s.

**Command Mode** gRPC process configuration mode

**Default Level** 14

**Usage Guide** Use this command to configure the authentication retry count and timeout time for the AAA server authentication mode in the case of server login. It is not recommended to change the default retry count and timeout time. A large retry count or improper timeout time may result in AAA lockout for 15 minutes (you can run the **clear aaa local user lockout all** command to clear the AAA lockout).

**Configuration Example** The following example sets the retry count to 2 and timeout interval to 20s for AAA server authentication.

```
Ruijie(config)# grpc
Ruijie(config-grpc)# authen aaa-config retry 2
Ruijie(config-grpc)# authen aaa-config timeout 20
```

**Verification** Run the **show run** command to check whether the command is configured.

|                      |     |
|----------------------|-----|
| Prompt               | N/A |
| Common Errors        | N/A |
| Platform Description | N/A |

## 10.2 authen login

Use this command to configure the authentication mode for server login. Use the **no** form of this command to configure the authentication-free mode for server login. Use the **default** form of this command to restore the default login authentication mode.

**authen login {local | authentication *mlist*}**

**no authen login**

**default authen login**

| Parameter Description | Parameter                                                                                                                                                                                                                                                                                                                                                                                           | Description                                          |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
|                       | <b>local</b>                                                                                                                                                                                                                                                                                                                                                                                        | Uses the local username library for authentication.  |
|                       | <b>authentication</b>                                                                                                                                                                                                                                                                                                                                                                               | Uses a specified AAA server list for authentication. |
|                       | <i>mlist</i>                                                                                                                                                                                                                                                                                                                                                                                        | Indicates the name of an AAA list.                   |
| Defaults              | Local login is configured by default, that is, the <b>authen login local</b> command is configured.                                                                                                                                                                                                                                                                                                 |                                                      |
| Command Mode          | gRPC process configuration mode                                                                                                                                                                                                                                                                                                                                                                     |                                                      |
| Default Level         | 14                                                                                                                                                                                                                                                                                                                                                                                                  |                                                      |
| Usage Guide           | After receiving a login request from a server, the device selects AAA local authentication, AAA server authentication, or authentication-free mode as required. When the authentication is successful, the device records the login user information, namely, the IP address and username of the server. The device responds only to acquisition event requests initiated by authenticated servers. |                                                      |
| Configuration Example | <p>The following example sets the authentication mode to AAA local authentication.</p> <pre>Ruijie(config)# grpc Ruijie(config-grpc)# authen login local</pre> <p>The following example sets the authentication mode to the authentication-free mode.</p> <pre>Ruijie(config)# grpc Ruijie(config-grpc)# no authen login</pre>                                                                      |                                                      |

**Verification** Run the **show run** command to check whether the command is configured.

**Prompt** N/A

**Common Errors** N/A

**Platform Description** N/A

## 10.3 clear grpc channel

Use this command to clear statistics of a server that subscribes to gRPC events.

**clear grpc channel** [*ip-address* *port-id*] [**counter**]

| Parameter Description | Parameter         | Description                                                  |
|-----------------------|-------------------|--------------------------------------------------------------|
|                       | <i>ip-address</i> | Specifies the server IPv4 address.                           |
|                       | <i>port-id</i>    | Specifies the port ID of the server.                         |
|                       | <i>counter</i>    | Indicates the packet transmission statistics of the channel. |

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** Use this command to clear statistics of a server that subscribes to gRPC events.

**Configuration Example** The following example clears statistics of a server that subscribes to gRPC events.

```
Ruijie# clear grpc channel
```

The following example clears the statistics on transmitted packets of a server with the IP address of 192.168.1.1 and port ID of 50051 that subscribes to gRPC events.

```
Ruijie# clear grpc channel 192.168.1.1 50051 counter
```

**Prompt** N/A

**Platform Description** N/A

## 10.4 clear grpc subscr

Use this command to clear data of gRPC periodic events and real-time events.

**clear grpc subscr** [**sample**] [**counter**]

| Parameter<br>Description | Parameter      | Description                 |
|--------------------------|----------------|-----------------------------|
|                          | <b>sample</b>  | Indicates periodic events.  |
|                          | <b>counter</b> | Indicates event statistics. |

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** Use this command to clear data of gRPC periodic events and real-time events.

**Configuration Example** The following example clears data of gRPC periodic events and real-time events.

```
Ruijie# clear grpc subscr
```

The following example clears statistics on gRPC periodic events.

```
Ruijie# clear grpc subscr sample counter
```

**Prompt** N/A

**Platform Description** N/A

## 10.5 destination-group

Use this command to configure a destination group. Use the **no** form of this command to delete a destination group.

**destination-group** *group\_id*

**no destination-group** *group\_id*

| Parameter<br>Description | Parameter       | Description                  |
|--------------------------|-----------------|------------------------------|
|                          | <i>group_id</i> | Identifies a group uniquely. |

**Defaults** N/A

**Command Mode** gRPC process configuration mode

|                               |                                                                                                                                                                                                              |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default Level</b>          | 14                                                                                                                                                                                                           |
| <b>Usage Guide</b>            | <p>Use this command to create a gRPC destination group and switch to the gRPC destination group configuration mode.</p> <p>In this mode, multiple destination addresses can be configured in this group.</p> |
| <b>Configuration Examples</b> | <p>The following example configures a destination group with the unique ID of 1.</p> <pre>Ruijie(config)# grpc Ruijie(config-grpc)# destination-group 1</pre>                                                |
| <b>Verification</b>           | Run the <b>show run</b> command to check whether this command is configured.                                                                                                                                 |
| <b>Prompt Message</b>         | N/A                                                                                                                                                                                                          |
| <b>Common Errors</b>          | N/A                                                                                                                                                                                                          |
| <b>Platform Description</b>   | N/A                                                                                                                                                                                                          |

## 10.6 destination-group

Use this command to configure the destination group in a subscription association.

Use the **no** form of this command to delete the destination group in a subscription association.

**destination-group** *group\_id*  
**no destination-group** *group\_id*

| Parameter Description | Parameter       | Description                              |
|-----------------------|-----------------|------------------------------------------|
|                       | <i>group_id</i> | Identifies a destination group uniquely. |

|                               |                                                                                                                                                          |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>               | N/A                                                                                                                                                      |
| <b>Command Mode</b>           | gRPC subscription association configuration mode                                                                                                         |
| <b>Default Level</b>          | 14                                                                                                                                                       |
| <b>Usage Guide</b>            | Use this command to configure the destination group in a subscription association.                                                                       |
| <b>Configuration Examples</b> | <p>The following example configures a destination group with the unique ID of 1.</p> <pre>Ruijie(config)# grpc Ruijie(config-grpc)# subscription 1</pre> |

```
Ruijie(config-grpc-subscription)# destination-group 1
```

**Verification** Run the **show run** command to check whether this command is configured.

**Prompt Message** N/A

**Common Errors** N/A

**Platform Description** N/A

## 10.7 dscp

Use this command to configure the DSCP value for gRPC packets. Use the **no** form of this command to restore the DSCP value to the default value.

**dscp dscp**

**no dscp**

| Parameter Description | Parameter   | Description                                                               |
|-----------------------|-------------|---------------------------------------------------------------------------|
|                       | <i>dscp</i> | Indicates the DSCP value for gRPC packets. The value ranges from 0 to 63. |

**Defaults** The default value is **0**.

**Command Mode** gRPC process configuration mode

**Default Level** 14

**Usage Guide** Use this command on the device to configure the DSCP value for gRPC packets.

**Configuration Examples** The following example sets the DSCP value to **46** for gRPC packets.

```
Ruijie(config)# grpc
Ruijie(config-grpc)# dscp 46
```

**Verification** Run the **show run** command to check whether this command is configured.

**Prompt Message** N/A

**Common Errors** N/A

**Platform**  
**Description**

N/A

## 10.8 heartbeat

Use this command to configure the heartbeat detection mechanism. Use the **no** form of this command to restore the suppression time for real-time events to the default value.

**heartbeat inform** [*interval interval*] [*keepalive-times times*]

**no heartbeat inform**

**Parameter**  
**Description**

| Parameter       | Description                                                                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>inform</b>   | Enables the heartbeat detection mechanism.                                                                                                                                             |
| <i>interval</i> | Configures the heartbeat detection interval, in seconds. The value ranges from 1 to 3600.                                                                                              |
| <i>times</i>    | Configures the number of heartbeat keepalive times. If the number of keepalive failures exceeds this value, it is deemed that the server malfunctions. The value ranges from 1 to 300. |

**Defaults** No heartbeat message is sent by default.

**Command Mode** gRPC process configuration mode

**Default Level** 14

**Usage Guide** The heartbeat detection mechanism can be enabled on the device to detect whether the server operates properly. When the number of heartbeat failures or the number of consecutive result absence times exceeds this value, it is deemed that the server malfunctions. If a slave server is configured and operates properly, the slave server is switched to act as the master role and subsequent data will be sent to the slave server. If the slave server also becomes abnormal but the master server recovers, the master server acts as the master role again.

**Configuration Examples** The following example enables the heartbeat detection mechanism, and sets the detection interval to 1s and the number of keepalive times to 1.

```
Ruijie(config)# grpc
Ruijie(config-grpc)# heartbeat inform interval 1 keepalive-times
1
```

**Verification** Run the **show run** command to check whether this command is configured.

**Prompt** N/A

**Message**

**Common Errors** N/A

**Platform Description** N/A

## 10.9 ip

Use this command to configure the IP address and port ID of the destination server.  
Use the **no** form of this command to delete the IP address and port ID of the destination server.

**ip** *ip-address* **port** *port*

**no ip** *ip-address* **port** *port*

| Parameter Description | Parameter         | Description                               |
|-----------------------|-------------------|-------------------------------------------|
|                       | <i>ip-address</i> | Indicates the IPv4 address of the server. |
|                       | <i>port</i>       | Indicates the port ID of the server.      |
|                       |                   |                                           |

**Defaults** N/A

**Command Mode** gRPC destination group configuration mode

**Default Level** 14

**Usage Guide** Use this command to configure the address of the gRPC server.

**Configuration Examples** The following example configures a gRPC subscription server with the IP address 192.168.0.1 and port ID 12345.

```
Ruijie(config)# grpc
Ruijie(config-grpc)# destination-group 1
Ruijie(config-grpc-destination)# ip 192.168.0.1 port 12345
```

**Verification** Run the **show run** command to check whether this command is configured.

**Prompt Message** N/A

**Common Errors** N/A

**Platform** N/A

**Description**

## 10.10 grpc

Use this command to create the gRPC mode and enable the gRPC function. Use the **no** form of this command to delete the gRPC mode and disable the gRPC function.

**grpc**

**no grpc**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

The gRPC mode is not created and the gRPC function is disabled by default.

**Command  
Mode**

Global configuration mode

**Default Level**

14

**Usage Guide**

Use this command to create a gRPC instance, enable the gRPC function, and enter the gRPC process configuration mode.

The gRPC client and gRPC server services are created at the same time when the gRPC function is enabled. The gRPC client service uploads data to a server while the gRPC server service parses authentication messages and acquisition messages sent from a server.

**Configuration  
Example**

The following example creates the gRPC mode.

```
Ruijie# configure terminal
Ruijie(config)# grpc
```

**Verification**

Run the **show run** command to check whether the gRPC mode is created.

**Prompt**

N/A

**Common  
Errors**

N/A

**Platform  
Description**

N/A

## 10.11 reply-timeout

Use this command to set the data response timeout time for the device serving as the gRPC server. Use the **no** form of this command to restore the default data response timeout time of the device serving as the gRPC server.

**reply-timeout** *interval*

**no reply-timeout**

| Parameter<br>Description | Parameter       | Description                                                                                                                                                |
|--------------------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <i>interval</i> | Indicates the data response timeout time of the device serving as the gRPC server, in seconds. The default value is 10 and the value ranges from 1 to 300. |

**Defaults** The default value is 10 seconds.

**Command Mode** gRPC process configuration mode

**Default Level** 14

**Usage Guide** After timeout time is set for the gRPC process and the collector delivers the GET/SET operation, the device returns a timeout error to the collector if it fails to obtain data within the timeout time.

**Configuration Examples** The following example sets the gRPC data response timeout time to 30 seconds.

```
Ruijie(config)# grpc
Ruijie(config-grpc)# reply-timeout 30
```

**Verification** Run the show run command to check whether the command is configured.

**Prompts** N/A

**Common Errors** N/A

**Platform Description** N/A

## 10.12 rpc

Use this command to enable functions defined in **gnmi.proto**. Use the **no** form of this command to disable functions defined in **gnmi.proto**.

**rpc gnmi enable**

**no rpc gnmi enable**

| Parameter Description  | Parameter                                                                                                                                          | Description |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
|                        | N/A                                                                                                                                                | N/A         |
| Defaults               | Functions defined in <b>gnmi.proto</b> are disabled by default.                                                                                    |             |
| Command Mode           | gRPC process configuration mode                                                                                                                    |             |
| Default Level          | 14                                                                                                                                                 |             |
| Usage Guide            | Use this command to enable functions defined in <b>gnmi.proto</b> , so that the functions become available.                                        |             |
| Configuration Examples | The following example enables functions defined in <b>gnmi.proto</b> .<br><pre>Ruijie(config)# grpc<br/>Ruijie(config-grpc)# rpc gnmi enable</pre> |             |
| Verification           | Run the <b>show run</b> command to check whether the configuration is successful.                                                                  |             |
| Prompt Message         | N/A                                                                                                                                                |             |
| Common Errors          | N/A                                                                                                                                                |             |
| Platform Description   | N/A                                                                                                                                                |             |

## 10.13 sensor-group

Use this command to configure a YANG model path group.

**sensor-group** *group-id*

Use the **no** form of this command to delete a YANG model path group.

**no sensor-group** *group-id*

| Parameter Description | Parameter                       | Description                  |
|-----------------------|---------------------------------|------------------------------|
|                       | <i>group-id</i>                 | Identifies a group uniquely. |
| Defaults              | N/A                             |                              |
| Command Mode          | gRPC process configuration mode |                              |

**Default Level** 14

**Usage Guide** Use this command to create a gRPC YANG model path group and switch to the gRPC YANG model group configuration mode.  
In this mode, you can configure multiple YANG model paths in this group.

**Configuration Examples** The following example configures a gRPC YANG model path group with the unique ID of 1.

```
Ruijie(config)# grpc
Ruijie(config-grpc)# sensor-group 1
```

**Verification** Run the **show run** command to check whether this command is configured.

**Prompt Message** N/A

**Common Errors** N/A

**Platform Description** N/A

## 10.14 sensor-group

Use this command to configure the YANG model path group in a subscription association.

**sensor-group** *group\_id* [**sample-interval** *interval*]

Use the **no** form of this command to delete the YANG model path group in a subscription association.

**no sensor-group** *group\_id*

| Parameter Description | Parameter       | Description                                                  |
|-----------------------|-----------------|--------------------------------------------------------------|
|                       | <i>group_id</i> | Identifies a YANG model path group uniquely.                 |
|                       | <i>interval</i> | Indicates the periodic collection interval, in milliseconds. |

**Defaults** N/A

**Command Mode** gRPC subscription association configuration mode

**Default Level** 14

**Usage Guide** Use this command to configure the data source of a subscription association. If **sample-interval** is configured, data needs to be collected periodically. If it is not configured, triggered data needs to be collected.

**Configuration Examples** The following example configures the device to collect data on all YANG model paths of the YANG model path group with the unique ID of 1 at an interval of 1s.

```
Ruijie(config)# grpc
Ruijie(config-grpc)# subscription 1
Ruijie(config-grpc-subscription)# sensor-group 1 sample-interval
1000
```

**Verification** Run the **show run** command to check whether this command is configured.

**Prompt Message** N/A

**Common Errors** N/A

**Platform Description** N/A

## 10.15 sensor-path

Use this command to configure a YANG model path.

**sensor-path** *path*

Use the **no** form of this command to delete a YANG model path.

**no sensor-path** *path*

| Parameter Description | Parameter   | Description                  |
|-----------------------|-------------|------------------------------|
|                       | <i>path</i> | Indicates a YANG model path. |

**Defaults** N/A

**Command Mode** gRPC YANG model group configuration mode

**Default Level** 14

**Usage Guide** Configure a YANG model path in a YANG model path group. For the path compilation, refer to the output of the **show grpc yang tree/node-path** command.

**Configuration Examples** The following example configures the YANG model path: **/rg-bridge:bridge/vlan/entry[id='1']/swport-list**.

```
Ruijie(config)# grpc
Ruijie(config-grpc)# sensor-group 1
Ruijie(config-grpc-sensor)# sensor-path
/rg-bridge:bridge/vlan/entry[id='1']/swport-list
```

**Verification** Run the **show run** command to check whether this command is configured.

**Prompt Message** N/A

**Common Errors** N/A

**Platform Description** N/A

## 10.16 standby-server

Use this command to preconfigure a slave subscription server.

**standby- server** *ip-address port-id*

Use the **no** form of this command to delete a preconfigured slave subscription server.

**no standby- server**

| Parameter Description | Parameter         | Description                               |
|-----------------------|-------------------|-------------------------------------------|
|                       | <i>ip-address</i> | Indicates the IPv4 address of the server. |
|                       | <i>port-id</i>    | Indicates the port ID of the server.      |

**Defaults** N/A

**Command Mode** gRPC subscription server mode

**Default Level** 14

**Usage Guide** Use this command to configure a slave server. After the heartbeat detection mechanism is enabled, if the master server is found faulty and the slave server operates properly, the slave server is switched to act as the master role. If the slave server also becomes abnormal but the master server recovers, the master server acts as the master role again.

**Configuration Examples** The following example configures a slave server with the IP address 192.168.0.2 and port ID 12345 for the gRPC subscription server with the IP address 192.168.0.1 and port ID 12345.

```
Ruijie(config)# grpc
```

```
Ruijie(config-grpc)# user-server 192.168.0.1 12345
Ruijie(config-grpc-us)# standby-server 192.168.0.2 12345
```

**Verification** Run the **show run** command to check whether this command is configured.

**Prompt Message** N/A

**Common Errors** N/A

**Platform Description** N/A

## 10.17 subscr

Use this command to enable subscribed events of gRPC. Use the **no** form of this command to disable subscribed events of gRPC.

**subscr [realtime | sample] enable**

**no subscr [realtime | sample] enable**

| Parameter Description | Parameter       | Description                            |
|-----------------------|-----------------|----------------------------------------|
|                       | <b>realtime</b> | Indicates subscribed real-time events. |
|                       | <b>sample</b>   | Indicates subscribed periodic events.  |
|                       |                 |                                        |

**Defaults** Subscribed events are disabled by default.

**Command Mode** gRPC process configuration mode

**Default Level** 14

**Usage Guide** After configuring to-be-subscribed events, the gRPC process waits for the NETCONF manager to send a subscribed event. When a received subscription message matches the local to-be-subscribed event, the gRPC process enables the function of reporting gRPC data of the event to the server. After the NETCONF manager sends an unsubscribed event, if the received unsubscription message matches the local to-be-subscribed event, the gRPC process disables the function of reporting gRPC data of the event to the server.

If the gRPC process configures no to-be-subscribed event, the gRPC process performs no processing when receiving a subscribed or unsubscribed event from the NETCONF manager.

|                             |                                                                             |
|-----------------------------|-----------------------------------------------------------------------------|
| <b>Configuration</b>        | The following example configures to-be-subscribed real-time events of gRPC. |
| <b>Example</b>              | <pre>Ruijie(config)# grpc Ruijie(config-grpc)# subscr realtime enable</pre> |
| <b>Verification</b>         | Run the <b>show run</b> command to check whether the command is configured. |
| <b>Prompt</b>               | N/A                                                                         |
| <b>Common Errors</b>        | N/A                                                                         |
| <b>Platform Description</b> | N/A                                                                         |

## 10.18 subscr-realtime-interval

Use this command to configure the suppression interval for real-time events. Use the **no** form of this command to restore the default suppression interval of real-time events.

**subscr-realtime-interval** {*all interval* | *realtime json-event interval*}

**no subscr-realtime-interval** {*all / realtime type*}

| Parameter Description | Parameter         | Description                                                                                                                                                                                      |
|-----------------------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | all               | Indicates that the configuration takes effect on all real-time events.                                                                                                                           |
|                       | realtime          | Indicates that the configuration takes effect on a specific real-time event.                                                                                                                     |
|                       | <i>json-event</i> | Indicates the type of the configured real-time event. For details, see the output of the <b>show grpc subscr   include json</b> command.                                                         |
|                       | <i>interval</i>   | Specifies the suppression interval for reporting data of real-time events, in milliseconds. The value ranges from <b>1</b> to <b>1000000</b> and real-time events are not suppressed by default. |

**Defaults** Real-time events are not suppressed by default.

**Command Mode** gRPC process configuration mode

**Default Level** 14

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guide</b>           | After the device enables a subscribed real-time event, if the threshold of the event is triggered, real-time packets are generated and sent to the server that subscribes to the event. When the threshold is triggered frequently, a large number of packets are generated and sent to the server within a short period of time. Data of these packets may be the same but handling these packets greatly increases the overheads of the device and server. To prevent this case, run the <b>subscr-realtime-interval</b> command to suppress the generation of new packets for real-time events within a period of time. |
| <b>Configuration Example</b> | <p>The following example sets the suppression time to 500 ms for all real-time events.</p> <pre>Ruijie(config)# grpc Ruijie(config-grpc)# subscr-realtime-interval all 500</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Verification</b>          | Run the <b>show run</b> command to check whether the command is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Prompt</b>                | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Common Errors</b>         | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Platform Description</b>  | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 10.19 subscr-sample-interval

Use this command to configure the timer interval for periodic events. Use the **no** form of this command to restore the default timer interval of periodic events.

**subscr-sample-interval** *interval* [ **millisecond** *millisecond* ]

**no subscr-sample-interval**

| Parameter Description | Parameter          | Description                                                                                                                                                                                                                                                                                                             |
|-----------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>interval</i>    | Indicates the locally configured interval for reporting periodic events, in seconds. The value ranges from <b>0</b> to <b>65535</b> and the default value is <b>10</b> . This value plus <i>millisecond</i> is the actual reporting interval.                                                                           |
|                       | <i>millisecond</i> | Indicates the millisecond part in the locally configured interval for reporting periodic events, in milliseconds. The value ranges from 0 to 999 and the default value is 0. This value plus <i>interval</i> is the actual reporting interval. Currently, the allowable minimum reporting interval is 100 milliseconds. |

**Defaults** The default interval is 10s.

**Command Mode** gRPC process configuration mode

**Default Level** 14

**Usage Guide** After a subscribed periodic event of the device is enabled and the NETCONF manager sends the subscribed periodic event, the gRPC process starts a periodic event timer and sends gRPC data to the server that subscribes to the event. When the periodic event sent by the NETCONF manager does not carry the timer interval, the timer interval is determined by the **subscr-sample-interval** command. When the periodic event sent by the NETCONF manager carries the timer interval, this timer interval shall prevail.

**Configuration Example** The following example sets the timer interval to 15s for periodic packets.

```
Ruijie(config)# grpc
Ruijie(config-grpc)# subscr-sample-interval 15
```

The following example sets the timer interval to 100 milliseconds for periodic packets.

```
Ruijie(config)# grpc
Ruijie(config-grpc)# subscr-sample-interval 0 millisecond 100
```

|                             |                                                                             |
|-----------------------------|-----------------------------------------------------------------------------|
| <b>Verification</b>         | Run the <b>show run</b> command to check whether the command is configured. |
| <b>Prompt</b>               | N/A                                                                         |
| <b>Common Errors</b>        | N/A                                                                         |
| <b>Platform Description</b> | N/A                                                                         |

## 10.20 subscr-source-interface

Use this command to configure a source interface for the real-time and periodic data. Use the **no** form of this command to restore the default settings of the source interface for the real-time and periodic data.

**subscr-source-interface** *interface-type interface-number*

**no subscr-source-interface**

| <b>Parameter Description</b> | Parameter                                                                                                                                                                                   | Description                  |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
|                              | <i>interface-type</i><br><i>interface-number</i>                                                                                                                                            | Specifies an interface name. |
| <b>Defaults</b>              | The source interface for real-time and periodic data is random by default.                                                                                                                  |                              |
| <b>Command Mode</b>          | gRPC process configuration mode                                                                                                                                                             |                              |
| <b>Default Level</b>         | 14                                                                                                                                                                                          |                              |
| <b>Usage Guide</b>           | By default, the real-time and periodic data is sent from a random source interface. You can use this command to enable the server to receive packets from a specified interface only.       |                              |
| <b>Configuration Example</b> | The following example binds the specified interface loopback 0 to send real-time and periodic data. <pre>Ruijie(config)# grpc Ruijie(config-grpc)# subscr-source-interface Loopback 0</pre> |                              |
| <b>Verification</b>          | Run the <b>show run</b> command to check whether the command is configured.                                                                                                                 |                              |
| <b>Prompt</b>                | N/A                                                                                                                                                                                         |                              |
| <b>Common</b>                | N/A                                                                                                                                                                                         |                              |

## 10.21 type

Use this command to preconfigure to-be-subscribed events of a specified server. Use the **no** form of this command to delete to-be-subscribed events of a specified server.

**type** *json-event* **value** *value* [**value-extend** *value-extend*]

**no type** *json-event*

| Parameter Description | Parameter           | Description                                                                                                                                                                                                                            |
|-----------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>json-event</i>   | Indicates the type of events. For details, see the output of the <b>show grpc subscr   include json</b> command.                                                                                                                       |
|                       | <i>value</i>        | Configures the parameter value, that is, the threshold for real-time events and time interval for periodic events.                                                                                                                     |
|                       | <i>value-extend</i> | Indicates the extension field of <i>value</i> . This field is used to only set the millisecond part in the interval for reporting periodic events. The value ranges from 0 to 999. The allowable minimum interval is 100 milliseconds. |

**Defaults** N/A

**Command Mode** gRPC server subscription mode

**Default Level** 14

**Usage Guide** Configure to-be-subscribed events and parameters for the channel, which should be consistent with the configuration on NETCONF.

**Configuration Example** The following example configures a gRPC server with the IP address of 192.168.0.1:12345, preconfigures the periodic event 0x10000000, and sets the time interval to 10 seconds for the event.

```
Ruijie(config)# grpc
Ruijie(config-grpc)# user-server 192.168.0.1 12345
Ruijie(config-grpc-us)# type 0x10000000 value 10
```

The following example configures a gRPC server with the IP address of 192.168.0.1:12345, preconfigures the periodic event 0x10000000, and sets the time interval to 100 milliseconds for the event.

```
Ruijie(config)# grpc
Ruijie(config-grpc)# user-server 192.168.0.1 12345
```

```
Ruijie(config-grpc-us)# type 0x10000000 value 0 value-extend 100
```

|                             |                                                                                                                                                                                                                                                                      |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Verification</b>         | Run the <b>show run</b> command to check whether the command is configured.                                                                                                                                                                                          |
| <b>Prompt</b>               | N/A                                                                                                                                                                                                                                                                  |
| <b>Common Errors</b>        | The threshold for real-time events ranges from <b>-1</b> to <b>100</b> , the time interval for periodic events ranges from <b>-1</b> to <b>65535</b> , and an existing type needs to be used. Otherwise, the configuration does not take effect and is not retained. |
| <b>Platform Description</b> | N/A                                                                                                                                                                                                                                                                  |

## 10.22 user-client

Use this command to preconfigure information about login users of servers. Use the **no** form of this command to delete preconfigured information about login users of servers.

**user-client** *id user-name ip-address*

**no user-client** *id*

| <b>Parameter Description</b> | Parameter                                                                                                                                                                                                                                                                                                                                                                                             | Description                                                                        |

|                              | <i>id</i>                                                                                                                                                                                                                                                                                                                                                                                             | Indicates the ID of a login user.                                                  |
|                              | <i>user-name</i>                                                                                                                                                                                                                                                                                                                                                                                      | Indicates the username (unrelated to the AAA library; there may be no login user). |
|                              | <i>ip-address</i>                                                                                                                                                                                                                                                                                                                                                                                     | Indicates the allowed server address.                                              |
| <b>Defaults</b>              | N/A                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                    |
| <b>Command Mode</b>          | gRPC process configuration mode                                                                                                                                                                                                                                                                                                                                                                       |                                                                                    |
| <b>Default Level</b>         | 14                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                    |
| <b>Usage Guide</b>           | <p>The device can precreate login users of authenticated servers via commands, or a server can be simulated to initiate a login request, pass authentication, and save information about the login users.</p> <p>The device can delete login users of authenticated servers via commands, or a server can be simulated to initiate a logout request and delete information about the login users.</p> |                                                                                    |
| <b>Configuration Example</b> | The following example configures information about the login user of a server, in which the ID of the login user is 12345, username is test-user, and server address is                                                                                                                                                                                                                               |                                                                                    |

```
192.168.0.1.
```

```
Ruijie(config)# grpc
```

```
Ruijie(config-grpc)# user-client 12345 test-user 192.168.0.1
```

**Verification** Run the **show run** command to check whether the command is configured.

**Prompt** N/A

**Common Errors** N/A

**Platform Description** N/A

## 10.23 user-server

Use this command to preconfigure a server that can subscribe to events. Use the **no** form of this command to delete the preconfigured server that can subscribe to events.

**user-server** *ip-address port-id*

**no user- server** *ip-address port-id*

| Parameter Description | Parameter         | Description                          |
|-----------------------|-------------------|--------------------------------------|
|                       | <i>ip-address</i> | Specifies the server IPv4 address.   |
|                       | <i>port-id</i>    | Specifies the port ID of the server. |
|                       |                   |                                      |

**Defaults** N/A

**Command Mode** gRPC process configuration mode

**Default Level** 14

**Usage Guide** Use this command to precreate a specified server channel and switch to the gRPC server subscription mode.

The to-be-subscribed events of the channel can be configured in this mode.

The device can precreate servers and to-be-subscribed events via commands, or a controller can be simulated to notify the device of servers and to-be-subscribed events via NETCONF.

The device can delete servers and subscribed events via commands, or a controller can be simulated to notify the device of servers and unsubscribed events via NETCONF.

**Configuration Example** The following example configures a server with the IP address and ID of 192.168.0.1:12345 that subscribes to gRPC events.

```
Ruijie(config)# grpc
Ruijie(config-grpc)# user-server 192.168.0.1 12345
```

**Verification** Run the **show run** command to check whether the command is configured.

**Prompt** N/A

**Common Errors** N/A

**Platform Description** N/A

## 10.24 show grpc channel

Use this command to display the IP address, port ID, and subscribed events of a server or various statistics.

**show grpc channel [ counter ]**

| Parameter Description | Parameter      | Description                                           |
|-----------------------|----------------|-------------------------------------------------------|
|                       | <i>counter</i> | Displays packet transmission statistics of a channel. |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Example** The following example displays the IP address, port ID, and subscribed events of a server.

```
Ruijie# show grpc channel
Server subscr all:
  server ip 172.31.32.70 port 50051
  state IDLE
  subscr event:
    GRPC_JSON_EVENT_SAMPLE_DCB_PFC_PAUSE_STAT (0x10010000)

  server ip 172.31.32.71 port 50051
```

```
state TRANSIENT_FAILURE
subscr event:
    GRPC_JSON_EVENT_REALTIME_CLI_CMD_LOG (0x00000000)
```

The following example displays statistics on packets sent to the server.

```
Ruijie#show grpc channel counter
Server subscr all:
    server ip 172.31.32.70 port 50051
    state TRANSIENT_FAILURE
    json list count: 0
    json send count: 1
    json drop count: 0
    call list count: 0
    call send count: 1
    call drop count: 0

    server ip 172.31.32.71 port 50051
    state TRANSIENT_FAILURE
    json list count: 0
    json send count: 1
    json drop count: 0
    call list count: 0
    call send count: 1
    call drop count: 0
```

Field description:

| Field           | Description                                                     |
|-----------------|-----------------------------------------------------------------|
| server ip       | IP address of the server to which information is to be reported |
| port            | Port ID of the server to which information is to be reported    |
| state           | Status of the channel between the current device and the server |
| subscr event    | Event subscribed by the server                                  |
| json list count | To-be-sent JSON data cached in the gRPC process                 |
| json send count | Sent JSON data cached in the gRPC process                       |
| json drop count | Discarded JSON data cached in the gRPC process                  |
| call list count | To-be-sent data cached in the gRPC process                      |
| call send count | Sent data cached in the gRPC process                            |
| call drop count | Discarded data cached in the gRPC process                       |

## 10.25 show grpc gnmi subscription

Use this command to display subscription associations generated via RPC methods defined in **gnmi.proto** (including **dial\_out.proto**).

**show grpc gnmi subscription**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Examples** The following example displays dynamic subscription associations automatically generated via RPC methods defined in **gnmi.proto**.

```
Ruijie# show grpc gnmi subscription
persistent subscriptions:
  subscription 1:
    sensor group 1:
      sample interval: 1000
      sample timer count: 870
      sensor path: /rg-bridge:bridge/vlan/entry/swport-list
      state: NORMAL
      recv count: 869
    destination group 1:
      destination: 172.30.31.30:50051
      state: READY
      task list count: 0
      task drop count: 0
      send request count: 847
      send update count: 69454
      recv response count: 847
dynamicsubscriptions:
  client(172.30.31.30:54080):
    subscriptions:
```

```
subscription:
  path: /rg-bridge:bridge/vlan/entry[id='1']
  mode: 2
  sample_interval: 10000
```

Field description:

| Field                   | Description                                                                                                                                                                                                       |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| persistent subscription | Static subscription, which is the same as the output of the <b>show grpc openconfig subscription</b> command.                                                                                                     |
| subscription            | Unique ID of a subscription association.                                                                                                                                                                          |
| sensor group            | YANG model path group.                                                                                                                                                                                            |
| sample interval         | Subscription interval. The value <b>0</b> indicates real-time subscription of triggered data.                                                                                                                     |
| sample timer count      | Number of started timers, that is, number of service data acquisition times.                                                                                                                                      |
| sensor path             | YANG model path.                                                                                                                                                                                                  |
| state                   | State of the YANG model path. It has two values: <ul style="list-style-type: none"> <li>● <b>NORMAL</b>: indicates the normal state.</li> <li>● <b>GIVEUP</b>: Abandons data acquisition.</li> </ul>              |
| recv count:             | Number of service data receiving times, which is usually the same as the number of started timers.                                                                                                                |
| destination group       | Unique ID of the destination group.                                                                                                                                                                               |
| destination             | Destination address.                                                                                                                                                                                              |
| state                   | Advertised state of the channel between the current device and the server.                                                                                                                                        |
| task list count         | Number of to-be-sent task lists cached by the gRPC process.                                                                                                                                                       |
| task drop count         | Number of tasks discarded after being cached by the gRPC process. A maximum of 10,000 task lists can be cached. Task lists beyond this number will be discarded.                                                  |
| send request count      | Number of requests sent by the gRPC process by invoking RPC.                                                                                                                                                      |
| send update count       | Number of update objects (defined in <b>dial_out.proto</b> ) sent by the gRPC process.                                                                                                                            |
| recv response count     | Number of server responses received by the gRPC process.                                                                                                                                                          |
| dynamic subscriptions:  | Dynamic subscription (data is subscribed to via the Subscribe RPC method defined in <b>gnmi.proto</b> ).                                                                                                          |
| client                  | Client IP address.                                                                                                                                                                                                |
| path                    | Subscribed YANG model path.                                                                                                                                                                                       |
| mode                    | Subscription mode. It has three values: <ul style="list-style-type: none"> <li>● <b>0</b>: default mode</li> <li>● <b>1</b>: subscription to triggered data</li> <li>● <b>2</b>: periodic subscription</li> </ul> |
| sample_interval         | Interval of periodic subscription, in milliseconds.                                                                                                                                                               |

## 10.26 show grpc openconfig subscription

Use this command to display the configuration of subscription associations implemented through openconfig-telemetry.yang.

**show grpc openconfig subscription**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Examples** The following example displays static subscription associations configured on the device.

```
Ruijie#show grpc openconfig subscription
all subscriptions:
  subscription 1:
    sensor group 1:
      sample interval: 1000
      sample timer count: 77
      sensor path: /rg-bridge:bridge/vlan/entry/swport-list
      state: NORMAL
      recv count: 77
    destination group 1:
      destination: 172.30.31.30:50051
      state: READY
      task list count: 0
      task drop count: 0
      send request count: 55
      send update count: 4510
      recv response count: 55
```

Field description:

| Field        | Description                              |
|--------------|------------------------------------------|
| subscription | Unique ID of a subscription association. |

|                     |                                                                                                                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sensor group        | YANG model path group.                                                                                                                                                                               |
| sample interval     | Subscription interval. The value <b>0</b> indicates real-time subscription of triggered data.                                                                                                        |
| sample timer count  | Number of started timers, that is, number of service data acquisition times.                                                                                                                         |
| sensor path         | YANG model path.                                                                                                                                                                                     |
| state               | State of the YANG model path. It has two values: <ul style="list-style-type: none"> <li>● <b>NORMAL</b>: indicates the normal state.</li> <li>● <b>GIVEUP</b>: Abandons data acquisition.</li> </ul> |
| recv count:         | Number of service data receiving times, which is usually the same as the number of started timers.                                                                                                   |
| destination group   | Unique ID of the destination group.                                                                                                                                                                  |
| destination         | Destination address.                                                                                                                                                                                 |
| state               | Advertised state of the channel between the current device and the server.                                                                                                                           |
| task list count     | Number of to-be-sent task lists cached by the gRPC process.                                                                                                                                          |
| task drop count     | Number of tasks discarded after being cached by the gRPC process. A maximum of 10,000 task lists can be cached. Task lists beyond this number will be discarded.                                     |
| send request count  | Number of requests sent by the gRPC process by invoking RPC.                                                                                                                                         |
| send update count   | Number of update objects (defined in <b>dial_out.proto</b> ) sent by the gRPC process.                                                                                                               |
| recv response count | Number of server responses received by the gRPC process.                                                                                                                                             |

**Prompt Message** N/A

**Platform Description** N/A

## 10.27 show grpc client

Use this command to display information about login users of gRPC servers.

**show grpc client**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Example** The following example displays information about login users of servers, including their IP addresses and usernames.

```
Ruijie# show grpc client
Client information all:
  1      : ruijie@172.31.32.71, ID 12345
  2      : root@172.31.32.72, ID 12346
```

Field description:

| Field        | Description                       |
|--------------|-----------------------------------|
| 1            | Sequence number of a login server |
| ruijie       | Username used for server login    |
| 172.31.32.71 | IP address of the login server    |
| ID 12345     | Login server ID                   |

**Prompt** N/A

**Platform** N/A

**Description**

## 10.28 show grpc status

Use this command to display the running status of gRPC.

**show grpc status**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Example** The following example displays the running status of gRPC.

```
Ruijie# show grpc status
GRPC:
  Uptime: 10h:08m:29s
```

Field description:

| Field  | Description                                               |
|--------|-----------------------------------------------------------|
| Uptime | Running duration of the gRPC function after being enabled |

**Prompt** N/A

**Platform Description** N/A

## 10.29 show grpc subscr

Use this command to display the statuses and statistics of subscribed events on the device.

**show grpc subscr [realtime | sample]**

**Parameter Description**

| Parameter       | Description                            |
|-----------------|----------------------------------------|
| <b>realtime</b> | Indicates subscribed real-time events. |
| <b>sample</b>   | Indicates subscribed periodic events.  |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Example** The following example displays the statuses of subscribed real-time events on the device.

```
Ruijie# show grpc subscr realtime
Subscr realtime all:
  json event: GRPC_JSON_EVENT_REALTIME_CLI_CMD_LOG (0x00000000)
    server subscr count: 1
    server threshold: 0
    local realtime interval: 0

  json event: GRPC_JSON_EVENT_REALTIME_SS_ERSPAN_PACKAGE
(0x00010000)
    server subscr count: 0
    server threshold: 0
    local realtime interval: 0
```

Field description:

| Field | Description |
|-------|-------------|
|-------|-------------|

|                          |                                                                                               |
|--------------------------|-----------------------------------------------------------------------------------------------|
| json event               | Module real-time event that is subscribed                                                     |
| server subscr count      | Number of servers subscribing to this event                                                   |
| server threshold         | Threshold for triggering the subscribed event                                                 |
| local realtime interval: | Locally configured suppression time for message generation for the subscribed real-time event |

The following example displays the statuses and statistics of subscribed periodic events on the device.

```
Ruijie# show grpc subscr sample
Subscr sample all:
  json event: GRPC_JSON_EVENT_SAMPLE_SS_QOS_ECN_WRED_STAT
(0x10000000)
    timer expire: 9204 msec
    timer reopen expire: inactive
    local sample interval: 14
    server sample interval: 0
    server subscr count: 1
    sample event drop: 0
    sample pkt recv: 181
    sample pkt drop: 0

  json event: GRPC_JSON_EVENT_SAMPLE_SS_MMU_LOSS_CNT (0x10000001)
    timer expire: inactive
    timer reopen expire: inactive
    local sample interval: 14
    server sample interval: 0
    server subscr count: 0
    sample event drop: 0
    sample pkt recv: 0
    sample pkt drop: 0
```

Field description:

| Field                 | Description                                                    |
|-----------------------|----------------------------------------------------------------|
| json event            | Module periodic event that is subscribed                       |
| timer expire          | Timer for reporting the subscribed periodic event              |
| timer reopen expire   | Restart timer for reporting the subscribed periodic event      |
| local sample interval | Locally configured interval for reporting the subscribed event |

|                        |                                                                     |
|------------------------|---------------------------------------------------------------------|
| server sample interval | Interval for reporting the event subscribed by the last server      |
| server subscr count    | Number of servers subscribing to this event                         |
| sample event drop      | Number of timeout times of the periodic event                       |
| sample pkt recv        | Number of received packets, that is, packets that are not discarded |
| sample pkt drop        | Number of packets discarded due to timeout                          |

**Prompt** N/A

**Platform Description** N/A

## 10.30 show grpc yang node-path

Use this command to display the path of a YANG node.

**show grpc yang tree** [*module\_name*]

| Parameter Description | Parameter          | Description                |
|-----------------------|--------------------|----------------------------|
|                       | <i>module_name</i> | Indicates the module name. |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Examples** The following example displays all paths defined in the RG-gRPC YANG file.

```
Ruijie#show grpc yang node-path rg-grpc

===== [rg-grpc] =====
==
/rg-grpc:grpc/client-instance/id
/rg-grpc:grpc/client-instance/enable-realtime
/rg-grpc:grpc/client-instance/enable-sample
/rg-grpc:grpc/client-instance/enable-gnmi
/rg-grpc:grpc/client-instance/realtime-interval/event-type
```

```

/rg-grpc:grpc/client-instance/realtime-interval/event-interval
/rg-grpc:grpc/client-instance/sample-interval
/rg-grpc:grpc/client-instance/sample-interval-ms
/rg-grpc:grpc/client-instance/source-interface
/rg-grpc:grpc/client-instance/reply-interface
/rg-grpc:grpc/client-instance/login-type
/rg-grpc:grpc/client-instance/login-mlist
/rg-grpc:grpc/client-instance/aaa-config-retry
/rg-grpc:grpc/client-instance/aaa-config-timeout
/rg-grpc:grpc/client-instance/reply-timeout
/rg-grpc:grpc/client-instance/subscription/server-ipv4
/rg-grpc:grpc/client-instance/subscription/server-port
/rg-grpc:grpc/client-instance/subscription/event/type
/rg-grpc:grpc/client-instance/subscription/event/value
/rg-grpc:grpc/client-instance/subscription/event/value-extend

```

**Prompt Message** N/A

**Platform Description** N/A

## 10.31 show grpc yang tree

Use this command to display the YANG model tree defined in the RG-gRPC YANG file.

**show grpc yang tree** [*module\_name*]

| Parameter Description         | Parameter                                                                                                                                    | Description                |

|                              | <i>id</i>                                                                                                                                                                     | Indicates the ACL ID.                                                                                              |
|                              | <i>name</i>                                                                                                                                                                   | Indicates the ACL name.                                                                                            |
|                              | <i>rate</i>                                                                                                                                                                   | Indicates the sampling rate. The value ranges from <b>1</b> to <b>65535</b> and the default value is <b>1000</b> . |
| <b>Defaults</b>              | IFA sampling is disabled by default.                                                                                                                                          |                                                                                                                    |
| <b>Command Mode</b>          | Interface configuration mode                                                                                                                                                  |                                                                                                                    |
| <b>Default Level</b>         | 14                                                                                                                                                                            |                                                                                                                    |
| <b>Usage Guide</b>           | This command can be configured only on physical ports and APs. Four sampling rules using different ACLs and sampling rates can be configured for one interface.               |                                                                                                                    |
| <b>Configuration Example</b> | <p>The following example sets the IFA sampling–associated ACL to 100 and sampling rate to 200.</p> <pre>Ruijie(config-if-TenGigabitEthernet 0/15)# ifa acl 100 rate 200</pre> |                                                                                                                    |
| <b>Verification</b>          | Run the <b>show run</b> command to check whether IFA sampling is configured on an interface.                                                                                  |                                                                                                                    |
| <b>Prompt</b>                | N/A                                                                                                                                                                           |                                                                                                                    |
| <b>Common Errors</b>         | N/A                                                                                                                                                                           |                                                                                                                    |
| <b>Platform Description</b>  | N/A                                                                                                                                                                           |                                                                                                                    |

## 11.3 ifa filter enable

Use this command to filter IFA packets on an interface. Use the **no** form of this command to delete IFA packet filtering configuration on an interface. Use the **default** form of this command to restore the default settings.

**ifa filter enable**

**no ifa filter enable**

**default ifa filter enable**

## 11.4 ifa host-port

Use this command to configure an interface as the IFA server port or globally enable the IFA server port function. Use the **no** form of this command to delete the configuration of an interface serving as the IFA server port or globally disable the IFA server port function. Use the **default** form of this command to restore the default settings.

**ifa host-port [ acl *id* | *name* ]**

**no ifa host-port**

**default ifa host-port**

| Parameter<br>Description | Parameter   |             | Description |

|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>              | No interface is configured as the IFA server port by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Command Mode</b>          | Interface configuration mode, global configuration mode                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default Level</b>         | 14                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Usage Guide</b>           | <p>In interface configuration mode, this command is used to configure an interface as an IFA server port. This command can be configured only on physical ports and APs, on which ACLs cannot be applied.</p> <p>In global configuration mode, this command is used to enable the IFA server port. It is used in combination with the <b>ifa host-port</b> command in interface configuration mode. The IFA server port is available only after both commands are configured. In addition, this command can be used to enable the IFA server port only after the IFA server is configured. When matching rules are needed to identify INT packets, ACLs need to be configured before this command is applied.</p> |
| <b>Configuration Example</b> | <p>The following example configures the TenGigabitEthernet 0/16 interface as the IFA server port.</p> <pre>Ruijie(config)# ifa host-port acl 101 Ruijie(config)# interface TenGigabitEthernet 0/16 Ruijie(config-if-TenGigabitEthernet 0/16)# ifa host-port</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Verification</b>          | Run the <b>show run</b> command to check whether the command is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Prompt</b>                | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 11.5 ifa passive md

Use this command to disable the function of adding the MD field to headers of IFA sampling packets on an interface. Use the **no** form of this command to delete the IFA server port configuration from an interface. Use the **no** form of this command to restore the default settings.

**ifa passive md**

**no ifa passive md**

**default ifa passive md**

## 11.6 ifa send-server

Use this command to configure the name of the server to which IFA packets of an interface are to be sent, and ACL rules. Use the **no** form of this command to delete the IFA packet transmission configuration of an interface. Use the **default** form of this command to restore the default settings.

**ifa send-server** *server-name* [ **acl** *id* | *name* ]

**no ifa send-server**

**default ifa send-server**

| <b>Defaults</b>              | IFA packets are not sent by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                      |
| <b>Command Mode</b>          | Interface configuration mode                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                      |
| <b>Default Level</b>         | 14                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                      |
| <b>Usage Guide</b>           | <p>This command can be configured only on physical ports and APs. Packets can be sent to the IFA server only after the IP address of the IFA server is configured. IFA packets of the same interface can be sent only to the same server.</p> <p>The ACL rule is optional configuration. All the IFA packets on the interface will be sent to the server when no ACL rule is configured. To send the IFA packets matching the ACL rule to the specified server, configure the ACL rule first, and then apply the rule on the interface.</p> |                                      |
| <b>Configuration Example</b> | <p>The following example sends IFA packets of the TenGigabitEthernet 0/16 interface to the IFA server named server1.</p> <pre>Ruijie(config-if-TenGigabitEthernet 0/16)# ifa send-server server1</pre>                                                                                                                                                                                                                                                                                                                                      |                                      |
| <b>Verification</b>          | Run the <b>show run</b> command to check the IFA packet transmission configuration of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                      |
| <b>Prompt</b>                | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                      |
| <b>Common Errors</b>         | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                      |

| Default Level            | 14                                                                                                                                                                                                                                                                                                                   |                                                                                  |
| Usage Guide              | This command is used to configure the source and destination addresses of IFA encapsulated packets. The addresses can be host addresses only. When a non-host address (such as a multicast address or broadcast address) is configured, a configuration failure occurs. The IFA server listens to a configured port. |                                                                                  |
| Configuration<br>Example | The following example sets the IP address of the IFA server named server1 to 192.168.2.101 and configures the server to listen to port 2000.<br><pre>Ruijie(config)# ifa server server1 source 192.168.2.100 port 1000<br/>destination 192.168.2.101 port 2000</pre>                                                 |                                                                                  |
| Verification             | Run the <b>show run</b> command to check whether the command is configured.                                                                                                                                                                                                                                          |                                                                                  |
| Prompt                   | An error is displayed if the configured address is invalid.<br><pre>invalid host address.</pre>                                                                                                                                                                                                                      |                                                                                  |
| Common<br>Errors         | N/A                                                                                                                                                                                                                                                                                                                  |                                                                                  |
| Platform<br>Description  | N/A                                                                                                                                                                                                                                                                                                                  |                                                                                  |

## 11.8 ifa set-device

Use this command to configure the address of an IFA device. Use the **no** form of this command to delete the address of an IFA device. Use the **default** form of this command to restore the default settings.

**ifa set-device** *ip-address*

**no ifa set-device**

**default ifa set-device**

| <b>Default Level</b>         | 14                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Usage Guide</b>           | <p>In interface configuration mode, this command is used to enable the function of adding the MD field to headers of IFA sampling packets on an interface. It can be configured only on physical ports and APs. After this command is configured on an interface, no interface can be configured with the <b>ifa passive md</b> command.</p> <p>When this command is configured globally, the function of adding the MD field to headers of IFA sampling packets is enabled on all physical ports and APs. If this function needs to be disabled on some interfaces, run the <b>ifa passive md</b> command on these interfaces.</p> <p>The configuration in interface configuration mode is mutually exclusive to that in global configuration mode. That is, the command cannot be configured globally after it is configured on an interface, and vice versa.</p> <p>The <b>ifa set-header md</b> command needs to be configured on all layer-3 intermediate devices that forward IFA sampling packets. Otherwise, the IFA sampling packets may not be re-encapsulated nor sent to the server, or the packets may be incomplete even if they reach the server. When matching rules are needed, expert-level ACLs must be configured. After this command is configured, the MD field will be added to headers of packets matching the ACLs.</p> |
| <b>Configuration Example</b> | <p>The following example adds the MD field to the header of IFA sampling packets on the TenGigabitEthernet 0/15 interface.</p> <pre>Ruijie(config)#access-list 2701 permit icmp any any any any Ruijie(config)#interface TenGigabitEthernet 0/15 Ruijie(config-if-TenGigabitEthernet 0/15)# ifa set-header md acl 2701</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Verification</b>          | Run the <b>show run</b> command to check whether the command is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 11.10 ifa set-loopback interface

Use this command to configure an IFA loopback interface. Use the **no** form of this command to delete the configured IFA loopback interface. Use the **default** form of this command to restore the default settings.

**ifa set-loopback interface** *interface-name*

**no ifa set-loopback interface** *interface-name*

**default ifa set-loopback interface** *interface-name*

| Parameter Description | Parameter                                                                                                                                                              | Description                  |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
|                       | <i>interface-name</i>                                                                                                                                                  | Specifies an interface name. |
| Defaults              | No IFA loopback interface is configured by default.                                                                                                                    |                              |
| Command Mode          | Global configuration mode                                                                                                                                              |                              |
| Default Level         | 14                                                                                                                                                                     |                              |
| Usage Guide           | This command can be configured only on physical ports.                                                                                                                 |                              |
| Configuration Example | The following example configures TenGigabitEthernet 0/1 as the IFA loopback interface.<br><pre>Ruijie(config)# ifa set-loopback interface TenGigabitEthernet 0/1</pre> |                              |
| Verification          | Run the <b>show run</b> command to check whether the command is configured.                                                                                            |                              |

## 12 PSR Commands

### 12.1 clear psr statistics

Use this command to clear the PSR statistics.

**clear psr statistics**

| Parameter Description | Parameter                                                                                           | Description |
|-----------------------|-----------------------------------------------------------------------------------------------------|-------------|
|                       | N/A                                                                                                 | N/A         |
| Defaults              | N/A                                                                                                 |             |
| Command Mode          | Privileged EXEC mode                                                                                |             |
| Default Level         | 14                                                                                                  |             |
| Usage Guide           | N/A                                                                                                 |             |
| Configuration Example | The following example clears the PSR statistics.<br><pre>Ruijie(config)# clear psr statistics</pre> |             |
| Verification          | Run the <b>show psr statistics</b> command to display the PSR statistics.                           |             |
| Prompt                | N/A                                                                                                 |             |
| Common Errors         | N/A                                                                                                 |             |
| Platform Description  | N/A                                                                                                 |             |

### 12.2 psr collect-interface

Use this command to configure the number of interfaces whose sampling information is to be encapsulated into PSR packets. Use the **no** form of this command to delete the configured number of interfaces whose sampling information is to be encapsulated into PSR packets. Use the **default** form of this command to restore the default settings.

**psr collect-interface** *numbers*

**no psr collect-interface**  
**default psr collect-interface**

| Parameter Description | Parameter                                                                                                                                                                               | Description                                                                                                          |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
|                       | <i>numbers</i>                                                                                                                                                                          | Indicates the interface quantity. The value ranges from <b>1</b> to <b>100</b> , and the default value is <b>1</b> . |
| Defaults              | The default number of interfaces is 1.                                                                                                                                                  |                                                                                                                      |
| Command Mode          | Global configuration mode                                                                                                                                                               |                                                                                                                      |
| Default Level         | 14                                                                                                                                                                                      |                                                                                                                      |
| Usage Guide           | This command is used to configure the number of interfaces whose sampling information is to be encapsulated into PSR packets.                                                           |                                                                                                                      |
| Configuration Example | <p>The following example sets the number of interfaces whose sampling information is to be encapsulated into PSR packets to 50.</p> <pre>Ruijie(config)# psr collect-interface 50</pre> |                                                                                                                      |
| Verification          | Run the <b>show run</b> command to check whether the number of interfaces whose sampling information is to be encapsulated into PSR packets is configured correctly.                    |                                                                                                                      |
| Prompt                | N/A                                                                                                                                                                                     |                                                                                                                      |

## 12.3 psr interval

Use this command to configure the time interval for PSR sampling. Use the **no** form of this command to delete the configured time interval of PSR sampling. Use the **default** form of this command to restore the default settings.

**psr interval** *seconds*  
**no psr interval**  
**default psr interval**

| Parameter<br>Description | Parameter |             | Description |

| <b>Defaults</b>              | The default time interval is 5s.                                                                                                                                                               |                |                                                                                                                           |
| <b>Command Mode</b>          | Global configuration mode                                                                                                                                                                      |                |                                                                                                                           |
| <b>Default Level</b>         | 14                                                                                                                                                                                             |                |                                                                                                                           |
| <b>Usage Guide</b>           | This command is used to configure the global time interval for PSR sampling. The PSR sampling of all interfaces uses this sampling interval.                                                   |                |                                                                                                                           |
| <b>Configuration Example</b> | <p>The following example sets the time interval for PSR sampling to 60s.</p> <pre>Ruijie(config)# psr interval 60</pre>                                                                        |                |                                                                                                                           |
| <b>Verification</b>          | Run the <b>show run</b> command to check whether the time interval for PSR sampling is configured.                                                                                             |                |                                                                                                                           |
| <b>Prompt</b>                | N/A                                                                                                                                                                                            |                |                                                                                                                           |
| <b>Common Errors</b>         | N/A                                                                                                                                                                                            |                |                                                                                                                           |
| <b>Platform Description</b>  | N/A                                                                                                                                                                                            |                |                                                                                                                           |

## 12.4 psr send-server

Use this command to configure the name of the server to which PSR packets of an interface are to be sent. Use the **no** form of this command to delete the PSR packet transmission configuration of an interface. Use the **default** form of this command to restore the default settings.

**psr send-server** *server-name*

**no psr send-server**

**default psr send-server**

| <b>Parameter Description</b> | Parameter                            | Description                         |
|------------------------------|--------------------------------------|-------------------------------------|
|                              | <i>server-name</i>                   | Indicates the name of a PSR server. |
| <b>Defaults</b>              | PSR packets are not sent by default. |                                     |
| <b>Command</b>               | Interface configuration mode         |                                     |

**Mode****Default Level** 14

**Usage Guide** This command can be configured only on physical ports and APs. Packets can be sent to the PSR server only after the IP address of the PSR server is configured. PSR packets of the same interface can be sent only to the same server.

**Configuration Example** The following example sends PSR packets of the TenGigabitEthernet 0/16 interface to the PSR server named server1.

```
Ruijie(config-if-TenGigabitEthernet 0/16)# psr send-server
server1
```

**Verification** Run the **show run** command to check the PSR packet transmission configuration of the interface.

**Prompt** N/A**Common Errors** N/A**Platform Description** N/A

## 12.5 psr server

Use this command to configure a PSR server. Use the **no** form of this command to delete the PSR server configuration. Use the **default** form of this command to restore the default settings.

**psr server** *server-name* **source** *ip-address* **port** *udp-port* **destination** *ip-address* **port** *udp-port*

**no psr server** *server-name*

**default psr server** *server-name*

**Parameter Description**

| Parameter          | Description                                                                      |
|--------------------|----------------------------------------------------------------------------------|
| <i>server-name</i> | Indicates the name of a PSR server.                                              |
| <i>ip-address</i>  | Specifies the source and destination IPv4 addresses of PSR encapsulated packets. |
| <i>udp-port</i>    | Indicates the source and destination port IDs of PSR packets.                    |

**Defaults** N/A

|                              |                                                                                                                                                                                                                                                                                                                      |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command Mode</b>          | Global configuration mode                                                                                                                                                                                                                                                                                            |
| <b>Default Level</b>         | 14                                                                                                                                                                                                                                                                                                                   |
| <b>Usage Guide</b>           | This command is used to configure the source and destination addresses of PSR encapsulated packets. The addresses can be host addresses only. When a non-host address (such as a multicast address or broadcast address) is configured, a configuration failure occurs. The PSR server listens to a configured port. |
| <b>Configuration Example</b> | <p>The following example sets the IP address of the PSR server named server1 to 192.168.2.101 and configures the server to listen to Port 2000.</p> <pre>Ruijie(config)# psr server server1 source 192.168.2.100 port 1000 destination 192.168.2.101 port 2000</pre>                                                 |
| <b>Verification</b>          | Run the <b>show run</b> command to check whether the command is configured.                                                                                                                                                                                                                                          |
| <b>Prompt</b>                | <p>An error is displayed if the configured address is invalid.</p> <pre>invalid host address.</pre>                                                                                                                                                                                                                  |
| <b>Common Errors</b>         | N/A                                                                                                                                                                                                                                                                                                                  |
| <b>Platform Description</b>  | N/A                                                                                                                                                                                                                                                                                                                  |

## 12.6 show psr statistics

Use this command to display PSR statistics.

**show psr statistics**

| <b>Parameter Description</b> | Parameter                                                                         | Description |
|------------------------------|-----------------------------------------------------------------------------------|-------------|
|                              | N/A                                                                               | N/A         |
| <b>Defaults</b>              | N/A                                                                               |             |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, and interface configuration mode |             |
| <b>Default Level</b>         | 14                                                                                |             |
| <b>Usage Guide</b>           | N/A                                                                               |             |

**Configuration** The following example displays PSR statistics.

**Example**

```
Ruijie# show psr statistics
```

| Server id | Name | Statistic(pkts) | Applied interface |
|-----------|------|-----------------|-------------------|
| -----     |      |                 |                   |
| 1         | aaa  | 20426           | Hu1/1-9           |
| 2         | bbb  | 1000            | Hu16/1-16         |

Field description:

# 1 DCB Commands

## 1.1 clear priority-flow-control deadlock statistics interface

Use this command to clear the PFC deadlock statistics of an interface.

**clear priority-flow-control deadlock statistics** [**interface** *interface*]

| Parameter<br>Description | Parameter        | Description                  |
|--------------------------|------------------|------------------------------|
|                          | <i>interface</i> | Indicates an interface name. |

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** This command is used to clear the PFC deadlock statistics of an interface.

**Configuration** The following example clears PFC deadlock statistics of all priorities of all interfaces.

**Examples** Ruijie#clear priority-flow-control deadlock statistics

The following example clears PFC deadlock statistics of all priorities of a specified interface.

```
Ruijie#clear priority-flow-control deadlock statistics interface  
tenGigabitEthernet 0/1
```

## 1.2 clear priority-flow-control statistics

Use this command to clear the PFC statistics.

**clear priority-flow-control statistics** [**interface** *intf-name*]

| Parameter<br>Description | Parameter        | Description    |
|--------------------------|------------------|----------------|
|                          | <i>intf-name</i> | Interface name |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** If the intf-name 1 parameter is not defined, the PFC statistics of all ports is cleared.

**Configuration** The following example clears the PFC statistics of the interface FastEthernet 0/1:

**Examples**

```
Ruijie# clear interface FastEthernet 0/1 priority-flow-control
statistics
```

#Show the statistics:

```
Ruijie# show interface FastEthernet 0/1 priority-flow-control
statistics
Interface PriorityEnabledPFC PauseSended PauseReceived
-----
Fa 0/1      3                0                0
```

| N/A     | N/A         |

**Platform** N/A

**Description**

## 1.3 dcbx advertise

Use this command to enable DCBX TLV release on an interface. Use the **no** form or **default** form of this command to disable or restore DCBX TLV release.

**dcbx { app-proto | pfc } advertise**

**no dcbx { app-proto | pfc } advertise**

**default dcbx { app-proto | pfc } advertise**

**Parameter  
Description**

| Parameter        | Description                                           |
|------------------|-------------------------------------------------------|
| <b>app-proto</b> | Controls DCBX TLV release specific to APP capability. |
| <b>pfc</b>       | Controls DCBX TLV release specific to PFC capability. |

**Defaults** All DCBX TLVs can be released.

**Command  
Mode** Interface configuration mode

**Usage Guide** The following conditions must be met:

LLDP is enabled at both interface and global levels.

Interface LLDP works in txrx mode.

The interface supports the relevant DCB capability.

Interface DCBX is enabled.

Interface-specific DCBX TLVs can be released.

**Configuration** N/A

**Examples**

| Related<br>Commands | Command                 | Description                                                          |
|---------------------|-------------------------|----------------------------------------------------------------------|
|                     | <b>show dcbx status</b> | Displays the DCBX TLV type allowed to be released on each interface. |

**Platform** N/A

**Description**

## 1.4 dcbx enable

Use this command to enable DCBX on an interface. Use the **no** form or **default** form of this command to disable or restore DCBX.

**dcbx enable**

**no dcbx enable**

**default dcbx enable**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** The DCBX is enabled by default.

**Command Mode** Global configuration mode/Interface configuration mode

**Usage Guide** Enable DCBX in global or interface configuration mode to launch the DCB capability negotiation of the interface. Disabling the global DCBX function will disable the DCB capability negotiation of all interfaces.

To make the DCBX negotiation of an interface take effect, the following conditions must be met:

- 1) LLDP is enabled at both interface and global levels.
- 2) Interface LLDP works in txrx mode.
- 3) Interface-specific DCB TLVs can be released.
- 4) The interface supports the relevant DCB capability.
- 5) Global and interface DCBX are enabled.

 The LLDP enable and work mode configuration of the AP member interface will affect the DCBX protocol of the corresponding AP interface.

 During the configuration of the AP interface, ensure that the LLDP configurations of all AP member interfaces are consistent, the topology connection of the AP interface is correct, and the DCBX TLVs released by all AP member interfaces are the same. Otherwise, the DCB capability negotiation of both ends of the AP interface will be abnormal.

**Configuration** This example shows how to disable the DCBX protocol on GigabitEthernet 0/1:

**Examples**

```
Ruijie#config
Ruijie(config)#interface gigabitethernet 0/1
Ruijie(config-if)#no dcbx enable
```

**Related  
Commands**

| Command                 | Description                                                |
|-------------------------|------------------------------------------------------------|
| <b>show dcbx status</b> | Displays the DCBX protocol enable state of each interface. |

**Platform** N/A

**Description**

## 1.5 dcbx mode

Use this command to configure the DCBX mode of the interface. Use the **no** or **default** form of this command to restore the default DCBX mode.

**dcbx mode { auto | cee | ieee }**

**no dcbx mode**

**default dcbx mode**

**Parameter  
Description**

| Parameter   | Description                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------|
| <b>auto</b> | Auto-switches the DCBX mode according the DCBX TLV type received on the interface. The default mode is CEE-DCBX. |
| <b>cee</b>  | Specifies the DCBX mode to CEE-DCBX.                                                                             |
| <b>ieee</b> | Specifies the DCBX mode to IEEE-DCBX.                                                                            |

**Defaults** The default DCBX mode is auto, and the CEE-DCBX is effective.

**Command  
Mode** Interface configuration mode

**Usage Guide** The following conditions must be met:

1. LLDP is enabled at both interface and global levels.

Interface LLDP works in txrx mode.

Interface-specific DCB TLVs can be released.

The interface supports the relevant DCB capability.

Interface DCBX is enabled.

If the interface DCBX mode is auto, the CEE-DCBX takes effect and then the interface automatically switches the DCBX mode according the DCBX TLV type received.

If the interface DCBX mode is cee, the CEE-DCBX takes effect, but the interface does not switch the DCBX mode based on the DCBX TLV type received.

If the interface DCBX mode is ieee, the IEEE-DCBX takes effect, but the interface does not switch the DCBX mode based on the DCBX TLV type received.

**Configuration** This example shows how to configure the ieee DCBX mode on GigabitEthernet 0/1:

**Examples**

```
Ruijie#config
Ruijie(config)#interface gigabitethernet 0/1
Ruijie(config-if)#dcbx mode ieee
```

**Related  
Commands**

| Command                 | Description                                 |
|-------------------------|---------------------------------------------|
| <b>show dcbx status</b> | Displays the DCBX status of each interface. |

**Platform** N/A

**Description**

## 1.6 dcbx willing

To enable the acceptance of the peer DCB configuration, use the **dcbx { app-proto | ets | pfc } willing enable** command. To disable or restore the acceptance of the peer DCB configuration, use the **no** form or **default** form of this command.

**dcbx { app-proto | pfc } willing enable**

**no dcbx { app-proto | pfc } willing enable**

**default dcbx { app-proto | pfc } willing**

**Parameter  
Description**

| Parameter        | Description                                                                      |
|------------------|----------------------------------------------------------------------------------|
| <b>app-proto</b> | Controls the synchronous acceptance of the peer configuration of APP capability. |
| <b>pfc</b>       | Controls the synchronous acceptance of the peer configuration of PFC capability. |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>     | The local end does not accept the peer configuration, that is, the willing bit is 0.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Command Mode</b> | Interface configuration mode                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Usage Guide</b>  | <p>If the local end is unwilling to accept the peer configuration, disable the willing setting. Otherwise, enable it. The following conditions must be met:</p> <ul style="list-style-type: none"><li>LLDP is enabled at both interface and global levels.</li><li>Interface LLDP works in txrx mode.</li><li>The interface supports the relevant DCB capability.</li><li>Interface DCBX is enabled.</li><li>Interface-specific DCBX TLVs can be released.</li></ul> |

 When the willing settings are the same on the two ends, the configuration of the end with a less MAC address serves as the synchronization configuration if both ends accept the peer configuration. If neither end accepts the peer configuration, the same configuration indicates successful negotiation and different configurations indicate failed negotiation.

 The DCB capability that supports global configuration instead of interface configuration cannot be negotiated through DCBX, and the local configuration serves as the synchronization configuration. For example, if PFC supports global configuration instead of interface configuration, PFC capability negotiation cannot be performed even if the local PFC willing bit is 1, and the local PFC configuration serves as the final synchronization configuration.

**Configuration** N/A

| <b>Configuration Examples</b> | <p>The following example configures the global PFC statistics collection interval to 10 seconds.</p> <pre>Ruijie# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)# priority-flow-control counting-interval 10</pre> |                                                                                                        |
| <b>Verification</b>           | <p>Run the <b>show running-config</b> command to display the configuration.</p> <pre>Ruijie#show running-config</pre>                                                                                                                                              |                                                                                                        |

## 1.8 priority-flow-control deadlock cos-value

Use this command to configure attributes of the PFC deadlock detection function for a PFC priority. Use the **no** form of this command to cancel configured attributes of the PFC deadlock detection function for a PFC priority.

**priority-flow-control deadlock cos-value** *cos-value-list* [**detect** *detect-time* **recover** *recover-time* [ **continue** | **backoff** *most-times* ] ]

**no priority-flow-control deadlock cos-value** [*cos-value-list* **detect** *detect-time* **recover** *recover-time* [ **continue** | **backoff** *most-times* ] ]

| Parameter Description | Parameter                        | Description                                                                                                                             |
|-----------------------|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>cos-value-list</i>            | Indicates the priority list. The priority ranges from <b>0</b> to <b>7</b> .                                                            |
|                       | <i>detect-time</i>               | Indicates the deadlock detection time in time slices. The value ranges from <b>1</b> to <b>15</b> . The default value is <b>15</b> .    |
|                       | <i>recover-time</i>              | Indicates the deadlock recovery time in milliseconds. The value ranges from <b>10</b> to <b>3000</b> . The default value is <b>15</b> . |
|                       | <b>continue</b>                  | Indicates the continue algorithm used to calculate the deadlock recover-time.                                                           |
|                       | <b>backoff</b> <i>most-times</i> | Indicates the backoff algorithm used to calculate the                                                                                   |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Default Level</b> | 14                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Usage Guide</b>   | <p>1. The PFC deadlock detection function detects whether an interface at a PFC priority enters the <b>PFC deadlock</b> state. When it is detected that the interface enters the PFC deadlock state, the interface forwards or discards received packets within a period of time. You can run the <b>priority-flow-control deadlock drop</b> command to configure the packet processing mode.</p> <p>2. You can use this command to configure attributes of the PFC deadlock detection function for PFC priorities. The default values are used if not specified. The configuration of one or two priorities is available. Up to two priorities are supported.</p> <p>3. <i>detect-time</i>: Indicates the time for determining whether an interface at a PFC priority enters the PFC deadlock state. When the interface stays in the PFC congested state in consecutive detect-time periods, it indicates that the interface enters the PFC deadlock state. The default value is used if not specified.</p> <p>4. <i>recover-time</i>: indicates the allowed packet processing time after an interface at a PFC priority enters the PFC deadlock state. The default value is 150ms if not specified.</p> <p>5. <i>detect-time</i> is in unit of time slice. You can run the <b>priority-flow-control deadlock precision low</b> command to configure the length of one time slice. <i>recover-time</i> is in unit of milliseconds.</p> <p>6. <b>continue</b>: Indicates that an interface of the priority in the deadlock state continues in this state for one recover-time period if it receives PFC PAUSE frames. The interface checks whether it receives PFC PAUSE frames in the next recover-time period. If the interface still receives such frames, it continues to be in the deadlock state for another recover-time period. The process repeats till the interface does not receive PFC PAUSE frames within the recover-time period and then the interface exits the deadlock state.</p> <p>7. <i>most-times</i>: indicates the maximum number of recover-time backoff times . If an interface enters the deadlock state within the backoff period (recover-time x most-times) after it recovers from the first deadlock, the backoff time needs to be added to the recover-time (Backoff time = Number of backoff times x recover-time). If the interval between two deadlock states exceeds the backoff period, the number of backoff times is reset to zero. Otherwise, the number of backoff times increases by 1 (if the number of backoff times already reaches the maximum number of backoff times,</p> |

the maximum number of backoff times, that is, most-times, is used.)

8. If neither **continue** nor **backoff** is configured, the deadlock recover-time algorithm is disabled. After the deadlock recover-time ends, the interface directly exits the deadlock state.

**Configuration Examples** The following example sets the PFC deadlock detection time to 15 time slices and packet processing time to 10ms for the PFC priorities of 1 and 2.

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# priority-flow-control deadlock cos-value 1,2
detect 15 recover 10
```

The following example configures interfaces of PFC priorities 1 and 2 in the deadlock state to exit the deadlock state only when they do not receive PFC PAUSE frames within the recover-time

```
Ruijie(config)# priority-flow-control deadlock cos-value 1,2
detect 15 recover 10 continue
```

The following example uses the backoff algorithm to calculate the deadlock recover-time for interfaces of PFC priorities 1 and 2 and sets the maximum number of backoff times to 10.

```
Ruijie(config)# priority-flow-control deadlock cos-value 1,2
detect 15 recover 10 backoff 10
```

**Verification** Run the **show running-config** command to display the configuration.

```
Ruijie#show running-config
```

**Common Errors** N/A

## 1.9 priority-flow-control deadlock cos-value enable

Use this command to enable the PFC deadlock detection function on an interface for a priority. Use the **no** form of this command to disable the PFC deadlock detection function on an interface for a priority.

**priority-flow-control deadlock cos-value *cos-value-list* enable**

**no priority-flow-control deadlock cos-value *cos-value-list* enable**

**Parameter Description**

| Parameter             | Description                                                                  |
|-----------------------|------------------------------------------------------------------------------|
| <i>cos-value-list</i> | Indicates the priority list. The priority ranges from <b>0</b> to <b>7</b> . |

**Defaults** The PFC deadlock detection function is disabled on an interface for all priorities by default.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 1.11 priority-flow-control deadlock limit cos-value enable

Use this command to enable the PFC deadlock threshold function for a PFC priority. Use the **no** form of this command to disable the PFC deadlock threshold function for PFC priority.

**priority-flow-control deadlock limit cos-value** *cos-value-list* **enable**

**no priority-flow-control deadlock limit cos-value** [*cos-value-list* **enable**]

| Parameter Description | Parameter                 | Description                                                                  |
|-----------------------|---------------------------|------------------------------------------------------------------------------|
|                       | <i>cos-value-list</i>     | Indicates the priority list. The priority ranges from <b>0</b> to <b>7</b> . |
| <b>Defaults</b>       | N/A                       |                                                                              |
| <b>Command Mode</b>   | Global configuration mode |                                                                              |
| <b>Default Level</b>  | 14                        |                                                                              |

- Usage Guide**
1. This command is not configured by default. Configuring this command will enable the PFC deadlock threshold function for the PFC priority corresponding to *cos-value-list*. If the number of deadlock times occurring for a priority within one detection period (1 minute by default) reaches the threshold (10 times by default), the PFC function is disabled for the priority via the **priority-flow-control nodrop cos-value-list off** command.
  2. This command relies on the configuration of the **priority-flow-control deadlock cos-value cos-value-list detect detect-time recover recover-time** command. This command can be configured only after the command for configuring attributes of the PFC deadlock detection function is configured for a priority. Likewise, if the command for configuring attributes of the PFC deadlock detection function is deleted for a priority, the PFC deadlock threshold command of the priority is also deleted.
  3. You can run the **priority-flow-control deadlock limit frequency number period time** command to configure the detection period and deadlock threshold.

**Configuration** The following example enables the PFC deadlock threshold function for PFC Priority 2.

**Examples**

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# priority-flow-control deadlock limit cos-value 2
enable
```

**Verification** Run the **show running-config** command to display the configuration.

```
Ruijie#show running-config
```

**Common Errors**

The attributes of the PFC deadlock detection function are not configured for a priority.

## 1.12 priority-flow-control deadlock limit frequency period

Use this command to configure the PFC deadlock threshold and detection period. Use the **no** form of this command to cancel the configured PFC deadlock threshold and detection period.

**priority-flow-control deadlock limit frequency number period time**

**no priority-flow-control deadlock limit frequency [number period time]**

**Parameter Description**

| Parameter     | Description                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------|
| <i>number</i> | Indicates the PFC deadlock threshold. The value ranges from 10 times to 100,000 times and the default value is 10 times. |
| <i>time</i>   | Indicates the PFC deadlock detection period. The value ranges from 1 min to 5 min and the default value is 1 min.        |

|                               |                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>               | The default PFC deadlock detection period is 1 min and the default PFC deadlock threshold is 10 times.                                                                                                                                                                                                                                          |
| <b>Command Mode</b>           | Global configuration mode                                                                                                                                                                                                                                                                                                                       |
| <b>Default Level</b>          | 14                                                                                                                                                                                                                                                                                                                                              |
| <b>Usage Guide</b>            | 1. This command modifies the PFC deadlock threshold and detection period. When the <b>priority-flow-control deadlock limit cos-value cos-value-list enable</b> command is executed to enable the PFC deadlock threshold function for a PFC priority, the PFC deadlock threshold and detection period configured using this command are applied. |
| <b>Configuration Examples</b> | <p>The following example sets the PFC deadlock threshold to 100 and detection period to 5 min.</p> <pre>Ruijie# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)# priority-flow-control deadlock limit frequency 100 period 5</pre>                                                               |
| <b>Verification</b>           | <p>Run the <b>show running-config</b> command to display the configuration.</p> <pre>Ruijie#show running-config</pre>                                                                                                                                                                                                                           |

## 1.13 priority-flow-control deadlock precision low

Use this command to set the PFC deadlock time precision to low.

**priority-flow-control deadlock precision low**

Use the **no** form of this command to cancel the configured low PFC deadlock time precision.

**no priority-flow-control deadlock precision low**

| <b>Parameter Description</b> | Parameter                                                                                                           | Description |
|------------------------------|---------------------------------------------------------------------------------------------------------------------|-------------|
|                              | N/A                                                                                                                 | N/A         |
| <b>Defaults</b>              | The default deadlock time precision is high (10 ms). This command sets the deadlock time precision to low (100 ms). |             |
| <b>Command Mode</b>          | Global configuration mode                                                                                           |             |
| <b>Default Level</b>         | 14                                                                                                                  |             |

- Usage Guide**
1. This command is used to configure the length of a single deadlock time slice. It affects the time unit of *detect-time* in the **priority-flow-control deadlock cos-value cos-value-list detect detect-time recover recover-time** command.
  2. When this command is not configured, the PFC deadlock time precision is high (one time slice equals 10 ms).
  3. After the PFC deadlock function is configured for a priority, configuring this command will modify the time precision of the PFC deadlock function for the priority.

**Configuration** The following example sets the PFC deadlock time precision to low.

**Examples**

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# priority-flow-control deadlock precision low
```

**Verification** Run the **show running-config** command to display the configuration.

```
Ruijie#show running-config
```

**Prompts** N/A

**Platform** N/A

**Description**

## 1.14 priority-flow-control rx disable

Use this command to disable the PFC RX function. Use the **no** form of this command to enable the PFC RX function.

**priority-flow-control rx disable**

**no priority-flow-control rx disable**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** By default, the PFC RX function is enabled.

**Command  
Mode** Global or interface configuration mode

**Default Level** 14

- Usage Guide**
1. Use this command to configure the PFC RX function. By default, the PFC RX function is enabled.
  2. This command can be configured in global or interface configuration mode

depending on the chip capability. When the PFC RX function supports the global configuration capability, the command is unavailable on interfaces.

3. When the PFC RX function supports the interface configuration capability, the command can be configured in global configuration mode and the configuration can be saved to each interface. The configuration is displayed only on interfaces.

**Configuration Examples**

The following example disables the PFC RX function globally.

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# priority-flow-control rx disable
```

**Verification**

Run the **show running-config** command to display the configuration.

```
Ruijie#show running-config
```

## 1.15 priority-flow-control tx disable

Use this command to disable the PFC TX function. Use the no form of this command to enable the PFC TX function.

**priority-flow-control tx disable**

**no priority-flow-control tx disable**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

By default, the PFC TX function is enabled.

**Command Mode**

Global or interface configuration mode

**Default Level**

14

**Usage Guide**

1. Use this command to configure the PFC TX function. By default, the PFC TX function is enabled.
2. This command can be configured in global or interface configuration mode depending on the chip capability. When the PFC TX function supports the global configuration capability, the command is unavailable on interfaces.
3. When the PFC TX function supports the interface configuration capability, the command can be configured in global configuration mode and the configuration can be saved to each interface. The configuration is displayed only on interfaces.

**Configuration**

The following example disables the PFC TX function globally.

**Examples**

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# priority-flow-control tx disable
```

**Verification**

Run the **show running-config** command to display the configuration.

```
Ruijie#show running-config
```

## 1.16 priority-flow-control xoff-time

Use this command to configure the value of **XOFF-TIME** in a PFC frame. Use the **no** form of this command to restore the default value.

**priority-flow-control xoff-time** *number*

**no priority-flow-control xoff-time** [*number*]

**Parameter Description**

| Parameter     | Description                                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>number</i> | Value of <b>XOFF-TIME</b> in a PFC frame, ranging from <b>1</b> to <b>65535</b> (The unit of <b>XOFF-TIME</b> is the time required by the chip to send 512-bit data at the physical layer.) |

**Defaults**

The default value of **XOFF-TIME** in a PFC frame is **65535**.

**Command Mode**

Global or interface configuration mode

**Default Level**

14

**Usage Guide**

1. Use this command to configure the value of **XOFF-TIME** in a PFC frame.
2. This command can be configured in global or interface configuration mode depending on the chip capability. When the PFC frame XOFF-TIME function supports the global configuration capability, the command is unavailable on interfaces.
3. When the PFC frame XOFF-TIME function supports the interface configuration capability, the command can be configured in global configuration mode and the configuration can be saved to each interface. The configuration is displayed only on interfaces.

**Configuration Examples**

The following example sets the value of **XOFF-TIME** in a PFC frame to **100** globally.

**Examples**

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# priority-flow-control xoff-time 100
```

**Verification**

Run the **show running-config** command to display the configuration.

```
Ruijie#show running-config
```

## 1.17 priority-flow-control early-warning

Use this command to configure the flow rate warning for a priority of an interface. Use the **no** form of this command to cancel the configured flow rate warning for a priority of an interface.

**priority-flow-control early-warning** *cos-value-list* { **output pps** *rate-num* } | **input pps** *rate-num* }

**no priority-flow-control early-warning** *cos-value-list* { **output** [pps *rate-num*] | **input** [pps *rate-num*] }

| Parameter Description | Parameter             | Description                                                                                 |
|-----------------------|-----------------------|---------------------------------------------------------------------------------------------|
|                       | <i>cos-value-list</i> | Indicates the priority value. The value ranges from <b>0</b> to <b>7</b> .                  |
|                       | <i>rate-num</i>       | Indicates the flow rate warning value. The value ranges from <b>1</b> to <b>148809523</b> . |

**Defaults** The flow rate warning is disabled by default.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide**

1. This command configures the warning function for a PFC priority of an interface. When the rate of Pause frames exceeds the configured threshold, a warning is generated.
2. A flow rate warning threshold can be configured in each of the input and output directions in unit of pps (packets per second).

**Configuration Examples** The following example configures the flow rate warning function in the output direction for PFC Priority 1 of Interface TenGigabitEthernet 0/1 and sets the warning threshold to 1000 pps.

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#interface tenGigabitEthernet 0/1
Ruijie(config-if-TenGigabitEthernet 0/1)#priority-flow-control
early-warning 1 output pps 1000
```

**Verification** Run the **show running-config** command to display the configuration.

```
Ruijie#show running-config
```

## 1.18 priority-flow-control nodrop

Use this command to disable priority-based flow control (PFC).

**priority-flow-control nodrop** *cos-value-list* **off**

Use this command to enable PFC.

**priority-flow-control nodrop** *cos-value-list* **on**

| Parameter<br>Description | Parameter             | Description                                                            |
|--------------------------|-----------------------|------------------------------------------------------------------------|
|                          | <i>cos-value-list</i> | Priority list. The <b>cos</b> value ranges from <b>0</b> to <b>7</b> . |

**Defaults** By default, the PFC function is disabled.

**Command Mode** Interface or global configuration mode

**Usage Guide** Range of *cos-value-list* : 0 to 7. The format of *cos-value-list* is 1,3,4,5 or 1, 3-5.

**Configuration Examples** The following example enables PFC for the 802.1p priority of 1, 3, 4, 5 in global configuration mode.

```
Ruijie(config)# priority-flow-control nodrop 1,3,4,5 on
```

The following example enables PFC for the 802.1p priority of 1, 3, 4, 5 in interface configuration mode.

```
Ruijie(config-if)# priority-flow-control nodrop 1,3,4,5 on
```

| Related<br>Commands | Command | Description |

|                     | N/A     | N/A         |

**Platform Description** N/A

## 1.19 show dcbx status

To display the DCBX protocol enable state of each interface, use the **show dcbx control** command.

**show dcbx status** [ **interface** *interface-name* ]

| Parameter<br>Description | Parameter             | Description    |
|--------------------------|-----------------------|----------------|
|                          | <i>interface-name</i> | Interface name |

|                     |                                                                                                     |
|---------------------|-----------------------------------------------------------------------------------------------------|
| <b>Defaults</b>     | N/A                                                                                                 |
| <b>Command Mode</b> | Privileged EXEC mode                                                                                |
| <b>Usage Guide</b>  | Specify the interface parameter and the DCBX enable state of the specified interface will be shown. |

**Configuration** This example shows how to display the DCBX enable state of a specified interface:

**Examples**

```
Ruijie#show dcbx status interface tenGigabitEthernet 0/1
Global-----
-----
Port [TenGigabitEthernet 1/1]
-----
Local managing configuration information and port link state:
Port status of DCBX                      : Enable
PFC is allowed to advertise               : Yes
APP is allowed to advertise               : Yes
PFC is willing to accept peer configuration : Yes
APP is willing to accept peer configuration : No
Port link state                           : UP

Negotiated configuration information:
PFC negotiated result      : using peer configuration
APP negotiated result      : detecting misconfiguration
```

| <b>Related Commands</b> | Command | Description |
|-------------------------|---------|-------------|
|                         | N/A     | N/A         |

**Platform** N/A

**Description**

## 1.20 show dcbx information

To display the configuration information specific to DCB capability negotiation of each interface, use the **show dcbx information** command.

**show dcbx information { ets | app-proto } [ interface interface-name ]**

| <b>Parameter Description</b> | Parameter  | Description                                                                    |
|------------------------------|------------|--------------------------------------------------------------------------------|
|                              | <b>pfc</b> | Displays the configuration information specific to PFC capability negotiation. |

|                       |                                                                                |
|-----------------------|--------------------------------------------------------------------------------|
| <b>app-proto</b>      | Displays the configuration information specific to APP capability negotiation. |
| <i>interface-name</i> | Interface name                                                                 |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** Specify the interface parameter and the configuration information specific to DCB capability negotiation of the specified interface will be shown.

**Configuration** This example shows how to display the configuration information specific to PFC capability negotiation of a specified interface:

**Examples** Ruijie#show dcbx information pfc interface gigabitethernet 0/1

DCBX pfc - Enabled state, Willing state and Error state

```

Description

## 1.21 show priority-flow-control deadlock statistics

Use this command to display the PFC deadlock statistics of an interface.

**show priority-flow-control deadlock statistics** [*interface interface*]

| Parameter Description | Parameter        | Description                  |
|-----------------------|------------------|------------------------------|
|                       | <i>interface</i> | Indicates an interface name. |

### Defaults

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** When no interface is specified, the PFC deadlock statistics of all interfaces are displayed.

**Configuration Examples** The following example displays the PFC deadlock statistics of Interface hundredGigabitEthernet 0/1.

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#show priority-flow-control deadlock statistics
```

```
interface hundredGigabitEthernet 0/1
```

| Interface | Cos_value | Count | Recover |
|-----------|-----------|-------|---------|
| Hu0/1     | 0         | 0     | True    |
| Hu0/1     | 1         | 0     | True    |
| Hu0/1     | 2         | 0     | True    |
| Hu0/1     | 3         | 0     | True    |
| Hu0/1     | 4         | 0     | True    |
| Hu0/1     | 5         | 0     | True    |
| Hu0/1     | 6         | 0     | True    |
| Hu0/1     | 7         | 0     | True    |

Field description:

| Field     | Description              |
|-----------|--------------------------|
| Interface | Interface name           |
| cos_value | PFC priority             |
| count     | Number of deadlock times |

## 1.22 show priority-flow-control deadlock status

Use this command to display the PFC deadlock configuration.

**show priority-flow-control deadlock status**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** Use this command to display the PFC deadlock configuration and status.

**Configuration** The following example displays the PFC deadlock configuration and status.

**Examples**

```
Ruijie#show priority-flow-control deadlock status
Global PFC Deadlock: 1-2
Time precision: High<10ms>
Packet dispose: Forward
Limit cos-value: off
Limit period: 5
Limit frequency: 10
```

```

Priority attribute:
cos-value  detect-time  recover-time
-----
1          1           10
2          15          20

Interface Enable:
interface   cos-value
-----
Hu0/1       1-2
Hu0/2       2

Limit Log(Close PFC Log):
Interface   Cos-value  Frequency  Time
-----
Hu0/1       1          20          2017-12-15 11:00:00
Hu0/1       2          20          2017-12-15 11:00:00
Hu0/1       1          20          2017-12-15 12:00:00
Hu0/1       2          20          2017-12-15 12:00:00
Hu0/1       1          20          2017-12-15 13:00:00
Hu0/1       2          20          2017-12-15 13:00:00
Hu0/1       1          20          2017-12-15 14:00:00
Hu0/1       2          20          2017-12-15 14:00:00
Hu0/1       1          20          2017-12-15 15:00:00
Hu0/1       2          20          2017-12-15 15:00:00

```

Field description:

| Field               | Description                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Global PFC Deadlock | Priority value configured for the PFC deadlock function                                                                          |
| Time precision      | PFC deadlock time precision. High precision (10ms) is configured by default.                                                     |
| Packet dispose      | Packet processing mode in the PFC deadlock state. The default processing mode is <b>Forward</b> .                                |
| Limit cos-value     | Priority value configured for the PFC deadlock threshold                                                                         |
| Limit period        | Detection period set for the PFC deadlock threshold                                                                              |
| Limit frequency     | PFC deadlock threshold                                                                                                           |
| Priority attribute  | PFC deadlock priority attributes (cos-value, detection time, and recovery time)                                                  |
| Interface Enable    | Interface on which the PFC deadlock function is enabled and priority information (interface name and enabling priority)          |
| Limit Log           | PFC deadlock threshold log (recording the historical disabling of the PFC function resulted from that the number of PFC deadlock |

|           |                                                                            |
|-----------|----------------------------------------------------------------------------|
|           | events exceeds the threshold)                                              |
| Interface | Interface on which the number of PFC deadlock events exceeds the threshold |
| Cos-value | Priority for which the number of PFC deadlock events exceeds the threshold |
| Frequency | Number of PFC deadlock events that occur in a period                       |
| Time      | Time at which the number of PFC deadlock events exceeds the threshold      |

**Description**

## 1.23 show priority-flow-control status

Use this command to show the PFC configuration and status information.

**show priority-flow-control status [ interface *intf-name1* ]**

| Parameter<br>Description | Parameter         | Description    |
|--------------------------|-------------------|----------------|
|                          | <i>intf-name1</i> | Interface name |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** If the *intf-name 1* parameter is not defined, the configuration and status information of all ports is shown.

**Configuration Examples** The following example shows the configuration and status information of the interface FastEthernet 0/1:

```
Ruijie#show priority-flow-control status interface Fa 0/1
Interface  PriorityEnabledPFC  PriorityEnalbedPFCByUser
-----  -
FastEthernet 0/1    3                      3 4
```

**Description**

## 1.24 show priority-flow-control statistics

Use this command to show the PFC statistics.

**show priority-flow-control statistics** [ interface *intf-name1* ]

Use this command to show the PFC statistics and top history statistics.

**show priority-flow-control statistics** [history-top] [interface *interface-name*]

| Parameter Description | Parameter         | Description    |
|-----------------------|-------------------|----------------|
|                       | <i>intf-name1</i> | Interface name |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** If the intf-name 1 parameter is not defined, the PFC flow control statistics of all ports is shown.

**Configuration Examples** 1. The following example shows the PFC statistics of the interface FastEthernet 0/1:

```
Ruijie#show priority-flow-control statistics interface
FastEthernet 0/1
interface Priority PauseSend PauseSend-Rate PauseReceived
PauseReceived-Rate
                (packets/sec)
(packets/sec)
-----
-----
Fa 0/1      0      0      0      0      0
Fa 0/1      1      0      0      0      0
Fa 0/1      2      0      0      0      0
Fa 0/1      3      0      0      0      0
Fa 0/1      4      0      0      0      0
Fa 0/1      5      0      0      0      0
Fa 0/1      6      0      0      0      0
Fa 0/1      7      0      0      0      0
```

Field description:

| Field              | Description                                     |
|--------------------|-------------------------------------------------|
| Priority           | Indicates the 802.1p flow control.              |
| PauseSend          | Indicates the quantity of sent PFC packets.     |
| PauseSend-Rate     | Indicates the rate of sending PFC packets.      |
| PauseReceived      | Indicates the quantity of received PFC packets. |
| PauseReceived-Rate | Indicates the rate of receiving PFC packets.    |

2. The following example shows the PFC top history statistics of the interface tenGigabitEthernet 0/1.

```
Ruijie#show priority-flow-control statistics interface history-top
tenGigabitEthernet 0/1

14

#### Usage Guide

After the anycast attribute is configured, the device will use the MAC address of the global virtual anycast gateway as the gateway MAC address.

The anycast gateway IP addresses in the same VXLAN instance on the network must be the same.

#### Configuration Examples

The following example sets the Overlay router interface as an anycast gateway.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#interface OverlayRouter 1
Ruijie(config-if-OverlayRouter 1)# anycast-gateway
```

**Verification** Run the **show run interface overlayrouter** command to display the anycast configuration of the Overlay router interface.

```
Ruijie(config-if-OverlayRouter 1)# show run int overlayrouter 1

Building configuration...
Current configuration : 72 bytes

interface OverlayRouter 1

    anycast-gateway
```

**Common Errors** In the same VXLAN instance, the anycast gateway is configured for some devices but not configured for others, resulting in an IP/MAC address conflict.

**Platform Description** N/A

## 2.2 arp suppress enable(VTEP Configuration Mode)

Use this command to enable ARP suppression globally.

**arp suppress enable**

Use the **no** form of this command to disable ARP suppression globally.

**no arp suppress enable**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** ARP suppression is disabled by default.

**Command Mode** VTEP configuration mode

**Default Level** 14

**Usage Guide** After ARP suppression is enabled, the switch responds to the ARP request as a proxy.

Restrictions on ARP suppression:

1. After ARP suppression is enabled, the VTEP device does not flood ARP packets.
2. After ARP suppression is enabled, the VTEP device serves as a proxy by using the host MAC address by default. The device responds to ARP requests as a proxy according to stored ARP entries. The MAC address used for proxy response is the actual host MAC address found in the ARP entries.
3. After ARP suppression is enabled, you can run **route-in-vni** command on an overlay router interface to enable the ARP proxy function. The device responds to ARP requests as a proxy on a VNI-based VXLAN instance with ARP proxy enabled, and the MAC address used for proxy response is the MAC address of the VTEP device (if the anycast gateway is configured for the overlay router interface, the anycast MAC address is used; otherwise, the physical MAC address of VTEP device is used).
4. ARP suppression cannot be enabled on VXLAN bridging devices.
5. ARP suppression and ARP proxy (by running the **route-in-vni** command) can be enabled simultaneously only on VXLAN gateways and the gateway MAC address is used for the proxy response.
6. When global ARP suppression is configured (by running the **arp suppress enable** command in VTEP configuration mode), ARP suppression is enabled on all VXLAN instances. When VXLAN instance-based ARP suppression is configured (by running the **arp suppress enable** command in VXLAN configuration mode), ARP suppression is enabled only on the VXLAN instance. You can configure global ARP suppression or VXLAN instance-based ARP suppression to enable ARP suppression on a VXLAN instance.

**Configuration Examples** The following example enables ARP suppression.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vtep
Ruijie(config-vtep)# arp suppress enable
```

**Verification** Run the **show vxlan arp suppress** command to display the ARP suppression status of the current device.

```
Ruijie(config-vtep)#show vxlan arp suppress
GLOBAL ARP-SUPPRESS: ON

ARP Suppress Detail:
VXLAN      VNI Configure      Effect Configure
-----
2          -                  Enable
```

|      |        |        |
|------|--------|--------|
| 13   | –      | Enable |
| 100  | Enable | Enable |
| 2000 | –      | Enable |

## 2.3 arp suppress enable (VXLAN Configuration Mode)

Use this command to enable VNI-based ARP suppression.

**arp suppress enable**

Use the **no** form of this command to disable VNI-based ARP suppression.

**no arp suppress enable**

### Parameter Description

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

### Defaults

ARP suppression is disabled by default.

### Command Mode

VXLAN configuration mode

### Default Level

14

### Usage Guide

After ARP suppression is enabled, the VTEP device automatically responds to ARP requests as a proxy by using the host MAC address.

Scenario restriction description:

1. After ARP suppression is enabled, the VTEP device does not flood ARP packets.
2. After ARP suppression is enabled, the VTEP device serves as a proxy by using the host MAC address by default. The device responds to ARP requests as a proxy according to stored ARP entries. The MAC address used for proxy response is the actual host MAC address found in the ARP entries.
3. After ARP suppression is enabled, you can run **route-in-vni** command on an overlay router interface to enable the ARP proxy function. The device responds to ARP requests as a proxy on a VNI-based VXLAN instance with ARP proxy enabled, and the MAC address used for proxy response is the MAC address of the VTEP device (if the anycast gateway is configured for the overlay router interface, the anycast MAC address is used; otherwise, the physical MAC address of VTEP device is used).
4. ARP suppression cannot be enabled on VXLAN bridging devices.
5. ARP suppression and ARP proxy (by running the **route-in-vni** command) can be enabled simultaneously only on VXLAN gateways and the gateway MAC address is used for the proxy response.

- When global ARP suppression is configured (by running the **arp suppress enable** command in VTEP configuration mode), ARP suppression is enabled on all VXLAN instances. When VXLAN instance-based ARP suppression is configured (by running the **arp suppress enable** command in VXLAN configuration mode), ARP suppression is enabled only on the VXLAN instance. You can configure global ARP suppression or VXLAN instance-based ARP suppression to enable ARP suppression on a VXLAN instance.

**Configuration** The following example enables ARP suppression on VNI 100.

**Examples**

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan 100
Ruijie(config-vxlan)# arp suppress enable
```

**Verification** Run the **show vxlan arp suppress** command to display the ARP suppression status of the current device.

```
Ruijie#show vxlan arp suppress
GLOBAL ARP-SUPPRESS: OFF

| <b>Platform Description</b>   | N/A                                                                                                                                                                                                                         |     |

## 2.5 clear vxlan log

Use this command to clear key records about the operation of the VXLAN process.

**clear vxlan log**

| <b>Parameter Description</b> | Parameter | Description |
|------------------------------|-----------|-------------|
|                              | N/A       | N/A         |
| <b>Defaults</b>              | N/A       |             |

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example clears key records about the operation of the VXLAN process.

**Examples** Ruijie# clear vxlan log

**Verification** Run the **show vxlan log** command to check whether key information about the operation of the current VXLAN process is cleared.

```
Ruijie# show vxlan log
Ruijie#
```

**Prompts** N/A

**Common Errors** N/A

**Platform Description** N/A

## 2.6 clear vxlan mac dynamic

Use this command to clear VXLAN MAC entries.

**clear vxlan mac dynamic** [**vni** *vni-number* | **address** *mac-address* **vni** *vni-number*]

**Parameter Description**

| Parameter          | Description                                                                          |
|--------------------|--------------------------------------------------------------------------------------|
| <i>vni-number</i>  | Deletes the VXLAN MAC entries of a specified VNI. The range is from 1 to 16,777,215. |
| <i>mac-address</i> | Deletes the VXLAN MAC entries of a specified address. The format is xxxx.xxxx.xxxx.  |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** Only VXLAN MAC entries dynamically learnt via the chip can be deleted. Static MAC entries configured via the SDN/CLI or MAC entries generated by the protocol cannot be deleted.

**Configuration** The following example clears VXLAN MAC entries of the VXLAN 3 instance.

**Examples** Ruijie#clear vxlan mac dynamic vni 3

**Verification** Run the **show vxlan mac** command to check whether the VXLAN MAC entries (Type = dynamic) dynamically learnt by the current device are cleared.

```
Ruijie#show vxlan mac
```

| Vxlan | MAC Address    | Type   | Location | Interface           | Vlan |
|-------|----------------|--------|----------|---------------------|------|
| 1     | 0000.1111.1111 | STATIC | REMOTE   | OverlayTunnel 1     | -    |
| 1     | 0000.1111.2222 | STATIC | REMOTE   | OverlayTunnel 1     | -    |
| 1     | 0000.2222.2222 | STATIC | LOCAL    | GigabitEthernet 0/1 | 1    |
| 1     | 0000.5555.5555 | STATIC | LOCAL    | GigabitEthernet 0/1 | 1    |

## 2.7 clear vxlan vni-statistics

Use this command to clear VNI traffic statistics.

**clear vxlan vni-statistics { all | vni *vni-number* }**

| Parameter Description | Parameter             | Description                                                                                               |
|-----------------------|-----------------------|-----------------------------------------------------------------------------------------------------------|
|                       | all                   | Clears traffic statistics of all VNIs.                                                                    |
|                       | vni <i>vni-number</i> | Clears traffic statistics of a specified VNI. The value of <i>vni-number</i> ranges from 1 to 16,777,215. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** This command is used to clear VNI traffic statistics.

**Configuration** This following example clears traffic statistics of VNI 3.

**Examples**

```
Ruijie# clear vxlan vni-statistics vni 3
```

**Verification** Run the **show vxlan vni-statistics** command to check whether VNI traffic statistics are cleared.

```
Ruijie# show vxlan vni-statistics vni 3
VXLAN 3:
  10 seconds input rate 0 bits/sec, 0 packets/sec
  10 seconds output rate 0 bits/sec, 0 packets/sec
  0 packets input, 0 bytes
  0 packets output, 0 bytes
```

**Prompts** N/A

**Common Errors** N/A

**Platform** N/A  
**Description**

## 2.8 encapsulation vxlan

Use this command to configure VXLAN encapsulation for subinterfaces.

**encapsulation vxlan** *vni-number*

Use the **no** form of this command to cancel VXLAN encapsulation of subinterfaces.

**no encapsulation vxlan** [*vni-number*]

**Parameter**  
**Description**

| Parameter         | Description                                               |
|-------------------|-----------------------------------------------------------|
| <i>vni-number</i> | Indicates the VNI. The value ranges from 1 to 16,777,215. |

**Defaults** VXLAN encapsulation is not configured for subinterfaces by default.

**Command** L2 subinterface configuration mode

**Mode****Default Level** 14

- Usage Guide**
1. Only one VXLAN encapsulation rule can be configured for one subinterface.
  2. You can preconfigure VXLAN encapsulation rules when no VXLAN instance exists.

**Configuration Examples** The following example configures encapsulation rule named VXLAN 1 for subinterface TenGigabitEthernet 0/1.1.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#interface te 0/1.1
Ruijie(config-subif-TenGigabitEthernet 0/1.1)# encapsulation vxlan 1
```

**Verification** Run the **show run** command to check whether the current configuration is successful.

| <b>Usage Guide</b>            | <p>After this command is configured, the device parses one ARP entry and one MAC entry from a MAC-IP type-2 route synchronized from the VXLAN-EVPN neighbor.</p> <p>This command is disabled by default and the device parses one ARP entry but no MAC entry from a MAC-IP type-2 route synchronized from the VXLAN-EVPN neighbor.</p> <p>This command is configured on a VXLAN instance and affects only the EVPN entry parsing of the VXLAN instance. Other VXLAN instances, for which this command is not configured, are not affected.</p> <p>This command can be used in combination with the <b>evpn mac advertise disable</b> command. After they are executed, the network-wide VXLAN-EVPN neighbors synchronize only MAC-IP type-2 routes but no MAC-only type-2 routes. All devices parse and extract MAC entries from MAC-IP type-2 routes.</p> <p>This command is configured on L2-VNI VXLAN instances.</p> |
| <b>Configuration Examples</b> | <p>This command configures VXLAN 10 to extract MAC entries from EVPN MAC-IP type-2 routes (ARP entries).</p> <pre>Ruijie#configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)#vxlan 10 Ruijie(config-vxlan)#evpn arp mac-learning enable</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Verification</b>           | Run the <b>show run</b> command to check whether the configuration is successful.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 2.10 evpn mac advertise disable

Use this command to configure an L2-VNI VXLAN instance not to synchronize the local MAC address to the remote VTEP through EVPN messages.

**evpn mac advertise disable**

Use the **no** form of this command to cancel configuring an L2-VNI VXLAN instance not to synchronize the local MAC address to the remote VTEP through EVPN messages.

**no evpn mac advertise disable**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** VXLAN configuration mode

**Default Level** 14

**Usage Guide** This command is not configured on a device by default. The device generates one MAC-only type-2 route through the VXLAN-EVPN protocol based on a locally learned MAC entry, and synchronizes the type-2 route to the EVPN neighbor (that is, remote VTEP). Then, the remote VTEP can learn the MAC entry from the MAC-only type-2 route.

After this command is configured, the device does not generate VXLAN-EVPN MAC-only type-2 routes based on MAC entries, and therefore, it will not advertise MAC-only type-2 routes to the EVPN neighbor.

This command is configured on a VXLAN instance and affects only whether the VXLAN instance generates MAC-only type-2 routes. Other VXLAN instances, for which this command is not configured, can still generate MAC-only type-2 routes.

This command can be used in combination with the **evpn arp mac-learning enable** command. After they are executed, the network-wide VXLAN-EVPN neighbors synchronize only MAC-IP type-2 routes but no MAC-only type-2 routes. All devices parse and extract MAC entries from MAC-IP type-2 routes.

 This command can be configured only on L2-VNI VXLAN instances (that is, VXLAN instances with the **symmetric** command not configured). It is unavailable on L3-VNI VXLAN instances.

**Configuration Examples** The following example configures VXLAN 10 not to synchronize the local MAC address to the remote VTEP through EVPN messages.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan 10
Ruijie(config-vxlan)#evpn mac advertise disable
```

**Verification** Run the **show run** command to check whether the configuration is successful.

|                             |                                                       |
|-----------------------------|-------------------------------------------------------|
| <b>Prompts</b>              | N/A                                                   |
| <b>Common Errors</b>        | This command is configured on L3-VNI VXLAN instances. |
| <b>Platform Description</b> | N/A                                                   |

## 2.11 evpn mac advertise enable

Use this command to synchronize MAC entries with the egress of static tunnels to the remote VTEP.

**evpn mac advertise enable**

Use the **no** form of this command not to synchronize MAC entries with the egress of static tunnels to the remote VTEP.

**no evpn mac advertise enable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Overlay tunnel configuration mode

**Default Level** 14

**Usage Guide** This command is not configured on a device by default. The egress of MAC entries learned by the device from packets sent from a static tunnel is a static tunnel and such MAC entries are not synchronized to EVPN neighbors.

After this command is configured, MAC entries with the egress of static tunnels are synchronized to EVPN neighbors via VXLAN-EVPN.

**Configuration Examples** The following example synchronizes MAC entries with the egress of Overlay Tunnel 3 to the remote VTEP.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#interface overlaytunnel 3
Ruijie(config-if-OverlayTunnel 3)#evpn mac advertise enable
```

**Verification** Run the **show run** command to check whether the configuration is successful.

**Prompts** N/A

**Common Errors** N/A

**Platform Description** N/A

## 2.12 evpn mac inactive

Use this command to configure an L2-VNI VXLAN instance not to deliver MAC addresses remotely synchronized through EVPN messages to the local MAC address table.

**evpn mac inactive**

Use this command to cancel configuring an L2-VNI VXLAN instance not to deliver MAC addresses remotely synchronized through EVPN messages to the local MAC address table.

**no evpn mac inactive**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** VXLAN configuration mode

**Default Level** 14

**Usage Guide** After this command is configured, the device does not learn MAC entries from VXLAN-EVPN type-2 routes (MAC-IP or MAC-only type-2 routes) synchronized from neighbors.

This command is not configured on a device by default. The device learns MAC entries from VXLAN-EVPN type-2 routes synchronized from neighbors.

This command is configured on a VXLAN instance and affects only whether the VXLAN instance learns MAC entries from VXLAN-EVPN type-2 routes. Other VXLAN instances, for which this command is not configured, can still learn MAC entries.

This command can be configured only on L2-VNI VXLAN instances (that is, VXLAN instances with the

**symmetric** command not configured). It is unavailable on L3-VNI VXLAN instances.

**Configuration Examples** The following example bans VXLAN 10 from delivering MAC addresses remotely synchronized through EVPN messages to the local MAC address table.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan 10
Ruijie(config-vxlan)#evpn mac inactive
```

**Verification** Run the **show run** command to check whether the configuration is successful.

**Prompts** N/A

**Common Errors** This command is configured on L3-VNI VXLAN instances.

**Platform Description** N/A

## 2.13 evpn mac-ip advertise enable

Use this command to synchronize ARP entries with the egress of static tunnels to the remote VTEP.

**evpn mac-ip advertise enable**

Use the **no** form of this command not to synchronize ARP entries with the egress of static tunnels to the remote VTEP.

**no evpn mac-ip advertise enable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Overlay tunnel configuration mode

**Default Level** 14

**Usage Guide** This command is not configured on a device by default. The egress of ARP entries learned by the device from packets sent from a static tunnel is a static tunnel and such ARP entries are not synchronized to EVPN neighbors.

After this command is configured, ARP entries with the egress of static tunnels are synchronized to EVPN neighbors via VXLAN-EVPN.

**Configuration** The following example synchronizes ARP entries with the egress of Overlay Tunnel 3 to the remote VTEP.

**Examples**

```
Ruijie#configure terminal
Enter one configuration command in each line, ended with CNTL/Z.
Ruijie(config)#interface overlaytunnel 3
Ruijie(config-if-OverlayTunnel 3)#evpn mac-ip advertise enable
```

**Verification** Run the **show run** command to check whether the configuration is successful.

**Prompts** N/A

**Common Errors** N/A

**Platform Description** N/A

## 2.14 evpn nd mac-learning enable

Use this command to extract MAC entries from EVPN MAC-IPv6 type-2 routes (IPv6 ND packets).

**evpn nd mac-learning enable**

Use the **no** form of this command to cancel extracting MAC entries from EVPN MAC-IPv6 type-2 routes (IPv6 ND packets).

**no evpn nd mac-learning enable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** VXLAN configuration mode

**Default Level** 14

**Usage Guide** After this command is configured, the device parses one IPv6 ND entry and one MAC entry from a MAC-IPv6 type-2 route (IPv6 ND entry) synchronized from the VXLAN-EVPN neighbor.

This command is disabled by default and the device parses one IPv6 ND entry but no MAC entry from a MAC-IPv6 type-2 route synchronized from the VXLAN-EVPN neighbor.

This command is configured on a VXLAN instance and affects only the EVPN entry parsing of the VXLAN instance. Other VXLAN instances, for which this command is not configured, are not affected.

This command can be used in combination with the **evpn mac advertise disable** command. After they are executed, the network-wide VXLAN-EVPN neighbors synchronize only MAC-IPv6 type-2 routes but no MAC-only type-2 routes. All devices parse and extract MAC entries from MAC-IPv6 type-2 routes.

This command is configured on L2-VNI VXLAN instances.

**Configuration Examples** The following examples configure VXLAN 10 to extract MAC entries from EVPN MAC-IPv6 type-2 routes (IPv6 ND packets).

```
Ruijie#configure terminal
Enter one configuration command in each line, ended with CNTL/Z.
Ruijie(config)#vxlan 10
Ruijie(config-vxlan)#evpn nd mac-learning enable
```

**Verification** Run the **show run** command to check whether the configuration is successful.

**Prompts** N/A

**Common Errors** In symmetric deployment scenarios, this command is configured on L3-VNI VXLAN instances.

**Platform Description** N/A

## 2.15 evpn rt-2 advertise disable

Use this command to configure an L2-VNI VXLAN instance not to generate EVPN type-2 routes (MAC+ARP entries) and revoke generated routes.

**evpn rt-2 advertise disable**

Use the **no** form of this command to cancel configuring an L2-VNI VXLAN instance not to generate EVPN type-2 routes (MAC+ARP entries).

**no evpn rt-2 advertise disable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** VXLAN configuration mode

**Default Level** 14

**Usage Guide** This command is not configured on a device by default. The device generates one MAC-only type-2 route through the VXLAN-EVPN protocol based on a locally learned MAC entry, and synchronizes the type-2 route to the EVPN neighbor (that is, remote VTEP). Then, the remote VTEP learns the MAC entry from the MAC-only type-2 route. In addition, the device generates one MAC-IP type-2 route through the VXLAN-EVPN protocol based on a locally learned ARP entry and synchronizes the type-2 route to the EVPN neighbor. Then, the remote VTEP learns the ARP entry and host route from the MAC-IP type-2 route. After this command is configured, the MAC entries and ARP entries are not used to generate VXLAN-EVPN type-2 routes (MAC-IP or MAC-only routes) and therefore, no type-2 routes are advertised to EVPN neighbors.

This command is configured on a VXLAN instance and affects only whether the VXLAN instance generates type-2 routes. Other VXLAN instances, for which this command is not configured, can still generate type-2 routes.

This command can be configured only on L2-VNI VXLAN instances (that is, VXLAN instances with the **symmetric** command not configured). It is unavailable on L3-VNI VXLAN instances.

**Configuration** The following example configures VXLAN 10 not to generate EVPN type-2 routes.

**Examples**

```
Ruijie#configure terminal
Enter one configuration command in each line, ended with CNTL/Z.
Ruijie(config)#vxlan 10
Ruijie(config-vxlan)#evpn rt-2 advertise disable
```

**Verification** Run the **show run** command to check whether the configuration is successful.

**Prompts** N/A

**Common** This command is configured on L3-VNI VXLAN instances.

**Errors**

**Platform** N/A  
**Description**

## 2.16 extend-vlan

Use this command to specify the VLAN associated with a VXLAN instance. Packets of the associated VLAN will be encapsulated into the VXLAN format and forwarded. Multiple VLANs can associate with one VXLAN instance.

**extend-vlan** *vlan-id-list*

Use the **no** form of this command to delete all VLANs associated with the VXLAN instance.

**no extend-vlan** [*vlan-id-list*]

**Parameter  
Description**

| Parameter           | Description                                                                                                                                                                                                                                    |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan-id-list</i> | ID of the VLAN associated with a VXLAN instance, ranging from 1 to 4,094.<br><br>When the product supports multiple VLANs, the value can be multiple VLAN IDs.<br><br>When the product supports only one VLAN, you can enter only one VLAN ID. |

**Defaults** N/A

**Command  
Mode** VXLAN configuration mode

**Default Level** 14

**Usage Guide** One VLAN cannot be associated with different VXLAN instances.  
After a VLAN is associated with a VXLAN instance, all packets of the VLAN will be encapsulated into the VXLAN format. Therefore, an SVI cannot be used as the VLAN IP gateway on the device.

**Configuration**

The following example associates VXLAN 1 with VLAN 10.

**Examples**

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan 1
Ruijie(config-vxlan)#extend-vlan 10
```

The following example associates VXLAN 2 with VLANs 11, 12, 13, 14, and 22.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan 2
Ruijie(config-vxlan)#extend-vlan 11-14,22
```

The following example deletes VLANs 12 and 13 associated with VXLAN 2.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan 2
Ruijie(config-vxlan)#no extend-vlan 12-13
```

The following example deletes all VLANs associated with VXLAN 2.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan 2
Ruijie(config-vxlan)#no extend-vlan
```

**Verification**

Run the **show vxlan vni-number** command to display the **extend-vlan** value.

```
Ruijie#show vxlan 2
VXLAN 2
  Symmetric property : FALSE
  Router Interface   : -
  Extend VLAN        : 11-12,22
  VTEP Adjacency Count: 0
```

**Prompts**

If different VXLAN instances are associated with the same VLAN, the following prompt is displayed:

Following reason prevent some vlans to be set as vxlan 4's extend-vlan:

The vlan conflict with other vxlan extend-vlan

**Common  
Errors**

Different VXLAN instances are associated with the same VLAN.

**Platform  
Description**

N/A

## 2.17 fabric anycast-gateway-mac

Use this command to configure the virtual MAC address of the global anycast gateway.

**fabric anycast-gateway-mac** *mac-addr*

Use the **no** form of this command to delete the virtual MAC address of the global anycast gateway.

**no fabric anycast-gateway-mac** [*mac-addr*]

| Parameter<br>Description | Parameter       | Description                                          |
|--------------------------|-----------------|------------------------------------------------------|
|                          | <i>mac-addr</i> | Virtual MAC address, in the format of xxxx.xxxx.xxxx |

**Defaults** N/A

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** If the anycast gateway is required in a customer scenario, the virtual MAC address of the anycast gateway must be configured on the device first. The configured virtual MAC address must be unique on the whole network and cannot be 0000.0000.0000, a multicast MAC address, a local host MAC address, or MAC addresses of other VXLAN devices on the network.

**Configuration Examples** The following example sets the virtual MAC address of the anycast gateway to 0000.1111.2222.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# fabric anycast-gateway-mac 0000.1111.2222
```

**Verification** Run the **show vxlan global** command to display virtual MAC address configuration on the current device.

```
Ruijie#show vxlan global
Local switch vtep ip: 1.1.1.1.
  Binds with interface loopback 1, line protocol is UP.
```

```
Anycast mac: 0000.1234.5678 .
1 overlayrouters enable anycast .
```

**Prompts** N/A

**Common Errors** The anycast gateway can be configured to implement virtual machine migration without perception. The gateway MAC address and IP address do not need to be modified before and after virtual machine migration. If different virtual MAC addresses are configured for different devices, perception-free migration cannot be achieved.

If the MAC address of the network-wide anycast gateway is set to the MAC address of other VXLAN devices on the network, MAC addresses on the network will be in chaos, resulting in a data forwarding failure.

**Platform Description** N/A

## 2.18 nd suppress enable (VTEP Configuration Mode)

Use this command to enable global IPv6 ND suppression.

**nd suppress enable**

Use the **no** form of this command to disable global IPv6 ND suppression.

**no nd suppress enable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** Global IPv6 ND suppression is disabled by default.

**Command Mode** VTEP configuration mode

**Default Level** 14

**Usage Guide** After IPv6 ND suppression is enabled, the VTEP device automatically responds to NS multicast packets as a proxy by using the host MAC address.

Scenario restriction description:

1. After ND suppression is enabled, the VTEP device does not flood IPv6 NS multicast packets.
2. After ND suppression is enabled, the VTEP device serves as a proxy by using the host MAC address by default. The device responds to packets as a proxy according to the stored ND entries. The MAC

address used for proxy response is the actual host MAC address found in the ND entries.

3. IPv6 ND suppression cannot be enabled on VXLAN bridging devices.
4. When global ND suppression is configured (by running the **nd suppress enable** command in VTEP configuration mode), ND suppression is enabled on all VXLAN instances. When VXLAN instance-based ND suppression is configured (by running the **nd suppress enable** command in VXLAN configuration mode), ND suppression is enabled only on the VXLAN instance. You can configure global ND suppression or VXLAN instance-based ND suppression to enable ND suppression on a VXLAN instance.

**Configuration** The following example enables IPv6 ND suppression.

**Examples**

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vtep
Ruijie(config-vtep)# nd suppress enable
```

**Verification** Run the **show vxlan nd suppress** command to display the IPv6 ND suppression status of the current device.

```
Ruijie(config-vtep)#show vxlan nd suppress
GLOBAL ND-SUPPRESS: ON
```

## 2.19 nd suppress enable (VXLAN Configuration Mode)

Use this command to enable VNI-based IPv6 ND suppression.

**nd suppress enable**

Use the **no** form of this command to disable VNI-based IPv6 ND suppression.

**no nd suppress enable**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** VNI-based IPv6 ND suppression is disabled by default.

**Command  
Mode** VXLAN configuration mode

**Default Level** 14

**Usage Guide** After IPv6 ND suppression is enabled, the VTEP device automatically responds to NS multicast packets as a proxy by using the host MAC address.

Scenario restriction description:

1. After ND suppression is enabled, the VTEP device does not flood IPv6 NS multicast packets.
2. After ND suppression is enabled, the VTEP device serves as a proxy by using the host MAC address by default. The device responds to packets as a proxy according to the stored ND entries. The MAC address used for proxy response is the actual host MAC address found in the ND entries.
3. IPv6 ND suppression cannot be enabled on VXLAN bridging devices.

**Configuration** The following example enables IPv6 ND suppression on VNI 100.

**Examples**

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan 100
Ruijie(config-vxlan)# nd suppress enable
```

**Verification** Run the **show vxlan nd suppress** command to display the IPv6 ND suppression status of the current device.

```
Ruijie#show vxlan nd suppress
GLOBAL ND-SUPPRESS: OFF

## 2.20 port vxlan mode access

Use this command to configure an interface as a VXLAN network access interface. Use the **no** form of this command to cancel configuring an interface as a VXLAN network access interface.

**port vxlan mode access**

**no port vxlan mode access**

| <b>Parameter Description</b> | Parameter | Description |
|------------------------------|-----------|-------------|
|                              | N/A       | N/A         |

**Defaults** No interface is configured as a VXLAN network access interface by default.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide** This command is used to configure an interface as a VXLAN network access interface, to allow common IP packets that carry the destination UDP port number (4789 by default) dedicated to VXLAN packets to access the VXLAN network.

By default, the VXLAN network access device cannot encapsulate, via VXLAN, common IP packets that

carry the destination UDP port number (4789 by default) dedicated to VXLAN packets, from hosts nor send them to the VXLAN network. On the interface that connects the device to the host, you can run the **port vxlan mode access** command to configure the interface as a VXLAN network access interface to solve the above problem.

 This configuration applies only to layer-2 interfaces. This command is unavailable on an interface, on which the **no swithport** command is configured.

 This command can be configured only on downlink host interfaces (AC side), and not on the uplink VXLAN tunnel interface (PW side). Otherwise, received VXLAN packets cannot be decapsulated.

 In a scenario in which the MLAG technology is used for VXLAN network access, if this command is configured on a VAP interface connected to a downlink host, this command should also be configured on the peer-link interface. Otherwise, the traffic passing through the peer-link interface cannot be forwarded to the downlink host.

**Configuration** The following example configures an interface as a VXLAN network access interface.

**Examples**

```
Ruijie(config)#interface tfGigabitEthernet 0/1
Ruijie(config-if-TfGigabitEthernet 0/1)#port vxlan mode access
```

**Verification** Run the **show run interface** command to display the interface configuration.

```
Ruijie(config)#show run interface tfGigabitEthernet 0/1
Building configuration...
Current configuration : 58 bytes

interface tfGigabitEthernet 0/1
 port vxlan mode access
```

## 2.21 proxy check vlan disable

Use this command to disable VLAN check in the case of ARP proxy.

**proxy check vlan disable**

Use the **no** form of this command to enable VLAN check in the case of ARP proxy.

**no proxy check vlan disable**

**Parameter  
Description**

| Parameter | Description |

## 2.22 remote arp learn enable

Use this command to enable remote ARP packet learning globally.

**remote arp learn enable**

Use the **no** form of this command to disable remote ARP packet learning globally.

**no remote arp learn enable**

| Parameter<br>Description      | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Description |

| <b>Usage Guide</b>            | <p>After remote ARP packet learning is enabled, the switch learns ARP entries from ARP packets encapsulated in the VXLAN format received from the VXLAN tunnel.</p> <hr/> <p> Remote ARP packet learning can be enabled only on gateways in a centralized VXLAN. It is recommended to disable this function in other scenarios.</p> <p> This configuration command takes effect only on dynamic tunnels and is invalid to static tunnels. The device learns ARP entries from VXLAN packets received from static tunnels by default.</p> <hr/> |             |
| <b>Configuration Examples</b> | <p>The following example enables remote ARP packet learning.</p> <pre>Ruijie#configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)#vtep Ruijie(config-vtep)# remote arp learn enable</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |             |
| <b>Verification</b>           | <p>Run the <b>show run</b> command to display the configuration.</p> <pre>N/A</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |             |

**Common Errors** N/A

**Platform Description** N/A

## 2.23 remote nd learn enable

Use this command to enable remote IPv6 ND entry learning globally.

**remote nd learn enable**

Use the **no** form of this command to disable remote IPv6 ND entry learning globally.

**no remote nd learn enable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** Remote IPv6 ND entry learning is disabled by default.

**Command Mode** VTEP configuration mode

**Default Level** 14

**Usage Guide** After remote IPv6 ND entry learning function is enabled, the switch learns IPv6 ND entries from the VXLAN-encapsulated IPv6 NS packets received from the VXLAN tunnels.

 This configuration is applicable to gateways in the centralized VXLAN topology. It is not recommended in other scenarios.

 This configuration command takes effect only on dynamic tunnels and is invalid to static tunnels. The device learns IPv6 ND entries from VXLAN packets received from static tunnels by default.

**Configuration** The following example enables remote IPv6 ND entry learning.

**Examples**

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# vtep
Ruijie(config-vtep)# remote nd learn enable
```

**Verification** Run the **show run** command to display the configuration.

## 2.24 route-in-vni

Use this command to enable the intra-VXLAN routing function on an Overlay router interface.

**route-in-vni**

Use the **no** form of this command to disable the intra-VXLAN routing function on the Overlay router interface.

**no route-in-vni**

| Parameter Description | Parameter    | Description                                                                   |
|-----------------------|--------------|-------------------------------------------------------------------------------|
|                       | <b>force</b> | Uses the gateway MAC address forcibly for responses in the case of ARP proxy. |

**Defaults** The intra-VXLAN routing function is disabled on the Overlay router interface by default.

**Command Mode** Overlay router interface mode

**Default Level** 14

**Usage Guide** After the intra-VNI routing function (ARP proxy) is enabled on an overlay router interface, the device uses the gateway MAC address to respond to all ARP requests from hosts in the VNI, to which the local overlay router interface belongs, when serving as an ARP proxy. In this way, the communication traffic between hosts in the same VNI is forwarded through VXLAN routes.

After the function of forcibly responding by using the gateway MAC address is enabled, the device responds with the gateway MAC address regardless of whether the device has the host entry requested by an ARP packet. After the function is disabled, the device responds with the MAC address only when the device has the host entry requested by an ARP packet. If the destination host entry does not exist, the device forwards the packet.

 To use the intra-VXLAN routing function, the ARP suppression function must be enabled at the same time.

**Configuration Examples** The following example enables the intra-VXLAN routing function.

```
Ruijie(config)#int overlayrouter 20
Ruijie(config-if-OverlayRouter 20)#route-in-vni
```

**Verification** Run the **show run interface overlayrouter** command to display intra-VXLAN routing configuration of the Overlay router interface.

```
Ruijie(config-if-OverlayRouter 20)#show run int overlayrouter 20
Building configuration...
Current configuration : 118 bytes

interface OverlayRouter 20
 vrf forwarding vrf-10
 ip address 120.1.1.1 255.0.0.0
 anycast-gateway
 route-in-vni
```

**Prompts** N/A

**Common Errors** N/A

**Platform Description** N/A

## 2.25 router-interface

Use this command to set the VXLAN routing (gateway) interface.

**router-interface** *interface-name*

Use the **no** form of this command to delete the VXLAN routing (gateway) interface.

**no router-interface** [*interface-name*]

| Parameter Description  | Parameter                                                                                                                                                                                                                                                                                        | Description                                                                      |

Only Overlay router interfaces are supported. |
| Defaults               | N/A                                                                                                                                                                                                                                                                                              |                                                                                  |
| Command Mode           | VXLAN configuration mode                                                                                                                                                                                                                                                                         |                                                                                  |
| Default Level          | 14                                                                                                                                                                                                                                                                                               |                                                                                  |
| Usage Guide            | In normal cases, the VXLAN routing interface is used as the IP gateway of VXLAN users, similar to the SVI interface of a VLAN. An Overlay router interface can associate with only one VXLAN.                                                                                                    |                                                                                  |
| Configuration Examples | <p>The following example sets the routing (gateway) interface of VXLAN 1 to an interface of Overlay router 1.</p> <pre>Ruijie#configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)#vxlan 1 Ruijie(config-vxlan)#router-interface OverlayRouter 1</pre> |                                                                                  |
| Verification           | <p>Run the <b>show vxlan vni-number</b> command to display the VXLAN routing (gateway) interface.</p> <pre>Ruijie#show vxlan 1 VXLAN 1   Symmetric property   : FALSE   Router Interface     : overlayrouter 1 (non-anycast)   Extend VLAN          : -   VTEP Adjacency Count: 0</pre>          |                                                                                  |
| Prompts                | When a nonexistent overlay router interface is associated, the following prompt is displayed:                                                                                                                                                                                                    |                                                                                  |

```
Ruijie(config)#vxlan 1
Ruijie(config-vxlan)#router-interface OverlayRouter 100
                                     ^
```

% Invalid input detected at '^' marker.

When one overlay router interface is associated with multiple VXLANs, the following prompt is displayed:

```
Failed to configure router-interface: configuration conflict
```

**Common  
Errors**

One overlay router interface is associated with multiple VXLANs.

**Platform  
Description**

N/A

## 2.26 show vxlan

Use this command to display the VXLAN configuration and status.

**show vxlan** [ *vni-number* ]

**Parameter  
Description**

| Parameter         | Description                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>vni-number</i> | Displays the VXLAN instance quantity and configuration information of specified VXLANs. The quantity value ranges from 1 to 16,777,215. |

**Command  
Mode**

Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level**

14

**Usage Guide**

N/A

**Configuration**

1. Run the **show vxlan** command to display the configuration and status of all VXLAN instances.

**Examples**

```

Ruijie#show vxlan
VXLAN Total Count: 2
VXLAN Capacity   : 4000

VXLAN 1
  Symmetric property : FALSE
  Router Interface   : -
  Extend VLAN       : 100
  VTEP Adjacency Count: 2
  VTEP Adjacency List :
  Interface          Source IP      Destination IP  Type
  -----
  OverlayTunnel 4097   1.1.1.1        2.2.2.2        dynamic
  OverlayTunnel 4098   1.1.1.1        3.3.3.3        dynamic

VXLAN 100
  Symmetric property : FALSE
  Router Interface   : -
  Extend VLAN       : 200
  VTEP Adjacency Count: 2
  VTEP Adjacency List :
  Interface          Source IP      Destination IP  Type
  -----
  OverlayTunnel 4099   1.1.1.1        4.4.4.4        dynamic
  OverlayTunnel 4100   1.1.1.1        5.5.5.5        dynamic

```

## 2.27 show vxlan arp suppress

Use this command to display the VXLAN ARP suppression status on a device.

**show vxlan arp suppress [ vni vni-number ]**

| Parameter Description | Parameter                    | Description                                                                                                 |
|-----------------------|------------------------------|-------------------------------------------------------------------------------------------------------------|
|                       | <b>vni</b> <i>vni-number</i> | Displays the ARP information of a specified VXLAN. The value range of <i>vni-number</i> is 1 to 16,777,215. |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Examples** Run the **show vxlan arp suppress** command to check whether the VXLAN ARP suppression function is enabled on the device.

```
Ruijie#show vxlan arp suppress
GLOBAL ARP-SUPPRESS: OFF
```

ARP Suppress Detail:

| VXLAN | VNI Configure | Effect Configure |
|-------|---------------|------------------|
| 2     | -             | -                |
| 13    | -             | -                |
| 100   | Enable        | Enable           |
| 2000  | -             | -                |

Field description:

| Field               | Description                                                                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GLOBAL ARP-SUPPRESS | Status of the global ARP suppression                                                                                                                              |
| VXLAN               | ID of a VXLAN instance                                                                                                                                            |
| VNI Configure       | VNI-based ARP suppression configuration                                                                                                                           |
| Effect Configure    | Status of ARP suppression taking effect on a VNI (ARP suppression takes effect on a VNI after the global ARP suppression or VNI-based ARP suppression is enabled) |

**Verification** N/A

## 2.28 show vxlan debug detail

Use this command to display specified debugging information about VXLANs.

**show vxlan debug detail**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example displays specified debugging information about all VXLANs.

**Examples**

```
Ruijie(config)#show vxlan debug detail
Debug entry: 1.
Debug nsm_ip: 0.0.0.0.
Debug mac: 0000.0000.0000.
Debug route: 0.
Debug overlayTunnel: 0.
Debug overlayRouter: 0.
Debug ethernet intf: - .
```

**Prompts** N/A

**Platform Description** N/A

## 2.29 show vxlan ethernet

Use this command to display information about Ethernet interfaces of a VXLAN.

**show vxlan ethernet { interface | vlan [ vid ] | vni [ vni-number ] }**

| Parameter<br>Description | Parameter           | Description                                                      |
|--------------------------|---------------------|------------------------------------------------------------------|
|                          | <b>interface</b>    | Displays information about Ethernet interfaces.                  |
|                          | <b>vlan [ vid ]</b> | Displays information about Ethernet interfaces associated with a |

|                                  |                                                                                                             |
|----------------------------------|-------------------------------------------------------------------------------------------------------------|
|                                  | VLAN. The <i>vid</i> ranges from 1 to 4094.                                                                 |
| <b>vni</b> [ <i>vni-number</i> ] | Displays information about Ethernet interfaces associated with a VNI.<br>The VNI ranges from 1 to 16777215. |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example displays information about all Ethernet interfaces associated with a VXLAN instance.

**Examples**

```
Ruijie(config)#show vxlan ethernet vni
```

```
VLAN  Interface  VXLAN    State
-----
50    Te0/3         1001     DOWN
50    Te0/10        1001     DOWN
50    Te0/18        1001     DOWN
50    Fo0/49        1001     UP
```

Field description:

| Field     | Description                     |
|-----------|---------------------------------|
| VLAN      | VLAN ID                         |
| Interface | Name of an Ethernet interface   |
| VXLAN     | VXLAN instance                  |
| State     | Status of an Ethernet interface |

**Prompts** N/A

**Platform Description** N/A

## 2.30 show vxlan global

**Parameter Description** Use this command to display global VXLAN information, including the VTEP IP address and virtual MAC address.

**show vxlan global**

**Defaults** N/A

|                               |                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command Mode</b>           | Privileged EXEC mode, global configuration mode, and interface configuration mode                                                                                                                                                                                                                                    |
| <b>Default Level</b>          | 14                                                                                                                                                                                                                                                                                                                   |
| <b>Usage Guide</b>            | This command allows you to query the loopback port bound to the VTEP, the VTEP IP address, and virtual MAC address of the global anycast gateway on the current device.                                                                                                                                              |
| <b>Configuration Examples</b> | <p>Run the <b>show vxlan global</b> command to display global VXLAN information.</p> <pre>Ruijie#show vxlan global Local switch vtep ip: 3.3.3.3.     Binds with interface loopback 1, line protocol is UP. vxlan gateway synchronize is OFF. Anycast mac: 0000.1234.5678 .  1 overlayrouters enable anycast .</pre> |
| <b>Prompts</b>                | N/A                                                                                                                                                                                                                                                                                                                  |

**Description**

## 2.32 show vxlan mac

Use this command to display the MAC address information about a VXLAN.

**show vxlan mac** [ **address** *mac-address* ] [ **vni** *vni-number* ] [ **remote** | **local** ]

**Parameter**  
**Description**

| Parameter                         | Description                                                                                                           |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>vni</b> <i>vni-number</i>      | Displays MAC address information about a specified VXLAN. The value of <i>vni-number</i> ranges from 1 to 16,777,215. |
| <b>address</b> <i>mac-address</i> | Displays information about a specified MAC address. The format is xxxx.xxxx.xxxx.                                     |
| <b>remote</b>                     | Displays information about the remote MAC address.                                                                    |
| <b>local</b>                      | Displays information about the local MAC address.                                                                     |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Examples** 1. The following example displays MAC address information about all VXLAN instances.

#### Examples

```
Ruijie(config)#show vxlan mac
```

| Vxlan | MAC Address    | Type   | Location | Interface           | Vlan |
|-------|----------------|--------|----------|---------------------|------|
| ----- |                |        |          |                     |      |
| 1     | 0000.1111.1111 | STATIC | REMOTE   | OverlayTunnel 1     | -    |
| 1     | 0000.1111.2222 | STATIC | REMOTE   | OverlayTunnel 1     | -    |
| 1     | 0000.2222.2222 | STATIC | LOCAL    | GigabitEthernet 0/1 | 1    |
| 1     | 0000.5555.5555 | STATIC | LOCAL    | GigabitEthernet 0/1 | 1    |

Field description:

| Field       | Description                                 |
|-------------|---------------------------------------------|
| VXLAN       | VXLAN instance ID.                          |
| MAC Address | MAC address                                 |
| Type        | Type of the MAC address                     |
| Location    | Whether an entry is a remote or local entry |
| Interface   | L2 egress of the MAC address                |
| Vlan        | VLAN instance                               |

2. The following example displays the VXLAN MAC address information about the address 0000.2222.2222.

```
Ruijie# show vxlan mac address 0000.2222.2222 vni 1
```

| Vxlan | MAC Address    | Type   | Location | Interface           | Vlan |
|-------|----------------|--------|----------|---------------------|------|
| ----- |                |        |          |                     |      |
| 1     | 0000.2222.2222 | STATIC | LOCAL    | GigabitEthernet 0/1 | 1    |

Field description:

| Field       | Description                                 |
|-------------|---------------------------------------------|
| VXLAN       | VXLAN instance                              |
| MAC Address | MAC address                                 |
| Type        | Type of the MAC address                     |
| Location    | Whether an entry is a remote or local entry |
| Interface   | L2 egress of the MAC address                |
| Vlan        | VLAN instance                               |

**Description**

## 2.33 show vxlan mac-active

Use this command to display active VXLAN MAC entries.

**show vxlan mac-active** [ *vni vni-number* | **local** | **remote** ]

| Parameter Description | Parameter                    | Description                                                                                              |
|-----------------------|------------------------------|----------------------------------------------------------------------------------------------------------|
|                       | <b>vni</b> <i>vni-number</i> | Displays the MAC entries of a specified VNI. The value of <i>vni-number</i> ranges from 1 to 16,777,215. |
|                       | <b>remote</b>                | Displays the remote MAC entry (MAC entry synchronized via a protocol).                                   |
|                       | <b>local</b>                 | Displays the local MAC entry.                                                                            |

**Command Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example displays all active VXLAN MAC entries.

### Examples

```
Ruijie(config)#show vxlan mac-active
```

| VXLAN | MAC Address    | Type     | Location | VTEP-IP Address | Interface | Source |
|-------|----------------|----------|----------|-----------------|-----------|--------|

## 2.34 show vxlan mac-bgp

Use this command to display remote VXLAN MAC entries synchronized via BGP.

**show vxlan mac-bgp** [ *vni vni-number* ]

**Parameter**  
**Description**

| Parameter                    | Description                                                                                                         |
|------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>vni</b> <i>vni-number</i> | Displays the remote VXLAN MAC entry of a specified VNI. The value of <i>vni-number</i> ranges from 1 to 16,777,215. |

**Command** Privileged EXEC mode, global configuration mode, and interface configuration mode  
**Mode**

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example displays all remote VXLAN MAC entries synchronized via BGP.

**Examples**

```
Ruijie(config)#show vxlan mac-bgp
VXLAN      MAC Address      VTEP-IP Address Interface
-----
1          0000.3000.0312    2.2.2.2          Ot6145
1          0000.4000.0311    2.2.2.2          Ot6145
1          0000.5000.0312    2.2.2.2          Ot6145
```

## 2.40 show vxlan route-bgp

Use this command to display VXLAN ARP entries synchronized via BGP.

**show vxlan route-bgp** [ **count** | **vrf** *vrf-name* | **global-vrf** | **vni** *vni-number* ]

**Parameter**  
**Description**

| Parameter                    | Description                                                                                 |
|------------------------------|---------------------------------------------------------------------------------------------|
| <b>count</b>                 | Displays the number of VXLAN ARP entries synchronized via BGP.                              |
| <b>vrf</b> <i>vrf-name</i>   | Displays ARP entries of a specified VRF instance.                                           |
| <b>global-vrf</b>            | Displays ARP entries of the global VRF instance.                                            |
| <b>vni</b> <i>vni-number</i> | Displays ARP entries of a specified VNI. The <i>vni-number</i> ranges from 1 to 16,777,215. |

**Command** Privileged EXEC mode, global configuration mode, and interface configuration mode  
**Mode**

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example displays all VXLAN ARP entries synchronized via BGP.

**Examples** (Note: The following font size is adjusted for full display.)

```
Ruijie(config)#show vxlan route-bgp
```

| VXLAN | IP Address | VTEP-IP Address | Interface | MAC Address    | NH-MAC Address | IS_GW |
|-------|------------|-----------------|-----------|----------------|----------------|-------|
| 2     | 123.5.1.2  | 2.2.2.2         | Ot6145    | 0000.8888.9999 | 0000.1111.2222 | False |

## 2.47 show vxlan vni-statistics

Use this command to display VNI traffic statistics.

**show vxlan vni-statistics** { **all** | **vni** *vni-number* }

**Parameter**  
**Description**

| Parameter                    | Description                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>all</b>                   | Displays traffic statistics of all VNIs.                                                                    |
| <b>vni</b> <i>vni-number</i> | Displays traffic statistics of a specified VNI. The value of <i>vni-number</i> ranges from 1 to 16,777,215. |

**Parameter** N/A  
**Description**

**Command** Privileged EXEC mode, global configuration mode, and interface configuration mode  
**Mode**

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example displays traffic statistics of VNI 3.

**Examples**

```
Ruijie# show vxlan vni-statistics vni 3
VXLAN 3:
    10 seconds input rate 80 bits/sec, 1 packets/sec
    10 seconds output rate 8000 bits/sec, 100 packets/sec
    10 packets input, 100 bytes
    1000 packets output, 10000 bytes
```

**Description**

## 2.48 show vxlan vrf

Use this command to display VXLAN instances of a VRF instance.

**show vxlan vrf { all | global-vrf | vrf-name vrf-name }**

**Parameter  
Description**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <b>all</b>               | Displays VXLAN instances of all VRF instances.        |
| <b>global-vrf</b>        | Displays VXLAN instances of the global VRF instance.  |
| <b>vrf-name vrf-name</b> | Displays VXLAN instances of a specified VRF instance. |

**Parameter  
Description** N/A

**Command  
Mode** Privileged EXEC mode, global configuration mode, and interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example displays VXLAN instances of all VRF instances.

**Examples**

```
Ruijie# show vxlan vrf all
VRF                               Symmetric VXLAN      VXLAN
-----
vrf-z                             1677    (Or1677)      100    (Or100)
                                   1002    (Or1002)
```

## 2.51 source loopback

Use this command to bind a loopback port for a device. The IP address of this loopback port is used as the source IP address of the VXLAN and used to fill the source IP address field at the outer layer of VXLAN packets.

**source loopback** *loopback-port-id*

Use the **no** form of this command to delete the loopback port bound to the VXLAN instance.

**no source loopback** *loopback-port-id*

| Parameter Description  | Parameter                                                                                                                                                                                                                                                                                                    | Description                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                        | <i>loopback-port-id</i>                                                                                                                                                                                                                                                                                      | Loopback port ID. | Prompts                | N/A                                                                                                                                                                                                                                                                                                          |                                                          |

**Common****Errors**

The same IP address is configured for the loopback interfaces bound to different devices.

**Platform****Description**

N/A

## 2.52 storm-control

Use this command to configure storm control for a VXLAN instance.

**storm-control** { **broadcast** | **multicast** | **unicast** } [ **pps** *pps-value* / **kbps** *kbps-value* | **mbps** *mbps-value* ]

Use the **no** form of this command to cancel storm control.

**no storm-control** { **broadcast** | **multicast** | **unicast** } [ **pps** *pps-value* / **kbps** *kbps-value* | **mbps** *mbps-value* ]

**Parameter  
Description**

| Parameter         | Description                                        |
|-------------------|----------------------------------------------------|
| <i>pps-value</i>  | Indicates the rate limit value, in packets/second. |
| <i>kbps-value</i> | Indicates the rate limit value, in kbit/s.         |
| <i>mbps-value</i> | Indicates the rate limit value, in Mbit/s          |

**Defaults**

No rate limit is configured for a VXLAN instance by default.

**Command  
Mode**

VXLAN configuration mode

**Default Level**

14

**Usage Guide**

1. If VNI-based storm control is required, you can configure storm control rate limit on a VXLAN instance.
2. If the storm control rate limit is set to 0, packets of the specified type will not flooded or broadcast in the VXLAN instance.

If storm control is configured on a VXLAN instance, the unit of the storm control rate limit must be the same for the broadcast, multicast, and unicast packets. If the unit is set to pps for broadcast packets, the unit for multicast and unicast packets does not need to be set, but must be set to pps if required.

**Configuration**

The following example configures storm control for VXLAN 1.

**Examples**

```
Ruijie#configure terminal
```

```

Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan 1
Ruijie(config-vxlan)#storm-control broadcast pps 9600
Ruijie(config-vxlan)#storm-control multicast pps 8600
Ruijie(config-vxlan)#storm-control unicast pps 7600

```

**Verification** Run the **show vxlan storm-control vni 1** command to display the storm control configuration.

```

Ruijie# show vxlan storm-control vni 1
VXLAN                               Broadcast Control Multicast Control Unicast Control
-----
1                                   9600 pps          8600 pps          7600 pps

```

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** VXLAN instances are asymmetric by default.

**Command Mode** VXLAN configuration mode

**Default Level** 14

**Usage Guide** Only one symmetric instance can be configured on a VRF instance. Different VXLAN instances can associate with VRF instances by binding Overlay router interfaces. If you attempt to configure multiple symmetric instances on a VRF instance, the configuration fails.

This command is mutually exclusive to the **vxlan gateway synchronize** command. After the former is configured, the latter is unavailable. Likewise, after the latter is configured, the former is unavailable.

**Configuration Examples** The following example configures VXLAN 1 as a symmetric instance.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan 1
Ruijie(config-vxlan)#symmetric
```

**Verification** Run the **show vxlan vni-number** command to display the symmetric attribute.

```
Ruijie#show vxlan 1
VXLAN 1
    Symmetric property : TRUE
    Router Interface   : -
    Extend VLAN        : -
    VTEP Adjacency Count: 0
```

**Prompts** If different VXLAN instances are associated with the same VLAN, the following prompt is displayed:

```
Ruijie(config)#vxlan 1
Ruijie(config-vxlan)#symmetric
Ruijie(config)#vxlan 2
Ruijie(config-vxlan)#symmetric
```

Fail to configure symmetric. Another symmetric instance(vxlan 1) has belonged to VRF-default. And ONE VRF couldn't have two symmetric instances at the same time.

**Common Errors** Multiple symmetric instances are configured under the same VRF instance.

**Platform** N/A

**Description**

## 2.54 tunnel destination

Use this command to set the destination IP address of an Overlay tunnel interface.

**tunnel destination** *ip-address*

Use the **no** form of this command to delete the destination IP address of an Overlay tunnel interface.

**no tunnel destination** [*ip-address*]

| Parameter<br>Description | Parameter         | Description                                                  |
|--------------------------|-------------------|--------------------------------------------------------------|
|                          | <i>ip-address</i> | Destination (peer) IP address of an Overlay tunnel interface |

**Defaults** N/A

**Command Mode** Overlay tunnel configuration mode

**Default Level** 14

**Usage Guide** Use this command to specify the destination (peer) IP address of an Overlay tunnel interface.

**Configuration Examples** The following example sets the destination IP address for an interface of Overlay tunnel 1 to 3.3.3.3.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config-vxlan)#tunnel-interface OverlayTunnel 1
Ruijie(config)# interface OverlayTunnel 1
Ruijie(config-if-OverlayTunnel 1)# tunnel destination 3.3.3.3
```

**Verification** Run the **show running-config interface** command to display the interface configuration.

```
Ruijie#sh running-config interface OverlayTunnel 1
```

```
Building configuration...
Current configuration : 174 bytes

interface OverlayTunnel 1
  tunnel source 1.1.1.1
  tunnel destination 3.3.3.3
```

**Prompts**

If an invalid IP address is configured, the following prompt is displayed:

```
Ruijie(config)#interface OverlayTunnel 1
```

```
Ruijie(config-if-OverlayTunnel 1)#tunnel destination 234.1.1.1
```

```
Fail to configure tunnel destination: invalid ip
```

**Description**

## 2.55 tunnel source

Use this command to set the source (local) IP address of an Overlay tunnel.

**tunnel source** *ip-address*

Use the **no** form of this command to delete the source (local) IP address of an Overlay tunnel.

**no tunnel source** [*ip-address*]

**Parameter  
Description**

| Parameter         | Description                                    |
|-------------------|------------------------------------------------|
| <i>ip-address</i> | Source (local) IP address of an Overlay tunnel |

**Defaults**

N/A

**Command  
Mode**

Overlay tunnel configuration mode

**Default Level** 14

**Usage Guide** Use this command to specify the source (local) IP address of an Overlay tunnel.

**Configuration Examples** The following example sets the source IP address of Overlay tunnel 1 to 1.1.1.1.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config-vxlan)#tunnel-interface OverlayTunnel 1
Ruijie(config)# interface OverlayTunnel 1
Ruijie(config-if-OverlayTunnel 1)# tunnel source 1.1.1.1
```

**Verification** Run the **show running-config interface** command to display the interface configuration.

```
Ruijie#sh running-config interface OverlayTunnel 1

Building configuration...
Current configuration : 174 bytes

interface OverlayTunnel 1
  tunnel source 1.1.1.1
  tunnel destination 3.3.3.3
```

**Prompts** If an invalid IP address is configured, the following prompt is displayed:

```
Ruijie(config)#interface OverlayTunnel 1
Ruijie(config-if-OverlayTunnel 1)#tunnel source 234.1.1.1
Fail to configure tunnel source: invalid ip
```

**Common Errors** N/A

**Platform Description** N/A

## 2.56 tunnel-interface

Use this command to associate a tunnel with a VXLAN instance (statically specify the VXLAN VTEP).

**tunnel-interface** *interface-name*

Use the **no** form of this command to delete the tunnel associated with the VXLAN instance (delete the statically specified VXLAN VTEP).

**no tunnel-interface** *interface-name*

| Parameter<br>Description | Parameter             | Description                            |
|--------------------------|-----------------------|----------------------------------------|
|                          | <i>interface-name</i> | Indicates an overlay tunnel interface. |

**Defaults** N/A

**Command Mode** VXLAN configuration mode

**Default Level** 14

**Usage Guide** This command is used to statically specify a VXLAN VTEP.

**Configuration Examples** The following example associates VXLAN 1 with Overlay tunnel 1.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan 1
Ruijie(config-vxlan)#tunnel-interface OverlayTunnel 1
```

**Verification** Run the **show vxlan vni-number** command to display information about the VXLAN tunnel associated with the VXLAN instance.

```
Ruijie#show vxlan 1
VXLAN 1
  Symmetric property : FALSE
  Router Interface   : OverlayRouter 1 (non-anycast)
  Extend VLAN       : -
  VTEP Adjacency Count: 1
  VTEP Adjacency List :
  Interface          Source IP      Destinaton IP  Type
```

```
-----
OverlayTunnel 1      1.1.1.1      3.3.3.3      static
```

**Prompts** When a nonexistent overlay tunnel interface is associated, the following prompt is displayed:

```
Ruijie(config)#vxlان 1
Ruijie(config-vxlان)#tunnel-interface OverlayTunnel 100
                                     ^
% Invalid input detected at '^' marker.
```

**Common Errors** N/A

**Platform Description** N/A

## 2.57 vni-counting enable (VTEP Configuration Mode)

Use this command to enable the global VNI traffic statistics function.

**vni-counting enable**

Use the **no** form of this command to disable the global VNI traffic statistics function.

**no vni-counting enable**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** The global VNI traffic statistics function is disabled by default.

**Command Mode** VTEP configuration mode

**Default Level** 14

**Usage Guide**

1. After this command is configured, the VNI traffic statistics function is enabled on all VNIs.
2. When the global VNI traffic statistics function is configured (by running the **vni-counting enable** command in VTEP configuration mode), the VNI traffic statistics function is enabled on all VXLAN instances. When VXLAN instance-based VNI traffic statistics function is configured (by running the

**vni-counting enable** command in VXLAN configuration mode), the VNI traffic statistics function is enabled only on the VXLAN instance. You can configure global VNI traffic statistics function or VXLAN instance-based VNI traffic statistics function to enable the VNI traffic statistics function on a VXLAN instance.

**Configuration** The following example enables the global VNI traffic statistics function.

**Examples**

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# vtep
Ruijie(config-vtep)# vni-counting enable
```

**Verification** Run the **show run** command to display the configuration.

**Description**

## 2.58 vni-counting enable (VXLAN Configuration Mode)

Use this command to enable the traffic statistics function on a VNI.

**vni-counting enable**

Use the **no** form of this command to disable the traffic statistics function on a VNI.

**no vni-counting enable**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

The traffic statistics function is disabled on VNIs by default.

**Command  
Mode**

VXLAN configuration mode

**Default Level**

14

- Usage Guide**
1. This command is configured in VXLAN configuration mode to enable the traffic statistics function on a specified VNI.
  2. When the global VNI traffic statistics function is configured (by running the **vni-counting enable** command in VTEP configuration mode), the VNI traffic statistics function is enabled on all VXLAN instances. When VXLAN instance-based VNI traffic statistics function is configured (by running the **vni-counting enable** command in VXLAN configuration mode), the VNI traffic statistics function is enabled only on the VXLAN instance. You can configure global VNI traffic statistics function or VXLAN instance-based VNI traffic statistics function to enable the VNI traffic statistics function on a VXLAN instance.

**Configuration** The following example enables the traffic statistics function on VXLAN 1.

**Examples**

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan 1
Ruijie(config-vxlan)# vni-counting enable
```

**Verification** Run the **show run** command to display the configuration.

**Prompts** If the number of VXLAN instances on which the VNI traffic statistics function is enabled reaches the maximum value, an error is displayed.

```
Failed to configure vni-counting: vni-counting capacity(1500 vxlans) is full.
```

**Common Errors** N/A

**Platform Description** N/A

## 2.59 vtep

Use this command to enter the VTEP configuration mode.

**vtep**

Use the **no** form of this command to delete all configurations in VTEP configuration mode.

**no vtep**

**Parameter Description**

| Parameter | Description |

## 2.60 vxlan

Use this command to create a VXLAN instance or enter the VXLAN instance configuration mode.

**vxlan** *vni-number*

Use the **no** form of this command to delete a VXLAN instance.

**no vxlan** *vni-number*

| Parameter<br>Description | Parameter         | Description                                               |
|--------------------------|-------------------|-----------------------------------------------------------|
|                          | <i>vni-number</i> | Indicates the VNI. The value ranges from 1 to 16,777,215. |

**Defaults** N/A

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Examples** The following example creates or enters VXLAN 1.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan 1
Ruijie(config-vxlan)#
```

**Verification** Run the **show vxlan** command to display information about all VXLAN instances.

```
Ruijie#show vxlan
VXLAN Total Count: 2
VXLAN Capacity   : 4000

VXLAN 1
  Symmetric property : FALSE
  Router Interface   : -
  Extend VLAN        : 100
  VTEP Adjacency Count: 2
  VTEP Adjacency List :
  Interface           Source IP       Destinaton IP   Type
  -----
  OverlayTunnel 4097   1.1.1.1         2.2.2.2         dynamic
```

```

OverlayTunnel 4098    1.1.1.1    3.3.3.3    dynamic

VXLAN 100

  Router Interface    : -
  Extend VLAN         : 200
  VTEP Adjacency Count: 2
  VTEP Adjacency List :
  Interface           Source IP      Destination IP  Type
  -----
  OverlayTunnel 4099    1.1.1.1        4.4.4.4        dynamic
  OverlayTunnel 4100    1.1.1.1        5.5.5.5        dynamic

```

**Prompts**

If the number of VXLAN instances reaches the maximum value, an error is displayed.  
 Fail to create vxlan: capacity is full

**Common  
Errors**

N/A

**Platform  
Description**

N/A

## 2.61 vxlan enhanced failover enable

Use this command to enable the VXLAN enhanced failover convergence function. Use the **no** form of this command to disable the VXLAN enhanced failover convergence function.

**vxlan enhanced failover enable**

**no vxlan enhanced failover enable**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       |             |

**Defaults**

The VXLAN enhanced failover convergence function is disabled by default.

**Command  
Mode**

VTEP configuration mode

**Default Level**

14

**Usage Guide**

In an EVPN VXLAN scenario, when multiple Network Interface Cards (NICs) of a server are connected to the TOR switch via BOND MODE 6 and the links between NICs and the TOR switch need to be switched, services will be interrupted due to network-side causes, and convergence and recovery should be implemented within seconds. After the **vxlan enhanced failover enable** command is executed, the convergence and recovery can be implemented within milliseconds in the case of layer-2 forwarding if links between NICs and the TOR switch are switched. Several seconds are still required for convergence and recovery in the case of layer-3 forwarding.

The function is disabled by default. It cannot be enabled in the presence of static tunnels but can be enabled only in pure EVPN VXLAN environment.

After this function is enabled, the EVPN MAC synchronization function cannot be disabled.

**Configuration**

The following example enables the VXLAN enhanced failover convergence function.

**Examples**

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vtep
Ruijie(config-vtep)#vxlan enhanced failover enable
```

**Verification**

Run the **show run** command to check whether the current configuration is successful.

**Prompt**

N/A

**Message****Common Errors**

1. The configuration will fail when the **vxlan enhanced failover enable** command is configured in the presence of static tunnels.

The error "static OverlayTunnel exists, vxlan enhanced failover enable cannot be configured" will be displayed.

2. After the **vxlan enhanced failover enable** command is configured, no static tunnel can be created.

The error "% vxlan enhanced failover enable configured, static OverlayTunnel cannot be created." will be displayed.

## 2.62 vxlan mac static

Use this command to set a static VXLAN MAC forwarding entry.

**vxlan mac static** *mac-address* **vni** *vni-number* **interface** *interface-name* [**vlan** *vid*]

Use the **no** form of this command to delete a static VXLAN MAC forwarding entry.

**no vxlan mac static** *mac-address* **vni** *vni-number* **interface** *interface-name* [**vlan** *vid*]

**Parameter  
Description**

| Parameter             | Description                                                                                                                                        |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>mac-address</i>    | Indicates the MAC address. The format is xxxx.xxxx.xxxx.                                                                                           |
| <i>vni-number</i>     | Indicates the VNI. The value ranges from 1 to 16,777,215.                                                                                          |
| <i>interface-name</i> | Indicates the name of the next-hop interface of the MAC entry. The interface can be an Ethernet port, aggregate port, or overlay tunnel interface. |
| <i>vid</i>            | Indicates the VLAN identifier. The value ranges from 1 to 4094.                                                                                    |

**Defaults** N/A

**Command  
Mode** Global configuration mode

**Default Level** 14

**Usage Guide**

1. This command is used to set a static VXLAN MAC forwarding entry. The next-hop interface must have been created when this command is configured. The next-hop interface cannot be a dynamic tunnel.
2. When the next-hop interface is not an overlay tunnel interface, *vid* must be set and the VID is not required for overlay tunnel interfaces.

**Configuration** The following example configures two static VXLAN MAC forwarding entries for VNI 1.

**Examples**

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan mac static 0000.1111.1111 vni 1 interface OverlayTunnel 1
Ruijie(config)#vxlan mac static 0000.5555.5555 vni 1 interface GigabitEthernet 0/1
vlan 1
```

**Verification** Run the **show vxlan mac** command to check whether the VXLAN MAC forwarding entries exist.

```
Ruijie#show vxlan mac
```

| Vxlan | MAC Address    | Type   | Location | Interface           | Vlan |
|-------|----------------|--------|----------|---------------------|------|
| 1     | 0000.1111.1111 | STATIC | REMOTE   | OverlayTunnel 1     | -    |
| 1     | 0000.1111.2222 | STATIC | REMOTE   | OverlayTunnel 1     | -    |
| 1     | 0000.2222.2222 | STATIC | LOCAL    | GigabitEthernet 0/1 | 1    |
| 1     | 0000.5555.5555 | STATIC | LOCAL    | GigabitEthernet 0/1 | 1    |

## 2.63 vxlan mac-log

Use this command to configure operation recording for VXLAN MAC entries.

**vxlan mac-log** { **limit** *num* | **type** { **event** | **timestamp** | **nstime** } | **disable** | **enable** }

Use the **no** form of this command to restore the default operation recording configuration of VXLAN MAC entries.

**default vxlan mac-log** { **limit** | **type** }

| Parameter<br>Description | Parameter                                                       | Description                                                                                       |
|--------------------------|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
|                          | <b>limit</b> <i>num</i>                                         | Indicates the upper limit of MAC entry operation records. The value ranges from 0 to 500,000.     |
|                          | <b>type</b> { <b>event</b>   <b>timestamp</b>   <b>nstime</b> } | Sets the data type of MAC entry operation records (event type, time type, or ns-level time type). |
|                          | <b>disable</b>                                                  | Disables the function of MAC entry operation recording.                                           |
|                          | <b>enable</b>                                                   | Enables the function of MAC entry operation recording.                                            |

**Defaults** The MAC entry operation recording function is enabled by default. The record limit depends on the device version and the default data type is event type.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** The configuration of this command cannot be displayed by the **show run** command.  
This command does not support device restart. If the device is restarted, the default configuration is restored.

**Configuration Examples** The following example sets the type of MAC entry operation records to time type.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

```
Ruijie(config)#vxlan mac-log type timestamp
Ruijie(config)#
```

**Verification** Run the **show vxlan mac-log status** command to display the status of the MAC entry operation recording function.

```
Ruijie(config)#show vxlan mac-log status
Vxlan mac-log function
    status: ON
    type: timestamp
    count: 1 (limit 5000)
    memory: 384 Bytes
```

**Prompts** N/A

**Common Errors** N/A

**Platform Description** N/A

## 2.64 vxlan overlaytunnel carrier-delay

Use this command to set the status change delay for VXLAN tunnel protocols.

**vxlan overlaytunnel carrier-delay up** *time*

Use the **no** form of this command to restore the default status change delay of the VXLAN tunnel protocols.

**no vxlan overlaytunnel carrier-delay up** [ *time* ]

**Parameter Description**

| Parameter             | Description                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>up</b> <i>time</i> | Indicates the delay required for a tunnel to go from the down state to up state. The unit is ms and the value range is <0–60000>. |

**Defaults** The default value is 2000 ms.

**Command Mode** VTEP configuration mode

**Default Level** 14

**Usage Guide** This command is used to set the status change delay for VXLAN tunnel protocols. You can adjust the delay according to scenario requirements.

**Configuration Examples** The following example sets no status change delay for VXLAN tunnel protocols, that is, changes in the VXLAN tunnel protocol status take effect immediately.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vtep
Ruijie(config-vtep)# vxlan overlaytunnel carrier-delay up 0
```

**Verification** Run the **show run** command to display the current configuration of the device.

**Prompts** N/A

**Common Errors** N/A

**Platform Description** N/A

## 2.65 vxlan overlaytunnel counting enable

Use this command to enable the VXLAN tunnel statistics function.

**vxlan overlaytunnel counting enable**

Use the **no** form of this command to disable the VXLAN tunnel statistics function.

**no vxlan overlaytunnel counting enable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** The VXLAN tunnel statistics function is disabled by default.

**Command Mode** VTEP configuration mode

**Default Level** 14

**Usage Guide** This command is used to enable or disable the VXLAN tunnel statistics function.

**Configuration** The following example enables the VXLAN tunnel statistics function.

**Examples**

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vtep
Ruijie(config-vtep)# vxlan overlaytunnel counting enable
```

**Verification** Run the **show run** command to display the current configuration of the device.

**Prompts** N/A

**Common Errors** N/A

**Platform Description** N/A

## 2.66 vxlan overlaytunnel nexthop resolution prefix-length minimum

Use this command to configure the shortest route length that can be preferentially selected for a tunnel.

**vxlan overlaytunnel nexthop resolution prefix-length minimum** [ *value-num* ]

Use the **no** form of this command to cancel the configuration of the shortest route length that can be preferentially selected for a tunnel.

**no vxlan overlaytunnel nexthop resolution prefix-length minimum** [ *value-num* ]

| Parameter Description | Parameter        | Description                                                                                                                                                                      |
|-----------------------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>value-num</i> | Shortest route length that can be preferentially selected for a tunnel. The value ranges from 0 to 32. If this parameter is set to <b>0</b> by default if no value is specified. |

**Defaults** The shortest route length is 0 by default, that is, the *value-num* parameter is set **0**.

**Command Mode** VTEP configuration mode

**Default Level** 14

**Usage Guide** Configure the shortest route length that can be preferentially selected for a tunnel to control the route preferentially selected for the DIP of the tunnel.

**Configuration Examples** The following example sets the shortest route length that can be preferentially selected for a tunnel to 32.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vtep
Ruijie(config-vtep)# vxlan overlaytunnel nexthop resolution prefix-length minimum
32
```

**Verification** Run the **show run** command to display the current device configuration.

—

**Prompts** N/A

**Common Errors** The configured value is out of range.

**Platform Description** N/A

## 2.67 vxlan range

Use this command to create VXLAN instances in batches or enter the VXLAN instance configuration mode.

**vxlan range** *vxlan-id-list*

| Parameter Description | Parameter            | Description                                                                                       |
|-----------------------|----------------------|---------------------------------------------------------------------------------------------------|
|                       | <i>vxlan-id-list</i> | VNI list, indicating VNIs of VXLAN instances created in batches. The value is a character string. |

**Defaults** N/A

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** You can use this command to create VXLAN instances in batches.  
VXLAN instances cannot be deleted in batches, that is, the **no vxlan range vxlan-id-list** command is unavailable.

**Configuration Examples** The following example creates or enters VXLANs 1, 2, 3, and 100.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan range 1-3,100
Ruijie(config-vxlan-range)#
```

**Verification** Run the **show vxlan** command to display information about all created VXLAN instances.

```
Ruijie#show vxlan
VXLAN Total Count: 2
VXLAN Capacity   : 4000

VXLAN 1
  Symmetric property : FALSE
  Router Interface   : -
  Extend VLAN       : 100
  VTEP Adjacency Count: 2
  VTEP Adjacency List :
  Interface          Source IP      Destinaton IP   Type
  -----
  OverlayTunnel 4097   1.1.1.1         2.2.2.2         dynamic
  OverlayTunnel 4098   1.1.1.1         3.3.3.3         dynamic

VXLAN 100
  Symmetric property : FALSE
  Router Interface   : -
```

```

Extend VLAN      : 200
VTEP Adjacency Count: 2
VTEP Adjacency List :
Interface          Source IP      Destination IP  Type
-----
OverlayTunnel 4099    1.1.1.1        4.4.4.4        dynamic
OverlayTunnel 4100    1.1.1.1        5.5.5.5        dynamic

```

**Prompts**

If the number of VXLAN instances reaches the maximum value, an error is displayed.  
Fail to create vxlan: capacity is full

**Common Errors**

N/A

**Platform Description**

N/A

## 2.68 vxlan route-log

Use this command to configure operation recording for VXLAN ARP/ND entries.

**vxlan route-log { limit *num* | type { event | timestamp | nstime } | disable | enable }**

Use the **no** form of this command to restore the default operation recording configuration of VXLAN ARP/ND entries.

**default vxlan route-log { limit | type }**

**Parameter Description**

| Parameter                                  | Description                                                                                          |
|--------------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>limit</b> <i>num</i>                    | Indicates the upper limit of ARP/ND entry operation records. The value ranges from 0 to 500,000.     |
| <b>type</b> { event   timestamp   nstime } | Sets the data type of ARP/ND entry operation records (event type, time type, or ns-level time type). |
| <b>disable</b>                             | Disables the function of ARP/ND entry operation recording.                                           |
| <b>enable</b>                              | Enables the function of ARP/ND entry operation recording.                                            |

**Defaults**

The ARP/ND entry operation recording function is enabled by default. The record limit depends on the device version and the default data type is event type.

|                               |                                                                                                                                                                                                                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command Mode</b>           | Global configuration mode                                                                                                                                                                                                                                                                           |
| <b>Default Level</b>          | 14                                                                                                                                                                                                                                                                                                  |
| <b>Usage Guide</b>            | <p>The configuration of this command cannot be displayed by the <b>show run</b> command.</p> <p>This command does not support device restart. ## 2.69 vxlan udp-port

Use this command to set the VXLAN UDP destination port.

**vxlan udp-port** *port-number*

Use the **no** form of this command to delete the VXLAN UDP destination port. After the port is deleted, the default value is restored.

**no vxlan udp-port** [*port-number*]

| Parameter Description  | Parameter                                                                                                                                                                                                                                                                                                                                                                                                  | Description                                                      |

## 2.70 vxlan vtep-log

Use this command to configure the operation recording for VXLAN tunnels.

**vxlan vtep-log** { **limit** *num* | **type** { **event** | **timestamp** | **nstime** } | **disable** | **enable** }

Use the **no** form of this command to restore the default operation recording configuration of VXLAN tunnels.

**default vxlan vtep-log** { **limit** | **type** }

| Parameter<br>Description | Parameter                                                       | Description                                                                                                       |
|--------------------------|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
|                          | <b>limit</b> <i>num</i>                                         | Indicates the upper limit of operation records relevant to VXLAN tunnels. The value ranges from 0 to 500,000.     |
|                          | <b>type</b> { <b>event</b>   <b>timestamp</b>   <b>nstime</b> } | Sets the data type of operation records relevant to VXLAN tunnels (event type, time type, or ns-level time type). |
|                          | <b>disable</b>                                                  | Disables the operation recording function for VXLAN tunnels.                                                      |
|                          | <b>enable</b>                                                   | Enables the operation recording function for VXLAN tunnels.                                                       |

**Defaults** The VXLAN tunnel–relevant operation recording function is enabled by default. The record limit depends on the device version and the default data type is time type.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** The configuration of this command cannot be displayed by the **show run** command.  
This command does not support device restart. If the device is restarted, the default configuration is restored.

**Configuration Examples** The following example sets the data type of operation records relevant to VXLAN tunnels to ns-level time type.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vxlan vtep-log type nstime
Ruijie(config)#
```

**Verification** Run the **show vxlan vtep-log status** command to display the status of the VXLAN tunnel–relevant operation recording function.

```
Ruijie(config)#show vxlan vtep-log status
Vxlan vtep-log function
    status: ON
    type: nstime
    count: 4 (limit 5000)
    memory: 2144 Bytes
```

**Common Errors** N/A

**Platform Description** N/A

## 3 RDMA Commands

### 3.1 clear cnp counters

Use this command to clear the CNP packet counter.

**clear cnp counters** [ **interface** *interface-name* ]

| Parameter<br>Description | Parameter                                                                | Description                  |
|--------------------------|--------------------------------------------------------------------------|------------------------------|
|                          | <i>interface</i>                                                         | Indicates an interface name. |
| Command<br>Mode          | Privileged EXEC mode                                                     |                              |
| Default Level            | 14                                                                       |                              |
| Usage Guide              | N/A                                                                      |                              |
| Configuration            | The following example clears the CNP packet counter on interface TF 0/1. |                              |
| Examples                 | <pre>Ruijie#clear cnp counters interface tf 0/1</pre>                    |                              |

### 3.2 clear nak counters

Use this command to clear the NAK packet counter.

**clear nak counters** [ **interface** *interface-name* ]

| Parameter<br>Description | Parameter                                                                | Description                  |
|--------------------------|--------------------------------------------------------------------------|------------------------------|
|                          | <i>interface</i>                                                         | Indicates an interface name. |
| Command<br>Mode          | Privileged EXEC mode                                                     |                              |
| Default Level            | 14                                                                       |                              |
| Usage Guide              | N/A                                                                      |                              |
| Configuration            | The following example clears the NAK packet counter on interface TF 0/1. |                              |

**Examples**

```
Ruijie#clear nak counters interface tf 0/1
```

### 3.3 cnp cos

Use this command to configure the CoS value of CNP packets. Use the **no** form of this command to restore the default CoS value of CNP packets.

**cnp cos** *cos-value*

**no cnp cos** *cos-value*

**Parameter  
Description**

| Parameter        | Description                                             |
|------------------|---------------------------------------------------------|
| <i>cos-value</i> | CoS value of CNP packets. The value ranges from 0 to 7. |

**Command  
Mode**

Global configuration mode

**Defaults**

The default CoS value of CNP packets is 6.

**Default Level**

14

**Usage Guide**

N/A

**Configuration** The following example configures the CoS value of the CNP packets to 5.

**Examples**

```
Ruijie(config)# cnp cos 5
```

### 3.4 cnp counting enable

Use this command to enable the CNP packet counting function. Use the **no** form of this command to disable the CNP packet counting function.

**cnp counting enable**

**no cnp counting enable**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Command  
Mode**

Interface configuration mode

**Defaults**

The CNP packet counting function is disabled by default.

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example enables the CNP packet counting function.

**Examples**

```
Ruijie(config)# interface tfGigabitEthernet 0/1
Ruijie(config-if-TFGigabitEthernet 0/1)# cnp counting enable
```

### 3.5 nak counting enable

Use this command to enable the NAK packet counting function. Use the **no** form of this command to disable the NAK packet counting function.

**nak counting enable**

**no nak counting enable**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Command Mode** Interface configuration mode

**Defaults** The NAK packet counting function is disabled by default.

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example enables the NAK packet counting function.

**Examples**

```
Ruijie(config)# interface tfGigabitEthernet 0/1
Ruijie(config-if-TFGigabitEthernet 0/1)# nak counting enable
```

### 3.6 show cnp counters

Use this command to display the CNP packet statistics.

**show cnp counters [ interface *interface-name* ]**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          |           |             |

|                       |                |
|-----------------------|----------------|
| <i>interface-name</i> | Interface name |
|-----------------------|----------------|

**Command Mode** Privileged EXEC mode, global configuration mode, interface configuration mode

**Defaults** N/A

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example displays the CNP packet statistics on interface TF 0/1.

**Examples**

```
Ruijie# show cnp counters interface tf 0/1
Interface          Input Packets   Output Packets
-----
TF0/1              10             20
```

## 3.7 show nak counters

Use this command to display the NAK packet statistics.

**show nak counters** [ **interface** *interface-name* ]

| Parameter Description | Parameter             | Description    |
|-----------------------|-----------------------|----------------|
|                       | <i>interface-name</i> | Interface name |

**Command Mode** Privileged EXEC mode, global configuration mode, interface configuration mode

**Defaults** N/A

**Default Level** 14

**Usage Guide** N/A

**Configuration** The following example displays the NAK packet statistics on interface TF 0/1.

**Examples**

```
Ruijie# show nak counters interface tf 0/1
Interface          Input Packets   Output Packets
-----
TF0/1              3              3
```
