## Preface

Thank you for using our products. This manual matches the RGOS Release 12.1(2)B0102.

## Audience

This manual is intended for:

- Network engineers
- Technical support and servicing engineers
- Network administrators

## Obtaining Technical Assistance

- Ruijie Networks Website: <https://www.ruijienetworks.com/>
- Technical Support Website: <https://ruijienetworks.com/support>
- Case Portal: <https://caseportal.ruijienetworks.com>
- Community: <https://community.ruijienetworks.com>
- Technical Support Email: [service\\_rj@ruijienetworks.com](mailto:service_rj@ruijienetworks.com)

## Related Documents

Documents	Description
Configuration Guide	Describes network protocols and related mechanisms that supported by the product, with configuration examples.
Hardware Installation and Reference Guide	Describes the functional and physical features and provides the device installation steps, hardware troubleshooting, module technical specifications, and specifications and usage guidelines for cables and connectors.

## Conventions

This manual uses the following conventions:

Convention	Description
<b>boldface font</b>	Commands, command options, and keywords are in <b>boldface</b> .
<i>italic font</i>	Arguments for which you supply values are in <i>italics</i> .
[ ]	Elements in square brackets are optional.
{ x   y   z }	Alternative keywords are grouped in braces and separated by vertical bars.

[ x | y | z ]

Optional alternative keywords are grouped in brackets and separated by vertical bars.

## Symbols

---

 Means reader take note. Notes contain helpful suggestions or references.

---

 Means reader be careful. In this situation, you might do something that could result in equipment damage or loss of data.

---

## System Configuration Commands

---

1. Command Line Interface Commands
2. Basic Configuration Management Commands
3. Line Commands
4. File System Commands
5. SYS Commands
6. Time Range Commands
7. HTTP Service Commands
8. Syslog Commands
9. CWMP Commands
10. Module Hot-plugging/Unplugging Commands
11. Supervisor Module Redundancy Commands
12. UFT Commands
13. Package Management Commands
14. OpenFlow Commands

# 1. Command Line Interface Commands

## 1.1 alias

Use this command to configure a command alias in global configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**alias** *mode command-alias original-command*

**no alias** *mode [command-alias]*

**default alias mode** [*command-alias*]

**Parameter Description**

Parameter	Description
<i>mode</i>	Mode of the command represented by the alias
<i>command-alias</i>	Command alias
<i>original-command</i>	Syntax of the command represented by the alias

**Defaults**

Some commands in user or privileged EXEC mode have default alias.

**Command Mode**

Global configuration mode.

**Usage Guide**

The following table lists the default alias of the commands in privileged EXEC mode.

Alias	Actual Command
h	help
p	ping
s	show
u	undebug
un	undebug

The default alias cannot be removed by the **no alias exec** command.

After configuring the alias, you can use a word to replace a command. For example, you can create an alias to represent the first part of a command, and then type the rest part of the command.

The mode of the command represented by the alias is the command mode existing in the current system. In the global configuration mode, you can use the **alias ?** command to list all the modes under which you can configure alias for commands.

```
Ruijie(config)# alias ?
  aaa-gs          AAA server group mode
  acl             acl configure mode
  bgp            Configure bgp Protocol
```

```
config          globle configure mode
.....
```

The alias also has its help information that is displayed after \* in the following format:

```
*command-alias=original-command
```

For example, in the privileged EXEC mode, the default alias s stands for show. You can enter s? to query the key words beginning with s and the help information of the alias.

```
Ruijie#s?
*s=show show start-chat start-terminal-service
```

If an alias represents more than one word, the command will be displayed in brackets. For example, if you set sv stand for show version in the privileged EXEC mode, then:

```
Ruijie#s?
*s=show *sv="show version" show start-chat
start-terminal-service
```

The alias must begin with the first letter of the command. The first letter of the command cannot be a space. The space before the command cannot be used as a valid alias.

```
Ruijie# s?
show start-chat start-terminal-service
```

The command alias also has its help information. For example, if the alias ia represents ip address in the interface configuration mode, then:

```
Ruijie(config-if)#ia ?
  A.B.C.D IP address
  dhcp    IP Address via DHCP
Ruijie(config-if)# ip address
```

The above help information lists the parameters of **ip address** and shows the actual command name.

You must enter an entire alias; otherwise it cannot be recognized.

Use the **show aliases** command to show the aliases setting in the system.

**Configuration Examples** The following example uses def-route to represent the default route setting of ip route 0.0.0.0 0.0.0.0 192.168.1.1 in the global configuration mode:

```
Ruijie# configure terminal
Ruijie(config)# alias config def-route ip route 0.0.0.0 0.0.0.0
192.168.1.1
Ruijie(config)#def-route?
*def-route="ip route 0.0.0.0 0.0.0.0 192.168.1.1"
Ruijie(config)# end
Ruijie# show aliases config
globle configure mode alias:
def-route          ip route 0.0.0.0 0.0.0.0
192.168.1.1
```

**Related Commands**

Command	Description
<b>show aliases</b>	Displays the aliases settings.

**Platform** N/A  
**Description**

## 1.2 cli-python

Use this command to install and uninstall a python script for CLI.

**cli-python** { **insmod** | **rmmod** } *python-filename*

**Parameter Description**

Parameter	Description
<i>python-filename</i>	Python script filename.

**Defaults** N/A.

**Command Mode** Privileged EXEC mode.

**Usage Guide** Upload a python script to the flash directory and run this command to install the python script.

**Configuration Examples** The following example installs python script ruijie.py.

```
Ruijie# cli-python insmod ruijie.py
% Python script module "ruijie.py" insert success.
```

**Related Commands**

Command	Description
N/A.	N/A.

**Platform Description** N/A.

## 1.3 privilege

Use this command to attribute the execution rights of a command to a command level in global configuration mode. Use the **no** form of this command to restore the default setting.

**privilege** *mode* [ **all** ] [ **level** *level* | **reset** ] *command-string*

**no privilege** *mode* [ **all** ] [ **level** *level* ] *command-string*

**Parameter Description**

Parameter	Description
<i>mode</i>	CLI mode of the command to which the execution rights are attributed.

<b>all</b>	Command alias
<b>level</b> <i>level</i>	Specifies the execution right levels (0–15) of a command or sub-commands
<b>reset</b>	Restores the command execution rights to its default level
<i>command-string:</i>	Command string to be authorized

**Defaults** N/A

**Command Mode** Global configuration mode.

**Usage Guide** The following table lists some key words that can be authorized by the **privilege** command in CLI mode. The number of command modes that can be authorized may vary with different devices. In the global configuration mode, you can use the **privilege ?** command to list all CLI command modes that can be authorized.

Mode	Description
config	Global configuration mode.
exec	Privileged EXEC mode
interface	Interface configuration mode
ip-dhcp-pool	DHCP address pool configuration mode
ip-dhcp-pool	DHCP address pool configuration mode
keychain	KeyChain configuration mode
keychain-key	KeyChain-key configuration mode

**Configuration Examples** The following example sets the password of CLI level 1 as **test** and attribute the **reload** rights to reset the device:

```
Ruijie(config)#privilege exec level 1 reload
```

You can access the CLI window as level-1 user to use the **reload** command:

```
Ruijie>reload ?
```

```
LINE Reason for reload
```

<cr> You can use the key word **all** to attribute all sub-commands of reload to level-1 users:

```
Ruijie(config)# privilege exec all level 1 reload
```

After the above setting, you can access the CLI window as level-1 user to use all sub commands of the **reload** command:

```
Ruijie>reload ?
```

```
LINE Reason for reload
```

```
at reload at a specific time/date
```

```
cancel cancel pending reload scheme
```

```
in reload after a time interval
```

```
<cr>
```

**Related Commands**

Command	Description
---------	-------------

<b>enable secret</b>	Sets the CLI-level password.
----------------------	------------------------------

**Platform** N/A.

**Description**

## 1.4 show aliases

Use this command to show all the command aliases or aliases in special command modes.

**show aliases** [ *mode* ]

Parameter Description	Parameter	Description
	<i>mode</i>	Mode of the command represented by the alias.

**Defaults** N/A.

**Command Mode** Privileged EXEC mode.

**Mode**

**Usage Guide** This command displays the configuration of all aliases if no command mode is input.

**Configuration** The following example displays the command alias in privileged EXEC mode:

**Examples**

```
Ruijie#show aliases exec
exec mode alias:
h          help
p          ping
s          show
u          undebug
un         undebug
```

Related Commands	Command	Description
	<b>alias</b>	Sets a command alias.

**Platform** N/A.

**Description**

## 2. Basic Configuration Management Commands

### 2.1 <1-99>

Use this command to restore the suspended Telnet Client session.

**<1-99>**

Parameter Description	Parameter	Description
	N/A	N/A

**Defaults** N/A

**Command Mode** User EXEC mode

**Usage Guide** This command is used to restore the suspended Telnet Client session. Hot keys (ctrl+shift+6 x) are used to exit the Telnet Client session creation. The **<1-99>** command is used to restore the session. If the session is created, you can use the **show session** command to display the session.

**Configuration** The following example restores the suspended Telnet Client session.

**Examples** Ruijie# 1

Related Commands	Command	Description
	N/A	N/A

**Platform Description** N/A

### 2.2 banner exec

Use this command to configure a message to welcome the user entering user EXEC mode through the line. Use the **no** form of this command to restore the default setting.

**banner exec c message c**

**no banner exec**

Parameter Description	Parameter	Description
-----------------------	-----------	-------------

<i>c</i>	Separator of the message. Delimiters are not allowed in the message.
<i>message</i>	Contents of the message.

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** This command is used to configure the welcome message. The system discards all the characters next to the terminating symbol.  
When you are logging in to the device, the MOTD message is displayed at first, and then the banner login message. After you have logged in, the EXEC message or the incoming message is displayed. If it's a reverse Telnet session, the incoming message is displayed. Otherwise, the EXEC message is displayed.  
The messages are for all lines. If you want to disable display the EXEC message on a specific line, configure the **no exec-banner** command on the line.

**Configuration Examples** The following example configures a welcome message.

```
Ruijie(config)# banner exec $ Welcome $
```

**Related Commands**

Command	Description
N/A	N/A

**Platform Description** N/A

## 2.3 banner incoming

Use this command to configure a prompt message for reverse Telnet session. Use the **no** form of this command to remove the setting.

**banner incoming** *c message c*

**no banner incoming**

**Parameter Description**

Parameter	Description
<i>c</i>	Separator of the message. Delimiters are not allowed in the message.
<i>message</i>	Contents of the message.

**Defaults** N/A

**Command** Global configuration mode  
**Mode**

**Usage Guide** This command is used to configure a prompt message. The system discards all the characters next to the terminating symbol.  
When you are logging in to the device, the MOTD message is displayed at first, and then the banner login message. After you have logged in, the welcome message or the prompt message is displayed. If it's a reverse Telnet session, the prompt message is displayed. Otherwise, the welcome message is displayed.

**Configuration** The following example configures a prompt message for reverse Telnet session.

**Examples** Ruijie(config)# banner incoming \$ Welcome \$

**Related  
Commands**

Command	Description
N/A	N/A

**Platform  
Description** N/A

## 2.4 banner login

Use this command to configure a login banner. Use **no** form of this command to r remove the setting.  
**banner login c message c**  
**no banner login**

**Parameter  
Description**

Parameter	Description
<i>c</i>	Separator of the message contained in the login banner. Delimiters are not allowed in the MOTD.
<i>message</i>	Contents of the login banner

**Defaults** N/A

**Command  
Mode** Global configuration mode

**Usage Guide** This command sets the login banner message, which is displayed at login. The system discards all the characters next to the terminating symbol.

**Configuration** The following example configures a login banner.

**Examples** Ruijie(config)# banner login \$ enter your password \$

Related Commands	Command	Description
	N/A	N/A

**Platform  
Description** N/A

## 2.5 banner motd

Use this command to set the Message-of-the-Day ( MOTD ) . Use the **no** form of this command to remove the setting.

**banner [ motd ] c message c**

**no banner [ motd ]**

Parameter Description	Parameter	Description
	<i>c</i>	Separator of the MOTD. Delimiters are not allowed in the MOTD.
	<i>message</i>	Contents of an MOTD

**Defaults** N/A

**Command  
Mode** Global configuration mode

**Usage Guide** This command sets the MOTD, which is displayed at login. The letters that follow the separator will be discarded.

**Configuration** The following example configures the MOTD.

**Examples** Ruijie(config)# **banner motd \$ hello,world \$**

Related Commands	Command	Description
	N/A	N/A

**Platform  
Description** N/A

## 2.6 banner prompt-timeout

Use this command to configure the prompt-timeout message to notify timeout. Use the **no** form of this command to remove the setting.

**banner prompt-timeout c message c**

**no banner prompt-timeout**

**Parameter Description**

Parameter	Description
<i>c</i>	Separator of the message. Delimiters are not allowed in the message.
<i>message</i>	Contents of the message.

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** The system discards all the characters next to the terminating symbol.  
When authentication times out, the banner prompt-timeout message is displayed.

**Configuration** The following example configures the prompt-timeout message to notify timeout.

**Examples**

```
Ruijie(config)# banner exec $ authentication timeout $
```

**Related Commands**

Command	Description
N/A	N/A

**Platform Description** N/A

## 2.7 banner slip-ppp

Use this command to configure the slip-ppp message for the SLIP/PPP session. Use the **no** form of this command to remove the setting.

**banner slip-ppp c message c**

**no banner slip-pp**

**Parameter Description**

Parameter	Description
<i>c</i>	Separator of the message. Delimiters are not allowed in the message.
<i>message</i>	Contents of the message.

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** This command is used to configure the slip-ppp message for the SLIP/PPP session. The system discards all the characters next to the terminating symbol.

When the SLIP/PPP session is created, the slip-ppp message is displayed on the corresponding terminal.

**Configuration** The following example configures the banner slip-ppp message for the SLIP/PPP session.

**Examples** Ruijie(config)# banner slip-ppp \$ Welcome \$

**Related Commands**

Command	Description
N/A	N/A

**Platform Description**

N/A

## 2.8 boot config

Use this command to modify the path for saving startup configurations and the corresponding file name.

**boot config { flash:filename | usb0:filename }**

**no boot config**

**Parameter Description**

Parameter	Description
<b>flash</b>	Saves the startup configuration file in the extensible Flash.
<b>usb0</b>	Saves the startup configuration file in USB0 device. The device must have a USB interface into which a USB device is inserted.

**Defaults**

By default, startup configuration file of a device is saved in **Flash:/config.text**

**Command Mode**

Privileged EXEC mode

**Usage Guide**

 The startup configuration file name follows a slash "/", for example, **Flash:/ruijie.text** and **Usb0:/ruijie.text**.

 The startup configuration file name consists of a path and a file name. The path is mandatory. Otherwise, configurations cannot be saved by using the **write** command. Take **Flash:/ruijie/ruijie.text** and **Usb0:/ruijie/ruijie.text** as examples, where the **Flash:/ruijie** and **Usb0:/ruijie** folders must exist. In master-slave mode, all device paths are required.

 To save the startup configuration file to a USB flash drive, the device must provide a USB interface with a USB flash drive inserted. Otherwise, configurations cannot be saved by using the **write** command. In master-slave mode, all devices must have USB flash drives connected.

**Configuration** The following example sets the startup configuration file path to flash:/ruijie.text..

**Examples**

```
Ruijie(config)#boot config flash:/ruijie.text
```

**Related Commands**

Command	Description
N/A	N/A

**Platform Description**

N/A

## 2.9 configure

Use this command to enter global configuration mode.

**configure [ terminal ]**

**Parameter Description**

Parameter	Description
N/A	N/A

**Defaults**

N/A

**Command Mode**

Privileged EXEC mode

**Usage Guide**

N/A

**Configuration** The following example enters global configuration mode.

**Examples**

```
Ruijie# configure
Ruijie(config)#
```

**Related Commands**

Command	Description
N/A	N/A

**Platform Description**

N/A

## 2.10 disable

Use this command to switch from privileged EXEC mode to user EXEC mode or lower the privilege level.

**disable** [ *privilege-level* ]

### Parameter Description

Parameter	Description
privilege-level	Privilege level

### Defaults

N/A

### Command Mode

User EXEC mode

### Usage Guide

Use this command to switch to user EXEC mode from privileged EXEC mode. If a new privilege level is added, the current privilege level will be lowered.

 The privilege level that follows the **disable** command must be lower than the current level.

### Configuration Examples

The following example lowers the current privilege level of the device to level 10.

### Examples

```
Ruijie# disable 10
```

### Related Commands

Command	Description
<b>enable</b>	Moves from user EXEC mode enter to privileged EXEC mode or reaches a higher level of authority.

### Platform Description

N/A

## 2.11 disconnect

Use this command to disconnect the Telnet Client session.

**disconnect** *session-id*

### Parameter Description

Parameter	Description
<i>session-id</i>	Telnet Client session ID.

### Defaults

N/A

**Command** User EXEC mode  
**Mode**

**Usage Guide** This command is used to disconnect the Telnet Client session by setting the session ID.

**Configuration** The following example disconnects the Telnet Client session by setting the session ID.

**Examples**  
Ruijie# disconnect 1

Related Commands	Command	Description
	N/A	N/A

**Platform Description** N/A

## 2.12 do telnet

Use this command to login to Telnet server.

**do telnet** [ **oob** ] *host* [ *port* ] [ /**source** { **ip** *A.B.C.D* | **ipv6** *X:X:X:X::X* | **interface** *interface-name* } ] [ /**vrf** *vrf-name* ] [ **via** *mgmt-name* ]

Parameter Description	Parameter	Description
	<b>oob</b>	
<i>host</i>		IPv4, IPv6 or host name of Telnet server.
<i>port</i>		Configures TCP port ID. The default is 23.
<b>/source</b>		Specifies source IP or source port for Telnet client.
<b>ip</b> <i>A.B.C.D</i>		Specifies source IPv4 address for Telnet client.
<b>ipv6</b> <i>X:X:X:X::X</i>		Specifies source IPv6 address for Telnet client.
<b>interface</b> <i>interface-name</i>		Specifies source port for Telnet client.
<b>/vrf</b> <i>vrf-name</i>		Specifies VRF table.
<b>via</b> <i>mgmt-name</i>		Specifies MGMT table.

**Defaults** N/A

**Command Mode** User EXEC mode/Privileged EXEC mode/Interface configuration mode

**Usage Guide** N/A

**Configuration** The following example configures destination IPv4 address 192.168.1.1, uses default port ID, and specifies source port Gi 0/1 and VRF table vpn1.

**Examples**

```
Ruijie(config)# do telnet 192.168.1.1 /source interface gigabitEthernet 0/1 /vrf vpn1
```

The following example configures destination IPv6 address 2AAA:BBBB::CCCC.

```
Ruijie(config)# do telnet 2AAA:BBBB::CCCC
```

The following example configures destination IPv4 address 192.168.1.1 and specifies MGMT port Mgmt 0.

```
Ruijie(config)# do telnet oob 192.168.1.1 via mgmt 0
```

**Related Commands**

Command	Description
N/A	N/A

**Platform Description**

N/A

## 2.13 enable

Use this command to enter privileged EXEC mode.

**Enable** [ *privilege-level* ]

**Parameter Description**

Parameter	Description
<i>privilege-level</i>	Privilege level

**Defaults** N/A

**Command Mode** User EXEC mode

**Usage Guide** N/A

**Configuration** The following example enters privileged EXEC mode and lowers the privilege level to 14.

**Examples**

```
Ruijie> enable 14
```

```
Password:
```

**Related Commands**

Command	Description
N/A	N/A

**Platform**  
**Description**

N/A

## 2.14 enable password

Use this command to configure passwords for different privilege levels. Use the **no** form of this command to restore the default setting.

**enable password** [ *level level* ] { [ **0** ] *password* | **7** *encrypted-password* }

**no enable password** [ *level level* ]

**Parameter  
Description**

Parameter	Description
<i>password</i>	Password for the user to enter the EXEC configuration layer
<i>level</i>	User's level.
<b>0</b>	(Optional) The password is in plain text.
<b>7</b> <i>encrypted-password</i>	The password is encrypted.

**Defaults**

N/A

**Command  
Mode**

Global configuration mode

**Usage Guide** No encryption is required in general. The encryption type must be specified for copying and pasting a encrypted password for the device.

A valid password is defined as follows:

- Consists of 1-26 upper/lower case letters and numbers
- Leading spaces are allowed but usually ignored. Spaces in between or at the end are regarded as part of the password.

 If an encryption type is specified and a plaintext password is entered, you cannot enter privileged EXEC mode. A lost password that has been encrypted using any method cannot be restored. In this case, you can only reconfigure the device password.

**Configuration** The following example configures the password as **pw10**.

**Examples**

```
Ruijie(config)# enable password pw10
```

**Related  
Commands**

Command	Description
<b>enable secret</b>	Sets the security password

**Platform** N/A  
**Description**

## 2.15 enable secret

Use this command to configure a security password for different privilege levels. Use the **no** form of this command to restore the default setting.

**enable secret** [ *level level* ] { [ **0** ] *password* | **5 encrypted-secret** }  
**no enable secret** [ *level level* ]

Parameter Description	Parameter	Description
	<b>secret</b>	Password for the user to enter the EXEC configuration layer
	<b>level</b>	User's level.
	<b>0</b>	"0" for no encryption.
	<b>5 encrypted-password</b>	"5" for security encryption.

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** A password comes under two categories: "password" and "security". "Password" indicates a simple password, which can be set only for level 15. "Security" means a security password, which can be set for levels 0-15. If both types of passwords coexist in the system, no "password" type is allowed. If a "password" type password is set for a level other than 15, the system gives an alert and the password is automatically converted into a "security" password. If a "password" type password is set for level 15 and the same as a "security" password, an alert is given. The password must be encrypted, with simple encryption for "password" type passwords and security encryption for "security" type passwords.

**Configuration Examples** The following example configures the security password as **pw10**.

```
Ruijie(config)# enable secret 0 pw10
```

Related Commands	Command	Description
	<b>enable password</b>	Sets passwords for different privilege levels.

**Platform Description** N/A

## 2.16 enable service

Use this command to enable or disable a specified service such as **SSH Server/Telnet Server/Web Server/SNMP Agent**.

**enable service { ssh-sesrver | telnet-server | web-server [ http | https | all ] | snmp-agent }**

**Parameter Description**

Parameter	Description
<b>ssh-server</b>	Enables SSH Server. IPv4 and IPv6 services are enabled at the same time.
<b>telnet-server</b>	Enables Telnet Server. IPv4 and IPv6 services are enabled at the same time.
<b>web-server [ http   https   all ]</b>	Enables HTTP Server. IPv4 and IPv6 services are enabled at the same time.
<b>snmp-agent</b>	Enables SNMP Agent. IPv4 and IPv6 services are enabled at the same time.

**Defaults** telnet-server, snmp-agent and web-server are enabled and ssh-server is disabled by default.

**Command Mode** Global configuration mode

**Usage Guide** Use this command to enable or disable a specified service. Use the **no enable service** command to disable the specified service.

 The **enable service web-server** command is followed by three optional keywords: [ **http** | **https** | **all** ]. If the command is followed by no keyword or by **all**, the command enables http and https services. Followed by **http**, the command enables http service only. Followed by **https**, the command enables https service only.

**Configuration Examples** The following example enables the SSH Server.

```
Ruijie(Config)# enable service ssh-sesrver
```

**Related Commands**

Command	Description
<b>show service</b>	Displays the service status in the current system.

**Platform Description** N/A

## 2.17 end

Use this command to return to privileged EXEC mode.

**end**

**Parameter Description**

Parameter	Description
N/A	N/A

**Defaults**

N/A

**Command Mode**

All modes except privileged EXEC mode

**Usage Guide**

N/A

**Configuration**

The following example returns to privileged EXEC mode.

**Examples**

```
Ruijie#con
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#line vty 0
Ruijie(config-line)#end
*May 20 09:49:38: %SYS-5-CONFIG_I: Configured from console by console
Ruijie#
```

**Related Commands**

Command	Description
N/A	N/A

**Platform Description**

N/A

## 2.18 exec-banner

Use this command to enable display of the EXEC message on a specific line. Use the **no** form of this command to restore the default setting.

**exec-banner**

**no exec-banner**

**Parameter Description**

Parameter	Description
N/A	N/A

**Defaults** The EXEC message is displayed on all lines by default.

**Command Mode** LINE configuration mode

**Usage Guide** After you configure the **banner exec** and the **banner motd** commands, the EXEC and the MOTD messages are displayed on all lines by default. If you want to disable display of the EXEC and the MOTD messages on a specific line, configure the **no** form of this command on the line.

 This command does not work for the banner incoming message. If you configure the **banner incoming** command, the banner incoming message is displayed on all reverse Telnet sessions and the display cannot be disabled on a specific line.

**Configuration Examples** The following example disables display of the EXEC message on line VTY 1.

```
Ruijie(config)# line vty 1
Ruijie(config-line)no exec-banner
```

## 2.19 exec-timeout

Use this command to configure connection timeout for this device in LINE mode. Use the **no** form of this command to restore the default setting and the connection never expires.

**exec-timeout** *minutes* [ *seconds* ]

**no exec-timeout**

**Parameter Description**

Parameter	Description
<i>minutes</i>	Timeout in minutes.
<i>seconds</i>	(Optional) Timeout in minutes

**Defaults** The default is 10 minutes.

**Command Mode** Line configuration mode

**Usage Guide** If there is no input or output for this connection within a specified time, this connection will expire, and this LINE will be restored to the free status.

**Configuration** The following example sets the connection timeout to 5'30".

**Examples** Ruijie(config-line)#**exec-timeout** 5 30

**Related  
Commands**

## 2.20 execute

Use this command to execute a command on the file.

**execute** { [ **flash:** ] *filename* }

**Parameter  
Description**

Parameter	Description
<i>filename</i>	Specifies the file path.

**Defaults** N/A

**Command  
Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example executes a command to configure an IP address for the specified interface.

**Examples**

```
Ruijie#execute flash:mybin/config.text
executing script file mybin/config.text .....
executing done
Ruijie#config
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#interface gigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)#ip address 192.168.21.158 24
Ruijie(config-if-GigabitEthernet 0/1)#end
*Sep 29 23:35:49: %SYS-5-CONFIG_I: Configured from console by console
Ruijie#
```

## 2.21 exit

Use this command to return to the upper configuration mode.

**exit**

Parameter Description	Parameter	Description
	N/A	N/A

**Defaults** N/A

**Command Mode** All configuration modes

**Usage Guide** N/A

**Configuration Examples** The following example returns to the upper configuration mode.

```
Ruijie#con
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#line vty 0
Ruijie(config-line)#end
*May 20 09:49:38: %SYS-5-CONFIG_I: Configured from console by console
Ruijie#con
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#line vty 0
Ruijie(config-line)#exit
Ruijie(config)#exit
*May 20 09:51:48: %SYS-5-CONFIG_I: Configured from console by console
Ruijie#exit

Press RETURN to get started
```

Related Commands	Command	Description

## 2.22 help

Use this command to display the help information.

### help

#### Parameter Description

Parameter	Description
N/A	N/A

**Defaults** Any mode

#### Command Mode

**Usage Guide** This command is used to display brief information about the help system. You can use "?" to display all commands or a specified command with its parameters.

**Configuration** The following example displays brief information about the help system.

#### Examples

```
Ruijie#help
Help may be requested at any point in a command by entering
a question mark '?'. If nothing matches, the help list will
be empty and you must backup until entering a '?' shows the
available options.
Two styles of help are provided:
1. Full help is available when you are ready to enter a
   command argument (e.g. 'show ?') and describes each possible
   argument.
2. Partial help is provided when an abbreviated argument is entered
   and you want to know what arguments match the input
   (e.g. 'show pr?'.)
```

The following example displays all available commands in interface configuration mode.

```
Ruijie(config-if-GigabitEthernet 0/0)#?
Interface configuration commands:
  arp          ARP interface subcommands
  bandwidth    Set bandwidth informational parameter
  carrier-delay Specify delay for interface transitions
  dampening    Enable event dampening
  default      Set a command to its defaults
  description  Interface specific description
  dldp        Exec data link detection command
  duplex       Configure duplex operation
  efm          Config efm for an interface
  end          Exit from interface configuration mode
```

exit	Exit from interface configuration mode
expert	Expert extended ACL
flowcontrol	Set the flow-control value for an interface
full-duplex	Force full duplex operation
global	Global ACL
gvrp	GVRP configure command
half-duplex	Force half duplex operation
help	Description of the interactive help system
ip	Interface Internet Protocol config commands
ipv6	Internet Protocol Version 6
isis	Intermediate System - Intermediate System (IS-IS)
l2	Config L2 attribute
label-switching	Enable interface process mpls packet
lACP	LACP interface subcommands
lldp	Link Layer Discovery Protocol
load-interval	Specify interval for load calculation for an interface
mac	Mac extended ACL
mac-address	Set mac-address
mpls	Multi-Protocol Label Switching
mtu	Set the interface Maximum Transmission Unit (MTU)
no	Negate a command or set its defaults
ntp	Configure NTP
port-group	Aggregateport/port bundling configuration
redirect	Redirect packets
rmon	Rmon command
security	Configure the Security
show	Show running system information
shutdown	Shutdown the selected interface
snmp	Modify SNMP interface parameters
speed	Configure speed operation
switchport	Set switching mode characteristics
vrf	Multi-af VPN Routing/Forwarding parameters on the interface
vrrp	VRRP interface subcommands
xconnect	Xconnect commands

The following example displays the parameters of a specified command.

```
Ruijie(config)#access-list 1 permit ?
A.B.C.D Source address
any Any source host
host A single source host
```

**Related  
Commands**

## 2.23 hostname

Use this command to specify or modify the hostname of a device.

**hostname** *name*

**Parameter**  
**Description**

Parameter	Description
<i>name</i>	Device hostname, string, number or hyphen, up to 63 characters.

**Defaults** The default is Ruijie.

**Command** Global configuration mode  
**Mode**

**Usage Guide** This hostname is mainly used to identify the device and is taken as the username for the local device during dialup and CHAP authentication.

**Configuration** The following example configures the hostname of the device as BeiJingAgenda.

**Examples**

```
Ruijie(config)# hostname BeiJingAgenda
BeiJingAgenda(config)#
```

**Related**

## 2.24 ip telnet source-interface

Use this command to configure the IP address of an interface as the source address for Telnet connection.

**ip telnet source-interface** *interface-name*

**Parameter**  
**Description**

Parameter	Description
-----------	-------------

<i>interface-name</i>	Configures the IP address of the interface as the source address for Telnet connection.
-----------------------	---

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** This command is used to specify the IP address of an interface as the source address for global Telnet connection. When using the telnet command to log in a Telnet server, apply the global setting if no source interface or source address is specified. Use the **no ip telnet source-interface** command to restore it to the default setting.

**Configuration Examples** The following example configures the IP address of the *Loopback1* interface as the source address for global Telnet connection.

```
Ruijie(Config)# ip telnet source-interface Loopback 1
```

**Related Commands**

Command	Description
telnet	Logs in a Telnet server.

**Platform Description** N/A

## 2.25 language character-set

Use this command to set a language character set.

**language character-set { UTF-8 | GBK | default }**

**Parameter Description**

Parameter	Description
<b>UTF-8</b>	Specifies the UFT-8 character set,
<b>GBK</b>	Specifies the GBK character set.
<b>default</b>	Specifies the default character set.

**Defaults** Default

**Command Mode** Global configuration mode

**Usage Guide** If you want to set a character set in running configuration, please delete the character set configuration different from the target character set first.

**Configuration** The following example specifies the UTF-8 character set.

```
Ruijie(config)#language character-set UTF-8
This may take some time to build configuration, Continue? (yes[no]): y
Ruijie(config)#
```

Related Commands	Command	Description
	N/A	N/A

**Platform Description** N/A

## 2.26 lock

Use this command to set a temporary password for the terminal.

**lock**

Parameter Description	Parameter	Description
	N/A	N/A

**Defaults** N/A

**Command Mode** User EXEC mode

**Usage Guide** You can lock the terminal interface and maintain the session continuity to prevent access to the interface by setting a temporary password. Take the following steps to lock the terminal interface:

- Enter the **lock** command, and the system will prompt you for a password:
- Enter the password, which can be any character string. The system will prompt you to confirm the password, clear the screen, and display the "Locked" information.
- To access the terminal, enter the preset temporary password.
- To lock the terminal, run the **lockable** command in line configuration mode and enable terminal locking in the corresponding line.

**Configuration** The following example locks a terminal interface.

```
Ruijie(config-line)# lockable
Ruijie(config-line)# end
Ruijie# lock
Password: <password>
Again: <password>
Locked
Password: <password>
```

Ruijie#

**Related  
Commands**

Command	Description
<b>lockable</b>	Supports terminal locking in the line.

**Platform  
Description**

N/A

## 2.27 lockable

Use this command to support the **lock** command at the terminal. Use the **no** form of this command to restore the default setting.

**lockable**

**no lockable**

**Parameter  
Description**

Parameter	Description
N/A	N/A

**Defaults**

This function is disabled by default

**Command  
Mode**

Line configuration mode

**Usage Guide**

This command is used to lock a terminal interface in the corresponding line. To lock the terminal, run the lock command in EXEC mode.

**Configuration**

The following example enables terminal locking at the console port and locks the console.

**Examples**

```
Ruijie(config)# line console 0
Ruijie(config-line)# lockable
Ruijie(config-line)# end
Ruijie# lock
Password: <password>
Again: <password>
Locked
Password: <password>
```

**Related  
Commands**

Command	Description
<b>lock</b>	Locks the terminal.

**Platform**  
**Description**

N/A

## 2.28 login

Use this command to enable simple login password authentication on the interface if AAA is disabled. Use the **no** form of this command to restore the default setting.

**login**  
**no login**

**Parameter**  
**Description**

Parameter	Description
N/A	N/A

**Defaults**

Login is disabled for console and enabled for AUX, TTY and VTY terminals by default.

**Command**  
**Mode**

Line configuration mode

**Usage Guide**

If the AAA security server is inactive, this command enables simple password authentication at login. The password is configured for a VTY or console interface.

**Configuration**

The following example sets a login password authentication on VTY..

**Examples**

```
Ruijie(config)# no aaa new-model
Ruijie(config)# line vty 0
Ruijie(config-line)# password 0 normatest
Ruijie(config-line)# login
```

**Related**  
**Commands**

Command	Description
<b>password</b>	Configures the line login password

**Platform**  
**Description**

N/A

## 2.29 login access non-aaa

Use this command to configure non-AAA authentication on line when AAA is enabled. Use the **no** form of this command to restore the default setting.

**login access non-aaa**  
**no login access non-aaa**

Parameter Description	Parameter	Description
	N/A	N/A

**Defaults** This function is disabled by default.

**Command Mode** Global configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example configures VTY line authentication with AAA enabled.

```
Ruijie(config)#log access non-aaa
Ruijie(config)#aaa new-model
Ruijie(config)#line vty 0 4
Ruijie(config-line)#login local
Ruijie(config-line)#
```

Related Commands	Command	Description
	N/A	N/A

**Platform Description** N/A

## 2.30 login authentication

If the AAA is enabled, login authentication must be performed on the AAA server. Use this command to associate login authentication method list. Use the **no** form of this command to remove the configuration.

**login authentication** { **default** | *list-name* }

**no login authentication** { **default** | *list-name* }

Parameter Description	Parameter	Description
	<b>default</b>	Name of the default authentication method list
	<i>list-name</i>	Name of the method list

**Defaults** The default authentication is used when AAA is enabled.

**Command Mode** Line configuration mode

**Usage Guide**

**Configuration** The following example associates the method list on VTY and perform login authentication on a radius server.

**Examples**

```
Ruijie(config)# aaa new-model
Ruijie(config)# aaa authentication login default radius
Ruijie(config)# line vty 0
Ruijie(config-line)# login authentication default
```

**Related Commands**

Command	Description
<b>aaa new-model</b>	Enables the AAA security service.
<b>aaa authentication login</b>	Configures the login authentication method list.

**Platform**

N/A

**Description**

## 2.31 login local

Use this command to enable local user authentication on the interface if AAA is disabled. Use the **no** form of this command to restore the default setting.

**login local**

**no login local**

**Parameter Description**

Parameter	Description
N/A	N/A

**Defaults**

N/A

**Command Mode**

Line configuration mode

**Usage Guide**

If the AAA security server is inactive, this command is used for local user login authentication. The user is allowed to use the **username** command.

**Configuration**

The following example sets local user authentication on VTY.

**Examples**

```
Ruijie(config)# no aaa new-model
Ruijie(config)# username test password 0 test
Ruijie(config)# line vty 0
Ruijie(config-line)# login local
```

Related Commands	Command	Description
		<b>username</b>

**Platform Description** N/A

## 2.32 login privilege log

Use this command to log privilege change. Use the **no** form of this command to restore the default setting.

**login privilege log**

**no login privilege log**

Parameter Description	Parameter	Description
		N/A

**Defaults** This command is disabled by default.

**Command Mode** Global configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example enables the function of logging privilege change.

```
Ruijie(config)# login privilege log
```

The following example displays the log of privilege change failure.

```
Ruijie>enable 10

Password:
Password:
Password:

% Access denied

Ruijie>

*Sep 10 11:34:19: %SYS-5-PRIV_AUTH_FAIL: Authentication to
privilege level 10 from console failed
```

The following example displays the log of privilege change success.

```
Ruijie>enable 10

Password:

Ruijie#

*Sep 10 11:34:20: %SYS-5-PRIV_AUTH_SUCCESS: Authentication to
privilege level 10 from console success
```

**Related  
Commands**

Command	Description
N/A	N/A

**Platform  
Description**

## 2.33 motd-banner

Use this command to enable display of the MOTD message on a specified line. Use the **no** form of this command to restore the default setting.

**motd-banner**  
**no motd-banner**

**Parameter  
Description**

Parameter	Description
N/A	N/A

**Defaults**

The MOTD message is displayed on all lines by default.

**Command  
Mode**

Line configuration mode

**Usage Guide**

After you configure the **banner exec** and the **banner motd** commands, the EXEC and the MOTD messages are displayed on all lines by default. If you want to disable display of the EXEC and the MOTD messages on a specific line, configure the **no** form of this command on the line.

 This command does not work for the incoming message. If you configure the **banner incoming** command, the banner incoming message is displayed on all reverse Telnet sessions and the display cannot be disabled on a specific line.

**Configuration**

The following example disables display of the MOTD message on VTY 1.

**Examples**

```
Ruijie(config)# line vty 1
Ruijie(config-line)no motd-banner
```

<b>Related Commands</b>	Command	Description
	N/A	N/A

**Platform Description** N/A

## 2.34 password

Use this command to configure a password for line login, run the **password** command. Use the **no** form of this command to restore the default setting.

**password** { [ **0** ] *password* | **7** *encrypted-password* }  
**no password**

<b>Parameter Description</b>	Parameter	Description
	<i>password</i>	Password for remote line login
	<b>0</b>	(Optional) The password is in plain text by a Ruijie device.
	<b>7</b> <i>encrypted-password</i>	The password is encrypted

**Defaults** N/A

**Command Mode** Line configuration mode

### Usage Guide

**Configuration Examples** The following example configures the line login password as "red".

```
Ruijie(config)# line vty 0
Ruijie(config-line)# password red
```

<b>Related Commands</b>	Command	Description
	<b>login</b>	Moves from user EXEC mode to privileged EXEC mode or enables a higher level of authority.

**Platform Description** N/A

## 2.35 prompt

Use this command to set the **prompt** command. Use the **no** form of this command to restore the default setting.

**prompt** *string*

**no prompt**

**Parameter Description**

Parameter	Description
<i>string</i>	Character string of the <b>prompt</b> command, containing up to 32 letters.

**Defaults**

N/A

**Command Mode**

Global configuration mode

**Usage Guide**

If no prompt string is configured, the system name applies and varies with the system name. The **prompt** command is valid only in EXEC mode.

**Configuration Examples**

The following example sets the prompt string to rgnos.

```
Ruijie(config)# prompt rgnos
Ruijie(config)# end
RGOS
```

**Related Commands**

Command	Description
N/A	N/A

**Platform Description**

N/A

## 2.36 secret

Use this command to set a password encrypted by irreversible MD5 for line login. Use the **no** form of this command to restore the default setting.

**secret** { [ **0** ] *password* | **5** *encrypted-secret* }

**no secret**

**Parameter Description**

Parameter	Description
<b>0</b>	(Optional) sets the plaintext password text and encrypts it with irreversible MD5 after configuration.

<i>password</i>	Sets the password plaintext, a string ranging from 1 to 25 characters.
<b>5</b> <i>encrypted-secret</i>	Sets the password text encrypted by irreversible MD5 and saves it as the encrypted password after configuration.

**Defaults** N/A

**Command mode** Line configuration mode

**Usage Guide** This command is used to set a password encrypted by irreversible MD5 that is authenticated by a remote user through line login.

 If the specified encryption type is 5, the logical length of the cipher text to be entered must be 24 and the 1<sup>st</sup>, 3<sup>rd</sup> and 8<sup>th</sup> characters of the password text must be \$.

In general, the encryption type does not need to be specified as 5 except when the encrypted password is copied and pasted.

Line mode allows configuration of both “password” and “secret” types passwords at the same time. When the two passwords are the same, the system will send alert notification but the configuration will be permitted. When the system is configured with the two passwords, if the user enters a password that does not match the “secret” type password, it will not continue to match the “password” type password and login fails, enhancing security for the system password.

**Configuration** The following example sets the password encrypted by irreversible MD5 for line login to vty0.

**Examples**

```
Ruijie(config)# line vty 0
Ruijie(config-line)# secret vty0
```

The following displays the encryption outcome by running the **show** command.

```
secret 5 $1$X834$wvx6y794uAD8svzD
```

Related Commands	Command	Description
	<b>login</b>	Sets simple password authentication on the interface as the login authentication mode

**Platform Description** N/A

## 2.37 session

Use this command to connect to another device in VSU multiple-device environment (box-type device).

**session { master | device *device-number* }**

<b>Parameter Description</b>	<b>Parameter</b>	<b>Description</b>
	<b>master</b>	Configures the slave host to connect with the master host or the slave management module with the master management module.
	<b>device</b> <i>device-number</i>	Sets the device number.
<b>Defaults</b>	N/A	
<b>Command Mode</b>	User EXEC mode	
<b>Usage Guide</b>	N/A	
<b>Configuration Examples</b>	<p>The following example configures the slave host to connect with the master host in VSU environment.</p> <pre>Ruijie# session master</pre> <p>The following example connects to device1 through session in VSU multiple-device environment (box-type device).</p> <pre>Ruijie# session device 1</pre>

## 2.38 session-timeout

Use this command to configure the session timeout for a remote terminal. Use the **no** form of this command to restore the default setting and the session never expires.

**session-timeout** *minutes* [ **output** ]

**no session-timeout**

<b>Parameter Description</b>	<b>Parameter</b>	<b>Description</b>
	<i>minutes</i>	Timeout in minutes.
	<b>output</b>	Regards data output as the input to determine whether the session expires.

**Defaults** The default timeout is 0.

**Command** LINE configuration mode

**Mode**

**Usage Guide** If no input or output in current LINE mode is found on the remote terminal for the session within a specified time, this connection will expire, and this LINE will be restored to the free status.

**Configuration** The following example specifies the timeout as 5 minutes.

**Examples** Ruijie (config-line) #**exec-timeout 5 output**

Use this command to display the service status.

**show service**

Parameter Description	Parameter	Description
	N/A	N/A

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays whether the service is enabled or disabled.

**Examples**

```
Ruijie# show service
web-server : disabled
web-server(https): disabled
snmp-agent : enabled
ssh-server : enabled
telnet-server : disabled
```

Related Commands	Command	Description
	N/A	N/A

**Platform Description** N/A

## 2.47 show sessions

Use this command to display the Telnet Client session information.

**show sessions**

Parameter Description	Parameter	Description
	N/A	N/A

**Defaults** N/A

**Command Mode** User EXEC mode

**Usage Guide** Telnet Client session information includes the VTY number and the server IP address.

**Configuration** The following example displays the Telnet Client session information.

**Examples**

```
Ruijie#show sessions
Conn Address
*1 127.0.0.1
*2 192.168.21.122
```

Related Commands	Command	Description
	N/A	N/A

**Platform Description** N/A

## 2.48 show startup-config

Use this command to display the device configuration stored in the Non Volatile Random Access Memory (NVRAM).

**show startup-config**

Parameter Description	Parameter	Description
	N/A	N/A

**Defaults** N/A

**Command** Privileged EXEC mode  
**Mode**

**Usage Guide** The device configuration stored in the NVRAM is executed while the device is starting. On a device that does not support **startup-config** is contained in the default configuration file **/config.text** in the built-in flash memory.

**Configuration Examples** N/A

Related Commands	Command	Description
	<b>boot config</b>	Sets the name of the boot configuration file.

**Platform Description** N/A

## 2.49 show this

Use this command to display effective configuration in the current mode.

### show this

Parameter Description	Parameter	Description
	N/A	N/A

**Defaults** N/A

**Command Mode** All modes.

**Usage Guide** The configuration in the following range modes cannot be displayed. If the **show this** command is run, the outcome is NULL.

1. Use the **line first-line last-line** command to configure lines in a continuous group and enter LINE configuration mode.
2. Use the **vlan range** command to configure VLANs and enter vlan range configuration mode. Use the **interface range** command to configure interfaces and enter interface range configuration mode.

**Configuration Examples** The following example displays configuration on interface fastEthernet 0/1.

```
Ruijie (config)#interface fastEthernet 0/1
Ruijie (config-if-FastEthernet 0/1)#show this
Building configuration...
```

```

!
spanning-tree link-type point-to-point
spanning-tree mst 0 port-priority 0
!
end
Ruijie (config-if-FastEthernet 0/1)#

```

The following example displays configuration on interface range vlan 1-3.

```

Ruijie(config-if-range)#show this

Building configuration...
!
interface VLAN 1
 ip address dhcp
interface VLAN 2
 ip address 1.1.1.1 255.255.255.0
interface VLAN 3
 ip address 3.3.3.3 255.255.255.0
!
End
Ruijie (config-if-range) #

```

## 2.50 speed

Use this command to set the speed at which the terminal transmits packets. Use the **no** form of this command to restore the default setting.

**speed** *speed*

**no speed**

**Parameter  
Description**

Parameter	Description
<i>speed</i>	Transmission rate (bps) on the terminal. For serial ports, optional rates include 9600, 19200, 38400, 57600, and 115200 bps. The default rate is 9600 bps.

**Defaults**

The default is 9600.

**Command** Line configuration mode  
**Mode**

**Usage Guide** This command is used to set the speed at which the terminal transmits packets.

**Configuration** The following example sets the rate of the serial port to 57600 bps.

**Examples**

```
Ruijie(config)# line console 0
Ruijie(config-line)# speed 57600
```

Related Commands	Command	Description

## 2.51 telnet

Use this command to log in a server that supports telnet connection.

**telnet** [ *oob* ] *host* [ *port* ] [ /*source* { **ip** *A.B.C.D* | **ipv6** *X:X:X:X::X* | **interface** *interface-name* } ]

Parameter Description	Parameter	Description
	<b>host</b>	
<b>Port</b>		Selects the TCP port number for login, 23 by default.
<b>/source</b>		Specifies the source IP address or source interface used by the Telnet client.
<b>ip</b> <i>A.B.C.D</i>		Specifies the source IPv4 address used by the Telnet client.
<b>ipv6</b> <i>X:X:X:X::X</i>		Specifies the source IPv6 address used by the Telnet client.
<b>interface</b> <i>interface-name</i>		Specifies the source interface used by the Telnet client.
<b>oob</b>		Connects to Telnet server through oob channel. This parameter is available only when the device has a MGMT port.

**Defaults** N/A

**Command Mode** User EXEC mode

**Usage Guide**

**Configuration Examples** The following example sets telnet to IPv4 address 192.168.1.11. The port number is the default, and the source interface is Gi 0/1. The queried VRF routing table is vpn1.

```
Ruijie# telnet 192.168.1.11 /source-interface gigabitEthernet 0/1 /vrf
vpnl
```

The following example sets telnet to IPv6 address 2AAA:BBBB::CCCC.

```
Ruijie# telnet 2AAA:BBBB::CCCC
```

**Related  
Commands**

Command	Description
<b>ip telnet source-interface</b>	Specifies the IP address of the interface as the source address for Telnet connection.
<b>show sessions</b>	Displays the currently established Telnet sessions.
<b>exit</b>	Exits current connection.

**Platform  
Description**

N/A

## 2.52 username

Use this command to set a local username and optional authorization information.. Use the **no** form of this command to restore the default setting.

```
username name [ login mode { aux | console | ssh | telnet } ] [ online amount number ]
[ permission oper-mode path ] [ privilege privilege-level ] [ reject remote-login ] [ web-auth ]
[ pwd-modify ] [ nopassword | password [ 0 | 7 ] text-string ] [ secret [ 0 | 5 ] text-string ]
no username name
```

**Parameter  
Description**

Parameter	Description
<i>name</i>	Username
<b>login mode</b>	Sets the login mode.
<b>aux</b>	Sets the login mode to aux.
<b>console</b>	Sets the login mode to console.
<b>ssh</b>	Sets the login mode to ssh.
<b>telnet</b>	Sets the login mode to telnet.
<b>online amount</b> <i>number</i>	Sets the amount of users online simultaneously.
<b>permission</b> <i>oper-mode path</i>	Sets the permission on the specified file. <i>oper-mode</i> refers to the operation mode and <i>path</i> to the file or the directory path.
<b>privilege</b> <i>privilege-level</i>	Sets the privilege level, in the range from 0 to 15.
<b>reject remote-login</b>	Confines the account to remote login.
<b>web-auth</b>	Confines the account to web authentication.
<b>pwd-modify</b>	Allows the web authentication user of this account to change the password. It works only when the <b>web-auth</b> command is configured.
<b>nopassword</b>	The account is not configured with a password.

<b>password</b> [ 0   7 ] <i>text-string</i>	If the password type is 0, the password is in plain text. If the type is 7, the password is encrypted. The password is in plain text by default.
<b>secret</b> [ 0   5 ] <i>text-string</i>	If the password type is 0, the password is in plain text. If the type is 5, the password is encrypted. The password is in plain text by default.

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** This command is used to establish a local user database for authentication.

-  If encryption type is 7, the cipher text you enter should contain seven characters to be valid. In general, do not set the encryption type 7. Instead, specify the type of encryption as 7 only when the encrypted password is copied and pasted.

**Configuration Examples** The following example configures a username and password and binds the user to level 15.

```
Ruijie(config)# username test privilege 15 password 0 pw15
```

The following example configures the username and password exclusive to web authentication.

```
Ruijie(config)# username user1 web-auth password 0 pw
```

The following example configures user test with read and write permissions on all files and directories.

```
Ruijie(config)# username test permission rw /
```

The following example configures user test with read, write and execute permissions on all files and directories except the config.text file.

```
Ruijie(config)# username test permission n /config.text
```

```
Ruijie(config)# username test permission rwx /
```

**Related Commands**

Command	Description
<b>login local</b>	Enables local authentication

**Platform Description** N/A

## 2.53 username export

Use this command to export user information to the file.

**username export** *filename*

<b>Parameter Description</b>	Parameter	Description
	<i>filename</i>	The file name.
<b>Defaults</b>	N/A	
<b>Command Mode</b>	Privileged EXEC mode	
<b>Usage Guide</b>	This command is used to export user information to the file.	
<b>Configuration Examples</b>	The following example exports user information to the file.	
	<pre>Ruijie# username export user.csv</pre>	
<b>Related Commands</b>	Command	Description
	N/A	N/A
<b>Platform Description</b>	N/A	

## 2.54 username import

Use this command to import user information from the file.

**username import** *filename*

<b>Parameter Description</b>	Parameter	Description
	<i>filename</i>	The file name.
<b>Defaults</b>	N/A	
<b>Command Mode</b>	Privileged EXEC mode	
<b>Usage Guide</b>	This command is used to import user information from the file.	
<b>Configuration Examples</b>	The following example imports user information from the file.	
	<pre>Ruijie# username import user.csv</pre>	
<b>Related Commands</b>	Command	Description
	N/A	N/A

**Platform**  
**Description** N/A

## 2.55 write

Use this command to save **running-config** at a specified location.

**write [ memory | terminal ]**

Parameter Description	Parameter	Description
	<b>memory</b>	Writes the system configuration (running-config) into NVRAM, which is equivalent to <b>copy running-config startup-config</b> .
	<b>terminal</b>	Displays the system configuration, which is equivalent to <b>show running-config</b> .

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** Despite the presence of alternative commands, these commands are widely used and accepted. Therefore, they are reserved to facilitate user operations.

The system automatically creates the specified file and writes it into system configuration if the device that stores the file exists;

The system will ask you whether to save the current configuration in default boot configuration file /config.text and perform an action as required if the device that stores the file does not exist possibly because the boot configuration file is stored on a removable storage device such as USB or SD disk, and the device has not been loaded when you run the **write [ memory ]** command.

**Configuration** The following example saves **running-config** at a specified location.

```
Examples Ruijie# write
Building configuration...
[OK]
```

Related Commands	Command	Description

**Platform Description** N/A

## 3. Line Commands

### 3.1 access-class

Use this command to control login into the terminal through IPv4 ACL. Use the **no** form of this command to restore the default setting.

**access-class** { *access-list-number* | *access-list-name* } { **in** | **out** }

**no access-class** { *access-list-number* | *access-list-name* } { **in** | **out** }

Parameter Description	Parameter	Description
	<i>access-list-number</i>	Specifies the ACL number. Standard IP ACL number is from 1 to 99 and from 1300 to 1999. Extended IP ACL number is from 100 to 199 and from 2000 to 2699.
	<i>access-list-name</i>	Specifies the ACL name.
	<b>in</b>	Filters the incoming connections.
	<b>out</b>	Filters the outgoing connections.

**Defaults** N/A

**Command Mode** Line configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example uses ACL 20 to filter the incoming connections in line VTY 0 5.

```
Ruijie(config)# line vty 0 5
Ruijie(config-line)access-list 20 in
```

The following example uses the ACL named "test" to filter the outgoing connections in line VTY 6 7.

```
Ruijie(config)# line vty 6 7
Ruijie(config-line)access-list test out
```

Related Commands	Command	Description
	<b>show running</b>	Displays status information

**Platform Description** N/A

## 3.2 accounting commands

Use this command to enable command accounting in the line. Use the **no** form of this command to restore the default setting.

**accounting commands** *level* { **default** | *list-name* }

**no accounting commands** *level*

### Parameter Description

Parameter	Description
<i>level</i>	Command level ranging from 0 to 15. The command of this level is accounted when it is executed.
<b>default</b>	Default authorization list name.
<i>list-name</i>	Optional list name.

**Defaults** This function is disabled by default.

**Command Mode** Line configuration mode

**Usage Guide** This function is used together with AAA authorization. Configure AAA command accounting first, and then apply it on the line.

**Configuration Examples** The following example enables command accounting in line VTY 1 and sets the command level to 15.

```
Ruijie(config)# aaa new-model
Ruijie(config)# aaa accounting commands 15 default start-stop group
tacacs+
Ruijie(config)# line vty 1
Ruijie(config-line)# accounting commands 15 default
```

### Related Commands

Command	Description

**Platform Description** N/A

## 3.3 accounting exec

Use this command to enable user access accounting in the line. Use the **no** form of this command to restore the default setting.

**accounting commands** *level* { **default** | *list-name* }

**no accounting commands** *level*

Parameter Description	Parameter	Description
	<i>level</i>	Command level ranging from 0 to 15. The command of this level is accounted when it is executed.
	<b>default</b>	Default authorization list name.
	<i>list-name</i>	Optional list name.

**Defaults** This function is disabled by default.

**Command Mode** Line configuration mode

**Usage Guide** This function is used together with AAA authorization. Configure AAA EXEC accounting first, and then apply it on the line.

**Configuration** The following example enables user access accounting in line VTY 1.

**Examples**

```
Ruijie(config)# aaa new-model
Ruijie(config)# aaa accounting exec default start-stop group radius
Ruijie(config)# line vty 1
Ruijie(config-line)# accounting exec default
```

Related Commands	Command	Description
	N/A	N/A

**Platform Description** N/A

## 3.4 authorization commands

Use this command to enable authorization on commands, Use the **no** form of this command to restore the default setting.

**authorization commands** *level* { **default** | *list-name* }

**no authorization commands** *level*

Parameter Description	Parameter	Description
	<i>level</i>	Command level ranging from 0 to 15. The command of this level is executed after authorization is performed.
	<b>default</b>	Default authorization list name,
	<i>list-name</i>	Optional list name.

- Defaults** This function is disabled by default.
- Command Mode** Line configuration mode
- Usage Guide** This function is used together with AAA authorization. Configure AAA authorization first, and then apply it on the line.

**Configuration** The following example enables authorization on commands of level 15 in line VTY 1.

**Examples**

```
Ruijie(config)# aaa new-model
Ruijie(config)# aaa authorization commands 15 default group tacacs+
Ruijie(config)# line vty 1
Ruijie(config-line)# authorization commands 15 default
```

**Related Commands**

Command	Description
N/A	N/A

**Platform Description** N/A

## 3.5 authorization exec

Use this command to enable EXEC authorization for the line. Use the **no** form of this command to restore the default setting.

**authorization { default | list-name }**  
**no authorization exec**

**Parameter Description**

Parameter	Description
<b>default</b>	Default authorization list name,
<i>list-name</i>	Optional list name.

- Defaults** This function is disabled by default,
- Command Mode** Line configuration mode
- Usage Guide** This function is used together with AAA authorization. Configure AAA EXEC authorization first, and then apply it on the line.
- Configuration** The following example performs EXEC authorization to line VTY 1.
- Examples**
- ```
Ruijie(config)# aaa new-model
```

```
Ruijie(config)# aaa authorization exec default group radius
Ruijie(config)# line vty 1
Ruijie(config-line)# authorization exec default
```

### 3.6 clear line

Use this command to clear connection status of the line.

**clear line** { **console** *line-num* | **vtty** *line-num* | *line-num* }

**Parameter  
Description**

| Parameter       | Description                                            |
|-----------------|--------------------------------------------------------|
| <b>console</b>  | Clears connection status of the console line.          |
| <b>vtty</b>     | Clears connection status of the virtual terminal line. |
| <i>line-num</i> | Specifies the line to be cleared.                      |

**Defaults**

N/A

**Command  
Mode**

Privileged EXEC mode

**Usage Guide**

This command is used to clear connection status of the line and restore the line to the unoccupied status to create new connections.

**Configuration  
Examples**

The following example clears connection status of line VTY 13. The connected session on the client (such as Telnet and SSH) in the line is disconnected immediately.

```
Ruijie# clear line vty 13
```

**Related  
Commands**

### 3.7 disconnect-character

Use this command to set the hot key that disconnects the terminal service connection. Use the **no** form of this command to restore the default setting.

**disconnect-character** *ascii-value*

**no disconnect-character**

**Parameter Description**

| Parameter          | Description                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------|
| <i>ascii-value</i> | ASCII decimal value of the hot key that disconnects the terminal service connection, in the range from 0 to 255. |

**Defaults**

The default hot key is **Ctrl+D** and the ASCII decimal value is 0x04.

**Command Mode**

Line configuration mode

**Usage Guide**

This command is used to set the hot key that disconnects the terminal service connection. The hot key cannot be the commonly used ASCII node such as characters ranging from a to z, from A to Z or numbers ranging from 0 to 9. Otherwise, the terminal service cannot operate properly.

**Configuration Examples**

The following example sets the hot key that disconnects the terminal service connection on line VTY 0 5 to **Ctrl+E** (0x05).

```
Ruijie(config)# line vty 0 5
Ruijie(config-line)# disconnect-character 5
```

### 3.8 escape-character

Use this command to set the escape character for the line. Use the **no** form of this command to restore the default setting.

**escape-character** *escape-value*

**no escape-character**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|                     |                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------|
| <i>escape-value</i> | Sets the ASCII value corresponding to the escape character for the line, in the range from 0 to 255. |
|---------------------|------------------------------------------------------------------------------------------------------|

**Defaults** The default escape character is **Ctrl+^ (Ctrl+Shift+6)** and the ASCII decimal value is 30.

**Command Mode** Line configuration mode

**Usage Guide** After configuring this command, press the key combination of the escape character and then press **x**, the current session is disconnected to return to the original session.

**Configuration** The following example sets the escape character for the line to 23 (**Ctrl+w**).

**Examples**

```
Ruijie(config)# line vty 0
Ruijie(config-line)# escape-character 23
```

**Related Commands**

### 3.9 exec

Use this command to enable the line to enter the command line interface. Use the **no** form of this command to disable the function.

**exec**  
**no exec**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command Mode** Line configuration mode

**Usage Guide** The **no exec** command is used to ban the line from entering the command line interface. You have to enter the command line interface through other lines,

**Configuration** The following example bans line VTY 1 from entering the command line interface.

**Examples**

```
Ruijie(config)# line vty 1
```

```
Ruijie(config-line)# no exec
Ruijie# show users
Line          User          Host(s)          Idle          Location
-----
*  0 con 0    ---          idle            00:00:00    ---
  1 vty 0    ---          idle            00:01:03    20.1.1.2
  3 vty 2    ---          idle            00:00:13    20.1.1.2
```

### 3.10 history

Use this command to enable command history for the line or set the number of commands in the command history. Use the **no history** command to disable command history. Use the **no history size** command to restore the number of commands in the command history to the default setting.

**history [ size size ]**

**no history**

**no history size**

**Parameter  
Description**

| Parameter        | Description                                         |
|------------------|-----------------------------------------------------|
| <b>size size</b> | The number of commands, in the range from 0 to 256. |

**Defaults** This function is enabled by default, The default *size* is 10.

**Command  
Mode** Line configuration mode

**Usage Guide** N/A

**Configuration  
Examples** The following example sets the number of commands in the command history to 20 for line VTY 0 5.

```
Ruijie(config)# line vty 0 5
Ruijie(config-line)# history size 20
```

The following example disables the command history for line VTY 0 5.

```
Ruijie(config)# line vty 0 5
Ruijie(config-line)# no history
```

**Description**

## 3.14 line vty

Use this command to increase the number of VTY connections currently available. Use the **no** form of this command to restore the default setting.

**line vty** *line-number*

**no line vty** *line-number*

**Parameter  
Description**

| Parameter          | Description                                           |
|--------------------|-------------------------------------------------------|
| <i>line-number</i> | Number of VTY connections, in the range from 0 to 35. |

**Defaults**

**Command** Global configuration mode.  
**Mode**

**Usage Guide**

**Configuration** The following example increases the number of available VTY connections to 20. The available VTY connections are numbered 0 to 19.

**Examples**

```
Ruijie(config)# line vty 19
```

The following example decreases the number of available VTY connections to 10. The available VTY connections are numbered 0-9.

```
Ruijie(config)# line vty 10
```

## 3.21 show privilege

Use this command to display the privilege level of the line.

**show privilege**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays the privilege level of the line.

**Examples**

```
Ruijie# show privilege
Current privilege level is 10
```

## 3.22 show users

Use this command to display the login user information.

**show users [ all ]**

| Parameter Description | Parameter  | Description                                                                                                |
|-----------------------|------------|------------------------------------------------------------------------------------------------------------|
|                       | <b>all</b> | Displays line user information, including users logging into the line and users not logging into the line. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays the information about users logging into the line,

**Examples**

```
Ruijie# show users
Line          User          Host(s)          Idle          Location
-----
0 con 0      ---          idle            00:00:46     ---
1 vty 0      ---          idle            00:00:29     20.1.1.2
* 2 vty 1    ---          idle            00:00:00     20.1.1.2
```

The following example displays all line user information,

```
Ruijie(config)# show users all
Line          User          Host(s)          Idle          Location
-----
0 con 0      ---          idle            00:00:49     ---
1 vty 0      ---          idle            00:00:32     20.1.1.2
* 2 vty 1    ---          idle            00:00:00     20.1.1.2
3 vty 2      ---          idle            00:00:00     ---
4 vty 3      ---          idle            00:00:00     ---
5 vty 4      ---          idle            00:00:00     ---
6 vty 5      ---          idle            00:00:00     ---
```

**Description**

### 3.23 speed

Use this command to configure the baud rate for the specified line. Use the **no** form of this command to restore the default setting,

**speed** *baudrate*

**no speed**

**Parameter Description**

| Parameter       | Description                                           |
|-----------------|-------------------------------------------------------|
| <i>baudrate</i> | Sets the baud rate, in the range from 9600 to 115200. |

**Defaults** The default is 9600.

**Command Mode** LINE configuration mode

**Usage Guide** N/A

**Configuration** The following example sets the baud rate to 115200,

**Examples** Ruijie(config-line)# speed 115200

## 3.24 terminal escape-character

Use this command to set the escape character for the current terminal. Use the **no** form of this command to restore the default setting.

**terminal escape-character** *escape-value*

**terminal no escape-character**

**Parameter Description**

| Parameter           | Description                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| <i>escape-value</i> | Sets the ASCII value corresponding to the escape character for the current terminal, in the range from 0 to 255. |

**Defaults** The default escape character is **Ctrl+^ (Ctrl+Shift+6)** and the ASCII decimal value is 30.

**Command Mode** Privileged EXEC mode

**Usage Guide** After configuring this command, press the key combination of the escape character and then press **x**, the current session is disconnected to return to the original session.

**Configuration** The following example sets the escape character for the current terminal to 23 (**Ctrl+w**).

**Examples** Ruijie# terminal escape-character 23

### 3.25 terminal history

Use this command to enable command history for the current terminal or set the number of commands in the command history. Use the **no history** command to disable command history. Use the **no history size** command to restore the number of commands in the command history to the default setting.

**terminal history** [ *size size* ]

**terminal no history**

**terminal no history size**

**Parameter Description**

| Parameter               | Description                                              |
|-------------------------|----------------------------------------------------------|
| <b>size</b> <i>size</i> | Sets the number of commands, in the range from 0 to 256. |

**Defaults** This function is enabled by default, The default *size* is 10.

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration Examples** The following example sets the number of commands in the command history to 20 for the current terminal.

```
Ruijie# terminal history size 20
```

The following example disables the command history for the current terminal.

```
Ruijie# terminal no history
```

### 3.28 terminal speed

Use this command to configure the baud rate for the current terminal. Use the **no** form of this command to restore the default setting,

**terminal speed** *baudrate*

**terminal no speed**

| Parameter Description | Parameter       | Description |
|-----------------------|-----------------|-------------|
|                       | <i>baudrate</i> |             |

**Defaults** The default is 9600.

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration Examples** The following example sets the baud rate for the current terminal to 115200,

```
Ruijie# terminal speed 115200
```

### 3.29 terminal width

Use this command to set the screen width for the terminal.

**terminal width** *screen-width*

**terminal no width**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       |           |             |

|                     |                                                                     |
|---------------------|---------------------------------------------------------------------|
| <i>screen-width</i> | Sets the screen width for the terminal, in the range from 0 to 256. |
|---------------------|---------------------------------------------------------------------|

**Defaults** The default is 79.

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration Examples** The following example sets the screen width for the terminal to 10.

```
Ruijie# terminal width 10
```

### 3.30 timeout login

Use this command to set the login authentication timeout for the line. Use the **no** form of this command to restore the default setting.

**timeout login response** *seconds*

**no timeout login response**

| Parameter Description | Parameter       | Description                                                       |
|-----------------------|-----------------|-------------------------------------------------------------------|
|                       | <b>response</b> |                                                                   |
|                       | <i>seconds</i>  | Timeout value, in the range from 1 to 300 in the unit of seconds. |

**Defaults** The default is 30.

**Command Mode** Line configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example sets the login authentication timeout to 300 seconds for line VTY 0 5.

```
Ruijie(config)# line vty 0 5
Ruijie(config-line)login timeout response 300
```

### 3.31 transport input

Use this command to set the specified protocol under Line that can be used for communication. Use the **no** form of this command to restore the default setting.

**transport input { all | ssh | telnet | none }**

**no transport input { all | ssh | telnet | none }**

| Parameter Description | Parameter     | Description                                                             |
|-----------------------|---------------|-------------------------------------------------------------------------|
|                       |               | <b>all</b>                                                              |
|                       | <b>ssh</b>    | Allows only the SSH protocol under Line to be used for communication    |
|                       | <b>telnet</b> | Allows only the Telnet protocol under Line to be used for communication |
|                       | <b>none</b>   | Allows none of protocols under Line to be used for communication        |

**Defaults** **all**, **ssh** and **telnet** protocols are allowed.

**Command Mode** Line configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example specifies that only the Telnet protocol is allowed to login in line vty 0 4.

```
Ruijie(config)# line vty 0 4
Ruijie(config-line)transport input ssh
```

### 3.32 vacant-message

Use this command to set the logout message. Use the **no** form of this command to restore the default setting.

**vacant-message** [ *c message c* ]

**no vacant-message**

#### Parameter Description

| Parameter      | Description                                                               |
|----------------|---------------------------------------------------------------------------|
| <i>c</i>       | Delimiter of the logout message, which is not allowed within the message. |
| <i>message</i> | Logout message.                                                           |

**Defaults** N/A

**Command Mode** Line configuration mode

**Usage Guide** This command is used to set the logout message for the line. The characters entered after the ending delimiter are discarded directly, The logout message is displayed when the user logs out.

**Configuration** The following example sets the logout message to "Logout from the ruijie device".

#### Examples

```
Ruijie(config-line)#vacant-message @ Logout from the ruijie device @
```

## 4. File System Commands

### 4.1 cd

Use this command to set the present directory for the file system.

**cd** [ *filesystem:* ] [ *directory* ]

| Parameter   | Parameter          | Description                                                                                                                            |
|-------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>filesystem:</i> | The URL of filesystem, followed by a colon (:). The filesystem includes <b>flash:</b> , <b>sata:</b> , <b>usb:</b> , and <b>tmp:</b> . |
|             | <i>directory</i>   | The path name. A file name starts with "/" is an absolute path. Otherwise, it is a relative path.                                      |

**Defaults** The default directory is the flash root directory.

**Command Mode** Privileged EXEC mode.

**Usage Guide**

**Configuration Examples** The following example sets the SATA directory.

```
Ruijie#pwd
flash:/
Ruijie#cd sata:
Ruijie#pwd
sata/
```

| Related Commands | Command    | Description                          |
|------------------|------------|--------------------------------------|
|                  | <b>pwd</b> | Displays the present word directory. |

**Platform Description** N/A.

### 4.2 copy

Use this command to copy a file from the specified source directory to the specified destination directory.

**copy** *source-url destination-url*

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|                    |                        |                                                     |
|--------------------|------------------------|-----------------------------------------------------|
| <b>Parameter</b>   | <i>source-url</i>      | Source file URL, which can be local or remote.      |
| <b>Description</b> | <i>destination-url</i> | Destination file URL, which can be local or remote. |

**Defaults** N/A.

**Command Mode** Privileged EXEC mode.

**Usage Guide** when the file to be copied exists on the target URL, the target file system determines the action, such as error report, overwrite, or offering you the choice.

The following table lists the URL:

| Prefix                                    | Description                                                                                                                |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>running-config</b>                     | Running configuration file.                                                                                                |
| <b>startup-config</b>                     | startup configuration file.                                                                                                |
| <b>flash:</b>                             | local FLASH file system.                                                                                                   |
| <b>tftp:</b>                              | The URL of TFTP network server, in the format as follows:<br><b>tftp:[[/location]/directory]/filename</b>                  |
| <b>oob_tftp:</b> [ via mgmt. { number } ] | The URL of TFTP network server connected with the Out-of-Band port, If there are multiple MGMT ports, you can specify one. |

**Configuration Examples** The following example copies the netconfig file from device 192.168.64.2 to the FLASH disk and the netconfig file exists locally.

```
Do you want to overwrite [/data/netconfig]? [Y/N]:y
Press Ctrl+C to quit
!
Copy success.
```

| Command       | Description                                        |
|---------------|----------------------------------------------------|
| <b>delete</b> | Deletes the file.                                  |
| <b>rename</b> | Renames the file.                                  |
| <b>dir</b>    | Displays the file list of the specified directory. |

**Platform Description** N/A

### 4.3 delete

Use this command to delete the files in the present directory.

**delete** [ filesystem: ] file-url | startup-config }

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|                              |                       |                                                                                                                                        |
|------------------------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter Description</b> | <i>filesystem:</i>    | The URL of file system, followed by a colon (:). The file system includes <b>flash:</b> , <b>sata:</b> , <b>usb:</b> and <b>tmp:</b> . |
|                              | <i>file-url</i>       | The file name containing the path. A file name starts with “/” is an absolute path. Otherwise, it is a relative path.                  |
|                              | <b>startup-config</b> | The startup file.                                                                                                                      |

**Defaults** The default *filesystem:* is **flash:**.

**Command Mode** Privileged EXEC mode.

**Usage Guide**

**Configuration Examples** The following example deletes the fstab file on the FLASH disk.

```
Ruijie#pwd
flash:/
Ruijie#dir
Directory of flash:/
1  -rw-      336  Jan 03 2012 18:53:42  fstab
2  -rw-     4096  Jan 03 2012 12:32:09  rc.d
3  -rw-  10485760  Jan 03 2012 18:13:37  rpmdb
3 files, 0 directories
10,490,192 bytes total (13,192,656 bytes free)
Ruijie#delete flash:/fstab
Do you want to delete [flash:/fstab]? [Y/N]:y
Delete success.
Ruijie#dir
Directory of flash:/
1  -rw-     4096  Jan 03 2012 12:32:09  rc.d
2  -rw-  10485760  Jan 03 2012 18:13:37  rpmdb
2 files, 0 directories
10,489,856 bytes total (13,192,992 bytes free)
```

| <b>Related Commands</b> | <b>Command</b> | <b>Description</b>                                 |
|-------------------------|----------------|----------------------------------------------------|
|                         | <b>copy</b>    | Copies the file.                                   |
|                         | <b>dir</b>     | Displays the file list of the specified directory. |

**Platform Description** N/A

## 4.4 dir

Use this command to display the files in the present directory.

**dir** [ *filesystem:* ] [ *directory* ]

| Parameter   | Parameter         | Description                                                                                                             |
|-------------|-------------------|-------------------------------------------------------------------------------------------------------------------------|
| Description | <i>filesystem</i> | The URL of file system, followed by a colon (:). The file system includes <b>flash:</b> , <b>usb:</b> and <b>tmp:</b> . |
|             | <i>directory</i>  | The path name. A file name starts with "/" is an absolute path. Otherwise, it is a relative path.                       |

**Defaults** By default, only the information under the present working path is displayed.

**Command Mode** Privileged EXEC mode.

### Usage Guide

**Configuration** The following example displays the file information of the root directory in the FLASH disk.

### Examples

```
Ruijie#dir flash:/
Directory of flash:/
 1  -rw-      336  Jan 03 2012 18:53:42  fstab
 2  -rw-     4096  Jan 03 2012 12:32:09  rc.d
 3  -rw-  10485760  Jan 03 2012 18:13:37  rpmdb
3 files, 0 directories
10,490,192 bytes total (13,192,656 bytes free)
```

| Field       | Description                                                                                                                                                     |

|                  | <b>pwd</b> | Displays the present directory.                |
|                  | <b>cd</b>  | Sets the present directory of the file system. |

**Platform** N/A.

### Description

## 4.5 eject

Use this command to remove the USB.

**eject [ usb0 ]**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example removes the USB disk.

```

Examples
Ruijie#eject ?
usb0 Eject usb disk 0

Ruijie#eject usb0
Ruijie#
    
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 4.6 erase

Use this command to erase the device or file that doesn't have a file system.

**erase filesystem**

| Parameter   | Parameter          | Description                                                           |
|-------------|--------------------|-----------------------------------------------------------------------|
| Description | <i>filesystem:</i> | Name of the file system, followed by a colon (:). For example, usb0:. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example erases the USB filesystem.

**Examples**

```
Ruijie#erase usb0:
Sure to erase usb0:? [Y/N] y
Erasing disk usb0 ...
Erase disk usb0 done!
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 4.7 file

Use this command to display the information about a file.

**file** [ *filesystem:* ] *file-url*

| Parameter Description | Parameter          | Description                                                                                                             |
|-----------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------|
|                       | <i>filesystem:</i> | The URL of file system, followed by a colon (:). The file system includes <b>flash:</b> , <b>usb:</b> and <b>tmp:</b> . |
|                       | <i>file-url</i>    | The file name containing the path. A file name starts with "/" is an absolute path. Otherwise, it is a relative path.   |

**Defaults** The default *filesystem:* is **flash:**.

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays the information about gcc executable file.

**Examples**

```
Ruijie#file flash:/gcc
/usr/bin/gcc-4.6: ELF 32-bit LSB executable, Intel 80386, version 1
(SYSV), dynamically linked (uses shared libs), for GNU/Linux 2.6.15,
stripped
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 4.8 file prompt

Use this command to set the prompt mode.

**file prompt** [ **noisy** | **quiet** ]

| Parameter   | Parameter    | Description                        |
|-------------|--------------|------------------------------------|
| Description | <b>noisy</b> | Displays prompt for all operation. |
|             | <b>quiet</b> | Displays prompt rarely.            |

**Defaults** The default mode is noisy.

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example sets the prompt mode to noisy.

**Examples** Ruijie#file prompt noisy

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 4.9 mkdir

Use this command to create a directory.

**mkdir** [ *filesystem:* ] *directory*

| Parameter   | Parameter          | Description                                                                                                             |
|-------------|--------------------|-------------------------------------------------------------------------------------------------------------------------|
| Description | <i>filesystem:</i> | The URL of file system, followed by a colon (:). The file system includes <b>flash:</b> , <b>usb:</b> and <b>tmp:</b> . |
|             | <i>directory</i>   | The path name. A file name starts with "/" is an absolute path. Otherwise, it is a relative path.                       |

**Defaults** The default *filesystem:* is **flash:**.  
The default *directory* is the root directory.

**Command Mode** Privileged EXEC mode.

**Usage Guide**

**Configuration** The following example creates a directory named newdir:

**Examples**

```
Ruijie#dir
Directory of flash:/
1  -rw-      336  Jan 03 2012 18:53:42  fstab
2  -rw-     4096  Jan 03 2012 12:32:09  rc.d
3  -rw-  10485760  Jan 03 2012 18:13:37  rpmdb
3 files, 0 directories
10,490,132 bytes total (13,192,656 bytes free)
Ruijie#mkdir newdir
Created dir flash:/newdir
Ruijie#dir
Directory of flash:/
1  -rw-      336  Jan 03 2012 18:53:42  fstab
2  -rw-     4096  Jan 03 2012 12:32:09  rc.d
3  -rw-  10485760  Jan 03 2012 18:13:37  rpmdb
4  drw-     4096  Jan 03 2012 18:13:37  newdir
3 files, 1 directories
10,494,228 bytes total (13,188,560 bytes free)
```

| Related Commands | Command      | Description                     |
|------------------|--------------|---------------------------------|
|                  | <b>rmdir</b> | Deletes the directory.          |
|                  | <b>pwd</b>   | Displays the present directory. |

**Platform** N/A  
**Description**

### 4.10 more

Use this command to display the content of a file.

**more** [ */ascii* | */binary* ] [ *filesystem:* ] *file-url*

| Parameter Description | Parameter          | Description                                                                                                             |
|-----------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------|
|                       | <i>/ascii</i>      | Displays the file content in the ASCII format.                                                                          |
|                       | <i>/binary</i>     | Displays the file content in the                                                                                        |
|                       | <i>filesystem:</i> | The URL of file system, followed by a colon (:). The file system includes <b>flash:</b> , <b>usb:</b> and <b>tmp:</b> . |
|                       | <i>file-url</i>    | The file name containing the path. A file name starts with "/" is an absolute path. Otherwise, it is a relative path.   |

**Defaults** The file is displayed in its own format by default.

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays the content of the netconfig file under root directory of FLASH disk.

```

Examples Ruijie#more flash:/netconfig
#
# The network configuration file. This file is currently only used in
# conjunction with the TI-RPC code in the libtirpc library.
#
# Entries consist of:
#
#     <network_id> <semantics> <flags> <protofamily> <protoname> \
#         <device> <nametoaddr_libs>
#
# The <device> and <nametoaddr_libs> fields are always empty in this
# implementation.
#
udp      tpi_clts      v   inet   udp    -    -
tcp      tpi_cots_ord v   inet   tcp    -    -
udp6     tpi_clts      v   inet6  udp    -    -
tcp6     tpi_cots_ord v   inet6  tcp    -    -
rawip    tpi_raw       -   inet   -      -    -
local    tpi_cots_ord -   loopback -      -    -
    
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 4.11 pwd

Use this command to display the working path.

**pwd**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A.      | N/A.        |

**Defaults** N/A.

**Usage Guide**

**Configuration** The following example switches from FLASH: to SATA:.

**Examples**

```
Ruijie#pwd
flash:/
Ruijie#cd sata:/
Ruijie#pwd
sata:/
```

**Related  
Commands**

| Command   | Description                                       |
|-----------|---------------------------------------------------|
| <b>cd</b> | Changes the file system in the present directory. |

**Platform** N/A.

**Description**

## 4.12 rename

Use this command to move or rename the specified file.

**rename** *src-url dst-url*

**Parameter  
Description**

| Parameter      | Description                                   |
|----------------|-----------------------------------------------|
| <i>src-url</i> | The source file URL to move.                  |
| <i>dst-url</i> | The URL of the destination file or directory. |

**Defaults** N/A.

**Command  
Mode** Privileged EXEC mode.

**Usage Guide** N/A

**Configuration** The following example renames the fstab file in the root directory on the FLASH disk as new-fstab.

**Examples**

```
Ruijie#dir
Directory of flash:/
1  -rw-      336  Jan 03 2012 18:53:42  fstab
2  -rw-     4096  Jan 03 2012 12:32:09  rc.d
3  -rw-  10485760  Jan 03 2012 18:13:37  rpmdb
3 files, 0 directories
10,490,192 bytes total (13,192,656 bytes free)
Ruijie#rename flash:/fstab flash:/new-fstab
Renamed file flash:/new-fstab
Ruijie#dir
Directory of flash:/
1  -rw-      336  Jan 03 2012 18:53:42  new-fstab
```

```

2  -rw-      4096   Jan 03 2012 12:32:09  rc.d
3  -rw- 10485760   Jan 03 2012 18:13:37  rpmdb
3 files, 0 directories
10,490,192 bytes total (13,192,656 bytes free)

```

**Related  
Commands**

| Command       | Description       |
|---------------|-------------------|
| <b>delete</b> | Deletes the file. |
| <b>copy</b>   | Copies the file.  |

**Platform** N/A

**Description**

## 4.13 rmdir

Use this command to delete an empty directory.

**rmdir** [ *filesystem:* ] *directory*

**Parameter  
Description**

| Parameter          | Description                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <i>filesystem:</i> | The URL of file system, followed by a colon (:). The file system includes <b>flash:</b> , <b>sata:</b> , <b>usb:</b> and <b>tmp:</b> . |
| <i>directory</i>   | The path name. A file name starts with "/" is an absolute path. Otherwise, it is a relative path.                                      |

**Defaults** The default *filesystem:* is **flash:**.

**Command  
Mode** Privileged EXEC mode.

**Usage Guide**

**Configuration** The following example deletes the null test directories.

**Examples**

```

Ruijie#mkdir newdir
Ruijie#dir
Directory of flash:/
1  -rw-      336   Jan 03 2012 18:53:42  fstab
2  -rw-      4096   Jan 03 2012 12:32:09  rc.d
3  -rw- 10485760   Jan 03 2012 18:13:37  rpmdb
4  drw-      4096   Jan 03 2012 18:13:37  newdir
3 files, 1 directories
10,494,228 bytes total (13,188,560 bytes free)
Ruijie#rmdir newdir
removed dir flash:/newdir
Ruijie#dir

```

```
Directory of flash:/
1  -rw-      336  Jan 03 2012 18:53:42  fstab
2  -rw-     4096  Jan 03 2012 12:32:09  rc.d
3  -rw-  10485760  Jan 03 2012 18:13:37  rpmdb
3 files, 0 directories
10,490,132 bytes total (13,192,656 bytes free)
```

### 4.14 show file systems

Use this command to display the file system information.

**show file systems**

| Parameter          | Parameter | Description |
|--------------------|-----------|-------------|
| <b>Description</b> | N/A.      | N/A.        |

**Defaults** N/A.

**Command Mode** User EXEC mode/Privileged EXEC mode/Global configuration mode/Interface configuration mode

**Usage Guide**

**Configuration Examples** The following example displays the file system information:

```
Ruijie#show file systems
  Size(KB)      Free(KB)      Type  Flags  Prefixes
      NA         NA         ram   rw    tmp:
      NA         NA        network  rw    tftp:
      NA         NA        network  rw    oob_tftp:
      NA         NA        xmodem  rw    xmodem:
      8192        2416         disk   rw    flash:
167772160     147772160     disk   rw    sata0
      1048576     548576        disk   rw    usb0:
```

| Field    | Description                                     |
|----------|-------------------------------------------------|
| Size(KB) | File system space, in the unit of KB.           |
| Free(KB) | Available file system space, in the unit of KB. |
| Type     | File system type                                |
| Flags    | Permissions on the file system include:         |

|          |                                                                                                                           |
|----------|---------------------------------------------------------------------------------------------------------------------------|
|          | <ul style="list-style-type: none"> <li>● ro: read-only</li> <li>● wo: write-only</li> <li>● rw: read and write</li> </ul> |

### 4.15 show mount

Use this command to display the mounted information.

**show mount**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command Mode** User EXEC mode/Privileged EXEC mode/Global configuration mode/Interface configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example displays the mounted information.

```
Ruijie#show mount
/dev/sda1 on / type ext4 (rw,errors=remount-ro,commit=0)
proc on /proc type proc (rw,noexec,nosuid,nodev)
sysfs on /sys type sysfs (rw,noexec,nosuid,nodev)
fusectl on /sys/fs/fuse/connections type fusectl (rw)
none on /sys/kernel/debug type debugfs (rw)
none on /sys/kernel/security type securityfs (rw)
udev on /dev type devtmpfs (rw,mode=0755)
devpts on /dev/pts type devpts (rw,noexec,nosuid,gid=5,mode=0620)
tmpfs on /run type tmpfs (rw,noexec,nosuid,size=10%,mode=0755)
none on /run/lock type tmpfs (rw,noexec,nosuid,nodev,size=5242880)
none on /run/shm type tmpfs (rw,nosuid,nodev)
/dev/sda3 on /hao-share type ext3 (rw,commit=0)
binfmt_misc on /proc/sys/fs/binfmt_misc type binfmt_misc
(rw,noexec,nosuid,nodev)
```

| Field | Description |
|-------|-------------|
|-------|-------------|

|                          |                               |
|--------------------------|-------------------------------|
| proc                     | Source address of mount.      |
| on                       | -                             |
| /proc                    | Destination address of mount. |

**Description**

## 4.16 tftp-client source

Use this command to bind a source IP address or source interface with a TFTP client. Use the **no** or **default** form of this command to restore the default setting.

**tftp-client source** { **ip** *ip-address* | **ipv6** *ipv6-address* | *interface* }

**no tftp-client source** { **ip** *ip-address* | **ipv6** *ipv6-address* | *interface* }

**default tftp-client source** { **ip** *ip-address* | **ipv6** *ipv6-address* | *interface* }

| Parameter          | Parameter           | Description                        |
|--------------------|---------------------|------------------------------------|
| <b>Description</b> | <i>ip-address</i>   | Specifies the IPv4 source address. |
|                    | <i>ipv6-address</i> | Specifies the IPv6 source address. |
|                    | <i>interface</i>    | Specifies the source interface     |

**Defaults** No source interface or IP address is bound with the TFTP client by default.

**Command Mode** Global configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example binds source IP address 192.168.23.236 with the TFTP client.

```
Ruijie(config)# tftp-client source ip 192.168.23.236
```

The following example binds source IPv6 address 2003:0:0:0::2 with the TFTP client.

```
Ruijie(config)# tftp-client source ipv6 2003:0:0:0::2
```

The following example binds source interface gigabitEthernet 0/0 with the TFTP client.

```
Ruijie(config)# tftp-client source gigabitEthernet 0/0
```

The following example removes the configuration.

```
Ruijie(config)# no tftp-client source ip 192.168.23.236
```

The following example restores the default setting.

```
Ruijie(config)# default tftp-client source ip 192.168.23.236
```

## 4.17 tree

Use this command to display the file tree of the current directory.

**tree** [ *filesystem:* ] [ *directory* ]

| Parameter Description | Parameter          | Description                                                                                                             |
|-----------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------|
|                       | <i>filesystem:</i> | The URL of file system, followed by a colon (:). The file system includes <b>flash:</b> , <b>usb:</b> and <b>tmp:</b> . |
|                       | <i>directory</i>   | The path name. A file name starts with "/" is an absolute path. Otherwise, it is a relative path.                       |

**Defaults** The default *filesystem:* is **flash:**.

**Command Mode** User EXEC mode/Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays the file tree of flash:/echo

**Examples**

```
Ruijie#tree flash:/echo
+-- client_module
+-- client_userspace

### 4.18 verify

Use this command to compute, display and verify Message Digest 5 (MD5).

**verify** [ /md5 md5-value ] filesystem: [ file-url ]

| Parameter Description | Parameter   | Description                                                                                                             |
|-----------------------|-------------|-------------------------------------------------------------------------------------------------------------------------|
|                       | /md5        | Computes and displays MD5.                                                                                              |
|                       | md5-value   | The file MD5, which is compared with the computed MD5.                                                                  |
|                       | filesystem: | The URL of file system, followed by a colon (:). The file system includes <b>flash:</b> , <b>usb:</b> and <b>tmp:</b> . |

|                 |                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>file-url</i> | The file name containing the path. A file name starts with "/" is an absolute path. Otherwise, it is a relative path. |
|-----------------|-----------------------------------------------------------------------------------------------------------------------|

**Defaults** The default *filesystem:* is **flash:**.

**Command Mode** Privileged EXEC mode.

**Usage Guide** N/A

**Configuration** The following example computes MD5 of flash:/gcc.

**Examples**

```
Ruijie#verify flash:/gcc
8b072de7db7affd8b2ef824e7e4d716c
```

The following example computes MD5 and makes a comparison.

```
Ruijie#verify /md5 8b072de7db7affd8b2ef824e7e4d716c flash:/gcc
%SUCCESS verifying /mnt/flash/gcc = 8b072de7db7affd8b2ef824e7e4d716c
Ruijie#verify /md5 8b072de7db7affd8b2ef824e7e4d71 flash:/gcc
%Error verifying flash:/gcc
Computed signature = 8b072de7db7affd8b2ef824e7e4d716c
Submitted signature = 8b072de7db7affd8b2ef824e7e4d71
```

## 4.19 show disk

Use this command to display USB/Flash information.

**show disk [ usb | flash ]**

| Parameter Description | Parameter   | Description                    |
|-----------------------|-------------|--------------------------------|
|                       | <b>sata</b> | Displays hardware information. |
|                       | <b>usb</b>  | Displays USB information.      |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays USB information.

**Examples**

```
Ruijie#show disk usb
Disk /dev/sdb: 8159 MB, 8159477760 bytes
252 heads, 62 sectors/track, 1020 cylinders
Units = cylinders of 15624 * 512 = 7999488 bytes
```

The following example displays FLASH information.

```
Ruijie#show disk flash
Nand flash size: 512MB
Nor flash size: 1MB
```

## 5. SYS Commands

### 5.1 calendar set

Use this command to set the hardware calendar.

**calendar set** { *hour* [ *:minute* [ *:second* ] ] } [ *month* [ *day* [ *year* ] ] ]

| Parameter Description | Parameter                                         | Description                                                                                                                                                                                |
|-----------------------|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>hour</i> [ <i>:minute</i> [ <i>:second</i> ] ] | Sets hardware time in the format of hour: minute: second. Only the specified parameters (hour, minute, or second) can be reset. The unspecified parameters keep the current system values. |
|                       | <i>month</i>                                      | Sets month. The range is from 1 to 12.                                                                                                                                                     |
|                       | <i>day</i>                                        | Sets date. The range is from 1 to 31.                                                                                                                                                      |
|                       | <i>year</i>                                       | Sets year. The range is from 1970 to 2069.                                                                                                                                                 |

**Defaults** -

**Command Mode** Privileged EXEC mode

**Default Level** -

**Usage Guide**

- The time parameter is mandatory. After setting time, set month, day, and year, which can be neglected according to your needs. The parameter that is neglected keeps the current system value. For example, if the current hardware time is "2012-02-29 09:33:44" and you want to change month and hour and keep values of other parameters, use the **calendar set 12 5** command to change the current time into "2012-05-29 12:33:44".

 The hardware time of the system is used as the UTC time, while the software time of the system refers to the local time of the device.

 This command is supported by only VSD0.

**Configuration Examples** The following example changes the current hardware time of the system (for example, 2012-02-01 18:23:06) into 6 o'clock and keeps the values of other parameters.

```
Ruijie# calendar set 6
06:41:39 UTC Fri, Jul 6, 2012
```

The following example changes the current hardware time of the system (for example, 2012-02-01 18:23:06) into 06:42 and keeps the values of other parameters.

```
Ruijie# calendar set 6:42
```

```
06:42:27 UTC Fri, Jul 6, 2012
```

The following example changes the current hardware time of the system (for example, 2012-02-01 18:23:06) into March 2 and keeps the values of other parameters.

```
Ruijie# calendar set 18 3 2
18:43:05 UTC Fri, Mar 2, 2012
```

 Because the *hour* parameter is mandatory, set it to the current time if you do not need to change its value. As shown in the last example, enter **18** (hour), and then enter **3** (month) and **2** (day).

**Check Method** -

**Platform** -  
**Description**

## 5.2 clock read-calendar

Use this command to enable the system to synchronize the software time with the hardware time.  
**clock read-calendar**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | -         | -           |

**Defaults** -

**Command Mode** Privileged EXEC mode

**Default Level** -

**Usage Guide** This command is supported by only VSD0.  
After you configure this command, the system will synchronize the software time with the current hardware time according to the time zone and summer time settings of the device.

**Configuration Examples** The following example enables the system to synchronize the software time with the hardware time.

```
Ruijie# clock read-calendar
Set the system clock from the hardware time.
```

**Check Method** -

**Platform** -  
**Description**

## 5.3 clock set

Use this command to set the system software clock.

**clock set** { *hour* [ *:minute* [ *:second* ] ] } [ *month* [ *day* [ *year* ] ] ]

| Parameter Description | Parameter                                         | Description                                                                                                                                                                             |
|-----------------------|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>hour</i> [ <i>:minute</i> [ <i>:second</i> ] ] | Sets software time in the format of hour: minute: second. Only the specified parameters (hour, minute, or second) can reset. The unspecified parameters keep the current system values. |
|                       | <i>month</i>                                      | Sets month. The range is from 1 to 12.                                                                                                                                                  |
|                       | <i>day</i>                                        | Sets date. The range is from 1 to 31.                                                                                                                                                   |
|                       | <i>year</i>                                       | Sets year. The range is from 1970 to 2069.                                                                                                                                              |

**Defaults** -

**Command Mode** Privileged EXEC mode

**Default Level** -

**Usage Guide**

- The time parameter is mandatory. After setting time, set month, day, and year, which can be neglected according to your needs. The parameter that is neglected keeps the current system value.

 For example, if the current hardware time is "2012-02-29 09:33:44" and you want to change month and hour and keep values of other parameters, use the **clock set 12 5** command to change the current time into "2012-05-29 12:33:44".

 This command is supported by only VSD0.

**Configuration Examples** The following example changes the current software time of the system (for example, 2012-02-01 18:23:06) into 6 o'clock and keeps the values of other parameters.

```
Ruijie# clock set 6
06:48:13 CST Fri, Mar 2, 2012
```

The following example changes the current software time of the system (for example, 2012-02-01 18:23:06) into 06:42 and keeps the values of other parameters.

```
Ruijie# clock set 6:42
06:42:31 CST Fri, Mar 2, 2012
```

The following example changes the current software time of the system (for example, 2012-02-01 18:23:06) into March 2 and keeps the values of other parameters.

```
Ruijie# clock set 18 3 2
```

---

18:42:48 CST Fri, Mar 2, 2012

 Because the *hour* parameter in this command is mandatory, set it to the current time if you do not need to change its value. As shown in the last example, enter **18** (hour), and then enter **3** (month) and **2** (day).

---

**Check Method** -

**Platform** -

**Description** -

## 5.4 clock summer-time

Use this command to set the summer time.

**clock summer-time** *zone* **start** *start-month* [*week*|**last**] *start-date hh:mm* **end** *end-month* [*week*|**last**] *end-date hh:mm* [**ahead** *hours-offset* [*minutes-offset* ]

Use this command to disable the summer time.

**no clock summer-time**

| Parameter Description | Parameter             | Description                                                                                                                                                                                                                                   |
|-----------------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>zone</b>           | Summer time name. It can only be a letter between A and Z or between a and z, which is not case sensitive. The summer time name contains 3 to 31 characters.                                                                                  |
|                       | <b>start</b>          | Indicates the start time of the summer time.                                                                                                                                                                                                  |
|                       | <i>start-month</i>    | Start month. Value range: January, February, March, April, May, June, July, August, September, October, November, and December. The value is not case sensitive and you are allowed to enter an incomplete word, for example, Febr and FebRu. |
|                       | <i>week</i>           | Start week in the start month. The range is from 1 to 5.                                                                                                                                                                                      |
|                       | <b>last</b>           | The last week of the specified month.                                                                                                                                                                                                         |
|                       | <i>start-date</i>     | Day in the start week of the start month. Value range: Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, and Saturday. The value is not case sensitive and you are allowed to enter an incomplete word, for example, Web and WeDne.       |
|                       | <b>hh:mm</b>          | Time, in the format of hour : minute.                                                                                                                                                                                                         |
|                       | <b>end</b>            | Indicates the end time of the summer time.                                                                                                                                                                                                    |
|                       | <i>end-month</i>      | End month. Value range: January, February, March, April, May, June, July, August, September, October, November, and December. The value is not case sensitive and you may enter an incomplete word, for example, Febr and FebRu.              |
|                       | <b>ahead</b>          | Indicates how much time for the summer time ahead of the standard time during the effective period of the summer time. By default, the summer time is one hour ahead of the standard time.                                                    |
|                       | <i>hours-offset</i>   | Hours ahead of the standard time. The range is from 0 to 12. You are not allowed to set it to 00:00.                                                                                                                                          |
|                       | <i>minutes-offset</i> | Minutes ahead of the standard time. The range is from 0 to 59. If <i>hours-offset</i> has been set to 0, you are not allowed to set <i>minutes-offset</i> to 0.                                                                               |

**Defaults** -

**Command Mode** Global configuration mode

**Default Level** -

**Usage Guide** This command is supported by only VSD0.

**Configuration Examples** Assume that the time zone name of your living place is ABC and the standard time is 8:15 ahead of UTC, namely, GMT+08:15. The summer time period starts from the first Saturday in February to the third Monday in May and the summer time is 01:20 ahead of the standard time. In this case, the summer time is 09:35 ahead of the UTC time, but non-summer time is still 08:15 ahead of the UTC time.

```

Ruijie(config)# clock timezone ABC 8 15
Set time zone name: ABC (GMT+08:15)
Ruijie(config)#show clock
16:39:16 ABC Wed, Feb 29, 2012
Ruijie(config)#show calendar
08:24:35 GMT Wed, Feb 29, 2012

Ruijie(config)# clock summer-time TZA start Feb 1 sat 2:00 end May 3 Monday 18:30 ahead 1 20
*May 10 03:45:58: %SYS-5-CLOCKUPDATE: Set summer-time: TZA from February the 1st Saturday at
2:00 TO May the 3rd Monday at 18:30, ahead 1 hour 20 minute
Set summer-time: TZA from February the 1st Saturday at 2:00 TO May the 3rd Monday at 18:30,
ahead 1 hour 20 minute

Ruijie# show clock
18:00:08 TZA Wed, Feb 29, 2012

# If the time is set to non-summer time, the time zone name is restored to ABC.
Ruijie#clo set 18 1 1
*Jan 1 18:00:09: %SYS-5-CLOCKUPDATE: Set system clock: 18:00:09 ABC Sun, Jan 1, 2012
Set system clock: 18:00:09 ABC Sun, Jan 1, 2012
Ruijie#show clock
18:00:12 ABC Sun, Jan 1, 2012

```

If the system uses the default summer time that is one hour ahead of the standard time, ahead and the parameters behind ahead can be neglected. For example, set the summer time to start from 2:00 a.m. of the first Sunday in April to 2:00 a.m. of the last Sunday in October and set the summer time to one hour ahead of the standard time.

```

Ruijie(config)#clo summer-time PDT start April 1 sunday 2:00 end October last Sunday 2:00
*May 10 03:15:05: %SYS-5-CLOCKUPDATE: Set summer-time: PDT from April the 1st Sunday at 2:00
TO October the last Sunday at 2:00, ahead 1 hour
Set summer-time: PDT from April the 1st Sunday at 2:00 TO October the last Sunday at 2:00,
ahead 1 hour

```

The following example disables summer time.

```

Ruijie(config)#no clock summer-time
*Jan 1 18:01:09: %SYS-5-CLOCKUPDATE: Set no summer time.
Set no summer time.

```

## 5.5 clock timezone

Use this command to set the time zone.

**clock timezone** [ *name* *hours-offset* [ *minutes-offset* ] ]

Use this command to remove the time zone settings.

**no clock timezone**

| Parameter Description | Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>name</i>           | Time zone name. It can only be a letter between A and Z or between a and z, which is not case sensitive. The name contains 3 to 31 characters.                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                       | <i>hours-offset</i>   | Hours of time difference. It indicates whether the time is faster or smaller than the hardware UTC time. The range is from -12 to 12. The negative digit indicates that the time is slower than the hardware time, while the positive digit indicates that the time is faster than the hardware time.<br><br><div style="border: 1px solid #ccc; padding: 2px; margin-top: 5px;">  If the time is slower than the UTC time, add "-" before <i>hours-offset</i>.                 </div> |
|                       | <i>minutes-offset</i> | Minutes of time difference. The range is from 0 to 59.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Defaults** -

**Command Mode** Global configuration mode

**Default Level** -

**Usage Guide** This command is supported by only VSD0.

**Configuration Examples** The following example sets the time zone name to CST. The software time is 8 hours faster than the hardware time.

```
Ruijie(config)# clock timezone CST 8
Set time zone name: CST (GMT+08:00)

Ruijie# show clock
18:00:17 CST Wed, Dec 5, 2012
```

The following example sets the time zone name TZA. The software time is 06:13 slower than the hardware time.

```
Ruijie(config)# clock timezone TZA -6 13
Set time zone name: TZA (GMT-06:13)
```

The following example removes the time zone settings.

```
Ruijie(config)# no clock timezone
```

```
Set no clock timezone.
```

**Check Method** -

**Platform** -  
**Description**

## 5.6 clock update-calendar

Use this command to enable the system to synchronize the hardware time with the software time.

### clock update-calendar

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | -         | -           |

**Defaults** -

**Command Mode** Privileged EXEC mode

**Default Level** -

**Usage Guide** This command is supported by only VSD0.  
 After you configure this command, the system will synchronize the hardware time with the current software time according to the time zone and summer time settings of the device.

**Configuration Examples** The following example enables the system to synchronize the hardware time with the software time.

```
Ruijie# clock update-calendar
Set the hardware time from the system clock.
```

The following example sets the time zone of the hardware time to GMT+5:10, which indicates that the hardware time is 5:10 slower than the software time. The summer time is not set.

```
Ruijie# show clock
09:30:21 TSZ Wed, Feb 29, 2012

Ruijie# clock update-calendar
Set the hardware time from the system clock.

Ruijie#show calendar
04:20:25 UTC Wed, Feb 29, 2012
```

The following example sets the hardware time. If it is set to GMT+5:10 and the summer time is set to be 1:15 faster from the first Monday in February 1 to the second Sunday in June 1, it indicates that the hardware time is 6:25 slower than the software time during the effective period of the summer time.

```
Ruijie# show clock
09:30:02 TSZ Wed, Feb 29, 2012

Ruijie# clock update-calendar
Set the hardware time from the system clock.

Ruijie#show calendar
03:05:08 UTC Wed, Feb 29, 2012
```

**Description** -

## 5.7 cpu high-watermark set

Use this command to set the watermark range of the CPU usage of the control core and enable CPU usage monitoring.

**cpu high-watermark set** [ [ **up** *up-value* ] [ **down** *down-value* ] ]

Use this command to disable CPU usage monitoring.

**no cpu high-watermark set**

Use this command to restore the default settings.

**default cpu high-watermark set**

| Parameter Description | Parameter                     | Description                                                          |
|-----------------------|-------------------------------|----------------------------------------------------------------------|
|                       | <b>up</b> <i>up-value</i>     | Sets the high watermark of the CPU usage. The range is from 1 to 99. |
|                       | <b>down</b> <i>down-value</i> | Sets the low watermark of the CPU usage. The range is from 1 to 99.  |

**Defaults** By default, the range of the CPU usage watermark is from 75% and 85%.

**Command Mode** Global configuration mode

**Default Level** -

**Usage Guide** This command is supported by only VSD0.  
You can use this command to set the high watermark of the CPU usage and enable CPU usage monitoring. When detecting that the CPU usage exceeds the fluctuation range of the highest watermark, the system prints prompts.

**Configuration Examples** The following example sets the CPU usage watermark to the default value and enables CPU usage monitoring (if it is disabled).

```
Ruijie(config)# default cpu high-watermark set
Reset default cpu watermark monitor
Set system cpu high-watermark up 85%, down 75%
```

The following example disables CPU usage monitoring.

```
Ruijie(config)# no cpu high-watermark set
Close cpu watermark monitor
```

The following example enables CPU usage monitoring. Keep the defined watermark value.

```
Ruijie(config)# cpu high-watermark set
Open cpu watermark monitor
Set system cpu high-watermark up 85%, down 75%
```

The following example enables CPU usage monitoring and sets the watermark range to 70%-90%.

```
Ruijie(config)# cpu high-watermark set up 90 down 70
Open cpu watermark monitor
Set system cpu high-watermark up 90%, down 70%
```

**Check Method** -

**Prompt Message** If the high watermark of the CPU usage is allowed to fluctuate from 85% to 91%, the system will print the following warning message when the CPU usage exceeds the upper limit of the high watermark:

```
*Jan 19 16:23:01: %RG_SYSMON-4-CPU_WATERMARK_HIGH: warning! system cpu usage above high watermark(91%),current cpu usage 100%
```

When the CPU usage is less than the lower limit of the high watermark, the system will print the following message about warning release:

```
*Jan 20 07:02:52: %RG_SYSMON-5- CPU_WATERMARK:withdraw warning! system cpu usage below high watermark(85%), current cpu usage 36%
```

**Platform** -  
**Description** -

## 5.8 memory history clear

Use this command to clear the history of the memory usage.

**memory history clear** [ **one-forth** | **half** | **all** ]

| Parameter Description | Parameter        | Description                |
|-----------------------|------------------|----------------------------|
|                       | <b>one-forth</b> | Clears one fourth entries. |
|                       | <b>half</b>      | Clears a half of entries.  |
|                       | <b>all</b>       | Clears all the entries.    |

**Defaults** -

**Command Mode** Global configuration mode

**Default Level** -

**Usage Guide** -

**Configuration Examples** The following example clears a half of the history of the memory usage.

```
Ruijie# show memory history

Time Thu Jan 1 00:24:45 1970
Used(k) 148516
Maximum memory users for this period

## 5.9 memory low-watermark set

Use this command to set the low watermark threshold of the memory and enable the memory low watermark detection.

**memory low-watermark set** *mem-rate*

Use this command to disable the detection of memory low watermark.

**no memory low-watermark set**

| Parameter Description | Parameter       | Description                                               |
|-----------------------|-----------------|-----------------------------------------------------------|
|                       | <i>mem-rate</i> | Memory watermark threshold. The range is from 1% to 100%. |

**Defaults** By default, the memory watermark threshold is 90%.

**Command Mode** Global configuration mode

**Default Level** -

**Usage Guide** You can use this command to enable the detection of the memory low watermark and set the memory watermark threshold. When the system memory is less than this threshold, the system will print prompts.

**Configuration** The following example sets the low watermark threshold of the memory to 80% and enables detection.

**Examples** Ruijie(config)#memory low-watermark set 80

**Check Method** -

**Prompt Message** When the system memory is less than the defined watermark value (such as 500000 KB), the system prints the following message:

```
Ruijie(config)#<187> Jan 1 00:18:59 syslog: Free Memory has dropped below 500000k
```

**Platform** -

**Description**

## 5.10 reload

Use this command to reload the device.

**reload** [ at { hour [ :minute [ :second ] ] } [ month [ day [ year ] ] ]

| Parameter Description | Parameter                                           | Description                                                                                                               |
|-----------------------|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
|                       | <i>hour</i> [ : <i>minute</i> [ : <i>second</i> ] ] | Sets the restart time in the format of hour : minute : second. Other neglected parameters keep the current system values. |
|                       | <i>month</i>                                        | Sets the month, in the range from 1 to 12.                                                                                |
|                       | <i>day</i>                                          | Sets the day, in the range from 1 to 31.                                                                                  |
|                       | <i>year</i>                                         | Sets the year, in the range from 1970 to 2069.                                                                            |

**Defaults** -

**Command Mode** Privileged EXEC mode

**Default Level** -

**Usage Guide** -

**Configuration** The following example reloads the device.

**Examples**

```
Ruijie# reload
Reload system?(Y/N) Y
Sending all processes the TERM signal... [ OK ]
Sending all processes the KILL signal... [ OK ]
Restarting system...
```

**Description** -

### 5.11 show calendar

Use this command to display the hardware calendar.

**show calendar**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | -         | -           |

**Command Mode** Privileged EXEC mode/ global configuration mode

**Default Level** -

**Usage Guide** -

**Configuration Examples** The following example displays the hardware calendar.

```
Ruijie# show calendar
21:57:48 GMT Sun, Feb 28, 2012
```

**Prompt Message** -

**Platform Description** -

### 5.12 show clock

Use this command to display the system software clock.

**show clock**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | -         | -           |

**Command Mode** Privileged EXEC mode / global configuration mode

**Default Level** -

**Usage Guide** -

**Configuration** The following example displays the software clock when the time zone is disabled.

**Examples**

```
Ruijie# show clock
18:22:20 UTC Tue, Dec 11, 2012
```

The following example displays the software clock when the time zone is enabled.

```
Ruijie# show clock
03:07:49 TSZ Wed, Feb 29, 2012
```

**Description**

## 5.13 show memory

Use this command to display the system memory.

**show memory** [ **sorted total** | **history** | **low-watermark** | *process-id* | *process-name* ]

**Parameter  
Description**

| Parameter            | Description                                                              |
|----------------------|--------------------------------------------------------------------------|
| <b>sorted total</b>  | Ranked according to the memory usage.                                    |
| <b>history</b>       | Displays the history of memory usage.                                    |
| <b>low-watermark</b> | Displays the memory low watermark threshold of the system.               |
| <i>process-id</i>    | Displays the memory usage of the task specified by <i>process-id</i> .   |
| <i>process-name</i>  | Displays the memory usage of the task specified by <i>process-name</i> . |

**Command** Privileged EXEC mode/ global configuration mode

**Mode**

**Default Level** -

**Usage Guide** Every time when the **show memory history** command is used, the number of displayed entries increases by one. Up to 10 entries can be displayed. You can use the **memory history clear** command to clear history entries.

**Configuration** The following example displays the memory usage of each task and the ranking (based on the total memory usage).

**Examples**

```
Ruijie# show memory sorted
System Memory: 508324K total, 481560K used, 26764K free, 348200K available, 50.5% used rate
```

```

Swap:          128000K total, 128000K free
Used detail:   149112K active, 247776K inactive, 30460K mapped, 50460K slab, 3752K others

**Description**

## 5.14 show memory vsd

Use this command to display memory information.

**show memory vsd** *vsd\_id*

| Parameter Description | Parameter     | Description                                                                                                             |
|-----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------|
|                       | <i>vsd_id</i> | VSD ID is a digit. You can use the <b>show vsd</b> command to display the ID of each VSD. The ID range is from 0 to 16. |

**Command Mode** Privileged EXEC mode/ global configuration mode

**Default Level** -

### Usage Guide

 This command is supported only in VSD0 mode.

### Configuration

The following example displays the memory usage of each task in VSD 1 mode.

### Examples

```
Ruijie#show memory vsd 1
PID      Text    Rss     Data   Stack  Total  Process

### 5.16 show processes cpu

Use this command to display system task information.

**show processes cpu [ history [ table ] | [ 5sec | 1min | 5min | 15min ] [ nonzero]]**

| Parameter Description | Parameter                         | Description                                                                                                                      |
|-----------------------|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>5sec   1min   5min   15min</b> | Displays lists of tasks in descending order of CPU usage within the last five seconds, one minute, five minutes, and 15 minutes. |
|                       | <b>nonzero</b>                    | Does not display the task with 0 CPU usage.                                                                                      |
|                       | <b>history</b>                    | Displays the CPU usage of the control core within the last 60 seconds, 60 minutes, and 72 hours in histogram.                    |
|                       | <b>table</b>                      | Displays the CPU usage of the control core within the last 60 seconds, 60 minutes, and 72 hours in table.                        |

**Command Mode** Privileged EXEC mode/ global configuration mode

**Default Level** -

**Usage Guide** This command is only supported by VSD0.

**Configuration Examples** The following example displays the tasks listed in ascending order of task IDs.

```

Ruijie# show processes cpu
System Uptime: 19:08.6
CPU utilization for five seconds:1.2%; one minute:0.8%; five minutes:0.8%
set system cpu watermark (open): high 80%(85~75%)

Tasks Statistics: 375 total, 10 running, 365 sleeping, 0 stopped, 0 zombie
  Pid Vsd S  PRI  P    5Sec    1Min    5Min    15Min Process
   1  0 S   20  0  0.0(0.0)  0.0(0.0)  0.0(0.0)  0.0(0.0) init
   2  0 S   20  1  0.0(0.0)  0.0(0.0)  0.0(0.0)  0.0(0.0) kthreadd
    
```

```

--More--

```

The following example displays the tasks listed in ascending order of task IDs without displaying the tasks with 0 CPU usage within 15 minutes.

```
Ruijie# show processes cpu nonzero
```

Description of the information displayed in this command:

| Field                    | Description                                                                                             |
|--------------------------|---------------------------------------------------------------------------------------------------------|
| System Uptime            | Total running time of the device, precious to seconds.                                                  |
| CPU Utilization          | Total CPU usage of the control core within the last five seconds, one minute, and five minutes.         |
| Virtual CPU usage        | Total CPU usage of the virtual control core within the last five seconds, one minute, and five minutes. |
| Tasks Statistics         | Task statistics information, including the total number of statistics tasks and the task status.        |
| set system cpu watermark | CPU watermark value and status of the control core.                                                     |

The task running statuses are listed below:

| Task Running Status | Description                                      |
|---------------------|--------------------------------------------------|
| running             | Running task                                     |
| sleeping            | Suspended task                                   |
| stopped             | Stopped task                                     |
| zombie              | Terminated task, but not reclaimed by the system |

Description of each task:

| Field                | Description                                                                                                                                                                                                          |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pid                  | Task ID                                                                                                                                                                                                              |
| Vsd                  | VSD ID                                                                                                                                                                                                               |
| S                    | Task status. Five statuses in total: R (running), T (stopped), S (sleeping), D (waiting), and Z (zombie).                                                                                                            |
| PRI                  | Task running priority                                                                                                                                                                                                |
| P                    | The core of the CPU on which the task runs                                                                                                                                                                           |
| 5sec/1min/5min/15min | CPU usage of the task within the last five seconds, one minute, five minutes, and 15 minutes. The value in the round brackets is the CPU usage that is not divided by the total number of cores where the task runs. |
| Process              | Task name. Only the first 15 characters are displayed. The remaining characters are truncated.                                                                                                                       |

The following example displays the CPU usage in ascending order of task IDs and only the processes with non-zero CPU usage within 15 minutes are displayed.

```
Ruijie #show processes cpu nonzero
```

The following example displays the CPU usage in descending order within five seconds and the tasks with zero CPU usage within one second are not displayed.

```
Ruijie #show processes cpu 5sec nonzero
```

The following example displays the CPU usage of the control core in histograms within the last 60 seconds, 60 minutes, and 72 hours.

The first histogram displays the CPU usage of the control core within 300 seconds. Every segment in the x-coordinate is five seconds, and every segment in the y-coordinate is 5%. The symbol "\*" indicates the CPU usage at the last specified second. In other words, the first segment on the x-coordinate nearest to 0 is the CPU usage in the last five seconds, measured in %.

The second histogram displays the CPU usage of the control core within the last 60 minutes, measured in %. Every segment on the x-coordinate is 1 minute.

The third histogram displays the CPU usage of the control core within the last 72 hours, measured in %. Every segment on the x-coordinate is 1 hour.

Example:

```
Ruijie#show processes cpu history
```

```

#=====#=====#====*==>
0      50      100      second
      system cpu percent usage(%) per 5second (last 125 second)

```

The following example displays the CPU usage of the core 0 in tables within the last 60 seconds, 60 minutes, and 72 hours.

The first table lists the CPU usage within 300 seconds. The first cell indicates the CPU usage within the last five seconds.

The second table lists the CPU usage within the last 60 minutes, measured in %. The two adjacent cells show the CPU usage measured at an interval of one minute.

The third table lists the CPU usage within the last 72 hours, measured in %. The two adjacent cells show the CPU usage measured at an interval of one hour.

Example:

```

Ruijie #show processes cpu history table
      system cpu percent usage(%) [last 300 second]

```

```

Description

### 5.17 show processes cpu detailed

Use this command to display the details of the specified task.

**show processes cpu detailed** { *process-id* | *process-name* }

Parameter Description

| Parameter           | Description                                                      |
|---------------------|------------------------------------------------------------------|
| <i>process-id</i>   | Displays the information on the task of the specified task ID.   |
| <i>process-name</i> | Displays the information on the task of the specified task name. |

Command

Privileged EXEC mode/ global configuration mode

Mode

**Default Level** -

**Usage Guide** This command is only supported by VSD0.

**Configuration** The following example displays the information on the task of the specified task name.

**Examples**

```
Ruijie# show processes cpu detailed demo
Process Id   : 1820
Process Name : demo
Vsdid       : 0
Process Ppid : 1

State       : R(running)
On CPU     : 0
Priority    : 20
Age Time   : 24:06.5
Run Time   : 00:01.0
Cpu Usage  :
  Last 5 sec  0.3% (0.6%)
  Last 1 min  0.3% (0.6%)
  Last 5 min  0.3% (0.6%)
  Last 15 min 0.3% (0.6%)
Tty        : ?
```

 **Code Usage: 209.6 KB.** If the specified task name is not unique, the system displays the following message:

```
Ruijie# show processes cpu detailed demo
duplicate process, choose one by id not name.
name: demo, id: 1089, state: S(sleeping)
name: demo, id: 1091, state: R(running)
process name: monitor_procs, do NOT exist, or NOT only one.
```

**Description of the displayed information:**

| Field        | Description                                               |
|--------------|-----------------------------------------------------------|
| Process Id   | Task ID                                                   |
| Vsdid        | VSD ID of the task                                        |
| Process Name | Task name                                                 |
| Process Ppid | Parent process task ID                                    |
| State        | Task running status                                       |
| On CPU       | CPU where the task is running                             |
| Priority     | Task priority                                             |
| Age Time     | Duration for the task from self-startup to now            |
| Run Time     | Duration for the task from self-startup to being executed |

|            |                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cpu Usage  | CPU usage of the task within the last five seconds, one minute, five minutes, and 15 minutes.<br>The value in the round brackets is the CPU usage that is not divided by the total number of cores where the task runs. For example, the demo task is running on No.0 core, which is the control core and the system has two control cores. In this case, the CPU usage is 0.3% (0.6%). |
| Tty        | Tty ID, in the format of "Primary device ID, secondary device ID". If it is 0, the value is ?.                                                                                                                                                                                                                                                                                          |
| Code Usage | Size occupied by the task code segment                                                                                                                                                                                                                                                                                                                                                  |

The following example displays the information on the task of the specified task ID.

```
Ruijie# show process cpu detailed 1715
Process Id      : 130
Process Name    : crypto
Vsdid          : 0
Process Ppid    : 2

State          : S(sleeping)
On CPU         : 0
Priority        : 0
Age Time       : 03:41:09.9
Run Time       : 00:00.0

## 5.20 show cpu

Use this command to display the information on the system task running on the control core instead of the non-virtual core.

**show cpu**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | -         | -           |

**Command Mode** Privileged EXEC mode/ global configuration mode

**Default Level** -

**Usage Guide** This command is supported only in VSD0 mode. Multiple VSDs are not supported. If the system is equipped with a virtual core, you can use the **show processes cpu** command to check the CPU usage of the virtual core.

**Configuration Examples** The following example displays the information on the system task running on the control core instead of the non-virtual core.

```
Ruijie#show cpu
=====
CPU Using Rate Information
CPU utilization in five seconds: 4.80%
CPU utilization in one minute: 4.10%
CPU utilization in five minutes: 4.00%

NO      5Sec   1Min   5Min Process
  1  0.00%  0.00%  0.00% init
  2  0.00%  0.00%  0.00% kthreadd
  3  0.00%  0.00%  0.00% ksoftirqd/0
  4  0.00%  0.00%  0.00% events/0
--More--
```

## 5.21 show reboot-reason

Use this command to display the reboot reason.

**show reboot-reason** [ *all* ]

**Parameter**  
**Description**

| Parameter  | Description                                               |
|------------|-----------------------------------------------------------|
| <i>all</i> | Displays the reboot reason of all devices/service modules |

**Command**  
**Mode** Privileged EXEC mode/ global configuration mode/ User EXEC mode

**Default Level** -

**Usage Guide** -

**Configuration** The following example displays the reboot reason of the device.

**Examples**

```
Ruijie#show reboot-reason
time: 1970-01-01 08:03:13
reason: reload cmd
info: /sbin/rg-sysmon/3844

Ruijie#
```

## 6. Time Range Commands

### 6.1 absolute

Use this command to configure an absolute time range.

**absolute** { [ *start time date* ] [ *end time date* ] }

Use the **no** form of this command to remove the absolute time range.

**no absolute**

#### Parameter Description

| Parameter                     | Description                            |
|-------------------------------|----------------------------------------|
| <b>start</b> <i>time date</i> | Indicates the start time of the range. |
| <b>end</b> <i>time date</i>   | Indicates the end time of the range.   |

#### Defaults

The default absolute time range is the maximum range, which is from 00:00 January 1, 0 to 23:59 December 31, 9999.

#### Command Mode

Time range configuration mode

#### Default Level

14

#### Usage Guide

Use the **absolute** command to configure a time absolute time range between a start time and an end time to allow a certain function to take effect within the absolute time range.

The maximum absolute time range is from 00:00 January 1, 0 to 23:59 December 31, 9999.

#### Configuration

The following example creates a time range and enters time range configuration mode.

#### Examples

```
Ruijie(config)# time-range no-http
Ruijie(config-time-range)#
```

The following example configures an absolute time range.

```
Ruijie(config-time-range)# absolute start 1:1 1 JAN 2013 end 1:1 1 JAN 2014
```

#### Check Method

Use the **show time-range** [ *time-range-name* ] command to display the time range configuration.

#### Prompt Message

-

#### Platform Description

-

## 6.2 periodic

Use this command to configure periodic time.

**periodic** *day-of-the-week time to [ day-of-the-week ] time*

Use the **no** form of this command to remove the configured periodic time.

**no periodic** *day-of-the-week time to [ day-of-the-week ] time*

| Parameter Description | Parameter              | Description                                                     |
|-----------------------|------------------------|-----------------------------------------------------------------|
|                       | <i>day-of-the-week</i> | Indicates the week day when the periodic time starts or ends.   |
|                       | <i>time</i>            | Indicates the exact time when the periodic time starts or ends. |

**Defaults** No periodic time is configured by default.

**Command Mode** Time range configuration mode

**Default Level** 14

**Usage Guide** Use the **periodic** command to configure a periodic time interval to allow a certain function to take effect within the periodic time. If you want to modify the periodic time, it is recommended to disassociate the time range first and associate the time range after the periodic time is modified.

**Configuration Examples** The following example creates a time range and enters time range configuration mode.

```
Ruijie(config)# time-range no-http
Ruijie(config-time-range)#
```

The following example configures a periodic time interval.

```
Ruijie(config-time-range)# periodic Monday 1:1 to Tuesday 2:2
```

**Check Method** Use the **show time-range [ time-range-name ]** command to display the time range configuration.

**Prompt Message** -

**Platform Description** -

## 6.3 show time-range

Use this command to display the time range configuration.

**show time-range** [ *time-range-name* ]

| Parameter Description | Parameter              | Description                      |
|-----------------------|------------------------|----------------------------------|
|                       | <i>time-range-name</i> | Displays a specified time range. |

**Command Mode** Privileged EXEC mode

**Default Level** 14

**Usage Guide** Use this command to check the time range configuration.

**Configuration** The following example displays the time range configuration.

**Examples**

```
Ruijie# show time-range
time-range entry: test (inactive)
  absolute end 01:02 02 February 2012
```

**Prompt Message** -

**Platform Description** -

## 6.4 time-range

Use this command to create a time range and enter time range configuration mode.

**time-range** *time-range-name*

Use the **no** form of this command to remove the configured time range.

**no time-range** *time-range-name*

| Parameter Description | Parameter              | Description     |
|-----------------------|------------------------|-----------------|
|                       | <i>time-range-name</i> | Time range name |

**Defaults** No time range is configured by default.

**Command Mode** Global configuration mode

**Default Level** 2

**Usage Guide** Some applications (such as ACL ) may run based on time. For example, an ACL can be effective within certain time ranges of a week. To this end, first you must configure a time range. After the time range is created, you can configure relevant time control in time range mode.

**Configuration** The following example creates a time range.

**Examples**

```
Ruijie(config)# time-range no-http
Ruijie(config-time-range)#
```

**Check Method** Use the **show time-range** [ *time-range-name* ] command to display the time range configuration.

**Prompt Message** -

**Platform Description** -

## 7. HTTP Service Commands

### 7.1 enable service web-server

Use this command to enable the HTTP service function.

Use the **no** form of this command to disable the HTTP service function.

**enable service web-server [ http | https | all ]**

**{ no | default } enable service web-server [ http | https | all ]**

| Parameter Description | Parameter    | Description                                          |
|-----------------------|--------------|------------------------------------------------------|
|                       | <b>http</b>  | Enables the HTTP service.                            |
|                       | <b>https</b> | Enables the HTTPS service.                           |
|                       | <b>all</b>   | Enables both the HTTP service and the HTTPS service. |

**Defaults** By default, the HTTP service function is disabled.

**Command mode** Global configuration mode.

**Usage Guide** If run a command ends with the keyword **all** or without keyword, it indicates enabling both the HTTP service and the HTTPS service; if run a command ends with keyword **http**, it indicates enabling the HTTP service; if run a command ends with keyword **https**, it indicates enabling the HTTPS service. Use the command **no enable service web-server** to disable the corresponding HTTP service.

**Configuration** The following example enables both the HTTP service and the HTTPS service:

**Examples**

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#enable service web-server
```

| Related Commands | Command | Description |

**Description**

### 7.2 http check version

Use this command to detect the available upgrade files on the HTTP server.

**http check-version**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command mode** Privileged EXEC mode

**Usage Guide** Use this command to detect the available upgrade files. The detected upgrade files version is later than that of local files.

**Configuration** The following example demonstrates the version of the detected HTTP upgrade file.

**Examples**

```
Ruijie# http check-version
Business modules need to be updated: character-db, route-db
app name:web
  app-name          version          filename
-----
character-db       2014.02.09.14.02.09  app_sub_1.exe
character-db       2014.02.09.14.02.09  app_file_list.txt
character-db       2014.02.09.14.02.09  app_sub_3.exe
character-db       2014.02.09.14.02.09  app_sub_2.exe
route-db           2013.12.01.00        route-choose.db
```

| Related Commands | Command | Description |

**Platform Description** N/A

## 7.3 http port

Use this command to configure the HTTP port number.

Use the **no** form of this command to restore the default HTTP port number.

**http port** *port-number*

**no http port**

| Parameter Description | Parameter          | Description                                                             |
|-----------------------|--------------------|-------------------------------------------------------------------------|
|                       | <i>port-number</i> | Configures the HTTP port number. The value includes 80, 1025 to 65,535. |

- Defaults** The default HTTP port number is 80.
- Command mode** Global configuration mode.
- Usage Guide** Use this command to configure the HTTP port number.

**Configuration** The following example configures the HTTP port number as 8080:

**Examples**

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#http port 8080
```

**Related Commands**

**Description**

## 7.4 http secure-port

Use this command to configure the HTTPS port number.  
Use the **no** form of this command to restore the default HTTPS port number.

**http secure-port** *port-number*

**no http secure-port**

**Parameter Description**

| Parameter          | Description                                                               |
|--------------------|---------------------------------------------------------------------------|
| <i>port-number</i> | Configures the HTTPS port number. The value includes 443, 1025 to 65,535. |

- Defaults** The default HTTP port number is 443.
- Command mode** Global configuration mode.
- Usage Guide** Use this command to configure the HTTPS port number.

**Configuration** The following example configures the HTTPS port number as 4443:

**Examples**

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#http secure-port 4443
```

| Related<br>Commands | Command                          | Description                                               |
|---------------------|----------------------------------|-----------------------------------------------------------|
|                     | <b>enable service web-server</b> | Enables the HTTP service.                                 |
|                     | <b>show web-server status</b>    | Displays the configuration and status of the Web service. |

**Platform** N/A

**Description**

## 7.5 http update

Use this command to manually upgrade files.

**http update** { **all** | *string* }

| Parameter<br>Description | Parameter     | Description                                                                                         |
|--------------------------|---------------|-----------------------------------------------------------------------------------------------------|
|                          | <i>string</i> | Name of the service to be upgraded. You can enter multiple services, and separate them with spaces. |
|                          | <b>all</b>    | Upgrade all services.                                                                               |

**Defaults** N/A

**Command mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example upgrades the route-db and url-db files.

### Examples

```
Ruijie# http update route-db
Downloading updated files, please wait...
Press Ctrl+C to quit
route-db: download and notify successfully.
```

| Related<br>Commands | Command                  | Description                                              |

**Description**

## 7.6 http update mode

Use this command to configure the HTTP upgrade mode to manual mode. Use the **no** form of this command to restore the default upgrade mode, namely, auto mode.

**http update mode manual**

**no http update mode**

### Parameter Description

| Parameter     | Description                         |
|---------------|-------------------------------------|
| <b>manual</b> | Configures the manual upgrade mode. |

### Defaults

The default update mode is auto mode.

### Command mode

Global configuration mode.

### Usage Guide

Use this command to configure the HTTP upgrade mode to manual mode.

### Configuration

The following example enables manual HTTP upgrade mode:

### Examples

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#http update mode manual
```

### Platform

N/A

### Description

## 7.7 http update server

Use this command to configure the IP address and the HTTP port number of the HTTP server.

**http update server** { *host-name* | *ip-address* } [ **port** *port-number* ]

**no http update server**

### Parameter Description

| Parameter          | Description                                                    |
|--------------------|----------------------------------------------------------------|
| <i>host-name</i>   | Host name of the HTTP server.                                  |
| <i>ip-address</i>  | IP address of the HTTP server.                                 |
| <i>port-number</i> | Port number of the HTTP server. The range is from 1 to 65,535. |

### Defaults

By default, the IP address of the HTTP remote upgrade server is 0.0.0.0 and the port number is 80.

**Command mode** Global configuration mode.

**Usage Guide** Use this command to configure the IP address and the HTTP port number of the HTTP server. When processing upgrade, the user-configured server address is preferentially used. If the connection fails, the server address in store in the local upgrade record file will be used to establish the connection. When all the above connection fails, upgrade will be suspended. At least one IP address of upgrade server is stored in the local upgrade record file, and this IP address cannot be modified.

 The HTTP upgrade server address is not need to be configured because the local upgrade record file records available upgrade server addresses.

If the server domain needs to be configured, enable the DNS function on the device and configure the DNS server address.

The server IP address cannot be an IPv6 address.

**Configuration Examples** The following example configures the IP address and the HTTP port number of the HTTP server:

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#http update server 10.83.132.1 port 90
```

| Related Commands | Command | Description |

## 7.8 http update set oob

Use this command to enable HTTP upgrade on the MGMT port. Use the **no** form of this command to restore the default setting.

**http update set oob**  
**no http update set oob**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** By default, HTTP upgrade is performed on the common port.

**Command mode** Global configuration mode.

**Usage Guide** This command is supported only on the device supporting the MGMT ports.

**Configuration** The following example enables HTTP upgrade on the MGMT port:

**Examples** Ruijie(config)# http update set oob

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Description**

## 7.9 http update time

Use this command to configure the HTTP auto-detection time. Use the **no** form of this command to restore the default auto-detection time.

**http update time daily hh:mm**

**no http update time**

| Parameter Description | Parameter | Description                                                          |
|-----------------------|-----------|----------------------------------------------------------------------|
|                       | hh:mm     | Specified auto-detection time; (24-hour system); accurate to minute. |

**Defaults** The default HTTP auto-detection time is random.

**Command mode** Global configuration mode.

**Usage Guide** Use this command to configure the HTTP auto-detection time. The device detects the files available for upgrade on the server at the specified detection time. Use can read these detected file information through Web interface.  
 Use the **no** form of this command to reset the auto-detection time as random.

**Configuration** The following example configures the HTTP auto-detection time.

**Examples** Ruijie#configure terminal  
 Enter configuration commands, one per line. End with CNTL/Z.  
 Ruijie(config)#http update time daily 23:40

| Related Commands | Command | Description |
|------------------|---------|-------------|

|-------------------------|---------------------------------|
| <b>http update mode</b> | Configures the HTTP update mode |
|-------------------------|---------------------------------|

**Platform** N/A

**Description**

## 7.10 show web-server status

Use this command to display the configuration and status of the Web service.

**show web-server status**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays the configuration and status of the Web service:

**Examples**

```
Ruijie#show web-server status
http server status : enabled
http server port : 80
https server status: enabled
https server port: 443
```

|------------------|----------------------------------|-----------------------------------|
|                  | <b>enable service web-server</b> | Enables the HTTP service.         |
|                  | <b>http port</b>                 | Configures the HTTP port number.  |
|                  | <b>http secure-port</b>          | Configures the HTTPS port number. |

**Platform** N/A

**Description**

## 7.11 webmaster level

Use this command to configure the username and password for Web login authentication. Use the **no** form of this command to restore the default setting.

**webmaster level** *privilege-level* **username** *name* **password** { *password* | [ 0 | 7 ] *encrypted-password* }

**no webmaster level** *privilege-level* [ **username** *name* ]

**Parameter Description**

| Parameter                 | Description                                                   |
|---------------------------|---------------------------------------------------------------|
| <i>privilege-level</i>    | Configures the user privilege-level.                          |
| <i>name</i>               | Username.                                                     |
| <i>password</i>           | Password.                                                     |
| <b>0   7</b>              | Password type; 0 indicates plaintext, 7 indicates ciphertext. |
| <i>encrypted-password</i> | Password text.                                                |

**Defaults**

By default, two users are configured.

1. User1 is configured with privilege level 1, username of admin and plaintext password of admin.
2. User2 is configured with privilege level 2, username of guest and plaintext password of guest.

**Command mode**

Global configuration mode.

**Usage Guide**

When HTTP is enabled, users can log in to the Web interface only after being authenticated. Use this command to configure the username and password for Web login authentication.

Use the **no webmaster level** *privilege-level* command to delete all the usernames and passwords with a specified *privilege-level*.

Use the **no webmaster level** *privilege-level* **username** *name* command to delete the specified username and password.

-  Usernames and passwords come with three permission levels, each of which includes at most 10 usernames and passwords.
-  By default, the system creates the **admin** account. The account cannot be deleted and only the password of the account can be changed. The administrator account is the **admin** account, which corresponds to the level 0 permission. The administrator account owns all permissions on the Web page and can edit other management accounts and authorize the accounts to access pages.

**Configuration Examples**

The following example configures the username and password for Web login authentication,

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#webmaster level 0 username ruijie password admin
```

**Related Commands**

| Command                          | Description               |
|----------------------------------|---------------------------|
| <b>enable service web-server</b> | Enables the HTTP service. |

**Platform Description**

N/A

## 8. Syslog Commands

### 8.1 clear logging

Use this command to clear the logs from the buffer in privileged EXEC mode.

**clear logging**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command clears the log packets from the memory buffer. You cannot clear the statistics of the log packets.

**Configuration Examples** The following example clears the log packets from the memory buffer.

```
Ruijie# clear logging
```

| Related Commands | Command                 | Function                               |
|------------------|-------------------------|----------------------------------------|
|                  | <b>logging on</b>       | Turns on the log switch.               |
|                  | <b>show logging</b>     | Displays the logs in the buffer.       |
|                  | <b>logging buffered</b> | Records the logs in the memory buffer. |

**Platform Description** N/A

### 8.2 logging

Use this command to send the log message to the specified syslog server.

**logging** { *ip-address* | **ipv6** *ipv6-address* } [ **udp-port** *port* ] [ **vrf** *vrf-name* ]

Use this command to delete the specified syslog server.

**no logging** { *ip-address* [ **vrf** *vrf-name* ] | **ipv6** *ipv6-address* }

Use this command to restore the default port 514.

**no logging** { *ip-address* [ **vrf** *vrf-name* ] | **ipv6** *ipv6-address* } **udp-port**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description |           |             |

|                             |                                                                              |
|-----------------------------|------------------------------------------------------------------------------|
| <i>ip-address</i>           | Sets the IP address of the host receiving log messages.                      |
| <i>vrf-name</i>             | Sets the VRF instance connecting with the host.                              |
| <i>ipv6-address</i>         | Sets the IPv6 address of the host receiving log messages.                    |
| <b>udp-port</b> <i>port</i> | Sets the port number of the host receiving log messages. The default is 514. |

**Defaults** No log message is sent to syslog server by default.

**Command Mode** Global configuration mode

**Usage Guide** This command is used to configure a syslog server to receive log messages from the device. You can configure up to five syslog servers, log messages are sent to all configured syslog servers simultaneously,

**Configuration** The following example configures a syslog server with IP address 202.101.11.1.

**Examples**

```
Ruijie(config)# logging 202.101.11.1
```

The following example configures a syslog server with IP address 10.1.1.100 and port number 8099.

```
Ruijie(config)# logging 202.101.11.1 udp-port 8099
```

The following example configures a syslog server with IPv6 address AAAA:BBBB::FFFF.

```
Ruijie(config)# logging ipv6 AAAA:BBBB::FFFF
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

### 8.3 logging buffered

Use this command to set the memory buffer parameters (log severity, buffer size) for logs at global configuration layer. Use the **no** form of the command to disable recording logs in the memory buffer. Use the **default** form of this command to restore the default setting.

**logging buffered** [ *buffer-size* | *level* ]

**no logging buffered**

**default logging buffered**

| Parameter Description | Parameter          | Description                                                                                                                                                                                                              |
|-----------------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>buffer-size</i> | Size of the buffer is related to the specific device type:<br>1. For the kernel / aggregation switches, 4 K to 10 M bytes.<br>2. For the access switches, 4 K to 1 M Bytes.<br>3. For other devices, 4 K to 128 K Bytes. |

|              |                                                                                     |
|--------------|-------------------------------------------------------------------------------------|
| <i>level</i> | Severity of logs, from 0 to 7. The name of the severity or the numeral can be used. |
|--------------|-------------------------------------------------------------------------------------|

**Defaults** The buffer size is related to the specific device type.

1. kernel switches: 1 M Bytes;
2. aggregation switches: 256 K Bytes;
3. access switches: 128 K Bytes;
4. other devices: 4 K Bytes

The log severity is 7.

**Command**

**Mode** Global configuration mode

**Usage Guide**

The memory buffer for log is used in recycled manner. That is, when the memory buffer with the specified size is full, the oldest information will be overwritten. To show the log information in the memory buffer, run the **show logging** command in privileged user mode.

The logs in the memory buffer are temporary, and will be cleared in case of device restart or the execution of the **clear logging** command in privileged user mode. To trace a problem, it is required to record logs in flash or send them to Syslog Server.

The log information is classified into the following 8 levels (Table 1):

**Table-1**

| Keyword       | Level | Description                                    |
|---------------|-------|------------------------------------------------|
| Emergencies   | 0     | Emergency case, system cannot run normally     |
| Alerts        | 1     | Problems that need immediate remedy            |
| Critical      | 2     | Critical conditions                            |
| Errors        | 3     | Error message                                  |
| warnings      | 4     | Alarm information                              |
| Notifications | 5     | Information that is normal but needs attention |
| informational | 6     | Descriptive information                        |
| Debugging     | 7     | Debugging messages                             |

Lower value indicates higher level. That is, level 0 indicates the information of the highest level. When the level of log information to be displayed on devices is specified, the log information at or below the set level will be allowed to be displayed.

 After running the system for a long time, modifying the log buffer size especially in condition of large buffer may fails due to the insufficient available continuous memory. The failure message will be shown. It is recommended to modify the log buffer size as soon as the system starts.

**Configuration Examples** The following example allows logs at and below severity 6 to be recorded in the memory buffer sized 10,000 bytes.

```
Ruijie(config)# logging buffered 10000 6
```

| <b>Related Commands</b> | Command       | Description                        |
|-------------------------|---------------|------------------------------------|
|                         | logging on    | Turns on the log switch.           |
|                         | show logging  | Displays the logs in the buffer.   |
|                         | clear logging | Clears the logs in the log buffer. |

**Platform Description** N/A

## 8.4 logging console

Use this command to set the severity of logs that are allowed to be displayed on the console in global configuration mode. Use the **no** form of this command to prohibit printing log messages on the console.

**logging console** [ *level* ]

**no logging console**

| <b>Parameter Description</b> | Parameter    | Description                                                                                                                          |
|------------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------|
|                              | <i>level</i> | Severity of log messages, 0 to 7. The name of the severity or the numeral can be used. For the details of log severity, see table 1. |

**Defaults** The default is debugging (7).

**Command Mode** Global configuration mode

**Usage Guide** When a log severity is set, the log messages at or below that severity will be displayed on the console.

The **show logging** command displays the related setting parameters and statistics of the log.

**Configuration Examples** The following example sets the severity of log that is allowed to be displayed on the console as 6:

```
Ruijie(config)# logging console informational
```

| <b>Related Commands</b> | Command      | Description                                                               |
|-------------------------|--------------|---------------------------------------------------------------------------|
|                         | logging on   | Turns on the log switch.                                                  |
|                         | show logging | Displays the logs and related log configuration parameters in the buffer. |

**Platform**  
**Description** N/A

## 8.5 logging count

Use this command to enable the log statistics function in global configuration mode. Use the **no** form of this command to restore the default setting.

**logging count**

**no logging count**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** The log statistics function is disabled by default.

**Command Mode** Global configuration mode

**Usage Guide** This command enables the log statistics function. The statistics begins when the function is enabled. If you run the **no logging count** command, the statistics function is disabled and the statistics data is deleted.

**Configuration Examples** The following example enables the log statistics function:

```
Ruijie(config)# logging count
```

| Related Commands | Command                   | Description                                                                    |
|------------------|---------------------------|--------------------------------------------------------------------------------|
|                  | <b>show logging count</b> | Displays log information about modules of the system.                          |
|                  | <b>show logging</b>       | Displays basic configuration of log modules and log information in the buffer. |

**Platform**  
**Description** N/A

## 8.6 logging delay-send file

Use this command to set the name of the log file saved locally for delay sending. Use the **no** form of this command to restore the default setting.

**logging delay-send file flash:filename**

**no logging delay-send file**

**Parameter Description**

| Parameter             | Description                                                    |
|-----------------------|----------------------------------------------------------------|
| <b>flash:filename</b> | Sets the name of the log file saved locally for delay sending. |

**Defaults**

The default name format is as follows: file size\_device IP address\_index.txt. If you want to change the file name, the file sent to the remote server should be named as follows: prefix\_ file size\_device IP address\_index.txt; the file saved locally should be named as follows: prefix\_index.txt. The default prefix is syslog\_ftp\_server.

**Command Mode**

Global configuration mode

**Usage Guide**

The file name cannot contain special symbols including . \ : \* " < > and |.  
 For example, the file name is log\_server, file index 5, file size 1000B and device IP address 10.2.3.5. The log file sent to the remote server is named log\_server\_1000\_10.2.3.5\_5.txt and the log file saved locally is named log\_server\_5.txt.  
 If the device has an IPv6 address, the colon (:) in the IPv6 address is replaced by the hyphen (-). For example, the is log\_server, file index 6, file size 1000B and device IPv6 address 2001::1. The log file sent to the remote server is named log\_server\_1000\_2001-1\_6.txt and the log file saved locally is named log\_server\_6.txt.

**Configuration Examples**

The following example sets the name of the log file saved locally to log\_server.

```
Ruijie(config)# logging delay-send file flash:log_server
```

## 8.7 logging delay-send interval

Use this command to set the interval at which log sending is delayed. Use the **no** form of this command to restore the default setting.

- logging delay-send interval seconds**
- no logging delay-send interval**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|                |                                                                                            |
|----------------|--------------------------------------------------------------------------------------------|
| <i>seconds</i> | Sets the interval at which log sending is delayed, in the range from 600 to 65535 seconds. |
|----------------|--------------------------------------------------------------------------------------------|

**Defaults** The default is 3600.

**Command Mode** Global configuration mode

**Usage Guide** N/A

**Configuration** The following example sets the the interval at which log sending is delayed to 600 seconds.

**Examples**

```
Ruijie(config)# logging delay-send interval 600
```

**Related Commands**

| Command | Description |
|---------|-------------|
| N/A     | N/A         |

**Platform Description** N/A

## 8.8 logging delay-send server

Use this command to set the interval at which log sending is delayed. Use the **no** form of this command to restore the default setting.

**logging delay-send server** { [ **oob** ] *ip-address* | **ipv6** *ipv6-address* } [ **vrf** *vrf-name* ] [ **via** *mgmt-name* ] **mode** { **ftp** **user** *username* **password** [ **0** | **7** ] *password* | **tftp** }

**no logging delay-send server** [ **oob** ] *hostname* [ **vrf** *vrf-name* ] [ **via** *mgmt-name* ]

**Parameter Description**

| Parameter                       | Description                                                                                                          |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>oob</b>                      | Indicates that logs are sent to the server through the MGMT port. It is required that the device have the MGMT port. |
| <i>ip-address</i>               | Specifies the IP address of the server.                                                                              |
| <b>ipv6</b> <i>ipv6-address</i> | Specifies the IPv6 address of the server.                                                                            |
| <b>vrf</b> <i>vrf-name</i>      | Specifies the VRF instance connected to the server.                                                                  |
| <i>username</i>                 | Sets the FTP server username.                                                                                        |
| <i>password</i>                 | Sets the FTP server password.                                                                                        |
| <b>0</b>                        | (Optional) The password is displayed in plaintext.                                                                   |
| <b>7</b>                        | The password are encrypted.                                                                                          |

**Defaults** The default is 3600.

**Command Mode** Global configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example sets the the interval at which log sending is delayed to 600 seconds.

```
Ruijie(config)# logging delay-send interval 600
```

## 8.10 logging facility

Use this command to configure the device value of the log information in global configuration mode.

Use the **no** form of the command to restore the default setting.

**logging facility** *facility-type*

**no logging facility**

| Parameter          | Parameter            | Description                                                           |
|--------------------|----------------------|-----------------------------------------------------------------------|
| <b>Description</b> | <i>facility-type</i> | Syslog device value. For specific settings, refer to the usage guide. |

**Defaults** The default is 23 if the RFC5424 format is enabled (Local7, local use).  
The default is 16 if the RFC5424 format is disabled (Local0, local use).

**Command Mode** Global configuration mode

**Usage Guide** The following table (Table-2) is the possible device values of Syslog:

| Numerical Code | Facility                                 |
|----------------|------------------------------------------|
| 0 (kern)       | Kernel messages                          |
| 1 (user)       | User-level messages                      |
| 2 (mail)       | Mail system                              |
| 3 (daemon)     | System daemons                           |
| 4 (auth1)      | security/authorization messages          |

## 8.11 logging file

Use this command to save log messages in the log file, which can be saved in hardware disk, expanded FLASH, USB or SD. Use the **no** form of this command to restore the default setting, **logging file { sata0:filename | flash:filename | flash2:filename | usb0:filename | usb1:filename | sd0:filename } [ max-file-size ] [ level ]**  
**no logging file**

| Parameter Description | Parameter            | Description                                                                                                                               |
|-----------------------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>sata0</b>         | Saves the log file in hardware disk.                                                                                                      |
|                       | <b>flash</b>         | Saves the log file in expanded FLASH.                                                                                                     |
|                       | <b>flash2</b>        | Saves the log file in expanded FLASH2.                                                                                                    |
|                       | <b>usb0</b>          | Saves the log file in USB0. This parameter is supported by the device with one USB connector and the USB extension device.                |
|                       | <b>usb1</b>          | Saves the log file in USB1, This parameter is supported by the device with two USB connectors and the USB extension device.               |
|                       | <b>sd0</b>           | Saves the log file in the SD card. This parameter is supported by the device with the SD card interface and the SD card extension device. |
|                       | <i>filename</i>      | Sets the file name. The file type is omitted, which is fixed as txt.                                                                      |
|                       | <i>max-file-size</i> | Sets the maximum file size, in the range from 128K to 6M bytes, The default is 128K,                                                      |

|              |                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>level</i> | Sets the level of the log message saved in the log file, which can be either the level name or the level number. The default is 6. See Usage Guide for details. |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Defaults** Log messages are not saved in expanded FLASH by default.

**Command Mode** Global configuration mode

**Usage Guide** You can save log messages in expanded FLASH if you don't want to transmit log messages on the network or there is no syslog server, The log file cannot be configured with the suffix, which is fixed as txt.

 If there is no expanded FLASH, the **logging file flash** command is hidden automatically and cannot be configured. If no FLASH2 is available, the **logging file flash** command is hidden automatically and cannot be configured. If FLASH2 is available, the log file is saved in FLASH2 after the **logging file flash** command is configured.

| Keyword       | Level | Description                                     |
|---------------|-------|-------------------------------------------------|
| Emergencies   | 0     | Emergency case. The system fails to run.        |
| Alerts        | 1     | Problem that call for immediate solution.       |
| Critical      | 2     | Critical message.                               |
| Errors        | 3     | Error message.                                  |
| warnings      | 4     | Alarm message.                                  |
| Notifications | 5     | message that is normal but calls for attention. |
| informational | 6     | Descriptive message.                            |
| Debugging     | 7     | Debugging message                               |

**Configuration Examples** The following example saves the log message in expanded FLASH and sets file name, file size and log level to syslog.txt, 128K and 6 respectively.

```
Ruijie(config)# logging file flash:syslog
```

## 8.12 logging file numbers

Use this command to set the number of log files written into FLASH. Use the **no** form of this command to restore the default setting.

**logging file numbers** *numbers*

**no logging file numbers**

| Parameter Description | Parameter      | Description                                                                 |
|-----------------------|----------------|-----------------------------------------------------------------------------|
|                       | <i>numbers</i> | Sets the number of log files written into FLASH, in the range from 2 to 16. |

**Defaults** The default is 16.

**Command Mode** Global configuration mode

**Usage Guide** The system does not delete previously generated log files even if you change this configuration, Therefore, you need to delete the log files manually to save FLASH size (you can send log files to the server through TFTP before that). For example, 16 log files are generated by default before you want to change the number to 2. New logs are overwritten constantly in log files indexed 0 to 1. However, log files indexed from 2 to 16 remain. You can delete these log files manually as needed.

**Configuration Examples** The following example sets the number of log files written into FLASH to 8.

```
Ruijie(config)# logging file numbers 8
```

## 8.13 logging filter direction

Use this command to filter the log messages destined to a certain direction. Use the **no** form of this command to restore the default setting.

**logging filter direction** { **all** | **buffer** | **file** | **server** | **terminal** }

**no logging filter direction** { **all** | **buffer** | **file** | **server** | **terminal** }

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|-----------------------|-----------|-------------|

|                 |                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>      | Log messages destined to all directions are filtered, including console, VTY terminal, log buffer, log file and log server.        |
| <b>buffer</b>   | Log messages destined to the log buffer are filtered, including log messages displayed by running the <b>show logging</b> command. |
| <b>file</b>     | Log messages destined to the log file are filtered.                                                                                |
| <b>server</b>   | Log messages destined to the log server are filtered.                                                                              |
| <b>terminal</b> | Log messages destined to the console and the VTY terminal (including Telnet and SSH).                                              |

**Defaults** Log messages destined to all directions are filtered by default.

**Command Mode** Global configuration mode

**Usage Guide** In general, log messages destined to all directions are filtered, including console, VTY terminal, log buffer, log file and log server. If you want to filter log messages destined to a certain direction, the terminal for instance, configure the **terminal** parameter.

**Configuration Examples** The following example filters log messages destined to the terminal (including the console and the VTY terminal).

```
Ruijie(config)# logging filter direction terminal
```

**Related Commands**

## 8.14 logging filter rule

Use this command to configure the filter rule of the log message,

```
logging filter rule { exact-match module module-name mnemonic mnemonic-name level level | single-match [ level level | mnemonic mnemonic-name | module module-name ] }
```

Use this command to delete the “exact-match” filter rule.

```
no logging filter rule exact-match [ module module-name mnemonic mnemonic-name level level ]
```

Use this command to delete the “single-match” filter rule.

```
no logging filter rule single-match [ level level | mnemonic mnemonic-name | module module-name ]
```

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|                                      |                                                                          |
|--------------------------------------|--------------------------------------------------------------------------|
| <b>exact-match</b>                   | Exact-match filter rule. Fill in all the following three parameters.     |
| <b>single-match</b>                  | Single-match filter rule. Fill in one of the following three parameters. |
| <b>module</b> <i>module-name</i>     | Module name.                                                             |
| <b>mnemonic</b> <i>mnemonic-name</i> | Mnemonic name.                                                           |
| <b>level</b> <i>level</i>            | Log level,                                                               |

**Defaults** No filter rule is configured by default,

**Command** Global configuration mode

**Mode**

**Usage Guide** If you want to filter a specific log message, use the “exact-match” filter rule and fill in all three parameters, namely, module name, mnemonic name and log level.  
If you want to filter a specific kind of log messages, use the “single-match” filter rule and fill in one of three parameters, namely, module name, mnemonic name and log level.  
When configured with the same module name, mnemonic name or log level, the “single-match” filter rule has a higher priority than the “exact-match” filter rule,

**Configuration Examples** The following example configures the “exact-match” filter rule with parameters of module name LOGIN, log level 5 and mnemonic name LOGOUT.

```
Ruijie(config)# logging filter rule exact-match module LOGIN mnemonic
LOGOUT level 5
```

The following example configures the “single-match” filter rule with the parameter of module name SYS.

```
Ruijie(config)# logging filter rule single-match module SYS
```

**Description**

## 8.15 logging filter type

Use this command to configure the filter type of log messages. Use the **no** form of this command to restore the default setting.

**logging filter type { contains-only | filter-only }**

**no logging filter type**

**Parameter Description**

| Parameter            | Description                                                            |
|----------------------|------------------------------------------------------------------------|
| <b>contains-only</b> | The log message containing the key word of the filter rule is printed. |

|                    |                                                                         |
|--------------------|-------------------------------------------------------------------------|
| <b>filter-only</b> | The log message containing the key word of the filter rule is filtered. |
|--------------------|-------------------------------------------------------------------------|

**Defaults** The default filter type is filter-only.

**Command Mode** Global configuration mode

**Usage Guide**

1. When too many log messages are printed, the terminal screen keeps being refreshed. If you are not concerned with these log messages, use the “filter-only” filter type to filter the log messages,
2. If you are concerned with certain log messages, use the “contains-only” filter type to print log messages containing the key word of the filter rule, so as to monitor whether certain events happen.

 In real operation, the contains-only and the filter-only filter types cannot be configured at the same time.

 If you configure the filter direction and the filter type without configuring the filter rule, the log messages are not filtered.

**Configuration** The following example sets the filter type to contains-only.

**Examples** Ruijie(config)# logging filter type contains-only

## 8.16 logging flash flush

Use this command to write log messages in the system buffer into the flash file immediately.

**logging flash flush**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** In general, the log messages are cached in the log buffer. Only when the buffer is full or the timer expires are log messages written into the flash file. This command is used to write log messages in the system buffer into the flash file immediately.

 The **logging flash flush** command takes effect only once for each configuration. The log messages cached in the buffer are written into the flash file immediately after configuration.

**Configuration** The following example writes log messages in the system buffer into the flash file immediately.

**Examples** Ruijie(config)# logging flash flush

## 8.17 logging flash interval

Use this command to set the interval to write log messages into the flash file, Use the **no** form of this command to restore the default setting.

**logging flash interval** *seconds*  
**no logging flash interval**

**Parameter Description**

| Parameter                      | Description                                                                                                  |
|--------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>interval</b> <i>seconds</i> | The interval to write log messages into the flash file, in the range from 1 to 57840 in the unit of seconds. |

**Defaults** The default is 3600.

**Command Mode** Global configuration mode

**Usage Guide** This command is used to set the interval to write log messages into the flash file. The timer starts after configuration, If you want to restore the interval to 3600 seconds, use the **no logging flash interval** command.

 To avoid writing log messages into the flash file too frequently, it is not recommended to set a short interval.

**Configuration** The following example sets the interval to write log messages into the flash file to 300 seconds.

**Examples** Ruijie(config)# logging flash interval 300

## 8.18 logging life-time

Use this command to configure the preservation duration of logs in expanded FLASH. Use the **no** form of this command to restore the default setting.

**logging life-time level** *level days*

**no logging life-time level** *level*

| Parameter Description | Parameter    | Description                             |
|-----------------------|--------------|-----------------------------------------|
|                       | <i>level</i> |                                         |
| <i>days</i>           |              | Sets the preservation duration of logs. |

**Defaults** No preservation duration is set by default.

**Command Mode** Global configuration mode

**Usage Guide** Due to difference in expanded FLASH size and log level, logs with different levels can be configured with different preservation durations.

 Once log preservation based on time is enabled, log preservation based on file size is disabled automatically. The log files are stored under the `syslog/` directory of the expanded FLASH,

**Configuration Examples** The following example sets the preservation duration of logs whose level is 6 to 10 days.

```
Ruijie(config)# logging life-time level 6 10
```

## 8.19 logging monitor

Use this command to set the severity of logs that are allowed to be displayed on the VTY window (telnet window, SSH window, etc.) in global configuration mode. Use the **no** form of this command to disable this function.

**logging monitor** [ *level* ]

**no logging monitor**

| Parameter   | Parameter    | Description                                                                                                                     |
|-------------|--------------|---------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>level</i> | Severity of the log message. The name of the severity or the numeral can be used. For the details of log severity, see Table-1. |

**Defaults** The default is debugging (7).

**Command Mode** Global configuration mode

**Usage Guide** To print log information on the VTY window, run the **terminal monitor** command in privileged EXEC mode. The level of logs to be displayed is defined by **logging monitor**.  
The log level defined with "Logging monitor" is for all VTY windows.

**Configuration Examples** The following example sets the severity of log that is allowed to be printed on the VTY window as 6:

```
Ruijie(config)# logging monitor informational
```

| Related Commands | Command             | Description                                                                       |
|------------------|---------------------|-----------------------------------------------------------------------------------|
|                  | <b>logging on</b>   | Turns on the log switch.                                                          |
|                  | <b>show logging</b> | Displays the log messages and related log configuration parameters in the buffer. |

**Platform** N/A

**Description**

## 8.20 logging on

Use this command globally to allow logs to be displayed on different devices. Use the **no** form of this command to disable this function.

**logging on**

**no logging on**

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|                              |     |     |
|------------------------------|-----|-----|
| <b>Parameter Description</b> | N/A | N/A |
|------------------------------|-----|-----|

**Defaults** Logs are allowed to be displayed on different devices.

**Command Mode** Global configuration mode

**Usage Guide** Log information can not only be shown in the Console window and VTY window, but also be recorded in different equipments such as the memory buffer, the expanded FLASH and the Syslog Server. This command is the total log switch. If this switch is turned off, no log will be displayed or recorded unless the severity level is smaller than 1.

**Configuration Examples** The following example disables the log switch on the device.

```
Ruijie(config)# no logging on
```

| Related Commands | Command                    | Description                                                                      |
|------------------|----------------------------|----------------------------------------------------------------------------------|
|                  | <b>logging buffered</b>    | Records the logs to a memory buffer.                                             |
|                  | <b>logging server</b>      | Sends logs to the Syslog server.                                                 |
|                  | <b>logging file flash:</b> | Records logs on the expanded FLASH.                                              |
|                  | <b>logging console</b>     | Allows the log level to be displayed on the console.                             |
|                  | <b>logging monitor</b>     | Allows the log level to be displayed on the VTY window (such as telnet window) . |
|                  | <b>logging trap</b>        | Sets the log level to be sent to the Syslog server.                              |

**Platform Description** N/A

## 8.21 logging policy

Use this command to configure the severity ranking policy. Use the **no** form of this command to remove one policy, Use the **no logging policy** command to remove all policies.

**logging policy module** *module-name* [ **not-lesser-than** ] *level* **direction** { **all** | **server** | **file** | **console** | **monitor** | **buffer** }

**no logging policy module** *module-name* [ **not-lesser-than** ] *level* **direction** { **all** | **server** | **file** | **console** | **monitor** | **buffer** }

**no logging policy**

| Parameter Description | Parameter          | Description                                         |
|-----------------------|--------------------|-----------------------------------------------------|
|                       | <i>module-name</i> | The name of the module applying the ranking policy. |

|                        |                                                                                                                                                                                                                                                                                                                     |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>not-lesser-than</b> | If this parameter is specified, only when the log's level is not lower than the configured level can the log be sent. Otherwise, the log is filtered.<br>If this parameter is not specified, only when the log's level is not higher than the configured level can the log be sent. Otherwise, the log is filtered. |
| <i>level</i>           | Severity level                                                                                                                                                                                                                                                                                                      |
| <b>all</b>             | Applies the ranking policy in all directions.                                                                                                                                                                                                                                                                       |
| <b>server</b>          | Applies the ranking policy to the direction toward the server.                                                                                                                                                                                                                                                      |
| <b>file</b>            | Applies the ranking policy to the direction toward the log file.                                                                                                                                                                                                                                                    |
| <b>console</b>         | Applies the ranking policy to the direction toward the console.                                                                                                                                                                                                                                                     |
| <b>monitor</b>         | Applies the ranking policy to the direction toward the remote server.                                                                                                                                                                                                                                               |
| <b>buffer</b>          | Applies the ranking policy to the direction toward the buffer.                                                                                                                                                                                                                                                      |

**Defaults** This function is disabled by default.

**Command** Global configuration mode

**Mode**

**Usage Guide** This command is used to send logs to different destinations based on module and severity.

**Configuration Examples** The following example sends logs of the SYS module leveled above 5 to the console and sends logs of the SYS module leveled below 3 to the buffer.

```
Ruijie(config)# logging policy module SYS not-lesser-than 5 direction
console

Ruijie(config)# logging policy module SYS 3 direction buffer
```

## 8.22 logging rate-limit

Use this command to enable log rate limit function to limit the output logs in a second in the global configuration mode. Use the **no** form of this command to disable this function.

**logging rate-limit** { *number* | **all** *number* | **console** { *number* | **all** *number* } } [ **except** *severity* ]

**no logging rate-limit**

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

**Parameter Description**

|                 |                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <i>number</i>   | The number of logs that can be processed in a second in the range from 1 to 10000.                                                          |
| <b>all</b>      | Sets rate limit to all the logs with severity level 0 to 7.                                                                                 |
| <b>console</b>  | Sets the amount of logs that can be shown in the console in a second.                                                                       |
| <b>except</b>   | By default, the severity level is error (3). The rate of the log whose severity level is less than or equal to error (3) is not controlled. |
| <i>severity</i> | Log severity level in the range from 0 to 7. The lower the level is, the higher the severity is.                                            |

**Defaults** The log rate limit function is disabled by default.

**Command Mode** Global configuration mode

**Usage Guide** Use this command to control the syslog output to prevent the massive log output.

**Configuration Examples** The following example sets the number of the logs (including debug) that can be processed in a second as 10. However, the logs with warning or higher severity level are not controlled:

```
Ruijie(config)#logging rate-limit all 10 except warnings
```

## 8.23 logging rd on

Use this command in global configuration mode on the host to enable the log re-direction function and allow re-directing logs on slave or backup devices to the host in the VSU environment. Use **no** form of this command to disable this function.

**logging rd on**  
**no logging rd on**

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|                              |     |     |
|------------------------------|-----|-----|
| <b>Parameter Description</b> | N/A | N/A |
|------------------------------|-----|-----|

**Defaults** The log re-direction function is enabled by default.

**Command Mode** Global configuration mode

**Usage Guide** The log information on slave or back devices not only can be shown on the Console window of slave or backup devices, but also can be re-directed to the host and exported to the Console and VTY windows of the host, and recorded in cache, expanded FLASH and Syslog Server of the host.

**Configuration Examples** The following example enables the log re-direction function on a device:

```
Ruijie(config)#logging rd on
```

| Related Commands | Command                   | Description                                                                    |
|------------------|---------------------------|--------------------------------------------------------------------------------|
|                  | <b>show logging count</b> | Displays log information about modules of the system.                          |
|                  | <b>show logging</b>       | Displays basic configuration of log modules and log information in the buffer. |

**Platform Description** N/A

## 8.24 logging rd rate-limit

Use this command in global configuration mode on the host to enable the log re-direction rate limiting function to limit the number of logs that can be re-directed from a slave or backup device to the host each second in the VSU environment. Use the **no** form of this command to disable this function.

**logging rd rate-limit** *number* [ **except** [ *severity* ] ]

**no logging rd rate-limit**

| Parameter Description | Parameter       | Description                                                                                                                                                     |
|-----------------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>number</i>   | Log information that can be re-directed each second, ranging from 1 to 10,000 logs                                                                              |
|                       | <b>except</b>   | Log information on or lower than the severity level will not be limited; error (3) by default, log information on or lower than the error level is not limited. |
|                       | <i>severity</i> | Log information severity level; lower the level is, higher the severity is, ranging from 0 to 7                                                                 |

**Defaults** The maximum number of logs that can be re-directed each second is 200 by default.

- Command Mode** Global configuration mode
- Usage Guide** This command is used to control the output of log information by system re-direction. You can use this command to prevent a slave or backup device from re-directing a large number of logs to the host.

- Configuration Examples** The following example sets the maximum number of logs (including debug) that can be re-directed from a slave device to the host each second at 10, excepting logs on and above the warning severity level:

```
Ruijie(config)#logging rd rate-limit 10 except warnings
```

|------------------|---------------------------|--------------------------------------------------------------------------------|
|                  | <b>show logging count</b> | Displays log information about modules of the system.                          |
|                  | <b>show logging</b>       | Displays basic configuration of log modules and log information in the buffer. |

- Platform Description** N/A

## 8.25 logging server

Use this command to send the logs to the specified Syslog Sever in global configuration mode. Use the **no** form of this command to remove the setting. Use the **default** form of this command to restore the default setting.

**logging server** [ **oob** ] { *ip-address* | **ipv6** *ipv6-address* } [ **udp-port** *port* ] [ **vrf** *vrf-name* ]

**no logging server** [ **oob** ] { *ip-address* [ **vrf** *vrf-name* ] | **ipv6** *ipv6-address* }

**no logging server** { *ip-address* [ **vrf** *vrf-name* ] | **ipv6** *ipv6-address* } **udp-port**

| Parameter Description | Parameter                   | Description                                                                                                              |
|-----------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------|
|                       | <b>oob</b>                  | Specifies out-of-band communication for the logging server. (logs are sent through the MGMT port to the logging server.) |
|                       | <i>ip-address</i>           | IP address of the host that receives log information.                                                                    |
|                       | <i>vrf-name</i>             | Specifies the VRF instance (VPN device forwarding table) connecting to the log host.                                     |
|                       | <i>ipv6-address</i>         | Specifies IPV6 address for the host receiving the logs.                                                                  |
|                       | <b>udp-port</b> <i>port</i> | Specifies the port number for the specified host (The default port number is 514).                                       |

- Defaults** No log is sent to any syslog server by default.

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command Mode</b> | Global configuration mode                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Usage Guide</b>  | <p>This command specifies a Syslog server to receive the logs of the device. Users are allowed to configure up to 5 Syslog Servers. The log information will be sent to all the configured Syslog Servers at the same time.</p> <p>The <b>via</b> parameter is available only after the <b>oob</b> parameter is used. The <b>/vrf</b> parameter cannot be used at the same time.</p> <p>The IPv6 server does not support VRF and oob.</p> |

**Configuration** The following example specifies a syslog server of the address 202.101.11.1:

**Examples**

```
Ruijie(config)# logging server 202.101.11.1
```

The following example specifies an ipv6 address as AAAA:BBBB:FFFF:

```
Ruijie(config)# logging server ipv6 AAAA:BBBB:FFFF
```

|---------------------|-------------------------------------------------------------------------------|
| <b>logging on</b>   | Turns on the log switch.                                                      |
| <b>show logging</b> | Displays log messages and related log configuration parameters in the buffer. |
| <b>logging trap</b> | Sets the level of logs allowed to be sent to Syslog server.                   |

**Platform**

N/A

**Description**

## 8.26 logging source interface

Use this command to configure the source interface of logs in global configuration mode. Use the **no** form of this command to restore the default setting.

**logging source [ interface ] interface-type interface-number**

**no logging source [ interface ]**

**Parameter Description**

| Parameter               | Description       |
|-------------------------|-------------------|
| <i>interface-type</i>   | Interface type.   |
| <i>interface-number</i> | Interface number. |

**Defaults**

No source interface is configured by default.

**Command Mode**

Global configuration mode

**Usage Guide**

By default, the source address of the log messages sent to the syslog server is the address of the sending interface. For easy tracing and management, this command can be used to fix the source

address of all log messages as an interface address, so that the administrator can identify which device is sending the message through the unique addresses. If the source interface is not configured on the device, or no IP address is configured for the source interface, the source address of the log messages is the address of the sending interface.

**Configuration** The following example specifies loopback 0 as the source address of the syslog messages:

**Examples**

```
Ruijie(config)# logging source interface loopback 0
```

**Related  
Commands**

| Command        | Description                      |
|----------------|----------------------------------|
| logging server | Sends logs to the Syslog server. |

**Platform  
Description**

N/A

## 8.27 logging source ip | ipv6

Use this command to configure the source IP address of logs in global configuration mode. Use the **no** form of this command to restore the default setting.

**logging source** {ip *ip-address* | ipv6 *ipv6-address*}

**no logging source** { ip | ipv6 }

**Parameter  
Description**

| Parameter           | Description                                                            |
|---------------------|------------------------------------------------------------------------|
| <i>ip-address</i>   | Specifies the source IPV4 address sending the logs to IPV4 log server. |
| <i>ipv6-address</i> | Specifies the source IPV6 address sending the logs to IPV6 log server. |

**Defaults**

No source address is configured by default.

**Command  
Mode**

Global configuration mode

**Usage Guide**

By default, the source address of the log messages sent to the syslog server is the address of the sending interface. For easy tracing and management, this command can be used to fix the source address of all log messages as an address, so that the administrator can identify which device is sending the message through the unique addresses. If this IP address is not configured on the device, the source address of the log messages is the address of the sending interface.

**Configuration** The following example specifies 192.168.1.1 as the source address of the syslog messages:

**Examples**

```
Ruijie(config)# logging source ip 192.168.1.1
```

| Related<br>Commands | Command | Description                 |
|---------------------|---------|-----------------------------|
|                     |         | <code>logging server</code> |

**Platform  
Description** N/A

## 8.28 logging statistic enable

Use this command to enable logging periodically. Use **no** form of this command to restore the default setting.

**logging statistic enable**

**no logging statistic enable**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          |           | N/A         |

**Defaults** This function is disabled by default.

**Command  
Mode** Global configuration mode

**Usage Guide** This command is used to send performance statistics at a certain interval for the server to monitor the system performance.

**Configuration** The following example enables logging periodically.

**Examples**

```
Ruijie(config)# logging statistic enable
```

| Related<br>Commands | Command | Description |
|---------------------|---------|-------------|
|                     |         | N/A         |

**Platform  
Description** N/A

## 8.29 logging statistic interval

Use this command to configure the interval at which logs are sent. Use the **no** form of this command to restore the default setting.

**logging statistic mnemonic *mnemonic interval minutes***

**no logging statistic mnemonic *mnemonic***

| Parameter Description | Parameter       | Description                                                       |
|-----------------------|-----------------|-------------------------------------------------------------------|
|                       | <i>mnemonic</i> | Sets the mnemonics to identify the object.                        |
|                       | <i>minutes</i>  | Sets the interval at which logs are sent, in the unit of minutes. |

**Defaults** The default is 15.

**Command Mode** Global configuration mode

**Usage Guide** The available settings include 0, 15, 30, 60 and 120. 0 indicates this function is disabled.

**Configuration Examples** The following example set the interval at which logs are sent to 30 minutes.

```
Ruijie(config)# logging statistic mnemonic TUNNEL_STAT interval 30
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 8.30 logging statistic terminal

Use this command to enable logs to be sent to the console and the remote terminal periodically. Use the **no** form of this command to restore the default setting.

**logging statistic terminal**  
**no logging statistic terminal**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Global configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example enable logs to be sent to the console and the remote terminal.

```
Ruijie(config)# logging statistic terminal
```

| <b>Related Commands</b> | Command | Description |
|-------------------------|---------|-------------|
|                         | N/A     | N/A         |

**Platform Description** N/A

### 8.31 logging synchronous

Use this command to enable synchronization function between user input and log output in line configuration mode to prevent interruption when the user is keying in characters. Use the **no** form of this command to restore the default setting.

**logging synchronous**

**no logging synchronous**

| <b>Parameter Description</b> | Parameter | Description |
|------------------------------|-----------|-------------|
|                              | N/A       | N/A         |

**Defaults** The synchronization function between user input and log output is disabled by default.

**Command Mode** Line configuration mode

**Usage Guide** This command enables synchronization function between user input and log output, preventing the user from interrupting when keying in the characters.  
Print UP-DOWN logs on the port when keying in the command, the input command will be output again:

```
Ruijie# configure terminal
Oct 9 23:40:55 %LINK-5-CHANGED: Interface GigabitEthernet 0/1, changed state to down
Oct 9 23:40:55 %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet 0/1, changed state to DOWN
Ruijie# configure terminal//---the input command by the user is output again rather than being intererupted.
```

**Configuration Examples**  
Ruijie(config)#**line console 0**  
Ruijie(config-line)#logging synchronous

| <b>Related Commands</b> | Command                    | Description                 |
|-------------------------|----------------------------|-----------------------------|
|                         | <b>show running-config</b> | Displays the configuration. |

**Platform**  
**Description** N/A

## 8.32 logging trap

Use this command to set the severity of logs that are allowed to be sent to the syslog server in global configuration mode. Use the **no** form of this command to prohibit sending log messages to the Syslog server.

**logging trap** [*level*]

**no logging trap**

| Parameter          | Parameter    | Description                                                                                                                     |
|--------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>level</i> | Severity of the log message. The name of the severity or the numeral can be used. For the details of log severity, see Table 1. |

**Defaults** The default is informational(6)

**Command Mode** Global configuration mode

**Usage Guide** To send logs to the Syslog Server, run the **logging** command in global configuration mode to configure the **Syslog Server**. Then, run the **logging trap** command to specify the severity level of logs to be sent.  
The **show logging** command displays the configured related parameters and statistics of the log.

**Configuration Examples** The following example enables logs at severity 6 to be sent to the Syslog Server with the address of 202.101.11.22:

```
Ruijie(config)# logging 202.101.11.22
Ruijie(config)# logging trap informational
```

| Related Commands | Command             | Description                                                                       |
|------------------|---------------------|-----------------------------------------------------------------------------------|
|                  | <b>logging on</b>   | Turns on the log switch.                                                          |
|                  | <b>logging</b>      | Sends logs to the Syslog server.                                                  |
|                  | <b>show logging</b> | Displays the log messages and related log configuration parameters in the buffer. |

**Platform**  
**Description** N/A

## 8.33 logging userinfo

Use this command to enable the logging function to record user log/exit. Use the **no** form of this command to restore the default setting.

**logging userinfo**

**no logging userinfo**

### Parameter Description

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

### Defaults

No log message is printed recording user log/exit by default.

### Command Mode

Global configuration mode

### Usage Guide

This command is used to print the log message to remind the administrator of user login. The log message is in the format as follows:

```
Mar 22 14:05:45 %LOGIN-5-LOGIN_SUCCESS: User login from vty0
(192.168.23.68) OK.
```

### Configuration

The following example enables the logging function to record user log/exit.

### Examples

```
Ruijie(config)# logging user-info
```

### Related Commands

| Command | Description |

### Description

## 8.34 logging userinfo command-log

Use this command to enable the logging function to record user operation. Use the **no** form of this command to restore the default setting.

**logging userinfo command-log**

**no logging userinfo command-log**

### Parameter Description

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

### Defaults

No log message is printed recording user operation by default.

**Command Mode** Global configuration mode

**Usage Guide** This command is used to print the log message to remind the administrator of configuration change. The log message is in the format as follows:

```
Mar 22 14:10:40 %CLI-5-EXEC_CMD: Configured from vty0 (192.168.23.68)
command-log: logging server 192.168.23.68.
```

**Configuration** The following example enables the logging function to record user operation.

**Examples** Ruijie(config)# logging user-info command-log

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

### 8.35 service log-format rfc5424

Use this command to enable the RFC5424 format. Use the **no** form of this command to restore the default setting.

**service log-format rfc5424**

**no service log-format rfc5424**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** The RFC3164 format is used by default.

**Command Mode** Global configuration mode

**Usage Guide** After the RFC5424 format is enabled, the service sequence-numbers, service sysname, **service timestamps**, **service private-syslog** and **service standard-syslog** commands become invalid and hidden.  
 After switching back to the RFC3164 format, the **logging delay-send**, **logging policy** and **logging statistic** commands become invalid and hidden.  
 After switching the log format, the results of running the **show logging** and **show logging config** commands change,

**Configuration** The following example enables the RFC5424 format.

**Examples** `Ruijie(config)# service log-format rfc5424`

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

### 8.36 service private-syslog

Use this command to set the syslog format to the private syslog format. Use the **no** form of this command to restore the default setting.

**service private-syslog**  
**no service private-syslog**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** The syslog is displayed in the default format.

**Command Mode** Global configuration mode

**Usage Guide** By default, the syslog is displayed in the format as follows:  
 \*timestamp: %facility-severity-mnemonic: description  
 Here is an example:  
`*May 31 23:25:21: %SYS-5-CONFIG_I: Configured from console by console`  
 With this function enabled, the syslog is displayed in the format as follows:  
 timestamp facility-severity-mnemonic: description  
 Here is an example:  
`May 31 23:31:28 SYS-5-CONFIG_I: Configured from console by console`  
 The difference between the private syslog format and the default syslog format lies in the following marks:  
 The private syslog does not have "\*" before the timestamp, ":" after the timestamp and "%" before the identifying string.

**Configuration** The following example sets the private syslog format.

**Examples** `Ruijie(config)# service private-syslog`

**Related  
Commands**

| Command | Description |
|---------|-------------|
| N/A     | N/A         |

**Platform**

**Description**

## 8.37 service sequence-numbers

Use this command to attach serial numbers into the logs in global configuration mode. Use the **no** form of this command to restore the default setting.

**service sequence-numbers**

**no service sequence-numbers**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

No serial number is contained in the logs by default.

**Command  
Mode**

Global configuration mode

**Usage Guide**

In addition to the timestamp, you can add serial numbers to the logs, numbering from 1. Then, it is clearly known whether the logs are lost or not and their sequence.

**Configuration**

The following example adds serial numbers to the logs.

**Examples**

```
Ruijie(config)# service sequence-numbers
```

**Related  
Commands**

| Command                   | Description                      |
|---------------------------|----------------------------------|
| <b>logging on</b>         | Turns on the log switch.         |
| <b>service timestamps</b> | Attaches timestamps to the logs. |

**Platform**

N/A

**Description**

## 8.38 service standard-syslog

Use this command to set the syslog format to the standard syslog format defined in RFC3164. Use the **no** form of this command to restore the default setting.

**service standard-syslog**

**no service standard-syslog**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** The syslog is displayed in the default format.

**Command Mode** Global configuration mode

**Usage Guide** By default, the syslog is displayed in the format as follows:

\*timestamp: %facility-severity-mnemonic: description

Here is an example:

```
*May 31 23:25:21: %SYS-5-CONFIG_I: Configured from console by console
```

With this function enabled, the syslog is displayed in the format as follows:

timestamp %facility-severity-mnemonic: description

Here is an example:

```
May 31 23:31:28 %SYS-5-CONFIG_I: Configured from console by console
```

The difference between the standard syslog format and the default syslog format lies in the following marks:

The standard syslog does not have "\*" before the timestamp and ":" after the timestamp.

**Configuration** The following example sets the standard syslog format.

**Examples** Ruijie(config)# service standard-syslog

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 8.39 service sysname

Use this command to attach system name to logs in global configuration mode. Use the **no** form of this command to restore the default setting.

**service sysname**

**no service sysname**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** No system name is attached to logs by default.

**Command Mode** Global configuration mode

**Usage Guide** This command allows you to decide whether to add system name in the log information.

**Configuration** The following example adds a system name in the log information:

**Examples**

```
Mar 22 15:28:02 %SYS-5-CONFIG: Configured from console by console
Ruijie #config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie (config)#service sysname
Ruijie (config)#end
Ruijie #
Mar 22 15:35:57 S3250 %SYS-5-CONFIG: Configured from console by console
```

**Related Commands**

|---------------------|--------------------------------------------------------------------------------|
| <b>show logging</b> | Displays basic configuration of log modules and log information in the buffer. |

**Platform Description** N/A

## 8.40 service timestamps

Use this command to attach timestamp into logs in global configuration mode. Use the **no** form of this command to remove the timestamp from the logs. Use the **default** form of this command to restore the default setting.

**service timestamps** [ *message-type* [ **uptime** | **datetime** [ **msec** | **year** ] ] ]

**no service timestamps** [ *message-type* ]

**default service timestamps** [ *message-type* ]

**Parameter Description**

| Parameter           | Description                                                                                                                                                                                         |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>message-type</i> | The log type, including <b>Log</b> and <b>Debug</b> . The <b>log</b> type indicates the log information with severity levels of 0 to 6. The <b>debug</b> type indicates that with severity level 7. |
| <b>uptime</b>       | Device start time in the format of *Day*Hour*Minute*Second, for example, 07:00:10:41.                                                                                                               |
| <b>datetime</b>     | Current time of the device in the format of Month*Date*Hour*Minute*Second, for example, Jul 27 16:53:07.                                                                                            |

|             |                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------|
| <b>msec</b> | Current time of the device in the format of Month*Date*Hour*Minute*Second*milisecond, for example, Jul 27 16:53:07.299 |
| <b>year</b> | Current time of the device in the format of Year*Month*Date*Hour*Minute*Second, for example, 2007 Jul 27 16:53:07      |

**Defaults** The time stamp in the log information is the current time of the device. If the device has no RTC, the time stamp is automatically set to the device start time.

**Command Mode** Global configuration mode

**Usage Guide** When the **uptime** option is used, the time format is the running period from the last start of the device to the present time, in seconds. When the **datetime** option is used, the time format is the date of the current device, in the format of YY-MM-DD, HH:MM:SS.

**Configuration Examples** The following example enables the timestamp for **log** and **debug** information, in format of Datetime, supporting millisecond display.

```
Ruijie(config)# service timestamps debug datetime msec
Ruijie(config)# service timestamps log datetime msec
Ruijie(config)# end
Ruijie(config)# Oct 8 23:04:58.301 %SYS-5-CONFIG I: configured from console by console
```

| Related Commands | Command                         | Description                     |
|------------------|---------------------------------|---------------------------------|
|                  | <b>logging on</b>               | Turns on the log switch.        |
|                  | <b>service sequence-numbers</b> | Enables serial numbers of logs. |

**Platform Description** N/A

## 8.41 show logging

Use this command to display configured parameters and statistics of logs and log messages in the memory buffer at privileged user layer. The log messages are sorted by the timestamp from before to now.

**show logging**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration Examples** The following command displays the result of the **show logging** command with RFC5424 format disabled.

```
Ruijie# show logging
Syslog logging: enabled
  Console logging: level debugging, 15495 messages logged
  Monitor logging: level debugging, 0 messages logged
  Buffer logging: level debugging, 15496 messages logged
  Standard format: false
  Timestamp debug messages: datetime
  Timestamp log messages: datetime
  Sequence-number log messages: enable
  Sysname log messages: enable
  Count log messages: enable
  Trap logging: level informational, 15242 message lines logged,0 fail
    logging to 202.101.11.22
    logging to 192.168.200.112
Log Buffer (Total 131072 Bytes): have written 1336,

## 8.42 show logging config

Use this command to display log configuration and statistics.

**show logging config**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

N/A

**Command  
Mode**

Privileged EXEC mode

**Usage Guide** N/A

**Configuration Examples** The following example displays the outcome of running the **show logging config** command with RFC5424 disabled.

```
Ruijie# show logging config
Syslog logging: enabled
  Console logging: level debugging, 15495 messages logged
  Monitor logging: level debugging, 0 messages logged
  Buffer logging: level debugging, 15496 messages logged
  Standard format: false
  Timestamp debug messages: datetime
  Timestamp log messages: datetime
  Sequence-number log messages: enable
  Sysname log messages: enable
  Count log messages: enable
  Trap logging: level informational, 15242 message lines logged, 0 fail
    logging to 202.101.11.22
    logging to 192.168.200.112
```

| Field                        | Description                                                                |
|------------------------------|----------------------------------------------------------------------------|
| Syslog logging               | Whether the logging function is enabled or disabled.                       |
| Console logging              | The level and statistics of the log message printed on the console.        |
| Monitor logging              | The level and statistics of the log message printed on the VTY window.     |
| Buffer logging               | The level and statistics of the log message recorded in the memory buffer. |
| Standard format              | Standard log format.                                                       |
| Timestamp debug messages     | Timestamp format of debugging message.                                     |
| Timestamp log messages       | Timestamp format of log message.                                           |
| Sequence-number log messages | Whether the sequence number function is enabled or disabled.               |
| Sysname log messages         | Adds the system name to the log message.                                   |
| Count log messages           | Log-counting function                                                      |
| Trap logging                 | The level and statistics of the log message sent to the syslog server.     |

The following example displays the outcome of running the **show logging config** command with RFC5424 enabled.

```
Ruijie# show logging
Syslog logging: enabled
  Console logging: level debugging, 4740 messages logged
  Monitor logging: level debugging, 0 messages logged
  Buffer logging: level debugging, 4745 messages logged
  Statistic log messages: disable
  Statistic log messages to terminal: disable
```

```

Delay-send file name:syslog_ftp_server, Current write index:3, Current
send index:3, Cycle:10 seconds
Count log messages: enable
Trap logging: level informational, 2641 message lines logged,4155 fail
logging to 192.168.23.89
logging to 2000::1
Delay-send logging: 2641 message lines logged
logging to 192.168.23.89 by tftp

```

## 8.43 show logging count

Use this command to display the statistics about occurrence times, and the last occurrence time of each module log in the system in privileged mode.

**show logging count**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** To use the log packet statistics function, run the **logging count** command in global configuration mode. The **show logging count** command can show the information of a specific log, occurrence times, and the last occurrence time.

You can use the **show logging** command to check whether the log statistics function is enabled.

**Configuration Examples** The following example displays the result of the **show logging count** command:

```
Ruijie# show logging count
Module Name  Message Name  Sev  Occur   Last Time
SYS          CONFIG_I      5    1      Jul 6 10:29:57
SYS TOTAL                    1
```

| Related Commands | Command              | Function                                                                       |
|------------------|----------------------|--------------------------------------------------------------------------------|
|                  | <b>logging count</b> | Enables the log statistics function.                                           |
|                  | <b>show logging</b>  | Displays basic configuration of log modules and log information in the buffer. |
|                  | <b>clear logging</b> | Clears the logs in the buffer.                                                 |

**Platform Description** N/A

## 8.44 show logging reverse

Use this command to display configured parameters and statistics of logs and log messages in the memory buffer at privileged user layer. The log messages are sorted by the timestamp from now to before.

**show logging reverse**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide**

**Configuration Examples** The following command displays the result of the **show logging reverse** command with RFC5424 format disabled.

```

Ruijie# show logging reverse
Syslog logging: enabled
  Console logging: level debugging, 15495 messages logged
  Monitor logging: level debugging, 0 messages logged
  Buffer logging: level debugging, 15496 messages logged
  Standard format: false
  Timestamp debug messages: datetime
  Timestamp log messages: datetime
  Sequence-number log messages: enable
  Sysname log messages: enable
  Count log messages: enable
  Trap logging: level informational, 15242 message lines logged,0 fail
    logging to 202.101.11.22
    logging to 192.168.200.112
Log Buffer (Total 131072 Bytes): have written 1336,

## 8.45 terminal monitor

Use this command to show logs on the current VTY window. Use the **no** form of this command to restore the default setting.

**terminal monitor**

**terminal no monitor**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

Log information is not allowed to be displayed on the VTY window by default.

**Command  
Mode**

Privileged EXEC mode

**Usage Guide**

This command only sets the temporary attributes of the current VTY. As the temporary attribute, it is not stored permanently. At the end of the VTY terminal session, the system will use the default setting, and the temporary setting is invalid. This command can be also executed on the console, but it does not take effect.

**Configuration**

The following example allows log information to be printed on the current VTY window:

**Examples**

```
Ruijie# terminal monitor
```

## 9. CWMP Commands

### 9.1 acs password

Use this command to configure the ACS password to be authenticated for the CPE to connect to the ACS. Use the **no** form of this command to cancel the configuration.

**acs password** { *password* | *encryption-type encrypted-password* }

**no acs password**

**Parameter Description**

| Parameter                 | Description                                                                                                                                    |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>password</i>           | Configures the ACS user password to be authenticated for the CPE to connect to the ACS.                                                        |
| <i>encryption-type</i>    | Specifies the encryption type, which can be set to 0 (indicating that no encryption is used) or 7 (indicating that simple encryption is used). |
| <i>encrypted-password</i> | Specifies the password in encrypted form.                                                                                                      |

**Defaults**  
 encryption-type: 0  
 encrypted-password: N/A

**Command Mode**  
 CWMP configuration mode

**Usage Guide** Use this command to configure the ACS user password to be authenticated for the CPE to connect to the ACS. In general, the encryption type does not need to be specified. The encryption type needs to be specified only when copying and pasting the encrypted password of this command. A valid password should meet the following format requirements:

-  The command contains English letters in upper or lower case and numeric characters.
-  Blanks are allowed at the beginning of the password but will be ignored. Intermediate and ending blanks, however, are regarded as a part of the password.

**Configuration Examples** The following example configures the ACS password to be authenticated for the CPE to connect to the ACS to 123.

```
Ruijie#config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#cwmp
Ruijie(config-cwmp)#acs password 123
Ruijie(config-cwmp)#
```

**Related  
Commands**

| Command                        | Description                                                                        |
|--------------------------------|------------------------------------------------------------------------------------|
| <b>show cwmp configuration</b> | Displays the current configuration of CWMP.                                        |
| <b>show cwmp status</b>        | Displays the running status of CWMP.                                               |
| <b>acs username</b>            | Configures the ACS username to be authenticated for the CPE to connect to the ACS. |

**Platform** N/A**Description**

## 9.2 acs url

Use this command to configure the URL of the ACS to which the CPE will connect.

Use the **no** form of this command to restore the default setting.

**acs url** *url*

**no acs url**

**Parameter  
Description**

| Parameter  | Description                   |
|------------|-------------------------------|
| <i>url</i> | Specifies the URL of the ACS. |

**Defaults** N/A**Command  
Mode** CWMP configuration mode

**Usage Guide** Use this command to configure the URL of the ACS to which the CPE will connect. If no ACS URL is manually specified but a dynamic ACS URL is obtained through DHCP, the CPE initiates a connection to the ACS using the dynamically obtained ACS URL. The URL of the ACS should meet the following format requirements:

- The URL of the ACS is formatted as `http://ip [: port ]/ path`.
- The URL of the ACS consists of at most 255 characters.

**Configuration Examples** The following example specifies the URL of the ACS to `http://10.10.10.1: 7547/acs`.

**Examples**

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#cwmp
Ruijie(config-cwmp)#acs url http://10.10.10.1:7547/acs
Ruijie(config-cwmp)#
```

| Related Commands | Command                        | Description                                 |
|------------------|--------------------------------|---------------------------------------------|
|                  | <b>show cwmp configuration</b> | Displays the current configuration of CWMP. |
|                  | <b>show cwmp status</b>        | Displays the running status of CWMP.        |

**Platform** N/A

**Description**

### 9.3 acs username

Use this command to configure the ACS username to be authenticated for the CPE to connect to the ACS. Use the **no** form of this command to restore the default setting.

**acs username** *username*

**no acs username**

| Parameter Description | Parameter | Description     |
|-----------------------|-----------|-----------------|
|                       |           | <i>username</i> |

**Defaults** N/A

**Command** CWMP configuration mode

**Mode**

**Usage Guide** Configures the ACS username to be authenticated for the CPE to connect to the ACS.

**Configuration Examples** The following example configures the ACS username to be authenticated for the CPE to connect to the ACS to admin.

```
Ruijie#config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#cwmp
Ruijie(config-cwmp)#acs username admin
Ruijie(config-cwmp)#
```

| Related Commands | Command                        | Description                                                                        |
|------------------|--------------------------------|------------------------------------------------------------------------------------|
|                  | <b>show cwmp configuration</b> | Displays the current configuration of CWMP.                                        |
|                  | <b>show cwmp status</b>        | Displays the running status of CWMP.                                               |
|                  | <b>acs password</b>            | Configures the ACS password to be authenticated for the CPE to connect to the ACS. |

**Platform** N/A  
**Description**

## 9.4 cpe back-up

Use this command to enable the CPE backup function.  
 Use the **no** form of this command to restore the default setting.

**cpe back-up** [*delay-time seconds*]  
**no cpe back-up**

**Parameter Description**

| Parameter      | Description                 |
|----------------|-----------------------------|
| <i>seconds</i> | Sets the backup delay time. |

**Defaults** The default is 60 seconds.

**Command Mode** CWMP configuration mode

**Usage Guide** After upgrading main programs or configurations, CPE cannot communicate with ACS for wrong configuration delivery. Use this command to recover the previous programs and configurations.

**Configuration** The following example disables the CPE backup function.

**Examples**

```
Ruijie#config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#cwmp
Ruijie(config-cwmp)#no cpe back-up
Ruijie(config-cwmp)#
```

**Platform** N/A  
**Description**

## 9.5 cpe inform

Use this command to configure the periodic notification function of the CPE.  
 Use the **no** form of this command to restore the default setting

**cpe inform** [ *interval seconds* ] [ *start-time time* ]  
**no cpe inform**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|                |                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------|
| <i>seconds</i> | Specifies the periodical notification interval of the CPE in the range from 30 to 3,600 in the unit of seconds. |
| <i>time</i>    | Specifies the date and time for starting periodical notification in yyyy-mm-ddThh:mm:ss format.                 |

**Defaults** The default is 600 seconds.

**Command Mode** CWMP configuration mode

**Usage Guide** Use this command to configure the periodic notification function of the CPE.

- If the time for starting periodical notification is not specified, periodical notification starts after the periodical notification function is enabled. The notification is performed once within every notification interval.
- If the time for starting periodical notification is specified, periodical notification starts at the specified start time. For instance, if the periodical notification interval is set to 60 seconds and the start time is 12:00 am next day, periodical notification will start at 12:00 am next day and once every 60 seconds.

 The narrower periodical notification interval allows the ACS to track the latest CPE status more accurately. However, narrower periodical notification interval brings about more sessions between the CPE and the ACS, consuming more resources of them. So the user should specify the periodical notification interval of the CPE to a reasonable value according to the network performance and the ACS performance.

**Configuration Examples** The following example specifies the periodical notification interval of the CPE to 60 seconds.

```
Ruijie#config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#cwmp
Ruijie(config-cwmp)#cpe inform interval 60
Ruijie(config-cwmp)#
```

**Related Commands**

| Command                        | Description                                 |
|--------------------------------|---------------------------------------------|
| <b>show cwmp configuration</b> | Displays the current configuration of CWMP. |
| <b>show cwmp status</b>        | Displays the running status of CWMP.        |

**Platform Description** N/A

## 9.6 cpe password

Use this command to configure the CPE password to be authenticated for the ACS to connect to the CPE. Use the **no** form of this command to cancel the configuration.

**cpe password** { *password* | *encryption-type encrypted-password* }

**no cpe password**

### Parameter Description

| Parameter                 | Description                                                                                                                                    |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>password</i>           | Configures the CPE user password to be authenticated for the ACS to connect to the CPE.                                                        |
| <i>encryption-type</i>    | Specifies the encryption type, which can be set to 0 (indicating that no encryption is used) or 7 (indicating that simple encryption is used). |
| <i>encrypted-password</i> | Specifies the password in encrypted form.                                                                                                      |

### Defaults

encryption-type: 0  
encrypted-password: N/A

### Command Mode

CWMP configuration mode

### Usage Guide

Use this command to configure the CPE user password to be authenticated for the ACS to connect to the CPE. In general, the encryption type does not need to be specified. The encryption type needs to be specified only when copying and pasting the encrypted password of this command. A valid password should meet the following format requirements:

-  The command contains English letters and numeric characters.
-  Blanks are allowed at the beginning of the password but will be ignored. Intermediate and ending blanks, however, are regarded as a part of the password.

### Configuration Examples

The following example configures the CPE password to be authenticated for the ACS to connect to the CPE to 123.

```
Ruijie#config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#cwmp
Ruijie(config-cwmp)#cpe password 123
Ruijie(config-cwmp)#
```

### Related Commands

## 9.7 cpe url

Use this command to configure the URL of the CPE to which the ACS will connect. Use the **no** form of this command to restore default setting.

**cpe url** *url*  
**no cpe url**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       |           | <i>url</i>  |

**Defaults** N/A

**Command Mode** CWMP configuration mode

**Usage Guide** Use this command to configure the URL of the CPE to which the ACS will connect. If no CPE URL is manually specified but a dynamic CPE URL is obtained through DHCP, the ACS initiates a connection to the CPE using the dynamically obtained CPE URL. The URL of the CPE should meet the following format requirements:

- The URL of the CPE is formatted as `http://ip [: port ]/ path`.
- The URL of the CPE consists of at most 255 characters.

**Configuration Examples** The following example specifies the URL of the CPE to `http://10.10.10.1:7547/acs`.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#cwmp
Ruijie(config-cwmp)#cpe url Hhttp://10.10.10.1:7547/
Ruijie(config-cwmp)#
```

|                  | <b>show cwmp configuration</b> | Displays the current configuration of CWMP. |
|                  | <b>show cwmp status</b>        | Displays the running status of CWMP.        |

**Platform** N/A  
**Description**

## 9.8 cpe username

Use this command to configure the ACS username to be authenticated for the CPE to connect to the ACS.

Use the **no** form of this command to restore the default setting.

**cpe username** *username*

**no cpe username**

| Parameter Description | Parameter       | Description                                                                        |
|-----------------------|-----------------|------------------------------------------------------------------------------------|
|                       | <i>username</i> | Configures the CPE username to be authenticated for the ACS to connect to the CPE. |

**Defaults** N/A

**Command Mode** CWMP configuration mode

**Usage Guide** Configures the CPE username to be authenticated for the ACS to connect to the CPE.

**Configuration Examples** The following example configures the CPE username to be authenticated for the ACS to connect to the CPE to admin.

```
Ruijie#config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#cwmp
Ruijie(config-cwmp)#cpe username admin
Ruijie(config-cwmp)#
```

| Related Commands | Command                        | Description                                                                        |
|------------------|--------------------------------|------------------------------------------------------------------------------------|
|                  | <b>show cwmp configuration</b> | Displays the current configuration of CWMP.                                        |
|                  | <b>show cwmp status</b>        | Displays the running status of CWMP.                                               |
|                  | <b>cpe password</b>            | Configures the CPE password to be authenticated for the ACS to connect to the CPE. |

**Platform** N/A  
**Description**

## 9.9 cwmp

Use this command to enable the CWMP function.

Use the **no** form of this command to disable this function.

**cwmp**

**no cwmp**

### Parameter Description

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

### Defaults

**Command Mode** Global configuration mode

**Usage Guide** Use this command to enable or disable the CWMP function.

**Configuration Examples** The following example disables the CWMP function.

### Examples

```
Ruijie#config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#no cwmp
Ruijie(config)#
```

| CPE URL                | URL of the CPE.                                                                                 |
| CPE username           | CPE username to be authenticated for the ACS to connect to the CPE.                             |
| CPE password           | CPE password to be authenticated for the ACS to connect to the CPE.                             |
| CPE inform status      | Status of CPE periodical notification function.                                                 |
| CPE inform interval    | CPE periodical notification interval.                                                           |
| CPE wait timeout       | Timeout period of CPE sessions.                                                                 |
| CPE inform start time  | The start time of periodical notification.                                                      |
| CPE download status    | Indicates whether to download main program and configuration files from the ACS.                |
| CPE upload status      | Indicates whether to upload configuration files and log files to the ACS.                       |
| CPE back up status     | Indicates whether backup and restoration of the main program and configuration file is enabled. |
| CPE back up delay time | Delay time of the backup and restoration of the main program and configuration files.           |

**Related Commands**

| Command                 | Description                          |
|-------------------------|--------------------------------------|
| <b>show cwmp status</b> | Displays the running status of CWMP. |

**Platform** N/A  
**Description**

### 9.13 show cwmp status

Uses this command to display the running status of CWMP

**show cwmp status**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|     |     |
|-----|-----|
| N/A | N/A |
|-----|-----|

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays the running status of CWMP.

```

Examples Ruijie#show cwmp status
CWMP Status           : enable
Session status        : Close
Last success session   : Unknown
Last success session time : Thu Jan 1 00:00:00 1970
Last fail session      : Unknown
Last fail session time : Thu Jan 1 00:00:00 1970
Session retry times    : 0
    
```

The descriptions to the fields shown after executing the command **show cwmp configuration**.

| Field                     | Description                                                   |
|---------------------------|---------------------------------------------------------------|
| CWMP Status               | The running status of CWMP                                    |
| Session status            | The current status of the session between the CPE and the ACS |
| Last success session      | The last success session type                                 |
| Last success session time | The last success session time                                 |
| Last fail session         | The last failed session type                                  |
| Last fail session time    | The last failed session time                                  |
| Session retry times       | The number of session retransmission attempts                 |

| Related Commands | Command                        | Description                                 |
|------------------|--------------------------------|---------------------------------------------|
|                  | <b>show cwmp configuration</b> | Displays the current configuration of CWMP. |

**Platform Description** N/A

### 9.14 timer cpe-timeout

Uses this command to configure the session timeout period of the CPE.

**timer cpe- timeout** *seconds*

**no timer cpe-timeout**

| Parameter Description | Parameter      | Description                                                                   |
|-----------------------|----------------|-------------------------------------------------------------------------------|
|                       | <i>seconds</i> | Sets the session timeout, in the range from 10 to 600 in the unit of seconds. |

**Defaults** By default, the session timeout period is 30 seconds.

**Command Mode** CWMP configuration mode

**Usage Guide** Use this command to configure the session timeout period of the CPE.  
The maximum waiting period that the CPE has when the CPE failed to receive the ACS reply.

**Configuration Examples** The following example configures the session timeout period of the CPE to 50 seconds.

```
Ruijie#config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#cwmp
Ruijie(config-cwmp)#timer cpe-timeout 50
Ruijie(config-cwmp)#
```

| Related Commands | Command                        | Description                                 |
|------------------|--------------------------------|---------------------------------------------|
|                  | <b>show cwmp configuration</b> | Displays the current configuration of CWMP. |
|                  | <b>show cwmp status</b>        | Displays the running status of CWMP.        |

**Platform Description** N/A

## 10. Module Hot-plugging/ unplugging Commands

### 10.1 remove configuration module slot-num

Use this command to remove the module configurations.

**remove configuration module** *slot-num*

**Parameter  
Description**

| Parameter       | Description  |
|-----------------|--------------|
| <i>slot-num</i> | Slot number. |

**Defaults** N/A

**Command  
Mode** Global configuration mode.

**Usage Guide** Use this command to remove the module configurations. This command is invalid for module in on-line status. If there is a module inserted in the slot, this module will be reset.

**Configuration** The following example clears the configuration on slot 4.

**Examples**

```
Ruijie(config)# remove configure module 4
```

**Related  
Commands**

| Command | Description |
|---------|-------------|
| N/A     | N/A         |

**Platform  
Description** N/A

### 10.2 remove configuration device device-id

Use this command to remove the configuration on a VSU device, which validates in VSU mode after restart.

**remove configuration device** *device-id*

**Parameter  
Description**

| Parameter        | Description         |
|------------------|---------------------|
| <i>device-id</i> | The chassis number. |

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** This command is used to remove the configuration on a VSU device. It validates after the device is restarted.

**Configuration** The following example clears the configuration on device 1.

**Examples** `Ruijie(config)# remove configuration device 1`

**Related Commands**

| Command | Description |
|---------|-------------|
| N/A     | N/A         |

**Platform Description** N/A

### 10.3 show alarm

Use this command to display system alarm messages, concerning card startup failure, temperature, power, and fan alarms.

**show alarm**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays system alarm messages.

**Examples**

```
Ruijie#show alarm

Dev  Module          Level  Info
-----
-----
1    DEV              Warning Some fans are absent.
```

| 1      | DEV | Critical Some cards are in cannot-startup state.                                |
|--------|-----|---------------------------------------------------------------------------------|
| Field  |     | Description                                                                     |
| Dev    |     | Device ID                                                                       |
| Module |     | Service module                                                                  |
| Level  |     | Alarm level, including Critical and Warning                                     |
| Info   |     | Alarm cause, such as system power shortage fan absence and card startup failure |

**Related Commands**

| Command | Description |
|---------|-------------|
| N/A     | N/A         |

**Platform Description** N/A

## 10.4 show manuinfo

Use this command to display asset information about all independent components in the system for asset management, including the chassis, fan, power, management board, and line card. The information covers the ID, slot number, name, serial number (SN), software and hardware version, and MAC address. Not all devices support display of the same information and only supported information is printed.

**show manuinfo**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command is used to display asset information about all independent components in the system

**Configuration Examples** The following example displays asset information of the single physical device.

```
Ruijie#show manuinfo
Device 1
  Location:           Chassis
  Device name:       RG S12006
  Device Serial Number: 62150129A8B0DAF0F0321
  Hardware Version:  V1.0
```

```
Mac Address:                00.D0.F8.00.11.22

Device 2
  Location:                  Slot-M1
  Device name:               M12000 CM
  Device Serial Number:     32150129A8B0DAF0F0321
  Hardware Version:         V1.0
  Software Version:         RGOS 10.4(3b17) Release 129646
  Mac Address:               00.D0.F8.00.11.34

Device 3
  Location:                  Slot-1
  Device name:               M12000-04XFP-EA
  Device Serial Number:     32150129A8B0DAF0F0322
  Hardware Version:         V1.0
  Software Version:         RGOS 10.4(3b17) Release 129646

Device 4
  Location:                  Slot-2
  Device name:               M12000-04XFP-EA
  Device Serial Number:     32150129A8B0DAF0F0323
  Hardware Version:         V1.0
  Software Version:         RGOS 10.4(3b17) Release 129646

Device 5
  Location:                  Power 1
  Device name:               RG PD1200I
  Device Serial Number:     42150129A8B0DAF0F0321
  Hardware Version:         V1.0

Device 6
  Location:                  Power 2
  Device name:               RG PD1200I
  Device Serial Number:     42150129A8B0DAF0F0322
  Hardware Version:         V1.0

Device 7
  Location:                  FAN
  Device name:               M12000 FAN
  Device Serial Number:     52150129A8B0DAF0F0321
  Hardware Version:         V1.0
```

The following example displays asset information in VSU mode.

```
Ruijie#show manuinfo
Device 1
```

```
Location:                Chassis 1
Device name:              RG S12006
Device Serial Number:    62150129A8B0DAF0F0321
Hardware Version:        V1.0
Mac Address:              00.D0.F8.00.11.22

Device 2
Location:                Slot-1/M1
Device name:              M12000 CM
Device Serial Number:    32150129A8B0DAF0F0321
Hardware Version:        V1.0
Software Version:        RGOS 10.4(3b17) Release 129646
Mac Address:              00.D0.F8.00.11.56

Device 3
Location:                Slot-1/1
Device name:              M12000-04XFP-EA
Device Serial Number:    32150129A8B0DAF0F0322
Hardware Version:        V1.0
Software Version:        RGOS 10.4(3b17) Release 129646

Device 4
Location:                Slot-1/2
Device name:              M12000-04XFP-EA
Device Serial Number:    32150129A8B0DAF0F0323
Hardware Version:        V1.0
Software Version:        RGOS 10.4(3b17) Release 129646

Device 5
Location:                Power 1/1
Device name:              RG PD1200I
Device Serial Number:    42150129A8B0DAF0F0321
Hardware Version:        V1.0

Device 6
Location:                Power 1/2
Device name:              RG PD1200I
Device Serial Number:    42150129A8B0DAF0F0322
Hardware Version:        V1.0

Device 7
Location:                FAN 1

## 10.6 show version module detail

Use this command to display the details of the module.

**show version module detail** [ *slot-num* ]

**show version module detail** [ *device-id / slot-num* ]

**Parameter Description**

| Parameter        | Description           |
|------------------|-----------------------|
| <i>device-id</i> | (Optional) Device ID. |
| <i>slot-num</i>  | (Optional) Slot ID.   |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** Use this command to display details of the module

**Configuration**

```
Ruijie# show version module detail 2
```

**Examples**

```
Device : 1
Slot   : 2
User Status : none
Software Status: none
Online Module :
Type :
Ports : 0
Version :
Configured Module :
Type :
Ports :
Version :

# 11. Supervisor Module Redundancy Commands

## 11.1 auto-sync time-period

Use this command to configure the auto-sync time-period of running-config and startup-config when the dual supervisor module is redundant. Use the **no** form of this command to disable automatic synchronization for the dual supervisor modules. Use the **default** form of this command to restore the default automatic synchronization time period for the dual supervisor modules.

**auto-sync time-period** *value*

**no auto-sync time-period**

**default auto-sync time-period**

| Parameter Description | Parameter    | Description                                                                                                                 |
|-----------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------|
|                       | <i>value</i> | Automatic synchronization time interval measured in seconds, in the range from one second to one month (2,678,400 seconds). |

**Defaults** The default is one hour (3600 seconds) by default.

**Command Mode** Redundancy configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example sets the automatic synchronization interval to 60 seconds.

```
Ruijie(config)# redundancy
Ruijie(config-red)# auto-sync time-period 60
Redundancy auto-sync time-period: enabled (60 seconds).
Ruijie(config-red)# exit
```

The following example disables automatic synchronization.

```
Ruijie(config)# redundancy
Ruijie(config-red)# no auto-sync time-period
Redundancy auto-sync time-period: disabled.
Ruijie(config-red)# exit
```

## 11.3 redundancy forceswitch

Use this command to perform active/standby supervisor module switchover.

**redundancy forceswitch**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** If this command is executed on the active supervisor module, the module will be reset and the standby supervisor module will act as an active supervisor module.

The following conditions are required to perform hot backup switchover:

- This command is executed on the active supervisor module. There is a standby supervisor module.
- Hot backups on all virtual switch devices (VSDs) are in real-time status.
- Hot backup switchovers on VSDs are not prevented temporarily by any service entity.

When there are multiple VSDs, the system judges whether the hot backup on each VSD allows active/standby switchover; If any VSD does not allow the switchover, the command fails. Otherwise, active/standby switchovers are enforced on all VSDs.

**Configuration** The following example performs active/standby supervisor module switchover.

**Examples**

```
Ruijie# redundancy forceswitch
This operation will reload the master unit and force switchover to the
slave unit. Are you sure to continue? [N/y] y
```

|------------------|---------------|--------------------------------------|
|                  | <b>reload</b> | Resets the active supervisor module. |

**Platform** N/A  
**Description**

## 11.4 redundancy reload

Use this command to reset the supervisor module.

**redundancy reload { peer | shelf [ switchid ] }**

| Parameter Description | Parameter                                                                                                                                                                                                                                                                 | Description                           |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|
|                       | <b>peer</b>                                                                                                                                                                                                                                                               | Resets the standby supervisor module. |
| <b>shelf</b>          | Resets both the active and standby supervisor modules on the device which works as a single physical device. The device ID should be specified on the device which works as a Virtual Switching Unit (VSU) device.                                                        |                                       |
| <i>switchid</i>       | VSU device ID, supported on a VSU device.<br><br> This parameter is not supported in stand-alone mode. It must be contained in the <b>redundancy reload shelf</b> command in VSU mode. |                                       |

**Defaults** N/A

**Command** Privileged EXEC mode  
**Mode**

**Usage Guide** Resetting the supervisor module does not affect data forwarding. Data forwarding will not be interrupted and the user session information will not be missing.  
The **redundancy reload shelf** command is used to reset the device which works as a single physical device. The **redundancy reload shelf switchid** command is used to reset the specified device which works as a VSU device.

**Configuration** The following example resets the standby supervisor module.

**Examples**

```
Ruijie# redundancy reload peer
This operation will reload the current slave unit. Are you sure to
continue? [N/y] y
Preparing to reload peer!
```

The following example resets device 2 which works as a VSU device.

```
Ruijie# redundancy reload shelf 2
This operation will reload the device 2. Are you sure to continue? [N/y] y
Preparing to reload device 2!
```

| Related Commands | Command | Description |
|------------------|---------|-------------|

**Platform** N/A  
**Description**

## 11.5 show redundancy states

Use this command to display the current redundancy state.  
**show redundancy states**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | -         | -           |

**Defaults** N/A

**Command** User EXEC mode / Privileged EXEC mode  
**Mode**

**Usage Guide** Currently, only 1:1 hot backup (for the global active module and standby module) is supported in the VSU mode. Therefore, only the hot backup state of the local and peer device is displayed.

If the system is configured with multiple VSDs, the hot backup state of all VSDs is displayed in VSD 0 in global configuration mode.

**Configuration** The following example displays the redundancy states of active supervisor module.

**Examples**

```
Ruijie> enable
Ruijie# show redundancy states
Redundancy role: master
Redundancy state: realtime
Auto-sync time-period: 3600 s
```

```
Redundancy management role: master
Redundancy control role: active
Redundancy control state: realtime
Auto-sync time-period: 3600 s
```

The following example displays the redundancy state of the standby supervisor module.

```
Ruijie> enable
Ruijie# show redundancy states
Redundancy role: slave
Redundancy state: realtime
```

```
Redundancy management role: slave
Redundancy control role: standby
Redundancy control state: realtime
```

The following example displays the redundancy state of the candidate supervisor module.

```
Ruijie> enable
Ruijie# show redundancy states
Redundancy role: candidate
Redundancy state: none

Redundancy management role: candidate
Redundancy control role: standby
Redundancy control state: realtime
```

The following example displays the redundancy state of the active supervisor module with VSD1 and VSD2 configured.

```
Ruijie> enable
Ruijie# show redundancy states
Redundancy role: master
Redundancy state: realtime
Auto-sync time-period: 3600 s
```

```

Redundancy management role: master
Redundancy control role: active
Redundancy control state: realtime
Auto-sync time-period: 3600 s

VSD vsd1 redundancy state: realtime
VSD vsd2 redundancy state: realtime
    
```

| Field                              | Description                                                                                                                                                        |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| role                               | The role of the supervisor module.                                                                                                                                 |
| state                              | The state of the supervisor module.                                                                                                                                |
| Auto-sync time-period              | Displayed on the active supervisor module. The configuration file synchronizes the time interval automatically. "disabled" indicates no automatic synchronization. |
| VSD <vsd name><br>redundancy state | Displays hot backup state of the specified VSD in VSD 0.                                                                                                           |

## 12. UFT Commands

### 12.1 switch-mode

Use this command to switch the UFT operating mode for a line card in stand-alone mode.

**switch-mode** *mode\_type* [ **overlay** ] **slot** *slot\_num*

Use this command to restore the default UFT operating mode for the specified line card in stand-alone mode.

**no switch-mode** *mode\_type* [ **overlay** ] **slot** *slot\_num*

| Parameter Description | Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>mode_type</i> | Indicates the UFT operating mode.<br>In stand-alone mode, the line card can operate in the following modes:<br><b>default:</b> Default mode, which is applied to most of application scenarios.<br><b>bridge:</b> Bridge mode, which is applied to the application scenarios where pure Layer 2 services dominate.<br><b>gateway:</b> Gateway mode, which is applied to the application scenario in which Layer 3 services dominate. |
|                       | <i>overlay</i>   | Enables overlay mode (Optional).                                                                                                                                                                                                                                                                                                                                                                                                     |
|                       | <i>slot_num</i>  | Indicates the corresponding line card installed in the chassis.                                                                                                                                                                                                                                                                                                                                                                      |

**Defaults** The default UFT operating mode is **Default**.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Examples** The following example switches the UFT operating mode of the line card in slot 3 of the switch to bridge mode in stand-alone mode.

```
Ruijie(config)#switch-mode bridge slot 3
Please save current config and restart your device!
Ruijie(config)#show running-config | include switch-mode
switch-mode bridge slot 3
```

**Verification** Use the **show switch-mode status** command to display the current operating mode.

```
Ruijie#show switch-mode status
```

| Slot No | Switch-Mode-Next | Switch-Mode-Current |
|---------|------------------|---------------------|
| 3       | bridge           | bridge              |

**Prompt Messages** N/A

**Common Errors** N/A

**Platforms** The S6120-20XS4VS2QXS switch does not support UFT mode configuration.

## 12.2 show switch-mode status

Use this command to display the UFT mode of a switch.

**show switch-mode status**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Command Mode** Privileged EXEC mode, global configuration mode, interface configuration mode

**Default Level** 14

**Usage Guide** N/A

**Configuration Examples** The following example displays the UFT mode of the switch in stand-alone mode.

```
Ruijie#show switch-mode status
Slot No      Switch-Mode      Status
-----      -
1            default          ok
```

The following example displays the UFT mode of the switch in VSU mode.

```
Ruijie#show switch-mode status
Device No    Slot No    Switch-Mode      Status
-----
1            2          default          ok
1            3          default          none
```

Field Description:

| Field | Description |
|-------|-------------|
|-------|-------------|

---

|             |                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------|
| Slot No     | Displays only slot number in stand-alone mode; displays both device number and slot number in VSU mode. |
| Device No   | Indicates the device number in VSU mode.                                                                |
| Switch Mode | Indicates the UFT operating mode.                                                                       |
| Status      | Indicates whether the node (device or line card) is online or not.<br>ok: Online<br>none: Offline       |

**Prompt****Messages****Platforms**      N/A

## 13. Package Management Commands

### 13.1 show upgrade auto-sync

Use this command to display related auto-sync configuration on the device.

**show upgrade auto-sync**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Command Mode** Privileged EXEC mode

**Default Level** 2

**Usage Guide** This command is used to display the auto-sync upgrade configuration in the system including the policy, range and upgrade package's path.

**Prompt Messages** The auto-sync information of the system is displayed after running.

```
Ruijie#show upgrade auto-sync
  auto-sync policy: coordinate
  auto-sync range: vsu
  auto-sync package: flash:/eg1000m_main_1.0.0.0f328e91.bin
```

### 13.2 show upgrade file

Use this command to display the information of the installation package files in the device file system.

**show upgrade file *url***

| Parameter Description | Parameter  | Description                                                                       |
|-----------------------|------------|-----------------------------------------------------------------------------------|
|                       | <i>url</i> | The local <i>url</i> path indicates where an installation package file is stored. |

**Command Mode** Privileged EXEC mode

**Default Level** 2

**Usage Guide** This command is used to preview main messages of an installation package after it is downloaded into local file system.

**Configuration** The following example displays the information of an installation package file.

#### Examples

```
Ruijie#show flash:S6120_RGOS12.1(1)B0101-FULL_install.bin
Name           : main
Version        : 1.0.0.2f1c4dd8
Package type   : unknown
Size           : 166440370
Build time     : Fri 23 Nov 2018 09:01:43 UTC
Description    : main upgrade package
Package files  :
                /fdt.img
                /initrd.img
                /kernel.img
                /rboot-s6120.bin
```

**Prompt Messages**

N/A

## 13.3 show upgrade history

Use this command to display the upgrade history.

**show upgrade history**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Command Mode** Privileged EXEC mode

**Default Level** 2

**Configuration** The following example displays the upgrade history.

**Examples**

```
Ruijie#show upgrade history
Upgrade History Information:
    Time           : 2018-11-05 06:13:17
    Method          : OOBTFTP
    Package Name    : s6120.bin
    Package Type    : MAIN

    Time           : 2018-11-06 03:11:16
    Method          : OOBTFTP
    Package Name    : S6120_RGOS12.1(1)B1_install.bin
    Package Type    : MAIN
```

**Prompt Messages** N/A

**Platforms** N/A

### 13.4 show upgrade status

Use this command to display the upgrade status of all line cards on the chassis device.

**show upgrade status**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Command Mode** Privileged EXEC mode

**Default Level** 2

**Configuration Examples** The following example displays the upgrade status of all line cards on the chassis device.

```
Ruijie#show upgrade status
[slot: M1]
    dev_type: s12k-ppc-cm
    status  : ready
[slot: 8]
    dev_type: s12k-s86-ppc-lc
    status  : upgrading
```

**Prompt Messages** The upgrade status of various line cards is displayed.

```
[slot: M1]
    dev_type: s12k-ppc-cm
    status  : ready
[slot: 8]
    dev_type: s12k-s86-ppc-lc
    status  : upgrading
```

**Platforms** This command is supported only on the chassis device.

## 13.5 upgrade

Use this command to install and upgrade an installation package in the local file system.

**Upgrade** *url* [ **force** ]

| Parameter Description | Parameter    | Description                                                                                                                                 |
|-----------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>url</i>   | The local path indicates where an installation package is stored.<br>This command is used to upgrade an installation package on the device. |
|                       | <b>force</b> | Mandatory upgrade                                                                                                                           |

**Command Mode** Privileged EXEC mode

**Default Level** 2

**Usage Guide** This command is applicable to installation packages of all subsystem components, chassis devices, and feature components. Before its use, run the **copy** command to copy feature packages into the file system in the device.

When there is no specified range of parameters, the command is used to upgrade the matched system components according to the auto-sync configuration.

**Configuration** The following example upgrades the main package on the device.

**Examples**

```
Ruijie#upgrade usb0:/egl000m_main_1.0.0.0f328e91.bin
Upgrade processing is 10%
Upgrade processing is 60%
Upgrade processing is 90%
Upgrade info [OK]

**Verification** Run the **show version detail** command to check whether the upgrade of a subsystem component is successful.

Run the **show component** command to check whether the upgrade of a feature component is successful. upgrading a feature component

**Prompt** The prompt message of successful running is displayed.

**Messages**

```
Upgrade info [OK]
```

The installation package is invalid or damaged and needs to be regained for upgrade command.

```
Invalid package file
```

The installation package is not available on the device and needs to be regained for upgrade command.

```
Device don't support
```

There is no need to upgrade the device.

```
The version in device is newer or the same
```

When there is insufficient space for upgrade, check USB flash disk attached on the device.

```
No enough space for decompress
```

Contact the service center to solve the system problem.

```
No enough space,rootfs been destroyed. Please upgrade in uboot
```

## 13.6 upgrade auto-sync package

Use this command to configure the path for the auto-sync upgrade.

**upgrade auto-sync package** *url*

| Parameter Description | Parameter  | Description                       |
|-----------------------|------------|-----------------------------------|
|                       | <i>url</i> | The path of installation package. |

**Defaults** The default is the last upgrade path.

**Command Mode** Privileged EXEC mode

**Default Level** 2

**Usage Guide** It is recommended to use default settings.

**Configuration Examples** The following example sets the path to the upgrade package in the USB flash disk.

```
Ruijie# upgrade auto-sync package usb0:/eg1000m_main_1.0.0.0f328e91.bin
```

**Verification** Run the **show upgrade auto-sync** command to display current auto-sync policy.

If *url* provides normal path, run the **stat** command to check whether it can be accessed.

**Prompt** The prompt message of successful running is displayed:  
**Messages** Upgrade auto-sync package is set as usb0:/eg1000m\_main\_1.0.0.0f328e91.bin

## 13.7 Upgrade auto-sync policy

Use this command to set an auto-sync policy for the system.

**upgrade auto-sync policy [ none | compatible | coordinate ]**

| Parameter Description | Parameter         | Description                                                                                      |
|-----------------------|-------------------|--------------------------------------------------------------------------------------------------|
|                       | <b>none</b>       | No auto-sync upgrade                                                                             |
|                       | <b>compatible</b> | Performs auto-synchronization based on the sequential order of versions.                         |
|                       | <b>coordinate</b> | Synchronizes with the version based on the system upgrade patch stored on the supervisor module. |

**Defaults** **coordinate**

**Command Mode** Privileged EXEC mode

**Default Level** 2

**Usage Guide** Check whether the upgrade package is ready before using the command.

**Configuration Examples** The following example sets the auto-sync policy of the device based on the version of supervisor modules.

```
Ruijie# upgrade auto-sync policy coordinate
```

**Verification** Display the current policy for auto-sync upgrade by running the **show upgrade auto-sync** command.

**Prompt** The prompt message of successful running is displayed.

**Messages** Upgrade auto-sync policy is set as coordinate.

## 13.8 upgrade auto-sync range

Use this command to set the range of auto-sync upgrade.

**upgrade auto-sync range [ chassis | vsu ]**

| Parameter Description | Parameter      | Description                                               |
|-----------------------|----------------|-----------------------------------------------------------|
|                       | <b>chassis</b> | Auto-sync version upgrade in the range of chassis         |
|                       | <b>vsu</b>     | Auto-sync version upgrade in the range of the VSU system. |

**Defaults** vsu

**Command Mode** Privileged EXEC mode

**Default Level** 2

**Usage Guide** It is recommended to set the parameter to vsu to ensure system version consistency to the most extent.

**Configuration Examples** The following example installs the auto-sync upgrade in the VSU system.

```
Ruijie# upgrade auto-sync range vsu
```

**Verification** Run the **show upgrade auto-sync** command to display the range of current auto-sync upgrade.

**Prompt** The prompt message of successful running is displayed.

**Messages** Upgrade auto-sync range is set as vsu.

## 13.9 upgrade download tftp

Use this command to download, install and upgrade installation packages from the tftp server.

**upgrade download tftp://path [vrf vrf-name] [ force ]**

**upgrade download oob\_tftp://path [via mgmt {number}] [ force ]**

| Parameter Description | Parameter                     | Description                                                                                                                    |
|-----------------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>path</i>                   | The path of installation packages on the tftp server<br>This command is downloaded and upgraded automatically from the server. |
|                       | <b>vrf</b> <i>vrf-name</i>    | Specifies a VRF for downloading the installation package.                                                                      |
|                       | <b>via</b> <i>mgmt number</i> | If the transfer mode is <i>oob_tftp</i> and there are multiple MGMT ports, you can select a specific port.                     |
|                       | <b>force</b>                  | Enforces upgrade.                                                                                                              |

**Command Mode** Privileged EXEC mode

**Default Level** 2

**Usage Guide** This command is applicable to installation packages of all subsystem components and chassis devices. This command is used to perform automatic installation, copy and upgrade of files.

**Configuration Examples** The following example upgrades the device.

```
Ruijie#upgrade download tftp://172.30.31.176/S6120_RGOS12.1(1)B0101-FULL_install.bin
*Nov 23 13:21:38: %UPGRADE-6-INFO: Start upgrade

## 14. OpenFlow Commands

### 14.1 of controller-ip

Use this command to enable OpenFlow.

**of controller-ip** *ip-address* [ **port** *port-id* ] [ **aux** ] **interface** [ *interface-id* ]

Use the **no** form of this command to disable OpenFlow.

**no of controller-ip** [ *ip-address* ]

| Parameter Description | Parameter                            | Description                                                                                                                                                                                                                                             |
|-----------------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>ip-address</i>                    | Controller IP address. If you configure the <b>no</b> form of this command without any parameter, all controllers are disabled. (OpenFlow1.3 supports connection to multiple controllers and OpenFlow1.0 supports connection to one single controller). |
|                       | <b>port</b> <i>port-id</i>           | Controller access port ID. The default for OpenFlow1.0 is 6633 and for OpenFlow1.3 is 6653.                                                                                                                                                             |
|                       | <b>aux</b>                           | Auxiliary switch (it takes effect for only OpenFlow1.3)                                                                                                                                                                                                 |
|                       | <b>Interface</b> <i>interface-id</i> | Interface ID, whether out-of-band MGMT interface or in-band physical port (some devices may not have MGMT interfaces).                                                                                                                                  |

**Command Mode** Global configuration mode

**Default** OpenFlow is disabled by default.

**Usage Guide** N/A

**Configuration Examples** The following example enables OpenFlow.

```
Ruijie(config)#of controller-ip 192.168.21.57 interface gigabitEthernet 0/1
```

The following example disables OpenFlow.

```
Ruijie#no of controller-ip
```

### 14.2 of mode

Use this command to configure the controller mode.

**of mode** [ **single** | **multiple** ]

Use the **no** form of this command to restore the default setting.

**no of mode**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|-----------------------|-----------|-------------|

|                      |                                                        |     |
|----------------------|--------------------------------------------------------|-----|
|                      | N/A                                                    | N/A |
| <b>Command Mode</b>  | Global configuration mode                              |     |
| <b>Default</b>       | The default mode is multiple.                          |     |
| <b>Usage Guide</b>   | Configure this command before enabling the controller. |     |
| <b>Configuration</b> | The following example enables the single mode.         |     |
| <b>Examples</b>      | <pre>Ruijie(config)#of mode single</pre>               |     |
|                      | The following example enables the multiple mode.       |     |
|                      | <pre>Ruijie(config)#of mode multiple</pre>             |     |
|                      | The following example restores the default setting.    |     |
|                      | <pre>Ruijie(config)#no of mode</pre>                   |     |

### 14.3 of packet table-lookup

Use this command to enable table-lookup mode or disable table-lookup mode.

**of packet table-lookup [ enable | disable ]**

**no of packet table-lookup**

|                              |                                                          |                    |
|------------------------------|----------------------------------------------------------|--------------------|
| <b>Parameter Description</b> | <b>Parameter</b>                                         | <b>Description</b> |
|                              | N/A                                                      | N/A                |
| <b>Command Mode</b>          | Global configuration mode                                |                    |
| <b>Default</b>               | The table-lookup mode is enabled by default.             |                    |
| <b>Usage Guide</b>           | N/A                                                      |                    |
| <b>Configuration</b>         | The following example enables the table-lookup mode.     |                    |
| <b>Examples</b>              | <pre>Ruijie(config)#of packet table-lookup enable</pre>  |                    |
|                              | The following example disables the table-lookup mode.    |                    |
|                              | <pre>Ruijie(config)#of packet table-lookup disable</pre> |                    |
|                              | The following example restores the default setting.      |                    |
|                              | <pre>Ruijie(config)#no of packet table-lookup</pre>      |                    |

### 14.4 of packet vlantag

Use this command to determine whether to contain the VLAN tag in the packet sent by the OpenFlow device.

**[ no ] of packet vlantag**

| Parameter Description | Parameter                                                                                       | Description |
|-----------------------|-------------------------------------------------------------------------------------------------|-------------|
|                       | N/A                                                                                             | N/A         |
| <b>Command Mode</b>   | Global configuration mode                                                                       |             |
| <b>Default</b>        | The VLAN tag is contained in the packet sent by the OpenFlow device by default.                 |             |
| <b>Usage Guide</b>    | N/A                                                                                             |             |
| <b>Configuration</b>  | The following example contains the VLAN tag in the packet sent by the OpenFlow device.          |             |
| <b>Examples</b>       | <pre>Ruijie(config)#of packet vlantag</pre>                                                     |             |
|                       | The following example does not contain the VLAN tag in the packet sent by the OpenFlow device.. |             |
|                       | <pre>Ruijie(config)#no of packet vlantag</pre>                                                  |             |

### 14.5 show of

Use this command to display the connection between the current device and the controller.

**show of**

| Parameter Description | Parameter                                                                                    | Description |
|-----------------------|----------------------------------------------------------------------------------------------|-------------|
|                       | N/A                                                                                          | N/A         |
| <b>Command Mode</b>   | Global configuration mode                                                                    |             |
| <b>Default</b>        | N/A                                                                                          |             |
| <b>Usage Guide</b>    | Use this command to display the OpenFlow version on the device.                              |             |
| <b>Configuration</b>  | The following example displays the connection between the current device and the controller. |             |
| <b>Examples</b>       | <pre>Ruijie#show of</pre>                                                                    |             |

### 14.6 show of flowtable

Use this command to display flow table entries of OpenFlow Device

**show of flowtable**

| Parameter Description | Parameter                 | Description |
|-----------------------|---------------------------|-------------|
|                       | N/A                       | N/A         |
| <b>Command Mode</b>   | Global configuration mode |             |

**Default** N/A

**Usage Guide** Running the **of controller-ip** command before configuring this command. Otherwise, the flow table entries are not displayed.

**Configuration** The following example display flow table entries.

**Examples**

```
Ruijie#show of flowtable
```

## 14.7 show of group

Use this command to display group information of OpenFlow device.

**show of group**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Command Mode** Global configuration mode

**Default** N/A

**Usage Guide** This command takes effect only for OpenFlow1.3.

**Configuration** The following example displays group information of OpenFlow device.

**Examples**

```
Ruijie(config)#show of group
```

## 14.8 show of mergedflow

Use this command to display merged entries of OpenFlow device.

**show of mergedflow**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Command Mode** Global configuration mode

**Default** N/A

**Usage Guide** This command takes effect only for OpenFlow1.3. See the **show of flowtable** command for parameter description.

**Configuration** The following example displays merged entries of OpenFlow device.

**Examples**

```
Ruijie(config)#show of mergedflow
```

### 14.9 show of meter

Use this command to display meter information of OpenFlow device.

**show of meter**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       |           | N/A         |

**Command Mode** Global configuration mode

**Default** N/A

**Usage Guide** This command takes effect only for OpenFlow1.3.

**Configuration** The following example displays meter information of OpenFlow device.

**Examples**

```
Ruijie(config)#show of meter
```

### 14.10 show of port

Use this command to display port information of OpenFlow device.

**show of port**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       |           | N/A         |

**Command Mode** Global configuration mode

**Default** N/A

**Usage Guide** Running the **of controller-ip** command before configuring this command. Otherwise, the port information is not displayed.

**Configuration** The following example displays port information of OpenFlow device.

**Examples**

```
Ruijie#show of port
```

### 14.11 show of mergedflow

Use this command to display merged flow information.

**show of mergeflow**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       |           | N/A         |

**Command Mode** Global configuration mode

**Default** N/A

**Usage Guide** This command is active only for OpenFlow1.3.

**Configuration** The following example displays merged flow information.

**Examples** `Ruijie(config)#show of mergedflow`

# 1 Interface Commands

## 1.1 bandwidth

Use this command to set the bandwidth on the interface. Use the **no** form of this command to restore the default setting.

**bandwidth** *kilobits*

**no bandwidth**

| Parameter Description | Parameter       | Description                                |
|-----------------------|-----------------|--------------------------------------------|
|                       | <i>kilobits</i> | Bandwidth per second, in the unit of Kbps. |

**Defaults** If this command is not configured on the interface, use the show interface command to display the default setting in privileged EXEC mode.

**Command Mode** Interface configuration mode

**Usage Guide** This command does not affect the actual bandwidth on the interface. Instead, it is used to display the system the bandwidth specification. By default, the bandwidth is determined by the actual link rate on the interface. It can be set by the user as well.

**Configuration Examples** The following example sets the bandwidth on the interface to 64 Kbps.

```
Ruijie(config)#interface gigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)# bandwidth 64
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 1.2 carrier-delay

Use this command to set the carrier delay on the interface. Use the no form of this command to restore the default value.

**carrier-delay** { [ *milliseconds* ] *num* | **up** [ *milliseconds* ] *num* **down** [ *milliseconds* ] *num*}

**no carrier-delay**

| Parameter Description | Parameter           | Description                                                                        |
|-----------------------|---------------------|------------------------------------------------------------------------------------|
|                       | <i>num</i>          | (Optional) in the range from 0 to 60 in the unit of seconds.                       |
|                       | <i>milliseconds</i> | (Optional) in the range from 0 to 60000 in the unit of milliseconds.               |
|                       | <b>up</b>           | (Optional) Configures the delay after which DCD changes from Down to Up in status. |
|                       | <b>down</b>         | (Optional) Configures the delay after which DCD changes from Up to Down in status. |

**Defaults** The default is 2 seconds.

**Command** Interface configuration mode

**Mode**

**Usage Guide** This parameter refers to the delay after which the carrier detection signal DCD of the interface link changes from the Down status to the Up status or vice versa. If the DCD changes within the delay, the system will ignore such changes without disconnecting the upper data link layer for renegotiation. If the DCD carrier is disconnected for a long time, the parameter should be set longer to accelerate route aggregation so that the routing table can be converged more quickly. On the contrary, if the DCD carrier interruption period is shorter than the time used for route aggregation, you should set the parameter to a higher value to avoid unnecessary route vibration.

**Configuration** The following example sets the carrier delay of serial interface to 5 seconds.

**Examples**

```
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config)# carrier-delay 5
```

The following example sets the carrier delay of serial interface to 100 milliseconds.

```
Ruijie(config)# interface GigabitEthernet 1/1
Ruijie(config-if-GigabitEthernet 1/1)#carrier-delay milliseconds 100
```

The following example sets the DCD delay from Down to Up in status to 100 milliseconds and from Up to Down to 200 milliseconds.

```
Ruijie(config)# interface GigabitEthernet 1/1
Ruijie(config-if-GigabitEthernet 1/1)# carrier-delay up milliseconds 100 down
milliseconds 200
```

| Related Commands | Command | Description |

**Platform** N/A

**Description**

### 1.3 clear counters

Use this command to clear the counters on the specified interface.

**clear counters** [*interface-type interface-number*]

| Parameter Description | Parameter                                        | Description                     |
|-----------------------|--------------------------------------------------|---------------------------------|
|                       | <i>interface-type</i><br><i>interface-number</i> | Interface type and interface ID |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** In the privileged EXEC mode, use the **show interfaces** command to display the counters or the **clear counters** command to clear the counters. If the interface is not specified, the counters on all interfaces will be cleared.

**Configuration** The following example clears the counters on interface gigabitethernet 1/1.

**Examples** Ruijie# clear counters gigabitethernet 1/1

| Related Commands | Command                | Description                         |
|------------------|------------------------|-------------------------------------|
|                  | <b>show interfaces</b> | Displays the interface information. |

**Platform Description** N/A

## 1.4 clear interface

Use this command to reset the interface.

**clear interface** *interface-type interface-number*

| Parameter Description | Parameter                                        | Description                     |
|-----------------------|--------------------------------------------------|---------------------------------|
|                       | <i>interface-type</i><br><i>interface-number</i> | Interface type and interface ID |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** This command is only used on the switch port, member port of the L2 Aggregate port, routing port, and member port of the L3 aggregate port. This command is equal to the **shutdown** and **no shutdown** commands.

**Configuration** The following example resets the interface gigabitethernet 1/1.

**Examples**

```
Ruijie# clear interface gigabitethernet 1/1
```

| Related Commands | Command | Description     |
|------------------|---------|-----------------|
|                  |         | <b>shutdown</b> |

**Platform** N/A

**Description**

## 1.5 description

Use this command to configure the alias of interface. Use the **no** form of this command to restore the default setting.

**description** *string*

**no description**

| Parameter Description | Parameter | Description   |
|-----------------------|-----------|---------------|
|                       |           | <i>string</i> |

**Defaults** No alias is configured by default.

**Command Mode** Interface configuration mode.

**Usage Guide** Use **show interfaces** to display the interface information, including the alias.

**Configuration** The following example configures the alias of interface.

**Examples**

```
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# description GBIC-1
```

| Related Commands | Command | Description            |
|------------------|---------|------------------------|
|                  |         | <b>show interfaces</b> |

**Platform** N/A

**Description**

## 1.6 duplex

Use this command to specify the duplex mode for the interface. Use the **no** form of this command to

restore the default setting.

**duplex { auto | full | half }**

**no duplex**

**Parameter  
Description**

| Parameter   | Description                               |
|-------------|-------------------------------------------|
| <b>auto</b> | Self-adaptive full duplex and half duplex |
| <b>full</b> | Full duplex                               |
| <b>half</b> | Half duplex                               |

**Defaults** The default is **auto**,

**Command  
Mode** Interface configuration mode.

**Usage Guide** The duplex mode is associated with the interface type. Use **show interfaces** to display the duplex mode of the interface

**Configuration** The following example specifies the duplex mode for the interface.

**Examples**

```
Ruijie(config-if)# duplex full
```

**Related  
Commands**

| Command                | Description                         |
|------------------------|-------------------------------------|
| <b>show interfaces</b> | Displays the interface information. |

**Platform  
Description** N/A

## 1.7 errdisable recovery

Use this command to recover the interface in violation.

**errdisable recovery [ interval time ]**

**Parameter  
Description**

| Parameter   | Description                                                                  |
|-------------|------------------------------------------------------------------------------|
| <i>time</i> | Time for the command to take effect. The range is from 30 to 86,400 seconds. |

**Defaults** N/A

**Command  
Mode** Interface configuration mode.

**Usage Guide** Use the command to recover the port that triggers violation after being configured with the **violation**

**shutdown** command.

**Configuration** The following example recovers the violation interface gigabitethernet 1/1.

**Examples**

```
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# errdisable recovery
```

**Related  
Commands**

| Command                                            | Description                                         |
|----------------------------------------------------|-----------------------------------------------------|
| <b>switchport port-security violation shutdown</b> | Configures the port security violation to shutdown. |

**Platform** N/A.

**Description**

## 1.8 fec mode

Use this command to enable or disable the FEC function.

**fec mode {rs | base-r | none | auto}**

Use the **no** form of this command to restore the default value.

**no fec mode**

**Parameter  
Description**

| Parameter     | Description                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rs</b>     | Indicates the RS mode for enabling the FEC function.                                                                                          |
| <b>base-r</b> | Indicates the base-r mode for enabling the FEC function.                                                                                      |
| <b>none</b>   | Disables the FEC function.                                                                                                                    |
| <b>auto</b>   | Indicates FEC function self-adaption, that is, the system determines whether to enable the FEC function based on the optical module and rate. |

**Defaults** The default configuration depends on the product model.

**Command  
Mode** Interface configuration mode

**Default Level** 14

**Usage Guide** When one end runs FEC function, the other end should enable it, too.  
On the premise of not affecting the negotiation status of the two ends, we suggest you NOT to:  
enable FEC function on the QSFP28-100G-LR4 optical module, on which FEC function is disabled by default.  
disable FEC function on QSFP28 modules (except QSFP28-100G-LR4), on which FEC function is enabled by default.

**Configuration** The following example forcibly enables the FEC function on Interface HundredGigabitEthernet 1/1.

**Examples**

```
Ruijie(config)# interface HundredGigabitEthernet 1/1
Ruijie(config-if- HundredGigabitEthernet 1/1)# fec mode rs
```

The following example forcibly enables the FEC function on Interface TFGigabitEthernet 2/1.

```
Ruijie(config)# interface TFGigabitEthernet 2/1
Ruijie(config-if- TFGigabitEthernet 2/1)# fec mode base-r
```

## 1.9 fiber antifake enable

Use this command to enable or disable the optical module antifake detection. Use the **no** form of this command to restore the default setting.

**fiber antifake {ignore | enable}**

**no fiber antifake enable**

**Parameter  
Description**

| Parameter     | Description                                     |
|---------------|-------------------------------------------------|
| <b>ignore</b> | Disables the optical module antifake detection. |
| <b>enable</b> | Enables the optical module antifake detection.  |

**Defaults** By default, optical module antifake detection is disabled.

**Command** Global configuration mode

**Mode**

**Usage Guide** If the optical module antifake detection is enabled by default, when a non-original optical module is inserted, alarm logs are printed.

**Configuration** The following example enables the optical module antifake detection.

**Examples**

```
Ruijie(config)# fiber antifake enable
```

**Related

**Description**

## 1.10 flowcontrol

Use this command to enable or disable the flow control. Use the **no** form of this command to restore the default setting.

**flowcontrol { auto | off | on}**

**no flowcontrol****Parameter  
Description**

| Parameter   | Description                       |
|-------------|-----------------------------------|
| <b>auto</b> | Self-negotiates the flow control. |
| <b>off</b>  | Disables the flow control.        |
| <b>on</b>   | Enables the flow control.         |

**Defaults** This function is disabled by default.

**Command  
Mode** Interface configuration mode.

**Usage Guide** Use the **show interfaces** command to display the flow control configuration.

**Configuration** The following example enables flow control on fastEthernet port 1/1.

**Examples**

```
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# flowcontrol on
```

**Related  
Commands**

| Command                | Description                         |
|------------------------|-------------------------------------|
| <b>show interfaces</b> | Displays the interface information. |

**Platform  
Description** N/A

## 1.11 interface

Use this command to enter the interface configuration mode.

**interface** *interface-type* *interface-number*

**Parameter  
Description**

| Parameter               | Description         |
|-------------------------|---------------------|
| <i>interface-type</i>   | The interface type. |
| <i>interface-number</i> | The interface ID.   |

**Defaults** N/A

**Command  
Mode** Global configuration mode

**Usage Guide** This command is used to enter interface configuration mode. The user can modify the interface configuration next,

**Configuration** The following example enters configuration mode on Aggregateport 1.

**Examples**

```
Ruijie(config)# interface Aggregateport 1
Ruijie(config-if-Aggregateport 1)#
```

The following example enters configuration mode on GigabitEthernet 1/2.

```
Ruijie(config)# interface GigabitEthernet 1/2
Ruijie(config-if-GigabitEthernet 1/2)#
```

The following example configuration mode on VLAN 1.

```
Ruijie(config)# interface vlan 1
Ruijie(config-if-VLAN 1)#
```

**Description**

## 1.12 interface range

Use this command to enter interface configuration mode on multiple interfaces.

**interface range** { *port-range* | **macro** *macro\_name* }

Use this command to define the macro name of the **interface range** command.

**define interface-range** *macro\_name*

**Parameter  
Description**

| Parameter                      | Description                                                                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>port-range</i>              | The interface type and ID range, entered in the form of <i>interface-type slot-number/interface-number</i> . The interface can be either an Ethernet physical interface or a loopback interface. |
| <b>macro</b> <i>macro_name</i> | The macro name which represents the interface range.                                                                                                                                             |

**Defaults** The **interface range** command is disabled by default.

**Command  
Mode** Global configuration mode

**Usage Guide** Use the define interface-range command to define a range of interfaces as the macro name and then use the **interface range** macro *macro\_name* command to enter interface configuration mode on multiple interfaces.

**Configuration  
Examples** The following example enters interface configuration mode on multiple interfaces by setting the interface range.

```
Ruijie(config)# interface range gigabitEthernet 0/0, 0/2
```

```
Ruijie(config-if-range)# bandwidth 100
```

The following example enters interface configuration mode on multiple interfaces by defining the macro name.

```
Ruijie(config)# define interface-range routel gigabitEthernet 0/0-2
Ruijie(config)# interface range macro routel
Ruijie(config-if-range)# bandwidth 100
```

#### Description

## 1.13 load-interval

Use this command to set the interval for calculating load on the interface. Use the **no** form of this command to restore the default setting.

**load-interval** *seconds*

**no load-interval**

#### Parameter Description

| Parameter      | Description                                        |
|----------------|----------------------------------------------------|
| <i>seconds</i> | In the range from 5 to 600 in the unit of seconds. |

#### Defaults

The default is 10.

#### Command Mode

Interface configuration mode

#### Usage Guide

This command is used to set the interval for calculating load on the interface. In general, the numbers of incoming and outgoing packets and bytes are calculated every 10 seconds. For example, if the parameter is set to 180 seconds, the following outcome is displayed when the **show interface gigabitEthernet 0/1** command is run.

```
3 minutes input rate 15 bits/sec, 0 packets/sec
3 minutes output rate 14 bits/sec, 0 packets/sec
```

#### Configuration Examples

The following example sets the interval for calculating load on interface GigabitEthernet 0/1 to 180 seconds.

```
Ruijie(config)# interface gigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)# load-interval 180
```

## 1.14 logging

Use this command to print information on the interface.

**logging** [ **link-updown** | **error-frame** | **link-dither** ]

**Parameter  
Description**

| Parameter          | Description                           |
|--------------------|---------------------------------------|
| <b>link-updown</b> | Prints the status change information. |
| <b>error-frame</b> | Prints the error frame information.   |
| <b>link-dither</b> | Prints the oscillation information.   |

**Defaults** This function is enabled by default.

**Command  
Mode** Global configuration mode

**Usage Guide** N/A

**Configuration** The following example prints information on the interface..

**Examples**

```
Ruijie(config)# logging link-updown
Ruijie(config)# logging error-frame
Ruijie(config)# logging link-dither
```

## 1.15 mtu

Use this command to set the MTU supported on the interface.

**mtu** *num*

**Parameter  
Description**

| Parameter  | Description                                     |
|------------|-------------------------------------------------|
| <i>num</i> | 64 to 9216 (or 65536, which varies by products) |

- Defaults** The default is 1500.
- Command** Interface configuration mode.
- Mode**
- Usage Guide** This command is used to set the maximum transmission unit (MTU) supported on the interface.

**Configuration** The following example sets the MTU supported on interface `gigabitethernet 1/1` to 9000.

**Examples**

```
Ruijie(config)# interface GigabitEthernet 1/1
Ruijie(config-if-GigabitEthernet)# mtu 9000
```

## 1.16 negotiation mode

Use this command to enable or disable auto-negotiation mode. Use the **no** form of this command to restore the default setting.

**negotiation mode { on | off }**  
**no negotiation mode**

| Parameter Description | Parameter  | Description                |
|-----------------------|------------|----------------------------|
|                       |            | <b>on</b>                  |
|                       | <b>off</b> | Disables auto-negotiation. |

**Defaults** This function is disabled by default.

**Command** Interface configuration mode

**Mode**

**Usage Guide** In general, the auto-negotiation status is determined by interface speed, duplex, and auto-negotiation factor mode.

**Configuration** The following example enables auto-negotiation mode on interface `GigabitEthernet 1/1`.

**Examples**

```
Ruijie(config)# interface GigabitEthernet 1/1
Ruijie(config-if-GigabitEthernet 1/1)# negotiation mode on
```

## 1.17 physical-port dither protect

Use this command to enable oscillation protection on the port.

**physical-port dither protect**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command** Global configuration mode

**Mode**

**Usage Guide** After you configure the **physical-port dither protect** command, the port will be shut down when the oscillation occurs for certain times.

 If oscillation occurs on the port for 6 times within 2 seconds, a syslog will be printed. If syslog is printed for 10 consecutive times, the port will be shut down. If oscillation occurs on the port for over 10 times within 10 seconds, a syslog will be printed but the port will not be shut down.

**Configuration** The following example enables oscillation protection on the port.

**Examples** Ruijie(config)# physical-port dither protect

| Related Commands | Command | Description |

**Platform** N/A

**Description**

## 1.18 port speed-mode

Use this command to configure the work rate mode of a 25 Gbps port.

**port speed-mode {25G | 10G }**

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

| Description |                                                           |
|-------------|-----------------------------------------------------------|
| <b>25G</b>  | Indicates that a 25 Gbps port works in 25 Gbps rate mode. |
| <b>10G</b>  | Indicates that a 25 Gbps port works in 10 Gbps rate mode. |

**Defaults** A 25 Gbps port works in 25 Gbps rate mode by default.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide**

1. Only 25 Gbps ports support this configuration. The four consecutive 25 Gbps ports of the same slot need to be set to work in the same rate mode.
2. Only 25 Gbps ports that work in the same rate mode can be added to the same aggregation group.
3. The **default interface** command will not clear the **port speed-mode** configuration of 25 Gbps ports.

**Configuration Examples** The following example configures Interfaces TFGigabitEthernet 2/1 through TFGigabitEthernet 2/4 to work in 10 Gbps rate mode.

```
Ruijie(config)# interface TFGigabitEthernet 2/2
Ruijie(config-if-TFGigabitEthernet 2/2)# port speed-mode 10G
Warning: Ports Tf2/1 - Tf2/4 will be set speed mode 10G. Continue? [Y/N]:Y
Ruijie(config-if-TFGigabitEthernet 2/2)# end
```

## 1.19 protected-ports route-deny

Use this command to configure L3 routing between the protected ports.

### protected-ports route-deny

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default..

**Command Mode** Global configuration mode.

**Usage Guide** The ports that are set as the protected ports can route on L3. Use this command to deny the L3 communication between protected ports. Use the **show running-config** command to display configuration.

**Configuration Examples** The following example configures L3 routing between the protected ports.

```
Ruijie(config)# protected-ports route-deny
```

| Related Commands | Command | Description         |
|------------------|---------|---------------------|
|                  |         | show running-config |

**Platform** N/A

**Description**

## 1.20 show interfaces

Use this command to display the interface information and optical module information.

**show interfaces** [ *interface-type interface-number* ] [ **description** [up | down] | **switchport** | **trunk** ]

| Parameter Description | Parameter          | Description                                                  |
|-----------------------|--------------------|--------------------------------------------------------------|
|                       |                    | <i>interface-id</i><br><i>interface-number</i>               |
|                       | <b>description</b> | The description of the interface, including the link status. |
|                       | <b>switchport</b>  | Layer 2 interface information.                               |
|                       | <b>trunk</b>       | Trunk port, applicable for physical port and aggregate port. |

**Defaults**

**Command** Privileged EXEC mode.

**Mode**

**Usage Guide** This command is used to show all basic information if no parameter is specified.

**Configuration** The following example displays the interface information when the Gi0/1 is a Trunk port.

**Examples**

```
SwitchA#show interfaces gigabitEthernet 0/1
Index(dec):1 (hex):1
GigabitEthernet 0/1 is DOWN , line protocol is DOWN
Hardware is Broadcom 5464 GigabitEthernet
Interface address is: no ip address

**Platform** N/A

**Description**

## 1.21 show interfaces counters

Use this command to display the received and transmitted packet statistics.

```

show interfaces [ interface-type interface-number ] counters [ increment | drops | errors | rate | summary ] [ up | down ]
    
```

**Parameter  
Description**

| Parameter                                        | Description                                                               |
|--------------------------------------------------|---------------------------------------------------------------------------|
| <i>interface-type</i><br><i>interface-number</i> | (Optional) The interface type and ID.                                     |
| <b>increment</b>                                 | Displays the packet statistics increased during the last sample interval. |
| <b>drops</b>                                     | Displays dropped packet statistics.                                       |
| <b>errors</b>                                    | Displays error packet statistics.                                         |

|                |                                                  |
|----------------|--------------------------------------------------|
| <b>rate</b>    | Displays packet receiving and transmitting rate. |
| <b>summary</b> | Displays packet statistics summary.              |
| <i>up</i>      | (Optional) Displays the port up statistics.      |
| <i>down</i>    | (Optional) Displays the port down statistics.    |

**Defaults** N/A

**Command** Any CLI mode

**Mode**

**Usage Guide** If you do not specify an interface, the packet statistics on all interfaces are displayed.

**Configuration** The following example displays packet statistics on interface GigabitEthernet 0/1.

**Examples**

```
Ruijie#show interfaces GigabitEthernet 0/1 counters
Interface : GigabitEthernet 0/1
5 minute input rate : 9144 bits/sec, 9 packets/sec
5 minute output rate : 1280 bits/sec, 1 packets/sec
Rxload           : 1%
InOctets         : 17310045
InPkts           : 1000 (Unicast: 10%, Multicast: 10%, Broadcast: 80%)
InUcastPkts      : 100
InMulticastPkts  : 100
InBroadcastPkts  : 800
Txload           : 1%
OutOctets        : 1282535
OutPkts          : 1000 (Unicast: 10%, Multicast: 10%, Broadcast: 80%)
OutUcastPkts     : 100
OutMulticastPkts : 100
OutBroadcastPkts : 800
Undersize packets : 0
Oversize packets : 0
collisions       : 0
Fragments        : 0
Jabbers          : 0
CRC alignment errors : 0
AlignmentErrors  : 0
FCSErrors        : 0
dropped packet events (due to lack of resources): 0
packets received of length (in octets):
 64:46264
 65-127: 47427
128-255: 3478
256-511: 658
512-1023: 18016
```

```

1024-1518: 125
Packet increment in last sampling interval(5 seconds):
  InOctets           : 10000
  InPkts             : 1000(Unicast: 10%, Multicast: 10%, Broadcast: 80%)
  InUcastPkts       : 100
  InMulticastPkts   : 100
  InBroadcastPkts   : 800
  OutOctets         : 10000
  OutPkts           : 1000(Unicast: 10%, Multicast: 10%, Broadcast: 80%)
  OutUcastPkts      : 100
  OutMulticastPkts  : 100

```

-  Rxload refers to the receive bandwidth usage and Txload refers to the Tx bandwidth usage. InPkts is the total number of receive unicast, multicast and broadcast packets. OutPkts is the total number of transmit unicast, multicast and broadcast packets. Packet increment in last sampling interval (5 seconds) represents the packet statistics increased during the last sample interval (5 seconds).

The following example displays the packet statistics on interface GigabitEthernet 0/1 increased during the last sample interval.

```

Ruijie#show interfaces GigabitEthernet 0/1 counters increment
Interface : GigabitEthernet 0/1
Packet increment in last sampling interval(5 seconds):
  InOctets           : 10000
  InPkts             : 1000(Unicast: 10%, Multicast: 10%, Broadcast: 80%)
  InUcastPkts       : 100
  InMulticastPkts   : 100
  InBroadcastPkts   : 800
  OutOctets         : 10000
  OutPkts           : 1000(Unicast: 10%, Multicast: 10%, Broadcast: 80%)
  OutUcastPkts      : 100
  OutMulticastPkts  : 100

```

The following example displays error packet statistics on interface GigabitEthernet 0/1.

```

Ruijie#show interfaces GigabitEthernet 0/1 counters increment
Interface  UnderSize           OverSize           Collisions
Fragments
-----
-----
Gi0/1      0                   0                   0                   0
Interface  Jabbers             CRC-Align-Err     Align-Err
FCS-Err
-----
-----
Gi0/1      0                   0                   0                   0

```

-  UnderSize is the number of valid packets smaller than 64 bytes.

OverSize is the number of valid packets smaller than 1518 bytes.

Collisions is the number of colliding transmit packets.

Fragments is the number of packets with CRC error or frame alignment error which are smaller than 64 bytes.

Jabbers is the number of packets with CRC error or frame alignment error which are smaller than 1518 bytes.

CRC-Align-Err is the number of receive packets with CRC error.

Align\_Err is the number of receive packets with frame alignment error.

FCS-Err is the number of receive packets with FCS error.

The following example displays packet receiving and transmitting rate on interface GigabitEthernet 0/1.

```
Ruijie#show interface gigabitEthernet 0/1 counters rate
Interface      Sampling Time      Input Rate          Input Rate
Output Rate    Output Rate
                (bits/sec)         (packets/sec)
(bits/sec)     (packets/sec)
-----
Gi0/1          5 seconds          23391              23
124            0
```

**i** Sampling Time is the time when packets are sampled. Input rate is packet receiving rate and Output rate is packet transmitting rate.

The following example displays packet statistics summary on interface GigabitEthernet 0/1.

```
Ruijie#show interface gigabitEthernet 0/1 counters summary
Interface      InOctets           InUcastPkts        InMulticastPkts
InBroadcastPkts
-----
Gi0/1          1475788005         1389               45880503
11886621
Interface      OutOctets           OutUcastPkts        OutMulticastPkts
OutBroadcastPkts
-----
Gi0/1          6667915            6382               31629
13410
```

**i** InOctets is the total number of packets received on the interface. InUcastPkts is the number of unicast packets received on the interface. InMulticastPkts is the number of multicast packets received on the interface. InBroadcastPkts is the number of broadcast packets received on the interface.

OutOctets is the total number of packets transmitted on the interface. OutUcastPkts is the number of unicast packets transmitted on the interface. OutMulticastPkts is the number of multicast packets transmitted on the interface. OutBroadcastPkts is the number of broadcast

packets transmitted on the interface.

#### Description

## 1.22 show interfaces link-state-change statistics

Use this command to display the link state change statistics, including the time and count.

**show interfaces** [ *interface-type interface-number* ] **link-state-change statistics**

#### Parameter Description

| Parameter               | Description                |
|-------------------------|----------------------------|
| <i>interface-type</i>   | The interface type and ID. |
| <i>interface-number</i> |                            |

#### Defaults

N/A

#### Command Mode

Privileged EXEC mode

#### Usage Guide

If you do not specify an interface, the link state statistics of all interfaces are displayed.

#### Configuration Examples

The following example displays the link state statistics of interface GigabitEthernet 0/1.

```
Ruijie#show int link-state-change statistics
Interface      Link state  Link state change times  Last change time
Link-dither begin  Link-dither end
-----
-----
Te0/1          down       0                          2018-05-05 11:07:45  none
none
```

| Interface               | Description                                                                           |
|-------------------------|---------------------------------------------------------------------------------------|
| Link state change times | The count of link state change.                                                       |
| Last change time        | The time when the last link state change occurs.                                      |
| Link-dither begin       | The time when the last frequent dithers begin.<br>"None" indicates no dither happens. |

|                 |                                                                                  |
|-----------------|----------------------------------------------------------------------------------|
|                 | Frequent dithers refer to six dithers happening within 2s.                       |
| Link-dither end | The time when the last frequent dithers end. "None" indicates no dither happens. |

## 1.23 show interfaces status

Use this command to display interface status information.

**show interfaces** [ *interface-type interface-number* ] **status**

**Parameter Description**

| Parameter                                        | Description                                                        |
|--------------------------------------------------|--------------------------------------------------------------------|
| <i>interface-type</i><br><i>interface-number</i> | The interface type and ID.                                         |
| <b>status</b>                                    | Displays interface status information, including speed and duplex. |

**Defaults** N/A**Command** Privileged EXEC mode**Mode****Usage Guide** If you do not specify an interface, the status information of all interfaces is displayed.**Configuration** The following example displays the status information of interface GigabitEthernet 0/1.**Examples**

```
Ruijie#show interfaces GigabitEthernet 0/1 status
Interface          Status      Vlan    Duplex  Speed  Type
-----
GigabitEthernet 0/1  up         1       Full   1000M  copper
```

## 1.24 show interfaces status err-disable

Use this command to display the interface violation status.

**show interfaces** [ *interface-type interface-number* ] **status err-disable**

| Parameter Description | Parameter               | Description                           |
|-----------------------|-------------------------|---------------------------------------|
|                       | <i>interface-type</i>   | (Optional) The interface type and ID. |
|                       | <i>interface-number</i> |                                       |

### Defaults

**Command Mode** Any CLI mode

**Usage Guide** If you do not specify an interface, violation status of all interfaces is displayed.

**Configuration Examples** The following example displays the violation status of interface GigabitEthernet 0/1.

```
Ruijie#show interface gigabitEthernet 0/1 status err-disabled
```

```
Interface                Status          Reason
-----
GigabitEthernet 0/1      err-disabled    BPDU Guard
```

 The violation status is displayed as **err-disabled**.

## 1.25 show interfaces transceiver

Use this command to display transceiver information of the interface.

**show interfaces** [ *interface-type interface-number* ] **transceiver** [ **alarm** | **diagnosis** ]

| Parameter Description | Parameter               | Description                                                         |
|-----------------------|-------------------------|---------------------------------------------------------------------|
|                       | <i>interface-type</i>   | The interface type and ID.                                          |
|                       | <i>interface-number</i> |                                                                     |
|                       | <b>transceiver</b>      | Displays the transceiver information.                               |
|                       | <b>alarm</b>            | Displays the alarm message of the transceiver. If there is no alarm |

|                  |                                                        |
|------------------|--------------------------------------------------------|
|                  | message, it is displayed as None.                      |
| <b>diagnosis</b> | Displays the diagnostic parameters of the transceiver. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** If you do not specify an interface, the transceiver information of all interfaces is displayed.

**Configuration Examples** The following example displays the transceiver information of interface GigabitEthernet 5/4.

```
Ruijie#show interfaces GigabitEthernet 5/4 transceiver
Transceiver Type      : 1000BASE-SX-SFP
Connector Type        : LC
Wavelength(nm)       : 850
Transfer Distance     :
    50/125 um OM2 fiber
    -- 550m
    62.5/125 um OM1 fiber
    -- 270m
Digital Diagnostic Monitoring : YES
Vendor Serial Number   : 101680093602489
```

The following example displays the alarm message of the transceiver of interface GigabitEthernet 5/4.

```
Ruijie#show interfaces GigabitEthernet 5/4 transceiver alarm
gigabitEthernet 5/4 transceiver current alarm information:
RX loss of signal
```

The following example displays the diagnostic parameters of the transceiver of interface GigabitEthernet 5/4.

```
Ruijie#show interfaces GigabitEthernet 5/4 transceiver diagnosis
Current diagnostic parameters[AP:Average Power]:
Temp(Celsius) Voltage(V) Bias(mA) RX power(dBm) TX
power(dBm)
38 (OK)          3.20 (OK)          0.04 (OK)
-40.00 (alarm) [AP] -40.00 (alarm)
```

**Related Commands**

**Platform Description** N/A

## 1.26 show interfaces usage

Use this command to display bandwidth usage of the interface.

**show interfaces** [ *interface-type interface-number* ] **usage** [ *up | down* ]

| Parameter Description | Parameter                                        | Description                                   |
|-----------------------|--------------------------------------------------|-----------------------------------------------|
|                       | <i>interface-type</i><br><i>interface-number</i> | (Optional) The interface type and ID.         |
|                       | <i>up</i>                                        | (Optional) Displays the port up statistics.   |
|                       | <i>down</i>                                      | (Optional) Displays the port down statistics. |

**Defaults** N/A

**Command Mode** Any CLI mode

**Usage Guide** If you do not specify an interface, the bandwidth usage of all interfaces is displayed. Bandwidth refers to the actual link bandwidth rather than the *bandwidth* parameter configured on the interface.

**Configuration Examples** The following example displays bandwidth usage of interface GigabitEthernet 0/1.

```

Interface           Bandwidth   Average Usage   Output Usage
Input Usage
-----
GigabitEthernet 0/0      1000 Mbit    0.002822759%   0.001183280%
0.004462237%
```

 Bandwidth refers to the interface link bandwidth, the maximum speed of link. Average Usage refers to the current usage.

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 1.27 shutdown

Use this command to disable an interface. Use the **no** form of this command to enable a disabled port.

**shutdown**

**no shutdown**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          |           | N/A         |

**Defaults** By default, the administrative status of an interface is Up.

**Command Mode** Interface configuration mode

**Usage Guide** Use this command to stop the forwarding on the interface (Gigabit Ethernet interface, Aggregate port or SVI). You can enable the port with the **no shutdown** command. If you shut down the interface, the configuration of the interface exists, but does not take effect. You can view the interface status by using the **show interfaces** command.

 If you use the script to run no shutdown frequently and rapidly, the system may prompt the interface status reversal.

**Configuration** The following example disables an interface.

**Examples**

```
Ruijie(config)# interface aggregateport 1
Ruijie(config-if)# shutdown
```

The following example enables an interface.

```
Ruijie(config)# interface aggregateport 1
Ruijie(config-if)# no shutdown
```

| Related<br>Commands | Command                | Description                         |
|---------------------|------------------------|-------------------------------------|
|                     |                        | <b>clear interface</b>              |
|                     | <b>show interfaces</b> | Displays the interface information. |

**Platform** N/A

**Description**

## 1.28 show split summary

Use this command to display split information.

**show split summary**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          |           | N/A         |

**Command Mode** All CLI user modes

**Default Level** 14

**Usage Guide** This command displays split information of all splittable ports.

### Configuration

#### Examples

The following example displays the split information about Interface GigabitEthernet 0/1.

```
Ruijie#show split summary
Port          SpliteStatus SplitPorts
Hu1/1         merged       Hu1/1:1   Hu1/1:2   Hu1/1:3   Hu1/1:4
Hu1/2         merged       Hu1/2:1   Hu1/2:2   Hu1/2:3   Hu1/2:4
Hu1/3         merged       Hu1/3:1   Hu1/3:2   Hu1/3:3   Hu1/3:4
Hu1/4         merged       Hu1/4:1   Hu1/4:2   Hu1/4:3   Hu1/4:4
Hu1/5         merged       Hu1/5:1   Hu1/5:2   Hu1/5:3   Hu1/5:4
Hu1/6         merged       Hu1/6:1   Hu1/6:2   Hu1/6:3   Hu1/6:4
Hu1/7         merged       Hu1/7:1   Hu1/7:2   Hu1/7:3   Hu1/7:4
Hu1/8         merged       Hu1/8:1   Hu1/8:2   Hu1/8:3   Hu1/8:4
Hu3/25        merged       Hu3/25:1  Hu3/25:2  Hu3/25:3  Hu3/25:4
Hu3/26        merged       Hu3/26:1  Hu3/26:2  Hu3/26:3  Hu3/26:4
```

Note: **Port** indicates the splittable master port, **SpliteStatus** indicates the current split status, and **SplitPorts** indicates member ports of the splittable port after splitting.

## 1.29 snmp trap link-status

Use this command to send LinkTrap on a port. Use the **no** form of this command to disable this function.

**snmp trap link-status**

**no snmp trap link-status**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is enabled by default

**Command Mode** Interface configuration mode.

**Usage Guide** For an interface (for instance, Ethernet interface, AP interface, and SVI interface), this command sets whether to send LinkTrap on the interface. If the function is enabled, the SNMP sends the LinkTrap when the link status of the interface changes.

**Configuration** The following example disables the interface from sending LinkTrap on the interface.

**Examples**

```
Ruijie(config)# interface gigabitEthernet 1/1
Ruijie(config-if)# no snmp trap link-status
```

The following example enables the interface to forward Link trap.

```
Ruijie(config)# interface gigabitEthernet 1/1
Ruijie(config-if)# snmp trap link-status
```

**Related Commands**

| Command                         | Description                                                    |
|---------------------------------|----------------------------------------------------------------|
| <b>snmp trap link-status</b>    | Enables the interface to send LinkTrap on the interface.       |
| <b>no snmp trap link-status</b> | Disables the interface from sending LinkTrap on the interface. |

**Platform** N/A

**Description**

### 1.30 snmp-server if-index persist

Use this command to set the interface index persistence. The interface index remains the same after the device is restarted.

**snmp-server if-index persist**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command** Global configuration mode

**Mode**

**Usage Guide** After this command is configured, all interface indexes are saved in the configuration file. After the device is restarted, interface indexes remain the same as before.

**Configuration** The following example enables the interface index persistence.

**Examples**

```
Ruijie(config)# snmp-server if-index persist
```

**Related Commands**

| Command | Description |
|---------|-------------|
| N/A     | N/A         |

**Platform** N/A

**Description**

## 1.31 speed

Use this command to configure the speed on the port.

**speed** [ **1000** | **40G** | **auto** ]

| Parameter Description | Parameter   | Description                                         |
|-----------------------|-------------|-----------------------------------------------------|
|                       | <b>1000</b> | The transmission rate of the interface is 1000Mbps. |
|                       | <b>40G</b>  | The transmission rate of the interface is 40Gbps.   |
|                       | <b>auto</b> | Self-adaptive                                       |

**Defaults** The default is **auto**.

**Command** Interface configuration mode.

**Mode**

**Usage Guide** If an interface is the member of an aggregate port, the rate of the interface depends on the rate of the aggregate port. You can set the rate of the interface, but it does not take effect until the interface exits the aggregate port. Use **show interfaces** to display configuration. The rate varies by interface types. For example, you cannot set the rate of a SFP interface to 10M.

**Configuration** N/A

**Examples**

| Related Commands | Command                | Description                         |

**Platform** N/A

**Description**

## 1.32 split interface

Use this command to split a 40G interface into four 10G interfaces. Use the **no** form of this command to restore the default setting.

**split interface FortyGigabitEthernet** *interface-number*

**no split interface FortyGigabitEthernet** *interface-number*

| Parameter Description | Parameter               | Description                     |
|-----------------------|-------------------------|---------------------------------|
|                       | <i>interface-number</i> | Specifies the interface number. |

**Defaults** By default, the interface is in the combination mode.

**Command** Global configuration mode.  
**Mode**

**Usage Guide** N/A

**Configuration** The following example splits the 40G interface 0/65 into four 10G interfaces.

**Examples**

```
Ruijie(config-if)# split interface forty-giga 0/65
```

| Related Commands | Command | Description            |
|------------------|---------|------------------------|
|                  |         | <b>show interfaces</b> |

**Description**

## 1.33 switchport

Use this command to configure a Layer 3 interface. Use the **no** form of this command to restore the default setting.

**switchport**

**no switchport**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       |           | N/A         |

**Defaults** All the interfaces are in Layer 2 mode by default.

**Command** Interface configuration mode.  
**Mode**

**Usage Guide** This command is valid only for physical interfaces. The **switchport** command is used to disable the interface and re-enable it. In this status, the device will send the information to indicate the connect status. If the interface is changed to Layer 3 mode from Layer 2, all the attributes in Layer 2 mode will be cleared.

**Configuration** The following example configures a Layer 3 interface.

**Examples**

```
Ruijie(config-if)# switchport
```

| Related Commands | Command | Description            |

|                  |         | <b>show interfaces</b> |

**Platform** N/A  
**Description**

## 1.34 switchport access

Use this command to configure an interface as a statics access port and add it to a VLAN. Use the **no** form of this command to restore the default setting.

**switchport access vlan** *vlan-id*

**no switchport access vlan**

| Parameter   | Parameter      | Description                                |
|-------------|----------------|--------------------------------------------|
| Description | <i>vlan-id</i> | The VLAN ID at which the port to be added. |

**Defaults** By default, the switch port is an access port and the VLAN is VLAN 1.

**Command** Interface configuration mode.

**Mode**

**Usage Guide** Enter one VLAN ID. The system will create a new one and add the interface to the VLAN if you enter a new VLAN ID. If the VLAN ID already exists, the command adds the interface to the VLAN.  
 If the port is a trunk port, the operation does not take effect.

**Configuration Examples** The following example configures interface gigabitethernet 1/1 as a static access port and adds it to VLAN 2.

```
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# switchport access vlan 2
```

| Related Commands | Command                 | Description                                                           |
|------------------|-------------------------|-----------------------------------------------------------------------|
|                  | <b>switchport mode</b>  | Configures the interface as Layer 2 mode (switch port mode).          |
|                  | <b>switchport trunk</b> | Configures a native VLAN and the allowed-VLAN list for the trunkport. |

**Platform** N/A  
**Description**

## 1.35 switchport mode

Use this command to specify a L2 interface (switch port) mode. You can specify this interface to be an access port or a trunk port or an 802.1Q tunnel. Use the **no** form of this command to restore the default setting.

**switchport mode { access | trunk }**

**no switchport mode**

**Parameter  
Description**

| Parameter     | Description                                   |
|---------------|-----------------------------------------------|
| <b>access</b> | Configures the switch port as an access port. |
| <b>trunk</b>  | Configures the switch port as a trunk port.   |

**Defaults**

The default is **access**.

**Command  
Mode**

Interface configuration mode.

**Usage Guide**

If a switch port mode is access port, it can be the member port of only one VLAN. Use **switchport access vlan** to specify the member of the VLAN.

A trunk port can be the member port of various VLANs defined by the allowed-VLAN list. The allowed VLAN list of the interface determines the VLANs to which the interface may belong. The trunk port is the member of all the VLANs in the allowed VLAN list. Use **switchport trunk** to define the allowed-VLANs list.

**Configuration**

The following example specifies a L2 interface (switch port) mode.

**Examples**

```
Ruijie(config-if)# switchport mode trunk
```

**Related  
Commands**

|--------------------------|----------------------------------------------------------------------------|
| <b>switchport access</b> | Configures an interface as a statics access port and assigns it to a VLAN. |
| <b>switchport trunk</b>  | Configures a native VLAN and the allowed-VLAN list for the trunk port.     |

**Platform**

N/A

**Description**

## 1.36 switchport protected

Use this command to configure the interface as the protected port.

**switchport protected**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

This function is disabled by default.

**Command** Interface configuration mode.  
**Mode**

**Usage Guide** The ports that are set as the protected ports cannot switch on L2, but can route on L3. A protected port can communicate with an unprotected port. Use the **show interfaces** command to display configuration.

**Configuration** The following example configures interface `gigabitethernet 1/1` as a protected port.

**Examples**

```
Ruijie(config)#interface gigabitethernet 1/1
Ruijie(config-if)# switchport protected
```

|                  |         | <b>show interfaces</b> |

**Platform** N/A  
**Description**

## 1.37 switchport trunk

Use this command to specify a native VLAN and the allowed-VLAN list for the trunk port. Use the **no** form of this command to restore the default setting.

**switchport trunk { allowed vlan { all | [ add | remove | except ] *vlan-list* } | native vlan *vlan-id* }**  
**no switchport trunk { allowed vlan | native vlan }**

| Parameter Description | Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>allowed vlan</b><br><i>vlan-list</i> | Configures the list of VLANs allowed on the trunk port. <i>vlan-list</i> can be a VLAN or a range of VLANs starting with the smaller VLAN ID and ending with the larger VLAN ID and being separated by hyphen, for example, 10 to 20. The segments can be separated with a comma (,), for example, 1 to 10, 20 to 25, 30, 33.<br>all means that the allowed VLAN list contains all the supported VLANs;<br>add means to add the specified VLAN list to the allowed VLAN list;<br>remove means to remove the specified VLAN list from the allowed VLAN list;<br>except means to add all the VLANs other than those in the specified VLAN list to the allowed VLAN list; |
|                       | <b>native vlan</b><br><i>vlan-id</i>    | Configures the native VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Defaults** The allowed VLAN list is all, the Native VLAN is VLAN1.

**Command** Interface configuration mode.  
**Mode**

**Usage Guide** Native VLAN:  
 A trunk port belongs to one native VLAN. A native VLAN means that the untagged packets received/sent on the trunk port belong to the VLAN. Obviously, the default VLAN ID of the interface (that is, the PVID in the IEEE 802.1Q) is the VLAN ID of the native VLAN. In addition, when frames belonging to the native VLAN are sent over the trunk port, they are untagged.  
 Allowed-VLAN List:  
 By default, a trunk port sends traffic to and received traffic from all VLANs (ID 1 to 4094). However, you can prevent the traffic from passing over the trunk by configuring allowed VLAN lists on a trunk. Use `show interfaces switchport` to display configuration.

**Configuration** The following example removes port 1/15 from VLAN 2.

**Examples**

```
Ruijie(config)# interface fastethernet 1/15
Ruijie(config-if)# switchport trunk allowed vlan remove 2
Ruijie(config-if)# end
Ruijie# show interfaces fastethernet1/15 switchport
Switchport is enabled
Mode is trunk port
Access vlan is 1,Native vlan is 1
Protected is disabled
Vlan lists is
1,3-4094
```

## 2 MAC Address Commands

### 2.1 clear mac-address-table dynamic

Use this command to clear the dynamic MAC address.

```
clear mac-address-table dynamic [ address mac-addr [ interface interface-id ] [ vlan vlan-id ] ]
{ [ interface interface-id ] [ vlan vlan-id ] }
```

| Parameter   | Parameter                            | Description                                                                              |
|-------------|--------------------------------------|------------------------------------------------------------------------------------------|
| Description | <b>dynamic</b>                       | Clears all the dynamic MAC addresses.                                                    |
|             | <b>address</b> <i>mac-addr</i>       | Clears the specified dynamic MAC address.                                                |
|             | <b>interface</b> <i>interface-id</i> | Clears all the dynamic MAC addresses of the specified interface.                         |
|             | <b>vlan</b> <i>vlan-id</i>           | Clears all the dynamic MAC addresses of the specified VLAN, in the range from 1 to 4094. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** Use the **show mac-address-table dynamic** command to display all the dynamic MAC addresses.

**Configuration** The following command clears all the dynamic MAC addresses.

**Examples** Ruijie# clear mac-address-table dynamic

| Related Commands | Command                               | Description                   |

**Platform** N/A

**Description**

### 2.2 mac-address-learning

Use this command to enable the port address learning. Use the **no** or **default** form of this command to restore the default setting.

**mac-address-learning**

**no mac-address-learning**

**default mac-address-learning**

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

|                    |     |     |
|--------------------|-----|-----|
| <b>Description</b> | N/A | N/A |
|--------------------|-----|-----|

**Defaults** The address learning function is enabled.

**Command Mode** Interface configuration mode.

**Usage Guide** MAC address learning cannot be disabled on the port where the security function is enabled. The security function cannot be configured on the port where address learning is disabled.

**Configuration** The following example disables the port address learning function.

**Examples**

```
Ruijie(config-if)# no mac-address-learning
```

| <b>Related Commands</b> | <b>Command</b> | <b>Description</b> |

## 2.3 mac-address-learning (global)

Use this command to enable MAC address learning globally. Use the **no** or **default** form of this command to restore the default setting.

### **mac-address-learning enable**

Use this command to disable MAC address learning globally.

### **mac-address-learning disable**

Use this command to restore MAC address learning globally.

### **default mac-address-learning**

| <b>Parameter Description</b> | <b>Parameter</b> | <b>Description</b>                      |
|------------------------------|------------------|-----------------------------------------|
|                              | <b>enable</b>    | Enables MAC address learning globally.  |
|                              | <b>disable</b>   | Disables MAC address learning globally. |

**Defaults** The **mac-address-learning enable** command is enabled by default.

**Command Mode** Global configuration mode

**Usage Guide** When this function is enabled, the MAC address is learned in global configuration mode the same as learned in interface configuration mode.

**Configuration** The following example disables MAC address learning globally.

**Examples**

```
Ruijie(config)# mac-address-learning disable
```

## 2.4 mac-address-table aging-time

Use this command to specify the aging time of the dynamic MAC address. Use the **no** or **default** form of the command to restore the default setting.

**mac-address-table aging-time** *seconds*

**no mac-address-table aging-time**

**default mac-address-table aging-time**

| Parameter   | Parameter      | Description                                                                                  |
|-------------|----------------|----------------------------------------------------------------------------------------------|
| Description | <i>seconds</i> | Aging time of the dynamic MAC address (in seconds).<br>The time range depends on the switch. |

Defaults The default is 300.

Command Global configuration mode.  
Mode

Usage Guide Use **show mac-address-table aging-time** to display configuration.

Configuration The following example sets the aging time of the dynamic MAC address to 500 seconds.

Examples 

```
Ruijie(config)# mac-address-table aging-time 500
```

| Related  | Command                                  | Description                                         |
|----------|------------------------------------------|-----------------------------------------------------|
| Commands | <b>show mac-address-table aging-time</b> | Displays the aging time of the dynamic MAC address. |
|          | <b>show mac-address-table dynamic</b>    | Displays dynamic MAC address.                       |

Platform N/A  
Description

## 2.5 mac-address-table filtering

Use this command to configure the filtering MAC address. Use the **no** or **default** form of the command to restore the default setting.

**mac-address-table filtering** *mac-address* **vlan** *vlan-id*

**no mac-address-table filtering** *mac-address* **vlan** *vlan-id*

**default mac-address-table filtering** *mac-address* **vlan** *vlan-id*

| Parameter   | Parameter          | Description                           |
|-------------|--------------------|---------------------------------------|
| Description | <i>mac-address</i> | Filtering Address                     |
|             | <i>vlan-id</i>     | VLAN ID, in the range from 1 to 4094. |

**Defaults** No filtering address is configured by default.

**Command** Global configuration mode.

**Mode**

**Usage Guide** The filtering MAC address shall not be a multicast address.

**Configuration** The following example configures the filtering MAC address for VLAN 1.

**Examples** Ruijie(config)#mac-address-table filtering 0000.0202.0303 vlan 3

| Related  | Command                                  | Description                       |

| Commands | <b>clear mac-address-table filtering</b> | Clears the filtering MAC address. |

**Platform** N/A

**Description**

## 2.6 mac-address-table notification

Use this command to enable the MAC address notification function. Use The **no** or **default** form of the command to restore the default setting.

**mac-address-table notification** [ **interval** *value* | **history-size** *value* ]

**no mac-address-table notification** [ **interval** | **history-size** ]

**default mac-address-table notification** [ **interval** | **history-size** ]

| Parameter   | Parameter                        | Description                                                                                          |
|-------------|----------------------------------|------------------------------------------------------------------------------------------------------|
| Description | <b>interval</b> <i>value</i>     | Sets the interval of sending the MAC address trap message, 1 second by default.                      |
|             | <b>history-size</b> <i>value</i> | Sets the maximum number of the entries in the MAC address notification table, 50 entries by default. |

**Defaults** By default, the interval is 1 and the maximum number of the entries in the MAC address notification table is 50.

**Command** Global configuration mode.

**Mode**

**Usage Guide** The MAC address notification function is specific for only dynamic MAC address and secure MAC address. No MAC address trap message is generated for static MAC addresses. In the global

configuration mode, you can use the **snmp-server enable traps mac-notification** command to enable or disable the switch to send the MAC address trap message.

**Configuration** The following example enables the MAC address notification function.

**Examples**

```
Ruijie(config)# mac-address-table notification
Ruijie(config)# mac-address-table notification interval 40
Ruijie(config)# mac-address-table notification history-size 100
```

**Related**

**Commands**

| Command                                    | Description                                                                                      |
|--------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>snmp-server enable traps</b>            | Sets the method of handling the MAC address trap message..                                       |
| <b>show mac-address-table notification</b> | Displays the MAC address notification configuration and the MAC address trap notification table. |
| <b>snmp trap mac-notification</b>          | Enables the MAC address trap notification function on the specified interface.                   |

**Platform** N/A

**Description**

## 2.7 mac-address-table static

Use this command to configure a static MAC address. Use the **no** or **default** form of the command to restore the default setting.

**mac-address-table static** *mac-addr* **vlan** *vlan-id* **interface** *interface-id*

**no mac-address-table static** *mac-addr* **vlan** *vlan-id* **interface** *interface-id*

**default mac-address-table static** *mac-addr* **vlan** *vlan-id* **interface** *interface-id*

**Parameter**

**Description**

| Parameter           | Description                                                                    |
|---------------------|--------------------------------------------------------------------------------|
| <i>mac-addr</i>     | Destination MAC address of the specified entry                                 |
| <i>vlan-id</i>      | VLAN ID of the specified entry, in the range from 1 to 4094.                   |
| <i>interface-id</i> | Interface (physical interface or aggregate port) that packets are forwarded to |

**Defaults** No static MAC address is configured by default.

**Command** Global configuration mode.

**Mode**

**Usage Guide** A static MAC address has the same function as the dynamic MAC address that the switch learns. Compared with the dynamic MAC address, the static MAC address will not be aged out. It can only be configured and removed by manual. Even if the switch is reset, the static MAC address will not be lost. A static MAC address shall not be configured as a multicast address. Use **show mac-address-table static** to display the static MAC address.

**Configuration** N/A

**Examples**

| Related  | Command                              | Description                      |

Platform N/A

Description

## 2.8 max-dynamic-mac-count

Use this command to set the maximum number of MAC address learned dynamically on the VLAN or interface. Use the **no** or **default** form of this command to restore the default setting.

**max-dynamic-mac-count** *num*

**no max-dynamic-mac-count**

**default max-dynamic-mac-count**

| Parameter   | Parameter  | Description                               |
|-------------|------------|-------------------------------------------|
| Description | <i>num</i> | Sets the maximum number of MAC addresses. |

Defaults The maximum number is not set by default.

Command VLAN configuration mode / Interface configuration mode

Mode

Usage Guide This command is used to set the maximum number of MAC addresses learned dynamically on the VLAN or interface.

If the number of MAC addresses dynamically learned on the VLAN or interface reaches the upper limit, MAC address learning is disabled on the VLAN or interface.

If the number of MAC addresses reaches the upper limit when this command is configured, the surplus MAC addresses are not cleared. Instead, they remain and then age. MAC address learning is disabled on the VLAN or interface.

Use the **show mac-address-table max-dynamic-mac-count** command to display the maximum number of MAC addresses learned dynamically on the VLAN or interface.

Configuration Examples The following example sets the maximum number of MAC addresses dynamically learned on VLAN 1.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vlan 1
Ruijie(config-vlan)#max-dynamic-mac-count 160
```

The following example sets the maximum number of MAC addresses dynamically learned on interface GigabitEthernet 0/1.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

```
Ruijie(config)#interface GigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)#max-dynamic-mac-count 160
```

**Description**

## 2.9 max-dynamic-mac-count exceed-action

Use this command to set the action if the dynamic MAC address learned on the VLAN or interface exceeds the limit. Run the no form of this command to restore the default setting.

**max-dynamic-mac-count exceed-action forward | discard**

**no max-dynamic-mac-count exceed-action forward | discard**

| Parameter Description | Parameter      | Description                                                                                         |
|-----------------------|----------------|-----------------------------------------------------------------------------------------------------|
|                       | <i>forward</i> | Forwards the packets if the dynamic MAC address learned on the VLAN or interface exceeds the limit. |
|                       | <i>discard</i> | Discards the packets if the dynamic MAC address learned on the VLAN or interface exceeds the limit. |

**Command Mode** VLAN configuration mode / Interface configuration mode

**Usage Guide** This command is used to set the action if the dynamic MAC address learned on the VLAN or interface exceeds the limit.

When the command **default interface** is run in global configuration mode, if there is any layer-2 sub-interface, the action when MAC address learned dynamically exceeds the limit cannot restore the default settings.

**Configuration Examples** The following example sets the maximum number of MAC addresses dynamically learned on VLAN 1.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#vlan 1
Ruijie(config-vlan)#max-dynamic-mac-count 160
Ruijie(config-vlan)#max-dynamic-mac-count exceed-action discard
```

The following example sets the maximum number of MAC addresses dynamically learned on interface GigabitEthernet 0/1.

```
Ruijie#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#interface GigabitEthernet 0/1
```

```
Ruijie(config-if-GigabitEthernet 0/1)#max-dynamic-mac-count 100
Ruijie(config-if-GigabitEthernet 0/1)#max-dynamic-mac-count exceed-action
discard
```

## 2.11 show mac-address-table

Use this command to display all types of MAC addresses (including dynamic address, static address and filter address).

**show mac-address-table [ address *mac-addr*] [ interface *interface-id*] [ vlan *vlan-id*]**

| Parameter   | Parameter                            | Description                               |
|-------------|--------------------------------------|-------------------------------------------|
| Description | <b>address</b> <i>mac-addr</i>       | The MAC address.                          |
|             | <b>interface</b> <i>interface-id</i> | The Interface ID.                         |
|             | <b>vlan</b> <i>vlan-id</i>           | The VLAN ID, in the range from 1 to 4094. |

**Defaults** N/A

**Command Mode** All modes

**Usage Guide** N/A

**Configuration** The following example displays the MAC address.

**Examples**

```
Ruijie# show mac-address-table address 00d0.f800.1001
Vlan      MAC Address      Type      Interface
-----  -
1         00d0.f800.1001  STATIC   GigabitEthernet 1/1
Ruijie# show mac-address-table
Vlan      MAC Address      Type      Interface
-----  -
1         00d0.f800.1001  STATIC   GigabitEthernet 1/1
1         00d0.f800.1002  DYNAMIC  GigabitEthernet 1/1
1         00d0.f800.1003  OTHER    GigabitEthernet 1/1
1         00d0.f800.1004  FILTER
```

| Field       | Description                                     |
|-------------|-------------------------------------------------|
| Vlan        | The interface address.                          |
| MAC Address | The MAC address.                                |
| Type        | The MAC address type.                           |

**Platform** N/A  
**Description**

## 2.14 show mac-address-table dynamic

Use this command to display the dynamic MAC address.

```
show mac-address-table dynamic [ address mac-addr ] [ interface interface-id ] [ vlan vlan-id ]
```

#### Parameter Description

| Parameter           | Description                                                                                  |
|---------------------|----------------------------------------------------------------------------------------------|
| <i>mac-addr</i>     | Destination MAC address of the entry                                                         |
| <i>vlan-id</i>      | VLAN of the entry, in the range from 1 to 4094.                                              |
| <i>interface-id</i> | Interface that the packet is forwarded to.<br>It may be a physical port or an aggregate port |

#### Defaults

**Command** All modes

**Mode**

**Usage Guide** N/A

**Configuration** The following example displays the dynamic MAC address.

**Examples**

```
Ruijie# show mac-address-table dynamic

## 2.15 show mac-address-table filtering

Use this command to display the filtering MAC address.

**show mac-address-table filtering [ ddr mac-addr ] [ vlan vlan-id ]**

**Parameter**

**Description**

| Parameter       | Description                                        |
|-----------------|----------------------------------------------------|
| <i>mac-addr</i> | Destination MAC address of the entry               |
| <i>vlan-id</i>  | VLAN ID of the entry, in the range from 1 to 4094. |

**Defaults** N/A

**Command** Privileged EXEC mode.

**Mode**

**Usage Guide** N/A

**Configuration** The following example displays the filtering MAC address.

**Examples**

```
Ruijie# show mac-address-table filtering
Vlan  MAC Address      Type  Interface
-----
```

```
1 0000.2222.2222 FILTER Not available
```

**Description**

## 2.16 show mac-address-table interface

Use this command to display all the MAC addresses on the specified interface including static and dynamic MAC address

**show mac-address-table interface** [ *interface-id* ] [ **vlan** *vlan-id* ]

| Parameter Description | Parameter           | Description                                                                                             |
|-----------------------|---------------------|---------------------------------------------------------------------------------------------------------|
|                       | <i>interface-id</i> | Displays the MAC address information of the specified Interface (physical interface or aggregate port). |
|                       | <i>vlan-id</i>      | VLAN ID of the entry, in the range from 1 to 4094..                                                     |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** N/A

**Configuration Examples** The following example displays all the MAC addresses on interface gigabitethernet 1/1.

```
Ruijie# show mac-address-table interface
gigabitethernet 1/1
Vlan  MAC Address  Type  Interface
-----
1  00d0.f800.1001  STATIC  gigabitethernet 1/1
1  00d0.f800.1002  STATIC  gigabitethernet 1/1
1  00d0.f800.1003  STATIC  gigabitethernet 1/1
1  00d0.f800.1004  STATIC  gigabitethernet 1/1
```

|------------------|-----------------------------------------|------------------------------------------------------------|
|                  | <b>show mac-address-table static</b>    | Displays the static MAC address.                           |
|                  | <b>show mac-address-table filtering</b> | Displays the filtering MAC address.                        |
|                  | <b>show mac-address-table dynamic</b>   | Displays the dynamic MAC address.                          |
|                  | <b>show mac-address-table address</b>   | Displays all types of MAC addresses.                       |
|                  | <b>show mac-address-table vlan</b>      | Displays all types of MAC addresses of the specified VLAN. |
|                  | <b>show mac-address-table count</b>     | Displays the address counts in the MAC address table.      |

**Platform** N/A  
**Description**

## 2.17 show mac-address-table max-dynamic-mac-count

Use this command to display the maximum number of dynamic MAC addresses learned on the VLAN or interface.

**show mac-address-table max-dynamic-mac-count** { **vlan** [ *vlan-id* ] | **interface** [ *interface-id* ] }

| Parameter Description | Parameter           | Description                                                                                                                              |
|-----------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>vlan</b>         | Displays the dynamic MAC address learned on all VLANs which are configured with the maximum number of dynamic MAC address learning.      |
|                       | <i>vlan-id</i>      | Displays the dynamic MAC address learned on the specified VLAN.                                                                          |
|                       | <b>interface</b>    | Displays the dynamic MAC address learned on all interfaces which are configured with the maximum number of dynamic MAC address learning. |
|                       | <i>interface-id</i> | Displays the dynamic MAC address learned on the specified interface.                                                                     |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration Examples** The following example displays the MAC address learned on all VLANs which are configured with the maximum number of dynamic MAC addresses.

```
Ruijie#show mac-address-table max-dynamic-mac-count vlan
Vlan Limit  MAC count Learning
-----
1    160      6          YES
```

The following example displays the MAC address learned dynamically on the specified VLAN.

```
Ruijie#show mac-address-table max-dynamic-mac-count vlan 1
Vlan Limit  MAC count Learning
-----
1    160      6          YES
```

| Field | Description                          |
|-------|--------------------------------------|
| Vlan  | The VLAN ID.                         |
| Limit | The maximum number of MAC addresses. |

|           |                                                            |
|-----------|------------------------------------------------------------|
| MAC count | The number of MAC address learned dynamically on the VLAN. |
| Learning  | Whether MAC address learning is disabled on the VLAN.      |

The following example displays the MAC address learned on all interfaces which are configured with the maximum number of the dynamic MAC address.

```
Ruijie#show mac-address-table max-dynamic-mac-count interface
Interface          Limit  MAC count Learning
-----
GigabitEthernet 0/1    160    6         YES
```

The following example displays the MAC address learned dynamically on the specified interface.

```
Ruijie#show mac-address-table max-dynamic-mac-count interface
GigabitEthernet 0/1
Interface          Limit  MAC count Learning
-----
GigabitEthernet 0/1    160    6         YES
```

| Field     | Description                                                     |
|-----------|-----------------------------------------------------------------|
| Interface | The Interface ID                                                |
| Limit     | The maximum number of MAC addresses.                            |
| MAC count | The number of MAC address learned dynamically on the interface. |
| Learning  | Whether MAC address learning is disabled on the interface       |

Description

## 2.18 show mac-address-table notification

Use this command to display the MAC address notification configuration and the MAC address notification table.

**show mac-address-table notification** [ interface [ *interface-id* ] | history ]

| Parameter Description | Parameter           | Description                                                                  |
|-----------------------|---------------------|------------------------------------------------------------------------------|
|                       | <b>interface</b>    | Displays the MAC address notification configuration on all interfaces.       |
|                       | <i>interface-id</i> | Displays the MAC address notification configuration on a specific interface. |
|                       | <b>history</b>      | Displays the MAC address notification history.                               |

**Defaults****Command** Privileged EXEC mode.**Mode****Usage Guide** N/A**Configuration Examples** The following example displays the MAC address notification configuration and the MAC address notification table.

```
Ruijie# show mac-address-table notification
MAC Notification Feature: Disabled
Interval between Notification Traps: 1 secs
Maximum Number of entries configured in History Table:1
Current History Table Length: 0
```

**Related****Commands**

| Command                               | Description                                                                    |
|---------------------------------------|--------------------------------------------------------------------------------|
| <b>mac-address-table notification</b> | Enables MAC address notification.                                              |
| <b>snmp trap mac-notification</b>     | Enables the MAC address trap notification function on the specified interface. |

**Platform** N/A**Description**

## 2.19 show mac-address-table static

Use this command to display the static MAC address.

**show mac-address-table static** [**addr** *mac-addr* *r*] [**interface** *interface-Id*] [**vlan** *vlan-id*]**Parameter****Description**

| Parameter           | Description                                                 |
|---------------------|-------------------------------------------------------------|
| <i>mac-addr</i>     | Destination MAC address of the entry                        |
| <i>vlan-id</i>      | VLAN ID of the entry, within the range from 1 to 4094.      |
| <i>interface-id</i> | Interface of the entry physical interface or aggregate port |

**Defaults** N/A**Command** Privileged EXEC mode.**Mode****Usage Guide** N/A**Configuration Examples** The following example displays the static MAC addresses**Examples**

```
Ruijie# show mac-address-table static
Vlan    MAC Address    Type    Interface
-----  -
```

```

1 00d0.f800.1001 STATIC gigabitethernet 1/1
1 00d0.f800.1002 STATIC gigabitethernet 1/1
1 00d0.f800.1003 STATIC gigabitethernet 1/1

```

|                  | <b>mac-address-table static</b> | Configures the static MAC address. |

**Platform** N/A

**Description**

## 2.20 show mac-address-table vlan

Use this command to display all addresses of the specified VLAN.

**show mac-address-table vlan [ *vlan-id* ]**

| Parameter          | Parameter      | Description                                            |
|--------------------|----------------|--------------------------------------------------------|
| <b>Description</b> | <i>vlan-id</i> | VLAN ID of the entry, within the range from 1 to 4094. |

**Defaults** N/A

**Command** Privileged EXEC mode

**Mode**

**Usage Guide** N/A

**Configuration** The following example displays all addresses of the specified VLAN.

**Examples**

```

Ruijie# show mac-address-table vlan 1
Vlan  MAC Address   Type      Interface
-----
1     00d0.f800.1001  STATIC   gigabitethernet 1/1
1     00d0.f800.1002  STATIC   gigabitethernet 1/1
1     00d0.f800.1003  STATIC   gigabitethernet 1/1

```

| Related Commands | Command                                 | Description                                                     |
|------------------|-----------------------------------------|-----------------------------------------------------------------|
|                  | <b>show mac-address-table static</b>    | Displays static addresses.                                      |
|                  | <b>show mac-address-table filtering</b> | Displays filtered addresses.                                    |
|                  | <b>show mac-address-table dynamic</b>   | Displays dynamic addresses.                                     |
|                  | <b>show mac-address-table address</b>   | Displays all address information about the specified address.   |
|                  | <b>show mac-address-table interface</b> | Displays all address information about the specified interface. |
|                  | <b>show mac-address-table count</b>     | Displays the number of addresses in the address table.          |

**Platform** N/A

**Description**

## 2.21 snmp trap mac-notification

Use this command to enable the MAC address trap notification on the specified interface. Use The **no** or **default** form of the command to restore the default setting.

**snmp trap mac-notification { added | removed }**

**no snmp trap mac-notification { added | removed }**

**default snmp trap mac-notification { added | removed }**

| Parameter          | Parameter      | Description                            |
|--------------------|----------------|----------------------------------------|
| <b>Description</b> | <i>added</i>   | Notifies when a MAC address is added.  |
|                    | <i>removed</i> | Notifies when a MAC address is removed |

**Defaults**

**Command** Interface configuration mode.

**Mode**

**Usage Guide** Use **show mac-address-table notification interface** to display configuration.

**Configuration** The following example enables the MAC address trap notification on interface gigabitethernet 1/1.

**Examples**

```
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# snmp trap mac-notification added
```

| Related         | Command                                    | Description                                                                                 |

| <b>Commands</b> | <b>mac-address-table notification</b>      | Enables MAC address notification.                                                           |
|                 | <b>show mac-address-table notification</b> | Displays the MAC address notification configuration and the MAC address notification table. |

**Platform** N/A

**Description**

## 3 Aggregate Port Commands

### 3.1 aggregate bfd-detect

Use this command to enable BFD on the AP port. Use the **no** form of this command to restore the default setting.

**aggregate bfd-detect ipv4** *src\_ip dst\_ip*

**no aggregate bfd-detect ipv4**

| Parameter Description | Parameter     | Description                                                                              |
|-----------------------|---------------|------------------------------------------------------------------------------------------|
|                       | <b>ipv4</b>   | Enables IPv4 BFD when the AP port is configured with an IPv4 address.                    |
|                       | <i>src_ip</i> | Specifies source IP address, namely, the IP address configured on the AP port.           |
|                       | <i>dst_ip</i> | Specifies destination IP address, namely, the IP address configured on the peer AP port. |

**Defaults** This function is disabled by default.

**Command Mode** AP interface configuration mode

**Usage Guide** If you want to enable BFD on the AP port, you should see corresponding configuration guide for BFD parameter settings.

Different products vary in support for IPv4 BFD on AP port.

If an AP port supports IPv4 BFD, it is allowed to enable IPv4 BFD at the same time.

If an AP port is enabled with BFD, its member ports in forwarding state create BFD session automatically.

**Configuration** The following example enables BFD on the AP port.

**Examples**

```
Switch(config)# interface aggregateport 3
Switch(config-if-Aggregateport 3)# ip address 1.0.0.1
Switch(config-if-Aggregateport 3)# aggregate bfd-detect ipv4 1.0.0.1 1.0.0.2
Switch(config-if-Aggregateport 3)# bfd interval 50 min_rx 50 multiplier 3
```

|                  | N/A     | N/A         |

**Platform Description** N/A

## 3.2 aggregateport capacity mode

Use this command to configure the AP capacity mode. Use the **no** form of this command to restore the default setting. Use the **no** form of this command to restore the default setting,

**aggregateport capacity mode** *capacity-mode*

**no aggregateport capacity mode**

| Parameter   | Parameter            | Description                   |
|-------------|----------------------|-------------------------------|
| Description | <i>capacity-mode</i> | Configures the capacity mode. |

**Defaults** The default *capacity-mode* varies with the device.

**Command Mode** Global configuration mode

**Usage Guide** The system provides several capacity modes for devices that support capacity mode configuration. To restore the default settings, run **no aggregateport capacity mode** in global configuration mode.

**Configuration Examples** The following example configures the the capacity mode.

```
Ruijie# configure terminal
Ruijie(config)# aggregateport capacity mode 256*8
```

| Related Commands | Command | Description |

|                  | N/A     | N/A         |

**Platform Description** N/A

## 3.3 aggregateport hash-header

Use this command to specify the balancing factor acquisition mode for specific tunnel packets, to optimize traffic balancing. Use the **default** form of this command to restore the default setting,

**aggregateport hash-header** {**inner** | **outer**}

**default aggregateport hash-header**

| Parameter   | Parameter    | Description                                                                                                 |
|-------------|--------------|-------------------------------------------------------------------------------------------------------------|
| Description | <b>inner</b> | Specifies the inner layer in the header of tunnel packets as the source for acquiring the balancing factor. |
|             | <b>outer</b> | Specifies the outer layer in the header of tunnel packets as the source for acquiring the balancing factor. |

**Defaults** The default configuration varies with products.

**Command Mode** Global configuration mode

**Usage Guide** Optional. When performing load balancing, use this command to specify the balancing factor acquisition mode for specific tunnel packets, to optimize traffic balancing.

Use the **default** form of this command to restore the default acquisition mode.

After configuration, if the **show running** command does not display the configuration, the configured mode is the same as the default value.

 The supported configuration options and types of tunnel packets vary with products.

**Configuration Examples** The following example specifies the inner layer in the header of tunnel packets as the source for acquiring the balancing factor in global configuration mode.

```
Ruijie# configure terminal
Ruijie(config)# aggregateport hash-header inner
```

### 3.4 aggregateport load-balance

Use this command to configure a global load-balance algorithm for aggregate ports or a load-balance algorithm for an aggregate port . Use the **no** form of this command to return the default setting.

**aggregateport load-balance { dst-mac | src-mac | src-dst-mac | dst-ip | src-ip | src-dst ip | src-dst-ip-l4port | enhanced profile *profile-name* }**  
**no aggregateport load-balance**

| Parameter Description | Parameter         | Description                                                                                                                                                                                                                                                                          |
|-----------------------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>dst-mac</b>    | Load balance based on the destination MAC addresses of the incoming packets. For all the links of an aggregate port, the messages with the same destination MAC addresses are sent to the same port, and those with different destination MAC addresses are sent to different ports. |
|                       | <b>src-mac</b>    | Load balance based on the source MAC addresses of the incoming packets. For all the links of an aggregate port, the messages from different addresses are distributed to different ports, and those from the same addresses are distributed to the same port.                        |
|                       | <b>src-dst-ip</b> | Load balance based on the source IP address and destination IP address. Packets with different source and destination IP address pairs are forwarded through different ports. The packets with the same source and destination IP address pairs                                      |

|                                                                   |                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                   | are forwarded through the same links. At layer 3, this load balancing style is recommended.                                                                                                                                                                                       |
| <b>dst-ip</b>                                                     | Load balance based on the destination IP addresses of the incoming packets. For all the links of an aggregate port, the messages with the same destination IP addresses are sent to the same port, and those with different destination IP addresses are sent to different ports. |
| <b>src-ip</b>                                                     | Load balance based on the source IP addresses of the incoming packets. For all the links of an aggregate port, the messages from different addresses are distributed to different ports, and those from the same addresses are distributed to the same port.                      |
| <b>src-dst-mac</b>                                                | Load balance based on the source and destination MAC addresses. Packets with different source and destination MAC address pairs are forwarded through different ports. The packets with the same source and destination MAC address pairs are forwarded through the same port.    |
| <b>src-dst-ip-l4port</b> (supported in global configuration mode) | Load balance based on the source IP address, destination IP address, L4 source port number and L4 destination port number.                                                                                                                                                        |
| <b>enhanced profile</b>                                           | Load balance based on the packet type                                                                                                                                                                                                                                             |

**Defaults** The default load balance mode is **src-dst-mac** for the L2 AP port and **src-dst-ip** for the L3 AP port .

**Command Mode** Global configuration mode/Interface configuration mode

**Usage Guide** You can run aggregateport load-balance in interface configuration mode of an AP port on devices that support load balancing configuration on a specific AP port. The configuration in interface configuration mode prevails. To disable the load balancing algorithm, run no aggregateport load-balance in interface configuration mode of the AP port. After that, the load balancing algorithm configured in global configuration mode takes effect.

**Configuration Examples** The following example configures a load-balance algorithm globally based on the destination MAC address.

```
Ruijie(config)# aggregateport load-balance dst-mac
```

### 3.5 aggregateport member linktrap

Use this command to send LinkTrap to aggregate port members. Use the **no** form of this command to restore the default setting.

**aggregateport member linktrap**

**no aggregateport member linktrap**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Global configuration mode

**Usage Guide** This function cannot be enabled by running the **snmp trap link-status** command in interface configuration mode.

**Configuration Examples** The following example enables the LinkTrap function on the aggregate port members.

```
Ruijie# configure terminal
Ruijie(config)# aggregateport member linktrap
```

| Related Commands | Command | Description |

### 3.6 aggregateport primary-port

Use this command to configure the AP member port as a primary port. Use the **no** form of this command to restore the default setting.

**aggregateport primary-port**

**no aggregateport primary-port**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** The AP member port is not a primary port by default.

**Command Mode** Interface configuration mode

**Usage Guide** Only one primary port can be configured for an aggregate port.

**Configuration** The following example configures GigabitEthernet 0/1 as a primary port.

**Examples**

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)# port-group 1 mode active
Ruijie(config-if-GigabitEthernet 0/1)# aggregateport primary-port
Ruijie(config-if-GigabitEthernet 0/1)# end
Ruijie# show interface aggregateport 1
...
Aggregate Port Informations:
    Aggregate Number: 1
    Name: "AggregatePort 1"
    Members: (count=1)
    Primary Port: GigabitEthernet 0/1
    GigabitEthernet 0/1      Link Status: Up   LACP Status: bndl
```

### 3.7 hash-disturb

Use this command to configure HASH disturbance. Use the **no** form of this command to restore the default setting.

**hash-disturb** { *string* | { [ **seed** *seed\_value* ] [ **offset** *offset* ] } }

**no hash-disturb**

| Parameter          | Parameter         | Description                       |
|--------------------|-------------------|-----------------------------------|
| <b>Description</b> | <i>string</i>     | HASH disturbance.                 |
|                    | <i>seed_value</i> | Seed value of HASH disturbance.   |
|                    | <i>offset</i>     | Offset value of HASH disturbance. |

**Defaults** This function is disabled by default.

**Command Mode** Enhanced template configuration mode

**Usage Guide** You can configure this function if you want to balance packets of the same type among multiple devices of the same type.

To configure HASH disturbance, you can run either the **hash-disturb** *string* command or the

**hash-disturb** { [ **seed** *seed\_value* ] [ **offset** *offset* ] } command. The latter is supported on few models. And these two commands are mutually excluded. Thus, you need to remove the first configuration before adopting a second configuration.

**Configuration** The following example configures the HASH disturbance.

**Examples**

```
Ruijie# configure terminal
Ruijie(config)#load-balance-profile
Ruijie(config-load-balance-profile)#
Ruijie(config-load-balance-profile)#hash-disturb A
Ruijie(config-load-balance-profile)#
```

The following example sets the seed value to 12 and offset to 1.

```
Ruijie# configure terminal
Ruijie(config)#load-balance-profile
Ruijie(config-load-balance-profile)#
Ruijie(config-load-balance-profile)#hash-disturb seed 12 offset 1
Ruijie(config-load-balance-profile)#
```

### 3.8 hash-symmetrical

Use this command to configure HASH symmetry. Use the **no** form of this command to restore the default setting.

**hash-symmetrical** {**ipv4** | **ipv6** }

**no hash-symmetrical** {**ipv4** | **ipv6** }

**Parameter  
Description**

| Parameter   | Description                                |
|-------------|--------------------------------------------|
| <b>ipv4</b> | Configures HASH symmetry for IPv4 packets. |
| <b>ipv6</b> | Configures HASH symmetry for IPv6 packets. |

**Defaults** This function is enabled by default.

**Command  
Mode** Enhanced template configuration mode

**Usage Guide** You can configure this function if you want to specify a link for both the uplink and downlink traffic of packets of the same type.

**Configuration** The following example disables HASH symmetry for IPv6 packets.

**Examples**

```
Ruijie# configure terminal
Ruijie(config)#load-balance-profile
Ruijie(config-load-balance-profile)#
Ruijie(config-load-balance-profile)#no hash-symmetrical ipv6
```

### 3.9 interfaces aggregateport

Use this command to create the aggregate port or enter interface configuration mode of the aggregate port. Use the **no** form of this command to restore the default setting.

**interfaces aggregateport** *ap-number*

**no interfaces aggregateport** *ap-number*

**Parameter**

| Parameter        | Description            |
|------------------|------------------------|
| <i>ap-number</i> | Aggregate port number. |

**Description****Defaults**

The aggregate port is not created by default.

**Command**

Global configuration mode

**Mode****Usage Guide**

If the aggregate port is created, this command is used to enter the interface configuration mode. Otherwise, this command is used to create the aggregate port and then enter its interface configuration mode.

**Configuration** The following example creates AP 5 and enters its interface configuration mode.

**Examples**

```
Ruijie# configure terminal
Ruijie(config)# interfaces aggregateport 5
Ruijie(config-if-Aggregateport 5)# end
```

### 3.10 ipv4 field

Use this command to configure the IPv4 load balance mode for a specified profile. Use the **no** form of this command to restore the default setting.

**ipv4 field** [ **src-ip** ] [ **dst-ip** ] [ **protocol** ] [ **I4-src-port** ] [ **I4-dst-port** ] [ **vlan** ]

**no ipv4 field**

| Parameter   | Parameter          | Description                                                              |
|-------------|--------------------|--------------------------------------------------------------------------|
| Description | <b>src-ip</b>      | Load balance based on the source IP address of the IPv4 packet.          |
|             | <b>dst-ip</b>      | Load balance based on the destination IP address of the IPv4 packet.     |
|             | <b>protocol</b>    | Load balance based on the protocol type of the IPv4 packet.              |
|             | <b>I4-src-port</b> | Load balance based on the L4 source port number of the IPv4 packet.      |
|             | <b>I4-dst-port</b> | Load balance based on the L4 destination port number of the IPv4 packet. |
|             | <b>vlan</b>        | Load balance based on the VLAN ID of the IPv4 packet.                    |

**Defaults** The default load balance mode is **src-ip** and **dst-ip**.

**Command Mode** Load balance profile configuration mode

**Usage Guide** You need to configure the load balance profile first.

**Configuration Examples** The following example sets the IPv4 load balance mode for profile apl to **src-ip**.

```
Ruijie# configure terminal
Ruijie(config)# load-balance-profile apl
Ruijie(config-load-balance-profile)# ipv4 field src-ip
```

### 3.11 ipv6 field

Use this command to configure the IPv6 load balance mode for a specified profile. Use the **no** form of this command to restore the default setting.

**ipv6 field** [ **src-ip** ] [ **dst-ip** ] [ **protocol** ] [ **I4-src-port** ] [ **I4-dst-port** ] [ **vlan** ]

**no ipv6 field**

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

|                    |                    |                                                                            |
|--------------------|--------------------|----------------------------------------------------------------------------|
| <b>Description</b> | <b>src-ip</b>      | Load balance based on the source IP addresses of the IPv6 packets.         |
|                    | <b>dst-ip</b>      | Load balance based on the destination IP addresses of the IPv6 packets.    |
|                    | <b>protocol</b>    | Load balance based on the protocol types of the IPv6 packets.              |
|                    | <b>I4-src-port</b> | Load balance based on the L4 source port numbers of the IPv6 packets.      |
|                    | <b>I4-dst-port</b> | Load balance based on the L4 destination port numbers of the IPv6 packets. |
|                    | <b>vlan</b>        | Load balance based on the VLAN ID of the IPv4 packet.                      |

**Defaults** The default load balance mode is **src-ip** and **dst-ip**.

**Command Mode** Load balance profile configuration mode

**Usage Guide** You need to configure the load balance profile first.

**Configuration** The following example sets the load balance mode of IPv6 packets to **src-ip**.

```
Ruijie(config)# load-balance-profile apl
Ruijie(config-load-balance-profile)# ipv6 field src-ip
```

### 3.12 I2 field

Use this command to configure the load balance mode of L2 packets for a specified profile. Use the **no** form of this command to restore the default setting.

**I2 field [ src-mac ] [ dst-mac ] [ vlan ]**

**no I2 field**

| <b>Parameter Description</b> | <b>Parameter</b> | <b>Description</b>                                                   |
|------------------------------|------------------|----------------------------------------------------------------------|
|                              | <b>src-mac</b>   | Load balance based on the source MAC address of the L2 packet.       |
|                              | <b>dst-mac</b>   | Load balance based on the destination MAC address of the L2 packets. |
|                              | <b>vlan</b>      | Load balance based on the VLAN ID of the L2 packet.                  |

**Defaults** The default load balance mode is **src-mac**, **dst-mac**, and **vlan**.

**Command Mode** Load balance profile configuration mode

**Usage Guide** You need to configure the load balance profile first.

**Configuration** The following example sets the load balance mode of L2 packets to **src-mac** and **src-prot**.

**Examples**

```
Ruijie(config)# load-balance-profile apl
Ruijie(config-load-balance-profile)# l2 field src-mac src-port
```

**Description**

### 3.13 lacp individual-port enable

Use this command to enable the LACP independent port function. Use the **no** form of this command to restore the default setting.

**lacp individual-port enable**

**no lacp individual-port enable**

| Parameter          | Parameter | Description |
|--------------------|-----------|-------------|
| <b>Description</b> | N/A       | N/A         |

**Defaults** By default, the LACP independent port function is disabled.

**Command Mode** Interface configuration mode

**Usage Guide** (Optional) Perform this operation when the LACP member port cannot perform LACP negotiation and need to be changed to a common physical port.  
After this function is enabled, the member port becomes an independent port (a common physical port) if LACP negotiation fails because the port does not receive LACP packets from the peer end within the set time-out period.

**Configuration** This example shows how to enable the independent port function for GigabitEthernet 0/1.

**Examples**

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)# port-group 1 mode active
Ruijie(config-if-GigabitEthernet 0/1)# lacp individual enable
Ruijie(config-if-GigabitEthernet 0/1)# end
Ruijie# show interface aggregateport 1
...
Aggregate Port Informations:
  Aggregate Number: 1
  Name: "AggregatePort 1"
  Members: (count=1)
```

```
Primary Port: GigabitEthernet 0/1
GigabitEthernet 0/1      Link Status: Up   LACP Status: individual ...
```

### 3.14 lacp port-priority

Use this command to set the priority of the LACP AP member port. Use the **no** form of this command to restore the default setting.

**lacp port-priority** *port-priority*

**no lacp port-priority**

**Parameter  
Description**

| Parameter            | Description                                           |
|----------------------|-------------------------------------------------------|
| <i>port-priority</i> | The LACP port priority, in the range from 0 to 65535. |

**Defaults** The default is 32768.

**Command  
Mode** Interface configuration mode

**Usage Guide** N/A

**Configuration** This example sets the LACP port priority of interface Gi0/1 to 4096.

**Examples**

```
Ruijie(config)# interface gigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)# lacp port-priority 4096
```

**Related  
Commands**

| Command | Description |
|---------|-------------|
| N/A     | N/A         |

**Platform  
Description**

### 3.15 lacp short-timeout

Use this command to configure the short-timeout mode for the LACP AP member port. Use the **no** form of this command to restore the default setting.

**lacp short-timeout**

**no lacp short-timeout**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** The default is long-timeout mode.

**Command Mode** Interface configuration mode

**Usage Guide** In long-timeout mode, the port sends an LACP packet every 30 seconds. If the packet is not received in 90 seconds, the connection times out.  
In short-timeout mode, the port sends an LACP packet every 1 second. If the packet is not received in 3 seconds, the connection times out.

**Configuration** The following example configures the short-timeout mode for the LACP AP member port.

**Examples**

```
Ruijie(config)# interface gigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)# lacp short-timeout
```

| Related Commands | Command | Description |

### 3.16 lacp system-priority

Use this command to set the LACP system priority. Use the **no** form of this command to restore the default setting.

**lacp system-priority** *system-priority*

**no lacp system-priority**

| Parameter Description | Parameter              | Description                                             |
|-----------------------|------------------------|---------------------------------------------------------|
|                       | <i>system-priority</i> | The LACP system priority, in the range from 0 to 65535. |

**Defaults** The default is 32768.

**Command Mode** Global configuration mode.

**Usage Guide**

**Configuration** The following example sets the LACP system priority to 4096.

**Examples**

```
Ruijie(config)# lacp system-priority 4096
```

| Related Commands | Command                         | Description                                           |
|------------------|---------------------------------|-------------------------------------------------------|
|                  |                                 | <code>port-group key mode { active   passive }</code> |
|                  | <code>lacp port-priority</code> | Sets the LACP port priority.                          |

**Platform** N/A

**Description**

### 3.17 load-balance-profile

Use this command to rename a load balance enhanced profile and apply the profile. Use the **default** form of this command to restore the default setting.

**load-balance-profile** *profile-name*

**no load-balance-profile** *profile-name*

**no load-balance-profile**

| Parameter          | Parameter           | Description                                                     |
|--------------------|---------------------|-----------------------------------------------------------------|
| <b>Description</b> | <i>profile-name</i> | Specifies the profile name, which contains up to 31 characters. |

**Defaults** The default *profile-name* is default.

**Command** Global configuration mode.

**Mode**

**Usage Guide** By default, the device is configured with an enhanced profile named default. Use the **load-balance-profile default** command to enter the enhanced profile configuration mode. You can change the profile name by using the **load-balance-profile** *profile-name* command.

**Configuration** The following example creates a load balance profile named **apl**.

**Examples**

```
Ruijie(config)# load-balance-profile apl
Warning: The profile default has been used, and this command will rename it. Continue? [Y/N]:y
Ruijie(config-load-balance-profile)#
```

**Description**

## 3.18 port-group

Use this command to assign a physical interface to be a member port of a static aggregate port or an LACP aggregate port. Use the **no** form of this command to restore the default setting.

**port-group** *port-group-number*

**port-group** *key-number* **mode** { **active** | **passive** }

**no port-group**

| Parameter   | Parameter                | Description                                                                                                                                    |
|-------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>port-group-number</i> | Member group ID of an aggregate port, the interface number of the aggregate port.                                                              |
|             | <i>key-number</i>        | Member group ID of an LACP aggregate port, the interface number of the LACP aggregate port.                                                    |
|             | <b>active</b>            | Places a port into an active negotiating state, in which the port initiates negotiations with remote ports by sending LACP packets.            |
|             | <b>passive</b>           | Places a port into a passive negotiating state, in which the port responds to LACP packets it receives but does not initiate LACP negotiation. |

**Defaults** By default, the physical port does not belong to any aggregate port.

**Command** Interface configuration mode.

**Mode**

**Usage Guide** All the members of an aggregate port belong to a VLAN or configured to be trunk ports. The ports belonging to different native VLANs cannot form an aggregate port.

**Configuration** The following example specifies the Ethernet interface 1/3 as a member of the static AP 3.

**Examples**

```
Ruijie(config)# interface gigabitethernet 1/3
```

```
Ruijie(config-if-GigabitEthernet 1/3)# port-group 3
```

The following example specifies the Ethernet interface 2/3 as a member of the LACP AP4 and set the aggregation mode to active.

```
Ruijie(config)# interface gigabitethernet 2/3
```

```
Ruijie(config-if-GigabitEthernet 2/3)# port-group 4 mode active
```

**Description**

## 3.19 show aggregateport

Use this command to display the aggregate port configuration.

**show aggregateport** *aggregate-port-number* [ **load-balance** | **summary** ]

| Parameter   | Parameter                    | Description                                                |
|-------------|------------------------------|------------------------------------------------------------|
| Description | <i>aggregate-port-number</i> | Number of the aggregate port.                              |
|             | <b>load-balance</b>          | Displays the load-balance algorithm on the aggregate port. |
|             | <b>summary</b>               | Displays the summary of the aggregate port.                |

**Defaults** N/A

**Command Mode** Any mode

**Usage Guide** If the aggregate port number is not specified, all the aggregate port information will be displayed.

**Configuration Examples** The following example displays the aggregate port configuration.

```
Ruijie# show aggregateport 1 summary
AggregatePort  MaxPorts  SwitchPort Mode    Load balance    Ports
-----
-----
Ag1              8          Enabled  ACCESS  dst-mac          Gi0/2
```

| Field         | Description                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AggregatePort | Indicates AP name.                                                                                                                                                   |
| MaxPorts      | Indicates the maximum number of ports an AP can support.                                                                                                             |
| SwitchPort    | Indicates whether the AP is a switch port or not. "Enabled" indicates the AP is a switch port, while "Disabled" means the AP is not a switch port.                   |
| Mode          | Indicates the AP Mode, which can be ACCESS, TRUNK, TUNNEL, HYBRID, UPLINK, HOST, or PROMIS. When the AP is not a switch port, nothing is displayed under this field. |
| Load balance  | Indicates load balancing mode of the AP.                                                                                                                             |
| Ports         | Indicates the name of an AP member.                                                                                                                                  |

The following example displays the configuration information of **load-balance** globally.

```
Ruijie#show aggregateport load-balance
Load-balance      : Source MAC and Destination MAC
Hash-elasticity   : enable
Algorithm mode
current: 3, default: 0
Hash-disturb(Expert Mode):
current seed: 1, offset 0.
default seed: 0, offset 0.
Hash-disturb(Expert Mode):
```

```
current seed: 1, offset 0.
default seed: 0, offset 0.
```

| Field                     | Description                                                                                                                                                                                         |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Load-balance              | Indicates global load balancing mode.                                                                                                                                                               |
| Hash-elasticity           | Indicates whether Hash elasticity is enabled.                                                                                                                                                       |
| Algorithm mode            | Indicates Hash load-balancing algorithm mode.                                                                                                                                                       |
| Hash-disturb(Expert Mode) | Indicates the seed and offset values of Hash disturbance. Not all models are able to display this such information.<br>“Current” stands for the current values, and “default” for the default ones. |

### 3.21 show lacp summary

Use this command to display the LACP aggregation information.

**show lacp summary** [*key-number* ]

| Parameter Description | Parameter         | Description                                 |
|-----------------------|-------------------|---------------------------------------------|
|                       | <i>key-number</i> | Specifies the aggregation group id to show. |

**Defaults** N/A

**Command** Any mode.

**Mode**

**Usage Guide** N/A

**Configuration** The following example displays the LACP aggregation information.

**Examples**

```
Ruijie(config)# show lacp summary 3
System Id:32768, 00d0.f8fb.0002
Flags: S - Device is requesting Slow LACPDUs
F - Device is requesting Fast LACPDUs.
A - Device is in active mode.          P - Device is in passive mode.
Aggregate port 3:
Local information:
LACP port      Oper   Port   Port
Port   Flags   State  Priority   Key   Number  State
-----
Gi0/1   SA     bndl   4096     0x3   0x1     0x3d

|-----------------------------------|-----------------------------------------------------------------------------------------|
| <b>port-group</b> <i>key mode</i> | Enables the LACP on the port and specifies the aggregation group ID and operation mode. |
|-----------------------------------|-----------------------------------------------------------------------------------------|

**Platform** N/A

**Description**

### 3.22 show load-balance-profile

Use this command to display the enhanced profile.

**show load-balance-profile** [ *profile-name* ]

| Parameter          | Parameter           | Description                 |
|--------------------|---------------------|-----------------------------|
| <b>Description</b> | <i>profile-name</i> | Specifies the profile name. |

**Defaults** -

**Command** Any mode.

**Mode**

**Usage Guide** All enhanced profiles are displayed if the profile name is not specified.

**Configuration** The following example displays the enhanced profile of module0.

**Examples**

```
Ruijie# show load-balance-profile module0
Load-balance-profile: module0
Packet Hash Field:
IPv4: src-ip dst-ip
IPv6: src-ip dst-ip
L2 : src-mac dst-mac vlan
```

**Description**

## 4 VLAN Commands

### 4.1 add

Use this command to add one or a group Access interface into current VLAN. Use the **no** or **default** form of the command to remove the Access interface.

**add interface** { *interface-id* | **range** *interface-range* }

**no add interface** { *interface-id* | **range** *interface-range* }

**default add interface** { *interface-id* | **range** *interface-range* }

| Parameter Description | Parameter                           | Description                                                 |
|-----------------------|-------------------------------------|-------------------------------------------------------------|
|                       | <i>interface-id</i>                 | Layer-2 Ethernet interface or layer-2 AP port.              |
|                       | <b>range</b> <i>interface-range</i> | Range of the Layer-2 Ethernet interface or layer-2 AP port. |

**Defaults** All layer-2 Ethernet interfaces are in the VLAN1.

**Command mode** VLAN configuration mode.

**Usage Guide** This command is only valid for the access port.  
 The configuration of this command is the same as specifying the VLAN to which interface belongs in the interface configuration mode (that is the **switchport access vlan** *vlan-id* command). For the two commands of adding the interface to the VLAN, the command configured later will overwrite the one configured before and take effect.  
 The configuration of adding the layer-2 AP into current VLAN through this command will only take effect for the layer-2 AP port, but not for the member port of the layer-2 AP port.

**Configuration Examples** The following example adds the interface GigabitEthernet 0/10 to VLAN20.

```
Ruijie# configure terminal
SwitchA(config)#vlan 20
SwitchA(config-vlan)#add interface GigabitEthernet 0/10
Ruijie# show interface GigabitEthernet 0/10 switchport
Interface  Switchport  Mode  Access  Native  Protected  VLAN lists
-----  -
GigabitEthernet 0/10  enabled  ACCESS  20    1    Disabled  ALL
```

The following example adds the interface range GigabitEthernet 0/1-10 to VLAN200.

```
Ruijie# configure terminal
SwitchA(config)#vlan 200
SwitchA(config-vlan)#add interface range GigabitEthernet 0/1-10
Ruijie# show vlan
```

```
SwitchA#show vlan
VLAN Name          Status          Ports
-----
1 VLAN0001    STATIC    Gi0/11,Gi0/12,Gi0/13,Gi0/14,Gi0/15,
Gi0/16,Gi0/17,Gi0/18,Gi0/19,Gi0/20,Gi0/21, Gi0/22, Gi0/23, Gi0/24
200 VLAN0200  STATIC    Gi0/1,Gi0/2,Gi0/3,Gi0/4,Gi0/5,
Gi0/6,Gi0/7,Gi0/8,Gi0/9,Gi0/10
```

The following example adds the AggregatePort10 to VLAN20.

```
Ruijie# configure terminal
SwitchA(config)#vlan 20
SwitchA(config-vlan)#add interface aggregateport 10
Ruijie# show interface aggregateport 10 switchport
Interface Switchport Mode Access Native Protected VLAN lists
-----
AggregatePort 10 enabled ACCESS 20 1 Disabled ALL
```

#### Related Commands

| Command                                                     | Description                      |
|-------------------------------------------------------------|----------------------------------|
| <b>show interface</b> <i>interface-id</i> <b>switchport</b> | Displays the layer-2 interfaces. |

**Platform** N/A

**Description**

## 4.2 name

Use this command to specify the name of a VLAN. Use the **no** or **default** form of this command to restore the default setting.

**name** *vlan-name*

**no name**

**default name**

#### Parameter Description

| Parameter        | Description |
|------------------|-------------|
| <i>vlan-name</i> | VLAN name   |

#### Defaults

The default name of a VLAN is the combination of "VLAN" and VLAN ID, for example, the default name of the VLAN 2 is "VLAN0002".

#### Command mode

VLAN configuration Mode.

#### Usage Guide

N/A

**Configuration** The following example sets the name of VLAN to 10.

**Examples**

```
Ruijie(config)# vlan 10
Ruijie(config-vlan)# name vlan10
```

**Related  
Commands**

|------------------|------------------------------------|
| <b>show vlan</b> | Displays member ports of the VLAN. |

**Platform** N/A

**Description**

## 4.3 show vlan

Use this command to display member ports of the VLAN.

**show vlan [ id *vlan-id* ]**

**Parameter  
Description**

| Parameter      | Description |
|----------------|-------------|
| <i>vlan-id</i> | VLAN ID     |

**Defaults** N/A

**Command  
mode** All modes

**Usage Guide** N/A

**Configuration** The following command displays the status of VLAN 1.

**Examples**

```
Ruijie(config-vlan)#show vlan id 20
VLAN Name                Status    Ports
-----
20 VLAN0020              STATIC   Gi0/1
```

The following command displays the status of all VLANs.

```
Ruijie(config-vlan)#show vlan
VLAN Name                Status    Ports
-----
1 VLAN0001              STATIC   Gi0/1, Gi0/2, Gi0/4, Gi0/5
```

```

                Gi0/6, Gi0/7, Gi0/8, Gi0/9
                Gi0/10, Gi0/11, Gi0/12, Gi0/13
                Gi0/14, Gi0/15, Gi0/16, Gi0/17
                Gi0/18, Gi0/19, Gi0/20, Gi0/21
                Gi0/22, Gi0/23, Gi0/24
2-3 VLAN0002-VLAN0003          STATIC   Gi0/1
20 VLAN0020                   STATIC   Gi0/1

```

**Related  
Commands**

| Command                  | Description                   |
|--------------------------|-------------------------------|
| <b>name</b>              | VLAN name.                    |
| <b>switchport access</b> | Adds the interface to a VLAN. |

**Platform** N/A  
**Description**

## 4.4 switchport access

Use this command to configure an interface as a static access port and assign it to a VLAN. Use the **no** or **default** form of the command to assign the port to the default VLAN.

**switchport access vlan** *vlan-id*  
**no switchport access vlan**  
**default switchport access vlan**

**Parameter  
Description**

| Parameter      | Description                                |
|----------------|--------------------------------------------|
| <i>vlan-id</i> | The VLAN ID at which the port to be added. |

**Defaults** By default, the switch port is an access port and the VLAN is VLAN 1.

**Command mode** Interface configuration mode.

**Usage Guide** Enter one VLAN ID. The system will create a new one and add the interface to the VLAN if you enter a new VLAN ID. If the VLAN ID already exists, the command adds the port to the VLAN.  
If the port is a trunk port, the operation does not take effect.

**Configuration Examples**

```

Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# switchport access vlan 2

```

**Related  
Commands**

| Command | Description |
|---------|-------------|
|---------|-------------|

|                         |                                                                      |
|-------------------------|----------------------------------------------------------------------|
| <b>switchport mode</b>  | Specifies the interface as Layer 2 mode (switch port mode).          |
| <b>switchport trunk</b> | Specifies a native VLAN and the allowed-VLAN list for the trunkport. |

**Platform** N/A

**Description**

## 4.5 switchport hybrid allowed

Use this command to add the port to the VLAN or remove the port from the VLAN, Use the **no** or **default** form of this command to restore the default setting.

**switchport hybrid allowed vlan** { { [ **add** | **only** ] **tagged** *vlist* | [ **add** ] **untagged** *vlist* } | **remove** *vlist* }

**no switchport hybrid allowed vlan**

**default switchport hybrid allowed vlan**

| Parameter Description | Parameter       | Description                                                                                       |
|-----------------------|-----------------|---------------------------------------------------------------------------------------------------|
|                       | <b>add</b>      | Adds the port to the VLAN.                                                                        |
|                       | <b>only</b>     | Adds the port to the VLAN and removes the port from the VLANs not on the VLAN list.               |
|                       | <b>tagged</b>   | Adds the port to the VLAN and the VLAN packets going out on the port are tagged with VLAN ID.     |
|                       | <b>untagged</b> | Adds the port to the VLAN and the VLAN packets going out on the port are not tagged with VLAN ID. |
|                       | <b>remove</b>   | Removes the port from the VLAN.                                                                   |
|                       | <i>vlist</i>    | Specifies the VLAN.                                                                               |

**Defaults** By default, the hybrid port is in all VLANs. All VLAN packets (except native VLAN packets) going out on the port are tagged with VLAN ID. Native VLAN packets are not tagged with VLAN ID.

**Command mode** Interface configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example adds the hybrid port to VLAN 20 and VLAN 30 and the VLAN packets going out on the port are not tagged with VLAN ID.

```
Ruijie(config)# interface gigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)# switchport mode hybrid
Ruijie(config-if-GigabitEthernet 0/1)#switchport hybrid allowed vlan untagged
20
Ruijie(config-if-GigabitEthernet 0/1)#switchport hybrid allowed vlan add
```

```
untagged 30
```

The following example adds the hybrid port to VLAN 40 and VLAN 50 and the VLAN packets going out on the port are tagged with VLAN ID,

```
Ruijie(config)# interface gigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)#switchport mode hybrid
Ruijie(config-if-GigabitEthernet 0/1)#switchport hybrid allowed vlan tagged
40
Ruijie(config-if-GigabitEthernet 0/1)#switchport hybrid allowed vlan tagged
50
```

The following example removes the hybrid port from VLAN 20.

```
Ruijie(config)# interface gigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)#switchport mode hybrid
Ruijie(config-if-GigabitEthernet 0/1)#switchport hybrid allowed vlan remove
20
```

The following example adds the hybrid port to VLAN 20 and deletes all the other VLANs. The VLAN packets going out on the port are tagged with VLAN ID.

```
Ruijie(config)# interface gigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)#switchport mode hybrid
Ruijie(config-if-GigabitEthernet 0/1)#switchport hybrid allowed vlan only
tagged 20
```

## 4.6 switchport hybrid native

Use this command to configure the native VLAN for the hybrid port. Use the **no** or **default** form of this command to restore the default setting.

**switchport hybrid native vlan** *vlan-id*

**no switchport hybrid native vlan**

**default switchport hybrid native vlan**

#### Parameter Description

| Parameter      | Description                                     |
|----------------|-------------------------------------------------|
| <i>vlan-id</i> | Configures the native VLAN for the hybrid port. |

#### Defaults

The default is VLAN 1.

**Command mode** Interface configuration mode

**Usage Guide** Native VLAN packets going out on the hybrid port are not tagged with VLAN ID. Packets not tagged with VLAN ID coming in on the hybrid port are taken as native VLAN packets.

**Configuration Examples** The following example configures VLAN 20 as the native VLAN for hybrid port GigabitEthernet 0/1.

```
Ruijie(config-if-GigabitEthernet 0/1)#interface gigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)#switchport mode hybrid
Ruijie(config-if-GigabitEthernet 0/1)#switchport hybrid native vlan 20
```

**Related Commands**

| N/A     | N/A         |

**Platform Description** N/A

## 4.7 switchport mode

Use this command to specify a L2 interface (switch port) mode. You can specify this interface to be an access port or a trunk port. Use the **no** or **default** form of this command to restore the default setting.

**switchport mode { access | trunk | hybrid | uplink }**

**no switchport mode**

**default switchport mode**

**Parameter Description**

| Parameter     | Description                                   |
|---------------|-----------------------------------------------|
| <b>access</b> | Configures the switch port as an access port. |
| <b>trunk</b>  | Configures the switch port as a trunk port.   |
| <b>hybrid</b> | Configures the switch port as a hybrid port.  |
| <b>uplink</b> | Configures the switch port as an uplink port. |

**Defaults** By default, the switch port is an access port.

**Command mode** Interface configuration mode.

**Usage Guide** If a switch port is an access port, the port can be added only to one VLAN. You can run the **switchport access vlan** command to specify the VLAN to which the port belongs. If a switch port is a trunk port, the port is added to all VLANs by default. You can also run the **switchport trunk allowed** command to add the port to or remove the port from a specified VLAN. If a switch port is an uplink port, the port is added to all VLANs by default. Different from the trunk

port, the uplink port sends packets with a tag carried, that is, the tag of packets from default VLANs will not be deleted. You can run the **switchport trunk allowed** command to add the port to or remove the port from a specified VLAN.

If a switch port is a hybrid port, the port is added to all VLANs by default. Different from a trunk port, a hybrid port can be added to a VLAN in tag or untag mode by running the **switchport hybrid allowed** command.

**Configuration** The following example configures port 1 as an access port.

**Examples**

```
Ruijie(config)#int g 0/1
Ruijie(config-if-GigabitEthernet 0/1)#switchport mode access
```

The following example configures port 1 as a trunk port.

```
Ruijie(config)#int g 0/1
Ruijie(config-if-GigabitEthernet 0/1)# switchport mode trunk
```

The following example configures port 1 as an uplink port.

```
Ruijie(config)#int g 0/1
Ruijie(config-if-GigabitEthernet 0/1)# switchport mode uplink
```

The following example configures port 1 as a hybrid port.

```
Ruijie(config)#int g 0/1
Ruijie(config-if-GigabitEthernet 0/1)# switchport mode hybrid
```

**Related Commands**

| Command                  | Description                                                                |
|--------------------------|----------------------------------------------------------------------------|
| <b>switchport access</b> | Configures an interface as a statics access port and assigns it to a VLAN. |
| <b>switchport trunk</b>  | Specifies a native VLAN and the allowed-VLAN list for the trunkport.       |

**Platform** N/A

**Description**

## 4.8 switchport trunk allowed vlan

Use this command to add the trunk/uplink port to the VLAN or remove a trunk/uplink port from the VLAN. Use the **no** or **default** form of the command to restore the default setting.

**switchport trunk allowed vlan { all | { add *vlan-list* | remove *vlan-list* | except *vlan-list* | only *vlan-list* } }**

**no switchport trunk allowed vlan**

**default switchport trunk allowed vlan**

**Parameter Description**

| Parameter  | Description                              |
|------------|------------------------------------------|
| <b>all</b> | Adds the trunk/uplink port to all VLANs. |

|                  |                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------|
| <b>add</b>       | Adds the trunk/uplink port to the VLAN.                                                                    |
| <b>remove</b>    | Removes the trunk/uplink port from the VLAN port.                                                          |
| <b>except</b>    | Removes the trunk/uplink port from the VLAN and adds the port to all the other VLANs.                      |
| <b>only</b>      | Adds the trunk/uplink port to the specified VLAN and removes the port from the VLANs not on the VLAN list. |
| <i>vlan-list</i> | Specifies the VLAN.                                                                                        |

**Defaults** The trunk/unlink port is in all VLANs by default.

**Command mode** Interface configuration mode.

**Usage Guide** A trunk/uplink port transmits all VLAN (1-4094) data by default. You can block some VLAN data by configuring this command. Use the **show interfaces** command to display configuration.

**Configuration** The following example removes trunk port GigabitEthernet 0/10 from VLAN 2.

```
Ruijie(config)# interface gigabitEthernet 0/10
Ruijie(config-if-GigabitEthernet 0/10)# switchport mode trunk
Ruijie(config-if-GigabitEthernet 0/10)# switchport trunk allowed vlan remove 2
```

The following example removes trunk port GigabitEthernet 0/10 from VLAN 2.

```
Ruijie(config)# interface gigabitEthernet 0/10
Ruijie(config-if-GigabitEthernet 0/10)# switchport trunk allowed vlan except 10
```

The following example removes uplink port GigabitEthernet 0/10 from VLAN 10.

```
Ruijie(config)# interface gigabitEthernet 0/10
Ruijie(config-if-GigabitEthernet 0/10)# switchport mode uplink
Ruijie(config-if-GigabitEthernet 0/10)# switchport trunk allowed vlan remove 10
```

The following example adds uplink port GigabitEthernet 0/10 to all VLANs except VLAN10.

```
Ruijie(config)# interface gigabitEthernet 0/10
Ruijie(config-if-GigabitEthernet 0/10)# switchport trunk allowed vlan except 10
```

## 4.9 switchport trunk native vlan

Use this command to configure the native VLAN for the trunk/uplink port. Use the **no** or **default** form of this command to restore the default setting.

**switchport trunk native vlan** *vlan-id*

**no switchport trunk native vlan**

**default switchport trunk native vlan**

| Parameter Description | Parameter      | Description     |
|-----------------------|----------------|-----------------|
|                       | <i>vlan-id</i> | Native VLAN ID. |

**Defaults** By default, the native VLAN for the trunk/uplink port is VLAN 1.

**Command mode** Interface configuration mode

**Usage Guide** After this function is enabled, packets not tagged with VLAN ID are taken as native VLAN packets. Tags are removed from native VLAN packets going out on the trunk port.

**Configuration Examples** The following example configures VLAN 10 as the native VLAN for trunk port GigabitEthernet 0/10.

### Examples

```
Ruijie(config)#interface gigabitEthernet 0/10
Ruijie(config-if-GigabitEthernet 0/10)# switchport mode trunk
Ruijie(config-if-GigabitEthernet 0/10)# switch trunk native vlan 10
```

The following example configures VLAN 10 as the native VLAN for unlink port GigabitEthernet 0/10.

```
Ruijie(config)#interface gigabitEthernet 0/10
Ruijie(config-if-GigabitEthernet 0/10)# switchport mode uplink
Ruijie(config-if-GigabitEthernet 0/10)# switch trunk native vlan 10
```

**Platform Description** N/A

## 4.10 vlan

Use this command to enter the VLAN configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**vlan** { *vlan-id* | **range** *vlan-range* }

**no vlan** { *vlan-id* | **range** *vlan-range* }

**default vlan** { *vlan-id* | **range** *vlan-range* }

| <b>Parameter Description</b> | <b>Parameter</b>  | <b>Description</b>                                  |
|------------------------------|-------------------|-----------------------------------------------------|
|                              | <i>vlan-id</i>    | VLAN ID<br>Default VLAN (VLAN 1) cannot be removed. |
|                              | <i>vlan-range</i> | VLAN ID range.                                      |

**Defaults** The default is static VLAN.

**Command mode** Global configuration mode.

**Usage Guide** N/A

**Configuration Examples** The following example creates VLAN 10.

```
Ruijie(config)# vlan 10
Ruijie(config-vlan)#
```

| <b>Related Commands</b> | <b>Command</b>   | <b>Description</b>                 |
|-------------------------|------------------|------------------------------------|
|                         | <b>show vlan</b> | Displays member ports of the VLAN. |

**Platform Description** N/A

## 5 Super-VLAN Commands

### 5.1 proxy-arp

Use this command to enable the proxy ARP function for a VLAN. Use the **no** form of this command to disable this function. Use the **default** form of this command to restore the default setting.

**proxy-arp**

**no proxy-arp**

**default proxy-arp**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command mode** VLAN configuration Mode.

**Usage Guide** Super VLAN and sub VLAN must be both enabled with proxy ARP.

**Configuration Examples** The following example enables the proxy ARP function for VLAN 3.

```
Ruijie(config)# vlan 3
Ruijie(config-vlan)# proxy-arp
```

The following example disables the proxy ARP function for VLAN 3.

```
Ruijie(config)# vlan 3
Ruijie(config-vlan)# no proxy-arp
```

| Related Commands | Command               | Description                          |
|------------------|-----------------------|--------------------------------------|
|                  | <b>show supervlan</b> | Displays the super VLAN information. |

**Platform** N/A  
**Description**

### 5.2 show supervlan

Use this command to display the configuration of the super VLAN and its sub VLANs.

**show supervlan**

**show supervlan** *vlan-id*

| Parameter Description | Parameter      | Description |
|-----------------------|----------------|-------------|
|                       | <i>vlan-id</i> | VLAN ID     |

**Defaults** N/A

**Command mode** Any mode

**Usage Guide** N/A

**Configuration** The following example displays the configuration of super VLAN 2.

**Examples**

```
SwitchA(config-if-range)# show supervlan 2
supervlan id supervlan arp-proxy subvlan id subvlan arp-proxy subvlan ip
range
-----
      2          ON      10      ON      192.168.196.10 - 192.168.196.50
                          20      ON      192.168.196.60 - 192.168.196.100
                          30      ON      192.168.196.110 - 192.168.196.150
```

The following example displays the configuration of all super VLANs.

```
SwitchA(config-if-range)# show supervlan
supervlan id supervlan arp-proxy subvlan id subvlan arp-proxy subvlan ip
range
-----
      2          ON      10      ON      192.168.196.10 - 192.168.196.50
                          20      ON      192.168.196.60 - 192.168.196.100
                          30      ON      192.168.196.110 - 192.168.196.150
      6          ON      7-8    ON
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 5.3 subvlan

Use this command to set the sub VLAN for the super VLAN. Use the **no** form of this command to disable this function. Use the **default** form of this command to restore the default setting.

**subvlan** *vlan-id-list*

**no subvlan** [ *vlan-id-list* ]

**default subvlan** [ *vlan-id-list* ]

| Parameter Description | Parameter           | Description                                            |
|-----------------------|---------------------|--------------------------------------------------------|
|                       | <i>vlan-id-list</i> | Sub VLAN ID of the VLAN. Multiple VLANs are supported. |

**Defaults** No super VLAN is set by default.

**Command mode** VLAN configuration Mode.

**Usage Guide** Use the **no subvlan** command to delete all sub VLANs of this super VLAN.

**Configuration** The following example sets the sub VLAN.

**Examples**

```
SwitchA(config)#vlan 2
SwitchA(config-vlan)#supervlan
SwitchA(config-vlan)#subvlan 10,20,30
```

| Related Commands | Command               | Description                          |
|------------------|-----------------------|--------------------------------------|
|                  | <b>show supervlan</b> | Displays the super VLAN information. |

**Platform** N/A  
**Description**

## 5.4 subvlan-address-range

Use this command to set the IP address range of the sub VLAN. Use the **no** form of this command to disable this function. Use the **default** form of this command to restore the default setting.

**subvlan-address-range** *start-ip end-ip*

**no subvlan-address-range**

**default subvlan-address-range**

| Parameter Description | Parameter       | Description                           |
|-----------------------|-----------------|---------------------------------------|
|                       | <i>start-ip</i> | The start IP address of this sub VLAN |
|                       | <i>end-ip</i>   | The end IP address of this sub VLAN   |

**Defaults** No IP address range is set by default.

**Command mode** VLAN configuration Mode.

**Usage Guide** N/A

**Configuration** The following example sets the IP address range for the sub VLAN.

**Examples**

```
Ruijie(config)# vlan 2
Ruijie(config-vlan)#subvlan-address-range 192.168.23.1 192.168.23.5
```

## 6 Private VLAN Commands

### 6.1 debug bridge pvlan

Use this command to enable private VLAN debugging. Use the **no** or **default** form of this command to restore the default setting.

**debug bridge pvlan**

**no debug bridge pvlan**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** Debugging is disabled by default.

**Command mode** Privileged EXEC mode

**Usage Guide** Debugging information includes error and prompt messages appearing during private VLAN configuration.

This command can be used to troubleshoot VLAN and interface configuration failure.

 With private VLAN debugging enabled, all super VLAN configuration and packet processing on SVI is displayed.

 Debugging information helps troubleshooting and fault location.

**Configuration** The following example enables private VLAN debugging.

**Examples** Ruijie# debug bridge pvlan

The following example disables private VLAN debugging.

Ruijie# no debug bridge pvlan

**Description**

### 6.2 private-vlan

Use this command to configure the private VLAN feature. Use the **no** or **default** form of this command to restore the default setting.

**private-vlan { community | isolated | primary }**  
**no private-vlan { community | isolated | primary }**  
**default private-vlan { community | isolated | primary }**

| Parameter Description | Parameter        | Description              |
|-----------------------|------------------|--------------------------|
|                       | <b>community</b> | Sets the community VLAN. |
|                       | <b>isolated</b>  | Sets the isolated VLAN.  |
|                       | <b>primary</b>   | Sets the primary VLAN.   |

**Defaults** No private VLAN feature is configured by default.

**Command mode** VLAN configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example configures the private VLAN feature.

```
Ruijie(config)#vlan 90
Ruijie(config-vlan)#private-vlan primary
Ruijie(config-vlan)#vlan 91
Ruijie(config-vlan)#private-vlan isolated
Ruijie(config-vlan)#vlan 92
Ruijie(config-vlan)#private-vlan community
```

The following example disables the private VLAN feature using the **no private-vlan** command.

```
Ruijie(config)#vlan 90
Ruijie(config-vlan)#no private-vlan primary
Ruijie(config-vlan)#vlan 91
Ruijie(config-vlan)#no private-vlan isolated
Ruijie(config-vlan)#vlan 92
Ruijie(config-vlan)#no private-vlan community
```

The following example disables the private VLAN feature using the **default private-vlan** command.

```
Ruijie(config)#vlan 90
Ruijie(config-vlan)#default private-vlan primary
Ruijie(config-vlan)#vlan 91
Ruijie(config-vlan)#default private-vlan isolated
Ruijie(config-vlan)#vlan 92
Ruijie(config-vlan)#default private-vlan community
```

|                  | N/A     | N/A         |

**Platform** N/A

**Description**

## 6.3 private-vlan association

Use this command to associate the secondary VLAN with the primary VLAN on layer 2. Use the **no** or **default** form of this command to restore the default setting.

**private-vlan association** { *svlist* | **add** *svlist* | **remove** *svlist* }

**no private-vlan association**

**default private-vlan association**

| Parameter Description | Parameter                   | Description                            |
|-----------------------|-----------------------------|----------------------------------------|
|                       | <i>svlist</i>               | The secondary VLAN list                |
|                       | <b>add</b> <i>svlist</i>    | Adds the associated secondary VLAN.    |
|                       | <b>remove</b> <i>svlist</i> | Removes the associated secondary VLAN. |

**Defaults** This function is disabled by default.

**Command mode** VLAN configuration Mode.

**Usage Guide** N/A

**Configuration Examples** The following example associates the secondary VLAN with the primary VLAN on layer 2.

```
Ruijie(config)# vlan 22
Ruijie(config-vlan)# private-vlan association add 24-26
```

The following example removes the association between the secondary VLAN with the primary VLAN.

```
Ruijie(config)# vlan 22
Ruijie(config-vlan)# private-vlan association remove 24
```

## 6.4 private-vlan mapping

Use this command to associate the secondary VLAN with the primary VLAN on layer 3. Use the **no** or **default** form of this command to restore the default setting.

**private-vlan mapping** { *svlist* | **add** *svlist* | **remove** *svlist* }  
**no private-vlan mapping**  
**default private-vlan mapping**

| Parameter Description | Parameter                   | Description                            |
|-----------------------|-----------------------------|----------------------------------------|
|                       | <i>svlist</i>               | Secondary VLAN list.                   |
|                       | <b>add</b> <i>svlist</i>    | Adds the associated secondary VLAN.    |
|                       | <b>remove</b> <i>svlist</i> | Removes the associated secondary VLAN. |

**Defaults** This function is disabled by default.

**Command mode** Interface configuration mode

**Usage Guide** N/A

**Configuration** The following example associates the secondary VLAN with the primary VLAN on layer 3.

**Examples**

```
Ruijie(config)# interface vlan 22
Ruijie(config-if)# private-vlan mapping add 24-26
```

| Related Commands | Command                       | Description |

## 6.5 show vlan private-vlan

Use this command to display the private VLAN configuration.

**show vlan private-vlan** [ **community** | **primary** | **isolated** ]

Use this command to display all the private VLANs configuration.

**show vlan private-vlan**

| Parameter Description | Parameter        | Description                              |
|-----------------------|------------------|------------------------------------------|
|                       | <b>primary</b>   | Displays the primary VLAN information.   |
|                       | <b>community</b> | Displays the community VLAN information. |
|                       | <b>isolated</b>  | Displays the isolated VLAN information.  |

**Defaults** N/A

**Command mode** All modes

**Usage Guide** N/A

**Configuration** The following example displays the private VLAN configuration.

**Examples**

```
Ruijie# show vlan private-vlan
VLAN  Type      Status  Routed  Ports  Associated
-----
30    primary  inactive Enabled
31    isolated inactive Disabled  No Association
90    primary  active  Disabled 91-92
91    isolated active  Disabled 90
92    community active  Disabled Gi0/1 90
```

**Description**

## 6.6 switchport mode private-vlan

Use this command to declare the private VLAN mode of the interface. Use the **no** or **default** form of this command to restore the default setting.

**switchport mode private-vlan { host | promiscuous }**

**no switchport mode**

**default switchport mode**

**Parameter Description**

| Parameter          | Description                          |
|--------------------|--------------------------------------|
| <b>host</b>        | Host mode of the private VLAN        |
| <b>promiscuous</b> | Promiscuous mode of the private VLAN |

**Defaults** The port is an access port by default.

**Command mode** Interface configuration mode.

**Usage Guide** Before a port is configured as an isolated port or promiscuous port, and the port mode must be configured as the host port mode.

The port mode must be configured as the promiscuous mode.

**Configuration** The following example applies the private host mode to the interface.

**Examples**

```
Ruijie(config)# interface gigabitEthernet0/2
Ruijie(config-if)# switchport mode private-vlan host
```

The following example applies the promiscuous mode to the interface.

```
Ruijie(config)# interface gigabitEthernet 0/2
Ruijie(config-if-GigabitEthernet 0/2)#sw mode private-vlan promiscuous
```

**Related Commands**

| Command                       | Description |
|-------------------------------|-------------|
| <b>show vlan private-vlan</b> | N/A         |

**Platform** N/A

**Description**

## 6.7 switchport private-vlan association trunk

Use this command to associate the trunk port in the private VLAN mode, which is associated with the primary VLAN and the secondary VLAN. Use the **no** or **default** form of this command to restore the default settings.

**switchport private-vlan association trunk** *p\_vid s\_vid*

**no switchport private-vlan association trunk**

**default switchport private-vlan association trunk** *p\_vid s\_vid*

**Parameter Description**

| Parameter    | Description                                  |
|--------------|----------------------------------------------|
| <i>p_vid</i> | Primary VID.                                 |
| <i>s_vid</i> | Secondary VID                                |
| <b>no</b>    | Deletes the host port from the private VLAN. |

**Defaults** By default, it is trunk port.

**Command mode** Interface configuration mode.

**Usage Guide** The associated PVLAN must be a VLAN pair on which Layer-2 association is performed.

The interface must work in Trunk port mode.

One Trunk port can be associated with multiple PVLAN pairs.

**Configuration** The following example configures a Trunk port, and associates it with a layer 2 port and private VLAN.

**Examples**

```
Ruijie(config)# interface gigabitEthernet 0/2
Ruijie(config-if)# switchport mode trunk
Ruijie(config-if)# switchport private-vlan association trunk 202 203
```

**Related Commands**

| Command                       | Description |
|-------------------------------|-------------|
| <b>show vlan private-vlan</b> | N/A         |

**Platform** N/A  
**Description**

## 6.8 switchport private-vlan host-association

Use this command to associate the primary VLAN, which is associated with the private VLAN mode of the interface, with the secondary VLAN. Use the **no** or **default** form of this command to restore the default setting.

**switchport private-vlan host-association** *p\_vid* *s\_vid*

**no switchport private-vlan host-association**

**default switchport private-vlan host-association**

**Parameter Description**

| Parameter    | Description   |
|--------------|---------------|
| <i>p_vid</i> | Primary VID.  |
| <i>s_vid</i> | Secondary VID |

**Defaults** This function is disabled by default.

**Command mode** Interface configuration mode.

**Usage Guide** Before a port is configured as an isolated port or promiscuous port, and the port mode must be configured as the host port mode.

Whether a port is configured as an isolated port or community port depends on the *s\_vid* parameter. *p\_vid* and *s\_vid* must be respectively the IDs of the primary VLAN and secondary VLAN in a PVLAN pair, on which Layer-2 association is performed.

One host port can be associated with only one PVLAN pair.

**Configuration** The following example associates the secondary VLAN with the primary VLAN on the host port.

**Examples**

```
Ruijie(config)# interface gigabitEthernet 0/1
Ruijie(config-if)# switchport mode private-vlan host
Ruijie(config-if)# switchport private-vlan host-association 22 23
Ruijie(config-if)# default switchport private-vlan host-association
```

```
Ruijie(config-if)# switchport private-vlan host-association 22 25
```

| Related Commands | Command | Description                   |
|------------------|---------|-------------------------------|
|                  |         | <b>show vlan private-vlan</b> |

**Platform** N/A

**Description**

## 6.9 switchport private-vlan mapping

Use this command to configure the secondary VLAN for the promiscuous port. Use the **no** or **default** form of this command to restore the default setting.

**switchport private-vlan mapping** *p\_vid* { *svlist* | **add** *svist* | **remove** *svlist* }

**no switchport private-vlan mapping**

**default switchport private-vlan mapping**

| Parameter          | Parameter     | Description                                                                                                                          |
|--------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>p_vid</i>  | Indicates the primary VLAN ID in a PVLAN pair.                                                                                       |
|                    | <i>svlist</i> | Indicates the secondary VLAN associated with a promiscuous port. Layer-2 association must be performed between it and <i>p_vid</i> . |
|                    | <b>add</b>    | Adds a secondary VLAN to be associated with a port.                                                                                  |
|                    | <b>remove</b> | Cancels the secondary VLAN associated with a port.                                                                                   |

**Defaults** This function is disabled by default.

**Command mode** Interface configuration mode

**Usage Guide** The port mode must be configured as the promiscuous mode.  
Layer-2 association must be performed between the primary and secondary VLAN.

**Configuration** The following example configures the secondary VLAN for the promiscuous port.

**Examples**

```
Ruijie(config)# interface gigabitEthernet 0/1
Ruijie(config-if)# switchport mode private-vlan
promiscuous
Ruijie(config-if)# switchport private-vlan mapping 22 add 23-25
```

| Related Commands | Command | Description                   |
|------------------|---------|-------------------------------|
|                  |         | <b>show vlan private-vlan</b> |

**Platform** N/A

**Description**

## 6.10 switchport private-vlan promiscuous trunk

Use this command to configure the ports as a promiscuous trunk port, which is associated with the L2 port and the private VLAN. Multiple pairs are allowed to associate. Use the **no** or **default** form of this command to restore the default settings.

**switchport private-vlan promiscuous trunk** *p\_vid\_s\_list*

**no switchport private-vlan promiscuous trunk** *p\_vid\_s\_list*

**Parameter Description**

| Parameter     | Description                                                                |
|---------------|----------------------------------------------------------------------------|
| <i>p_vid</i>  | Primary VID                                                                |
| <i>svlist</i> | Secondary VLAN list.                                                       |
| <b>no</b>     | Removes all the relationships between the layer-2 ports and private VLANs. |

**Defaults** N/A

**Command mode** Interface configuration mode

**Usage Guide** The port mode must be a Trunk port.  
Layer-2 association must be performed between the primary and secondary VLAN.

**Configuration Examples**

```
Ruijie(config)# interface gigabitEthernet 0/2
Ruijie(config-if)# switchport mode trunk
Ruijie(config-if)# switchport private-vlan promiscuous trunk 202 203
```

## 7 MSTP Commands

### 7.1 bpdu src-mac-check

Use this command to enable the BPDU source MAC address check function on the interface. Use the **no** form of this command to restore the default setting.

**bpdu src-mac-check** *H.H.H*

**no bpdu src-mac-check**

| Parameter Description | Parameter    | Description                                                               |
|-----------------------|--------------|---------------------------------------------------------------------------|
|                       | <i>H.H.H</i> | Indicates that only the BPDU messages from this MAC address are received. |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode.

**Usage Guide** BPDU source MAC address check prevents BPDU packets from maliciously attacking switches and causing MSTP abnormal. When the switch connected to a port on a point-to-point link is determined, you can enable BPDU source MAC address check to receive BPDU packets sent only by the peer switch and discard all other BPDU packets, thereby preventing malicious attacks. You can enable the BPDU source MAC address check in interface configuration mode for a specific port. One port can only filter one MAC address.

**Configuration Examples** The following example indicates only the BPDU with 00d0.f800.1e2f as the source MAC address will be received by interface Gi 1/1 .

```
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if-interface-id-interface-id)# bpdu src-mac-check
00d0.f800.1e2f
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 7.2 bridge-frame forwarding protocol bpdu

Use this command to enable BPDU transparent transmission. Use the **no** form of this command to restore the default setting.

**bridge-frame forwarding protocol bpdu**  
**no bridge-frame forwarding protocol bpdu**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Global configuration mode

**Usage Guide** In the IEEE 802.1Q standard, 01-80-C2-00-00-00, the destination MAC address of BPDU frames, is reserved. Devices following the IEEE 802.1Q standard don't forward BPDU frames. In real network deployment, devices may be required to support BPDU transparent transmission. For example, when a device is not enabled with STP, BPDU transparent transmission can help implement STP calculation.  
 BPDU transparent transmission works only when STP is disabled.

**Configuration** The following example enables BPDU transparent transmission.

**Examples** Ruijie(config)# bridge-frame forwarding protocol bpdu

## 7.3 clear spanning-tree counters

Use this command to clear the statistics of the sent and received STP packets.

**clear spanning-tree detected-protocols [ interface *interface-id* ]**

| Parameter Description | Parameter           | Description         |
|-----------------------|---------------------|---------------------|
|                       | <i>interface-id</i> | ID of the interface |

**Defaults** N/A**Command Mode** Privileged EXEC mode**Usage Guide** It is used to clear the statistics of the sent and received STP packets.**Configuration** The following example clears the statistics of the sent and received STP packets.**Examples**

```
Ruijie# clear spanning-tree counters
```

The following example clears the statistics of the sent and received packets on interface Gi 0/1.

```
Ruijie# clear spanning-tree counters interface gigabitethernet 0/1
```

**Related Commands**

| Command                            | Description                                                |
|------------------------------------|------------------------------------------------------------|
| <b>show spanning-tree counters</b> | <b>Displays the statistics of STP transceived packets.</b> |

**Platform Description** N/A

## 7.4 clear spanning-tree detected-protocols

Use this command to force the interface to send the RSTP BPDU message and check the BPDU messages.

**clear spanning-tree detected-protocols [ interface *interface-id* ]**

**Parameter Description**

| Parameter           | Description         |
|---------------------|---------------------|
| <i>interface-id</i> | ID of the interface |

**Defaults** N/A**Command Mode** Privileged EXEC mode**Usage Guide** Use this command to force the interface to send the RSTP BPDU message.**Configuration** Forces to check the version of all interfaces.**Examples**

```
Ruijie# clear spanning-tree detected-protocols
```

**Related Commands**

**Description**

## 7.5 clear spanning-tree mst topochange record

Use this command to clear STP topology change record.

**clear spanning-tree mst *instance-id* topochange record**

| Parameter   | Parameter          | Description                                                        |
|-------------|--------------------|--------------------------------------------------------------------|
| Description | <i>instance-id</i> | Instance ID. For STP and RSTP protocols, only instance 0 is valid. |

**Defaults** N/A

**Command** Privileged EXEC mode

**Mode**

**Usage Guide** N/A

**Configuration** The following example clears STP topology change record.

**Examples**

```
Ruijie# show spanning-tree mst 0 topochange record
Topology change information on mst 0:
Time                Interface          Old status   New status   Type
-----
2013.5.1 4:18:46   GI0/6         Learning    Forwarding   Normal
Ruijie# clear spanning-tree mst 0 topochange record
Ruijie# show spanning-tree mst 0 topochange record
%There's no topology change information has been record on mst 0.
```

| Related Commands | Command | Description |

**Description**

## 7.6 instance instance-id vlan vlan-range

Use this command to set instance and VLAN mapping relations. Use the **no** form of the command to restore the default setting.

**instance** *instance-id* **vlan** *vlan-range*  
**no instance** *instance-id* { **vlan** *vlan-range* }

**Parameter Description**

| Parameter          | Description                              |
|--------------------|------------------------------------------|
| <i>instance-id</i> | Instance ID, in the range from 0 to 64   |
| <i>vlan-range</i>  | VLAN range, in the range from 1 to 4094. |

**Defaults** The default is instance 0.

**Command Mode** MST configuration mode

**Usage Guide** **instance** *instance-id* **vlan** *vlan-range* : Add VLAN to MST instance. Instance-ID is in the range from 0 to 64 and VLAN is in the range from 1 to 4094. Use commas to separate VLAN IDs and use hyphen to indicate VLAN range, e.g., instance 10 vlan 2,3,6-9, which adds VLAN 2, 3, 4, 5, 6, 7, 8, 9 to instance 10. By default, all VLANs are in instance 0. Use the **no** form of this command to remove VLAN from instance 1-64.

If you create 64 instances by stacking on a Ruijie device with a small memory (e.g., 64M), the memory may be undersized. It is recommended to limit stacking instance number.

**Configuration Examples** This example enters MST mode and maps VLAN 3 and 5-10 to MST instance1.

```
Ruijie(config)# spanning-tree mst configuration
Ruijie(config-mst)# instance 1 vlan 3, 5-10
Ruijie(config-mst)# show spanning-tree mst configuration
Multi spanning tree protocol : Enable
Name      :
Revision  : 0
Instance  Vlans Mapped
-----  -----
0         1-2,4,11-4094
1         3,5-10
-----
Ruijie(config-mst)# exit
Ruijie(config)#
```

The following example removes VLAN3 from instance 1.

```
Ruijie(config-mst)# no instance 1 vlan 3
```

The following example removes instance 1.

```
Ruijie(config-mst)# no instance 1
```

## 7.7 l2protocol-tunnel stp

Use this command to enable BPDU TUNNEL globally. Use the **no** form of this command to disable this function.

**l2protocol-tunnel stp**  
**no l2protocol-tunnel stp**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** If you want to BPDU TUNNEL globally, enable BPDU TUNNEL on the interface first.

**Configuration** The following example enables BPDU TUNNEL globally.

```

Examples Ruijie(config)# l2protocol-tunnel stp
Ruijie(config)# show l2protocol-tunnel stp

L2protocol-tunnel: stp Enable
L2protocol-tunnel destination mac address: 01d0.f800.0005

```

## 7.9 l2protocol-tunnel stp tunnel-dmac

Use this command to configure the STP address for transparent transmission through BPDU TUNNEL. Use the **no** form of this command to restore the default setting.

**l2protocol-tunnel stp tunnel-dmac** *mac-address*  
**no l2protocol-tunnel stp tunnel-dmac**

| <b>Parameter Description</b> | Parameter          | Description                                   |
|------------------------------|--------------------|-----------------------------------------------|
|                              | <i>mac-address</i> | The STP address for transparent transmission. |

**Defaults**

**Command Mode** Global configuration mode

**Usage Guide** The available STP address includes 01d0.f800.0005, 011a.a900.0005, 010f.e200.0003, 0100.0ccd.cdd0, 0100.0ccd.cdd1, and 0100.0ccd.cdd2.

**Configuration** The following example configures the STP address for transparent transmission through BPDU

**Examples** TUNNEL.

```
Ruijie(config)# l2protocol-tunnel stp tunnel-dmac 011a.a900.0005
```

| N/A     | N/A         |

**Platform** N/A

**Description**

## 7.10 name

Use this command to set MST name. Use the **no** form of the command to restore the default setting.

**name** *name*

**no name**

**Parameter  
Description**

| Parameter   | Description                    |
|-------------|--------------------------------|
| <i>name</i> | MST name, up to 32 characters. |

**Defaults** The default is NULL.

**Command  
Mode** MST configuration mode

**Usage Guide** **name** *name*: Sets the MST name, up to 32 characters.  
**show spanning-tree mst configuration**: Displays MST region information.

**Configuration** This example sets MST name to region1.

**Examples**

```
Ruijie(config)# spanning-tree mst configuration
Ruijie(config-mst)# name region1
Ruijie(config-mst)# show spanning-tree mst configuration
Multi spanning tree protocol : Enable
Name      : region1
Revision  : 0
Instance  Vlans Mapped
-----
0         : ALL
Ruijie(config-mst)# exit
Ruijie(config)#
```

**Platform** N/A

**Description**

## 7.11 revision

Use this command to set revision number of MSTP region. Use the **no** form of the command to restore the default setting.

**revision** *version*

**no revision**

| Parameter Description | Parameter      | Description                                        |
|-----------------------|----------------|----------------------------------------------------|
|                       | <i>version</i> | MST revision number, in the range from 0 to 65535. |

### Defaults

The default is 0.

**Command** MST configuration mode

**Mode**

**Usage Guide** **revision** *version*: Sets the MST version, in the range from 0 to 65535.  
**show spanning-tree mst configuration**: Displays MST region information.

**Configuration** This example sets revision number to 1.

### Examples

```
Ruijie(config)# spanning-tree mst configuration
Ruijie(config-mst)# revision 1
Ruijie(config-mst)# show spanning-tree mst configuration
Multi spanning tree protocol : Enable
Name      :
Revision  : 1
Instance  Vlans Mapped
-----
0         : ALL
Ruijie(config-mst)# exit
Ruijie(config)#
```

## 7.12 show l2protocol-tunnel stp

Use this command to display BPDU TUNNEL configuration.

**show l2protocol-tunnel stp**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode / Global configuration mode / Interface configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example displays BPDU TUNNEL configuration.

```
Ruijie# show l2protocol-tunnel stp

L2protocol-tunnel: stp Enable
L2protocol-tunnel destination mac address:011a.a900.0005
GigabitEthernet 0/1 l2protocol-tunnel stp enable
```

## 7.13 show spanning-tree

Use this command to display the global spanning-tree configuration.

**show spanning-tree [summary | forward-time | hello-time | max-age | inconsistentports| tx-hold-count | pathcost method | max\_hops | counters]**

| Parameter Description | Parameter                | Description                                                                         |
|-----------------------|--------------------------|-------------------------------------------------------------------------------------|
|                       | <b>summary</b>           | Displays the information of MSTP instances and forwarding status of the interfaces. |
|                       | <b>inconsistentports</b> | Displays the block port due to root guard or loop guard.                            |

|                               |                                                     |
|-------------------------------|-----------------------------------------------------|
| <b><i>forward-time</i></b>    | Displays BridgeForwardDelay.                        |
| <b><i>hello-time</i></b>      | Displays BridgeHelloTime.                           |
| <b><i>max-age</i></b>         | Displays BridgeMaxAge.                              |
| <b><i>max-hops</i></b>        | Displays the maximum hops of an instance.           |
| <b><i>tx-hold-count</i></b>   | Displays TxHoldCount.                               |
| <b><i>pathcost method</i></b> | Displays the method used for calculating path cost. |
| <b><i>counters</i></b>        | Displays the statistics of STP transceived packets. |

**Defaults** N/A

**Command** Privileged EXEC mode, global configuration mode and interface configuration mode.

**Mode**

**Usage Guide** N/A

**Configuration** The following example displays the global spanning-tree configuration.

**Examples** Ruijie# show spanning-tree hello-time

The following example displays the sent and received STP packets.

```
Ruijie# show spanning-tree counters
----- STP BPDU count -----
Port                                Receive      Send
GigabitEthernet 0/3                 0            122594

----- STP TC or TCN count -----
MSTID  Port                                Receive      Send
0      GigabitEthernet 0/3                 0            0
```

**Related  
Commands**

| Command                              | Description                           |
|--------------------------------------|---------------------------------------|
| <b>spanning-tree pathcost method</b> | Sets the pathcost method.             |
| <b>spanning-tree forward-time</b>    | Sets BridgeForwardDelay.              |
| <b>spanning-tree hello-time</b>      | Sets BridgeHelloTime.                 |
| <b>spanning-tree max-age</b>         | Sets BridgeMaxAge.                    |
| <b>spanning-tree max-hops</b>        | Sets the maximum hops of an instance. |
| <b>spanning-tree tx-hold-count</b>   | Displays TxHoldCount.                 |

**Platform** N/A

**Description**

## 7.14 show spanning-tree interface

Use this command to display the STP configuration of the interface, including the optional spanning

tree.

**show spanning-tree interface** *interface-id* [ { **bpdufilter** | **portfast** | **bpduguard** | **link-type** } ]

**Parameter  
Description**

| Parameter           | Description                             |
|---------------------|-----------------------------------------|
| <i>interface-id</i> | Interface ID                            |
| <b>bpdufilter</b>   | Displays the status of BPDU filter.     |
| <b>portfast</b>     | Displays the status of portfast.        |
| <b>bpduguard</b>    | Displays the status of BPDU guard.      |
| <b>link-type</b>    | Displays the link type of an interface. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode, global configuration mode and interface configuration mode.

**Usage Guide** N/A

**Configuration Examples** The following example displays the STP configuration on interface Gi 0/1.

```
Ruijie# show spanning-tree int gi 0/1

PortAdminPortFast : Disabled
PortOperPortFast : Disabled
PortAdminAutoEdge : Enabled
PortOperAutoEdge : Disabled
PortAdminLinkType : auto
PortOperLinkType : point-to-point
PortBPDUGuard : Disabled
PortBPDUFilter : Disabled
PortGuardmode : None

##### MST 0 vlans mapped :ALL
PortState : forwarding
PortPriority : 128
PortDesignatedRoot : 32768.001a.a979.00ea
PortDesignatedCost : 0
PortDesignatedBridge :32768.001a.a979.00ea
PortDesignatedPortPriority : 128

|---------------------|----------------------------------|--------------------------------------------------------|
|                     | <b>spanning-tree bpdudfilter</b> | Enables the BPDU filter feature someone the interface. |
|                     | <b>spanning-tree portfast</b>    | Enables the portfast on the interface.                 |
|                     | <b>spanning-tree bpduguard</b>   | Enables the BPDU guard on the interface.               |
|                     | <b>spanning-tree link-type</b>   | Sets the link type of the interface to point-to-point. |

**Platform** N/A

**Description**

## 7.15 show spanning-tree mst

Use this command to display the information of MST and instances.

**show spanning-tree mst { configuration | instance-id [ interface interface-id ] }**

| Parameter<br>Description | Parameter            | Description                             |
|--------------------------|----------------------|-----------------------------------------|
|                          | <b>configuration</b> | The MST configuration of the equipment. |
|                          | <i>instance-id</i>   | Instance number                         |
|                          | <i>interface-id</i>  | Interface number                        |

**Defaults** All the instances are displayed by default.

**Command Mode** Privileged EXEC mode/Global configuration mode/Interface configuration mode

**Usage Guide** N/A

**Configuration** The following example displays the information of MST and instances.

### Examples

```
Ruijie# show spanning-tree mst configuration
Multi spanning tree protocol : Enable
Name      : test
Revision  : 0
Instance  Vlans Mapped
-----
0         : 2-4094
1         : 1
```

Field Description

| Field                        | Description            |
|------------------------------|------------------------|
| Multi spanning tree protocol | Enables MSTP protocol. |

|                       |                                                |
|-----------------------|------------------------------------------------|
| Name                  | Name of the MST region                         |
| Revision              | Revision of the MST region                     |
| Instance Vlans Mapped | Mapping relation between the instance and VLAN |

**Related Commands**

| Command                                | Description                                      |
|----------------------------------------|--------------------------------------------------|
| <b>spanning-tree mst configuration</b> | Configures the MST region.                       |
| <b>spanning-tree mst cost</b>          | Displays the path cost of the instance.          |
| <b>spanning-tree mst max-hops</b>      | Displays the maximum hops of the instance.       |
| <b>spanning-tree mst priority</b>      | Displays the equipment priority of the instance. |
| <b>spanning-tree mst port-priority</b> | Displays the port priority of the instance.      |

**Platform** N/A

**Description**

## 7.16 show spanning-tree mst topochange record

Use this command to display the STP topology change record.

**show spanning-tree mst *instance-id* topochange record**

**Parameter Description**

| Parameter          | Description  |
|--------------------|--------------|
| <i>instance-id</i> | Instance ID. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode / Global configuration mode / Interface configuration mode

**Usage Guide** N/A

**Configuration** The following example displays the STP topology change record of instance 0.

**Examples**

```
Ruijie# show spanning-tree mst 0 topochange record
Topology change information on mst 0:
Time                Interface          Old status   New status   Type
-----
2013.5.1 4:18:46   GI0/6        Learning    Forwarding   Normal
```

| Field      | Description                           |
|------------|---------------------------------------|
| Time       | The time when the topology changes.   |
| Interface  | The interface whose topology changes. |
| Old status | Old STP status on the interface.      |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| New status | New STP status on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Type       | <p>Topology change may be caused by the following causes:</p> <p>Normal: UP/DOWN state change on the interface,</p> <p>LoopGuard Block: Loop-inconsistence causes the interface to be blocked.</p> <p>RootGuard Block: Root-inconsistence causes the interface to be blocked.</p> <p>Inferior Block: Receiving inferior BPDU frames causes the interface to be blocked.</p> <p>LoopGuard Unblock: The interface returns to Forward status from loop-inconsistence.</p> <p>RootGuard Unblock: The interface returns to Forward status from root-inconsistence.</p> <p>Inferior Unblock-The interface returns to Forward status after not receiving inferior BPDU frames.</p> |

| N/A     | N/A         |

**Platform Description**

N/A

## 7.17 spanning-tree

Use this command to enable MSTP and configure its basic settings globally. The **no** form of the command disables the spanning-tree function. The **no** form of the command with parameters only restores the corresponding parameters to the default values, but does not disable the spanning-tree function.

**spanning-tree** [ **forward-time** *seconds* | **hello-time** *seconds* | **max-age** *seconds* ]

**no spanning-tree** [ **forward-time** | **hello-time** | **max-age** ]

**Parameter Description**

| Parameter                          | Description                                                                                                              |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>forward-time</b> <i>seconds</i> | Interval at which the port status changes, in the range from 4 to 30 in the unit of seconds. The default is 15.          |
| <b>hello-time</b> <i>seconds</i>   | Interval at which the switch sends the BPDU message, in the range from 1 to 10 in the unit of seconds. The default is 2. |
| <b>max-age</b> <i>seconds</i>      | Maximum aging time of the BPDU message, in the range from 6 to 40 in the unit of seconds. The default is 20.             |

**Defaults** This function is disabled by default.

**Command** Global configuration mode.

**Mode**

**Usage Guide** The values of **forward-time**, **hello time** and **max-age** are interrelated. Modifying one of these three parameters will affect the others. There is a restricted relationship among the above three values.  
 $2 * (\text{Hello Time} + 1.0\text{snd}) \leq \text{Max-Age Time} \leq 2 * (\text{Forward-Delay} - 1.0\text{snd})$   
 If the values do not according with the condition, the settings do not work.

**Configuration** The following example enables the spanning-tree function.

**Examples** Ruijie(config)# **spanning-tree**

The following example configures the BridgeForwardDelay.

Ruijie(config)# spanning-tree forward-time 10

**Related Commands**

| Command                            | Description                            |
|------------------------------------|----------------------------------------|
| <b>show spanning-tree</b>          | Displays the global STP configuration. |
| <b>spanning-tree mst cost</b>      | Sets the PathCost of an STP interface. |
| <b>spanning-tree tx-hold-count</b> | Sets the global TxHoldCount of STP.    |

**Platform** N/A

**Description**

## 7.18 spanning-tree autoedge

Use this command to enable Autoedge on the interface. Use the **disabled** form of this command to disable this function.

**spanning-tree autoedge [ disabled ]**

**Parameter Description**

| Parameter | Description                         |
|-----------|-------------------------------------|
| disabled  | Disabled Autoedge on the interface. |

**Defaults** This function is enabled by default.

**Command** Interface configuration mode.

**Mode**

**Usage Guide** If the designated port of a device does not receive a BPDU from the downlink port within a specific period (3 seconds), the device regards a network device connected to the designated port, configures the port as an edge port, and switches the port directly into the forwarding state. The edge port will be automatically identified as a non-edge port after receiving a BPDU.  
 You can run the spanning-tree autoedge disabled command to disable Auto Edge.

**Configuration** The following example disables Autoedge on the interface.

**Examples**

```
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if-interface-id-interface-id)# spanning-tree autoedge disabled
```

**Related  
Commands**

| Command                             | Description                                                  |
|-------------------------------------|--------------------------------------------------------------|
| <b>show spanning-tree interface</b> | Displays the STP configuration information of the interface. |

**Platform** N/A

**Description**

## 7.19 spanning-tree bpdudfilter

Use this command to enable BPDU filter on the interface. You can use the **enabled** or **disabled** option of the command to enable or disable the BPDU filter function on the interface.

**spanning-tree bpdudfilter [ enabled | disabled ]**

**Parameter  
Description**

| Parameter       | Description                            |
|-----------------|----------------------------------------|
| <b>enabled</b>  | Enables BPDU filter on the interface.  |
| <b>disabled</b> | Disables BPDU filter on the interface. |

**Defaults** This function is disabled by default,

**Command  
Mode** Interface configuration mode.

**Usage Guide** If BPDU filter is enabled on a port, the port neither sends nor receives BPDUs.

**Configuration** The following example enables BPDU filter on interface Gi 1/1.

**Examples**

```
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if-interface-id-interface-id)# spanning-tree bpdudfilter enable
```

**Related  
Commands**

| Command                             | Description                                      |
|-------------------------------------|--------------------------------------------------|
| <b>show spanning-tree interface</b> | Displays the STP configuration of the interface. |

**Platform** N/A

**Description**

## 7.20 spanning-tree bpduguard

Use this command to enable the BPDU guard function on the interface. You can use the **enabled** or **disabled** option of the command to enable or disable the BPDU guard function on the interface.

**spanning-tree bpduguard [ enabled | disabled ]**

| Parameter Description | Parameter | Description                           |
|-----------------------|-----------|---------------------------------------|
|                       | enabled   | Enables BPDU guard on the interface.  |
|                       | disabled  | Disables BPDU guard on the interface. |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode.

**Usage Guide**

1. If BPDU guard is enabled on a port, the port enters the error-disabled state after receiving a BPDU.
2. Run command **errdisable recovery [ interval seconds ]** to recover the interface in Error-disabled state.

**Configuration Examples** The following example enables the BPDU guard function on the interface.

```
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if-interface-id-interface-id)# spanning-tree bpduguard enable
```

|                  | <b>show spanning-tree interface</b> | Displays the STP configuration of the interface. |

**Platform Description** N/A

## 7.21 spanning-tree compatible enable

Use this command to send the message selectively carried with MSTI according to the interface attribute of current port to realize interconnection with other vendors. Use the **no** form of this command to restore the default setting.

**spanning-tree compatible enable**

**no spanning-tree compatible enable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default. .

**Command Mode** Interface configuration mode.

**Usage Guide** If the compatibility mode is enabled on a port, this port will add different MSTI information into the to-be-sent BPDU based on the current port to realize interconnection between Ruijie devices and other SPs' devices.

**Configuration** The following example enables the compatibility mode on interface Gi 0/1.

**Examples**

```
Ruijie(config)# interface gigabitethernet 0/1
Ruijie(config-if-interface-id-interface-id)#spanning-tree compatible enable
```

## 7.22 spanning-tree guard loop

Use this command to enable **loop guard** on the interface to prevent the root port or backup port from generating loop since they cannot receive bpdu. Use the **no** form of this command to disable **loop guard**.

**spanning-tree guard loop**

**no spanning-tree guard loop**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode.

**Usage Guide**

1. Enabling loop guard on a root port or backup port will prevent possible loops caused by BPDU receipt failure.
2. The loop guard function and root guard function cannot be enabled at the same time.

**Configuration** The following example enables **loop guard** on interface Gi 0/1.

**Examples**

```
Ruijie(config)# interface gigabitethernet 0/1
Ruijie(config-if-interface-id)# spanning-tree guard loop
```

## 7.24 spanning-tree guard root

Use this command to enable **root guard** on the interface to prevent the change of current root bridge position because of error configuration and illegal packet attack. Use the **no** form of this command to

restore the default setting.

**spanning-tree guard root**

**no spanning-tree guard root**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode.

**Usage Guide**

- If root guard is enabled, the current root bridge will not change due to incorrect configuration or illegal packet attacks.
- The loop guard function and root guard function cannot be enabled at the same time.

**Configuration** The following example enables **root guard** on the interface.

**Examples**

```
Ruijie(config)# interface gigabitethernet 0/1
Ruijie(config-if-interface-id)# spanning-tree guard root
```

## 7.25 spanning-tree ignore tc

Use this command to enable the tc filtering on the interface. Use the **no** form of this command to restore the default setting. With tc filtering enabled, the TC packets received on the interface will not be processed.

**spanning-tree ignore tc**

**no spanning-tree ignore tc**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command** Interface configuration mode.

**Mode**

**Usage Guide** If TC filter is enabled on a port, the port does not process received TC packets.

**Configuration** The following example enables the tc filtering on the interface.

**Examples**

```
Ruijie(config)# interface gigabitethernet 0/1
Ruijie(config-if-interface-id)# spanning-tree ignore tc
```

## 7.26 spanning-tree link-type

Use this command to configure the link type of the interface. Use the **no** form of this command to restore the default setting.

**spanning-tree link-type [ point-to-point | shared ]**

**no spanning-tree link-type**

**Parameter  
Description**

| Parameter             | Description                                             |
|-----------------------|---------------------------------------------------------|
| <b>point-to-point</b> | Sets the link type of the interface to point-to-point.  |
| <b>shared</b>         | Forcibly sets the link type of the interface to shared. |

**Defaults** For a full-duplex interface, its link type is set to point-to-point link; for a half-duplex interface, its link type is set to shared.

**Command** Interface configuration mode.

**Mode**

**Usage Guide** If the link type of a port is point-to-point connection, RSTP can rapidly converge. If the link type is not configured, the device automatically sets the link type based on the duplex mode of the port.

**Configuration** The following example configures the link type of the interface.

**Examples**

```
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if-interface-id)# spanning-tree link-type point-to-point
```

**Description**

## 7.27 spanning-tree loopguard default

Use this command to enable **loop guard** globally to prevent the root port or backup port from generating loop since they cannot receive bpdu. Use the **no** form of this command to restore the default setting.

**spanning-tree loopguard default**

**no spanning-tree loopguard default**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Global configuration mode.

**Usage Guide** Enabling loop guard on a root port or backup port will prevent possible loops caused by BPDU receipt failure.

**Configuration Examples** The following example enables **loop guard** globally to prevent the root port or backup port from generating loop since they cannot receive bpdu.

```
Ruijie(config)# spanning-tree loopguard default
```

## 7.28 spanning-tree max-hops

Use this command to set the maximum number of hops(Max-hopsCount) of the BPDU message in the global configuration mode, the number of hops in a region that the BPDU message passes before being dropped. This parameter takes effect for all instances. Use the **no** form of this command to restore the default setting.

**spanning-tree max-hops** *hop-count*

**no spanning-tree max-hops**

The range is 1 to 40 hops. |
| <b>Defaults</b>               | The default is 20 hops.                                                                                                                                                                                                                                                                                                                     |                                                                                                          |
| <b>Command Mode</b>           | Global configuration mode.                                                                                                                                                                                                                                                                                                                  |                                                                                                          |
| <b>Usage Guide</b>            | In the region, the BPDU message sent by the root bridge includes a Hop Count field. When the BPDU message passes a device, the Hop Count is decreased by 1 until it reaches 0, which indicates the BPDU message times out. The device will drop the BPDU message whose Hop Count is 0. Changing the max-hops command affects all instances. |                                                                                                          |
| <b>Configuration Examples</b> | This example sets the max-hops of the spanning tree to 10 for all instances.                                                                                                                                                                                                                                                                |                                                                                                          |
|                               | <pre>Ruijie(config)# spanning-tree max-hops 10</pre>                                                                                                                                                                                                                                                                                        |                                                                                                          |

|                              | <i>mstp</i>                                                                                | Multiple spanning tree protocol(IEEE 802.1s) |
| <b>Defaults</b>              | The default is <b>mstp</b> .                                                               |                                              |
| <b>Command Mode</b>          | Global configuration mode.                                                                 |                                              |
| <b>Usage Guide</b>           | However, some vendors' devices do not work according to 802.1 protocol standards, possibly |                                              |

causing incompatibility. If other vendors' devices are incompatible with Ruijie devices, run this command to switch the STP mode to a lower version.

**Configuration** The following example sets the STP version.

**Examples**

```
Ruijie(config)# spanning-tree mode stp
```

**Related  
Commands**

| Command                   | Description                               |
|---------------------------|-------------------------------------------|
| <b>show spanning-tree</b> | Displays the spanning-tree configuration. |

**Platform** N/A

**Description**

## 7.30 spanning-tree mst configuration

Use this command to enter the MST configuration mode in the global configuration mode and configure the MSTP region. Use the **no** form of the command to restore the default setting.

**spanning-tree mst configuration**

**no spanning-tree mst configuration**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

**Command** Global configuration mode.

**Mode**

**Usage Guide** To return to the privileged EXEC mode, enter end or Ctrl+C.

To return to the global configuration mode, enter exit.

After entering the MST configuration mode, you can configure MSTP Region parameters:

**Configuration** This example enters the MST configuration mode.

**Examples**

```
Ruijie(config)# spanning-tree mst configuration
Ruijie(config-mst)# instance 1 vlan 3, 5-10
Ruijie(config-mst)# name region 1
Ruijie(config-mst)# revision 1
Ruijie(config-mst)# show spanning-tree mst configuration
Multi spanning tree protocol : Enable
Name      : region1
Revision  : 1Instance Vlans Mapped
```

```

-----
0      1-2, 4, 11-4094
1      3, 5-10
-----

Ruijie(config-mst) # exit
Ruijie(config) #

```

**Related  
Commands**

| Command                                                          | Description                            |
|------------------------------------------------------------------|----------------------------------------|

| <b>instance</b> <i>instance-id</i> <b>vlan</b> <i>vlan-range</i> | Adds VLANs to the MST instance.        |
| <b>name</b>                                                      | Configures the name of MST.            |
| <b>revision</b>                                                  | Configures the version of MST.         |

**Platform** N/A**Description**

## 7.31 spanning-tree mst cost

Use this command to set the path cost of an instance in the interface configuration mode. Use the **no** form of the command to restore the default setting.

**spanning-tree** [ **mst** *instance-id* ] **cost** *cost*

**no spanning-tree** [ **mst** *instance-id* ] *cost*

**Parameter  
Description**

| Parameter   | Description                                   |
|-------------|-----------------------------------------------|
| instance-id | Instance ID in the range from 0 to 64.        |
| cost        | Path cost in the range from 1 to 200,000,000. |

**Defaults**

The default instance-id is 0.

The default value is calculated by the link rate of the interface automatically.

1000 Mbps—20000

100 Mbps—200000

10 Mbps—2000000

**Command**

Interface configuration mode.

**Mode****Usage Guide**

A higher cost value means a higher path cost.

**Configuration**

This example sets the path cost to 400 on the interface associated with instances 3.

**Examples**

```

Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if)# spanning-tree mst 3 cost 400

```

| Related<br>Commands | Command                                | Description                                    |
|---------------------|----------------------------------------|------------------------------------------------|
|                     | <b>show spanning-tree mst</b>          | Displays the MSTP information of an interface. |
|                     | <b>spanning-tree mst port-priority</b> | Configures the priority of an interface.       |
|                     | <b>spanning-tree mst priority</b>      | Configures the priority of an instance.        |

**Platform** N/A

**Description**

## 7.32 spanning-tree mst port-priority

Use this command to configure the interface priority for different instances in the interface configuration mode. It will determine which interface of a loop in a region is in charge of forwarding.

Use the **no** form of this command to restore the default setting.

**spanning-tree [ mst *instance-id* ] port-priority *priority***

**no spanning-tree [ mst *instance-id* ] port-priority**

| Parameter<br>Description | Parameter                                                                                                                                                  | Description                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------|
|                          | <i>Instance-id</i>                                                                                                                                         | Instance ID, in the range of 0 to 64 |
| priority                 | Interface priority. Sixteen integers are available: 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, 240, which are the multiples of 16. |                                      |

**Defaults** The default instance-id is 0.  
The default priority is 128.

**Command Mode** Interface configuration mode.

**Usage Guide** When a loop occurs in the region, the interface of the higher priority will be in charge of forwarding. If all interfaces have the same priority value, the interface of the smaller number will be in charge of the forwarding.  
Run this command to determine which port in the loop of a region enters the forwarding state.

**Configuration Examples** This example sets the priority of **gigabitethernet 1/1** to 10 in instance 20.

```
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if-interface-id)# spanning-tree mst 20 port-priority 0
```

|-----------------------------------|---------------------------------------------------|
| <b>spanning-tree mst cost</b>     | Sets the path cost.                               |
| <b>spanning-tree mst priority</b> | Sets the device priority for different instances. |

**Platform** N/A

**Description**

## 7.33 spanning-tree mst priority

Use this command to set the device priority for different instances in the global configuration mode.

Use the **no** form of this command to restore the default setting.

**spanning-tree [mst *instance-id*] priority *priority***

**no spanning-tree [ mst *instance-id*] priority**

| Parameter Description | Parameter          | Description                                                                                                                                                                                    |
|-----------------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>instance-id</i> | Instance ID, in the range of 0 to 64                                                                                                                                                           |
|                       | <i>priority</i>    | Device priority. Sixteen integers are available: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344 and 61440, which are all multiples of 4096. |

**Defaults** The default instance ID is 0.  
The default device priority is 32768.

**Command Mode** Global configuration mode.

**Usage Guide** Configure the switch priority to determine a device as the root of the entire network and to determine the topology of the entire network.

**Configuration** The following example sets the device priority of the Instance to 8192.

**Examples**

```
Ruijie(config)# spanning-tree mst 20 priority 8192
```

| Related Commands | Command                                | Description                                    |

|                  | <b>spanning-tree mst cost</b>          | Sets path cost.                                |
|                  | <b>spanning-tree mst port-priority</b> | Sets the port priority of an instance.         |

**Platform** N/A

**Description**

## 7.34 spanning-tree pathcost method

Use this command to configure the path cost of the port. Use the **no** form of this command to restore the default setting.

**spanning-tree pathcost method** { { long [ standard ] | short }

**no spanning-tree pathcost method**

| Parameter Description | Parameter                | Description                                                                                                                                                   |
|-----------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>Long [ standard ]</b> | Adopts the 802.1t standard to configure path cost.<br>The standard indicates that use the expression recommended by the standard to calculate the cost value. |
|                       | <b>short</b>             | Adopts the 802.1d standard to configure path cost.                                                                                                            |

**Defaults** 802.1T standard is adopted to set path cost by default.

**Command** Global configuration mode.

**Mode**

**Usage Guide** If the port path cost uses the default value, the device automatically calculates the port path cost based on the port rate.

**Configuration** The following example configures the path cost of the port.

**Examples**

```
Ruijie(config-if)# spanning-tree pathcost method long
```

| Related Commands | Command                             | Description                                      |
|------------------|-------------------------------------|--------------------------------------------------|
|                  | <b>show spanning-tree interface</b> | Displays the STP configuration of the interface. |

**Platform** N/A

**Description**

## 7.35 spanning-tree portfast

Use this command to enable the portfast on the interface. Use the disabled form of this command to restore the default setting,

**spanning-tree portfast** [ disabled ]

| Parameter Description | Parameter       | Description                             |
|-----------------------|-----------------|-----------------------------------------|
|                       | <b>disabled</b> | Disables the portfast on the interface. |

**Defaults** This function is disabled by default.

**Command** Interface configuration mode.

**Mode**

**Usage Guide** After PortFast is enabled on a port, the port directly enters the forwarding state. However, since the Port Fast Operational State becomes disabled due to receipt of BPDUs, the port can properly run the STP algorithm and enter the forwarding state.

**Configuration** The following example enables the portfast on the interface.

**Examples**

```
Ruijie(config)# interface gigabitethernet 1/1
Ruijie(config-if-interface-id)# spanning-tree portfast
```

**Related  
Commands**

| Command                      | Description                                      |

| show spanning-tree interface | Displays the STP configuration of the interface. |

**Platform** N/A

**Description**

## 7.36 spanning-tree portfast bpdufilter default

Use this command to enable the BPDU filter function globally. You can use the **no** form of the command to restore the default setting.

**spanning-tree portfast bpdufilter default**

**no spanning-tree portfast bpdufilter default**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** This function is disabled by default,

**Command** Global configuration mode.

**Mode**

**Usage Guide** Once the BPDU filter is enabled, the BPDU message is neither received nor sent on the interface. Use the **show spanning-tree** command to display the configuration.

**Configuration** The following example enables the BPDU filter function globally.

**Examples**

```
Ruijie(config)# spanning-tree portfast bpdufilter default
```

**Related  
Commands**

| Command                      | Description                            |

| show spanning-tree interface | Displays the global STP configuration. |

**Platform** N/A

**Description**

## 7.37 spanning-tree portfast bpduguard default

Use this command to enable the BPDU guard globally. Use the **no** form of this command to restore the default setting,

**spanning-tree portfast bpduguard default**

**no spanning-tree portfast bpduguard default**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command** Global configuration mode.

**Mode**

**Usage Guide** Once the BPDU guard is enabled on the interface, it will enter the error-disabled status if the BPDU message arrives at the interface. Use the **show spanning-tree** command to display the configuration.

 The global BPDU guard takes effect only when PortFast is enabled on a port.

**Configuration** The following example enables the GPDU guard globally.

**Examples**

```
Ruijie(config)# spanning-tree portfast bpduguard
default
```

**Description**

## 7.43 spanning-tree tx-hold-count

Use this command to configure the TxHoldCount of the STP, the maximum number of the BPDU messages sent in one second. Use the **no** form of this command to restore the default setting.

**spanning-tree tx-hold-count** *tx-hold-count*

**no spanning-tree tx-hold-count**

| Parameter Description | Parameter            | Description                                                                                                   |
|-----------------------|----------------------|---------------------------------------------------------------------------------------------------------------|
|                       | <i>tx-hold-count</i> | Indicates the maximum number of BPDUs sent per second. The value ranges from 1 to 10. The default value is 3. |

**Defaults** The default is 3.

**Command Mode** Global configuration mode.

**Usage Guide** N/A

**Configuration Examples** The following example sets the maximum number of the BPDU messages sent in one second.

```
Ruijie(config)# spanning-tree tx-hold-count 5
```

## 8 GVRP Commands

### 8.1 bridge-frame forwarding protocol gvrp

Use this command to enable GVRP PDUs transparent transmission. Use the **no** form of this command to restore the default setting.

**bridge-frame forwarding protocol gvrp**  
**no bridge-frame forwarding protocol gvrp**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command mode** Global configuration mode

**Usage Guide** In the IEEE 802.1Q standard, the MAC address 01-80-C2-00-00-21 of GVRP PDUs is reserved for future standardization. In other words, the device following the IEEE 802.1Q standard does not forward GVRP PDUs frames. However, in actual network deployment, GVRP PDUs transparent transmission may be required. For example, the device not enabled with GVRP needs to transmit GVRP PDUs frames transparently to ensure proper GVRP topology calculation.

**Configuration Examples** The following example enables GVRP PDUs transparent transmission.

```
Ruijie(config)# bridge-frame forwarding protocol gvrp
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

### 8.2 clear gvrp statistic

Use this command to clear the GVRP statistics for re-counting.

**clear gvrp statistics** { *interface-id* | **all** }

| Parameter Description | Parameter           | Description  |
|-----------------------|---------------------|--------------|
|                       | <i>interface-id</i> | Interface id |

**Defaults** N/A

**Command mode** Privileged EXEC mode.

**Usage Guide** Use the **show gvrp statistics** to display the statistics.

**Configuration** The following example clears GVRP statistics.

**Examples**

```
Ruijie# clear gvrp statistics all
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

### 8.3 gvrp applicant state

Use this command configures the GVRP advertisement mode on the interface.. Use the **no** form of this command to restore default setting.

**gvrp applicant state { normal | non-applicant }**  
**no gvrp applicant state**

| Parameter Description | Parameter     | Description                                     |
|-----------------------|---------------|-------------------------------------------------|
|                       | normal        | The interface sends VLAN advertisement.         |
|                       | non-applicant | The interface does not send VLAN advertisement. |

**Defaults** The interface sends GVRP advertisement by default.

**Command mode** Interface configuration mode.

**Usage Guide** N/A

**Configuration** The following example configures the GVRP advertisement mode on the interface.

**Examples**

```
Ruijie(config-if)# gvrp applicant state normal
```

|------------------|-------------------------|-----------------------------------|
|                  | show gvrp configuration | Displays the GVRP configurations. |

**Platform** N/A

**Description**

## 8.4 gvrp dynamic-vlan-creation

Use this command to enable dynamic VLAN creation. Use the **no** form of this command to restore the default setting.

**gvrp dynamic-vlan-creation enable**

**no gvrp dynamic-vlan-creation enable**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command mode** Global configuration mode.

**Usage Guide** Use the **show gvrp configuration** to display the configuration.

**Configuration** The following example enables dynamic VLAN creation.

**Examples**

```
Ruijie(config)# gvrp dynamic-vlan-creation enable
```

**Related

- Description**

## 8.6 gvrp registration mode

Use this command to set the registration mode to control whether to enable dynamic VLAN creation/registration/canceling on the port. Use the **no** form of this command to restore the default setting.

**gvrp registration mode { normal | disabled }**  
**no gvrp registration mode**

**Parameter Description**

| Parameter | Description                                                        |
|-----------|--------------------------------------------------------------------|
| normal    | Enables dynamic VLAN creation/registration/canceling on the port.  |
| disabled  | Disables dynamic VLAN creation/registration/canceling on the port. |

- Defaults** Dynamic VLAN creation/registration/canceling is enabled by default,
- Command mode** Interface configuration mode.
- Usage Guide** N/A

**Configuration** The following example sets the registration mode.

**Examples**

```
Ruijie(config-if)# gvrp registration mode normal
```

**Related Commands**

**Platform** N/A  
**Description**

## 8.7 gvrp timer

Use this command to set the GVRP timer. Use the **no** form of this command to restore the default setting.

**gvrp timer** { **join** *timer\_value* | **leave** *timer\_value* | **leaveall** *timer\_value* }  
**no gvrp timer**

| Parameter Description | Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>join timer_value</i>      | Controls the maximum delay before sending the advertisement on the port. The actual sending interval is in the range of 0 to the maximum delay.                                                                                                                                                                                                                               |
|                       | <i>leave timer_value</i>     | Controls the waiting time before removing the VLAN from the port with the Leave Message received. If the Join Message is received again within this time range, the port-VLAN relation still exists and the timer becomes invalid. If no Join Message is received on the port, the port status will be the Empty and removed from the VLAN member list.                       |
|                       | <i>leave all timer_value</i> | Controls the minimum interval of sending the LeaveAll Message on the port. If the LeaveAll Message is received before the timer expires, the timer re-counts. If the timer expires, send the LeaveAll Message on the port and also send this Message to the port, so that the Leave timer begins counting. The actual sending interval ranges from leaveall to leaveall+join. |

**Defaults** Join timer: 200 milliseconds;  
 Leave timer: 600 milliseconds;  
 Leaveall timer: 10000 milliseconds.

**Command mode** Global configuration mode

**Usage Guide** Use the **show gvrp configuration** to display the configuration.  
 Use the **no gvrp timer** command to restore **join**, **leave** and **leaveall timer** to default settings.

**Configuration** The following example configures the join timer.

**Examples** Ruijie(config)# gvrp timer join 200

**Description**

## 8.8 l2protocol-tunnel gvrp

Use this command to enable global GVRP PDUs TUNNEL globally. Use the **no** form of this command to restore the default setting.

**l2protocol-tunnel gvrp**  
**no l2protocol-tunnel gvrp**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command mode** Global configuration mode

**Usage Guide** If you want to enable global GVRP PDUs TUNNEL, enable GVRP PDUs TUNNEL on the interface first.

**Configuration Examples** The following example enables GVRP PDUs TUNNEL globally.

```
Ruijie(config)# l2protocol-tunnel gvrp
Ruijie(config)# show l2protocol-tunnel gvrp

L2protocol-tunnel: Gvrp Disable
L2protocol-tunnel destination mac address:01d0.f800.0006
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform** N/A  
**Description**

## 8.9 l2protocol-tunnel gvrp enable

Use this command to enable GVRP PDUs TUNNEL on the interface. Use this command to restore the default setting.

**l2protocol-tunnel gvrp enable**  
**no l2protocol-tunnel gvrp enable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command mode** Interface configuration mode

**Usage Guide** If you want to enable global GVRP PDUs TUNNEL, enable GVRP PDUs TUNNEL on the interface first.

**Configuration Examples** The following example enables GVRP PDUs TUNNEL on the interface.

```
Ruijie(config-if-interface-id)# l2protocol-tunnel gvrp enable
Ruijie(config-if-interface-id)# show l2protocol-tunnel gvrp

L2protocol-tunnel: Gvrp Disable
L2protocol-tunnel destination mac address:01d0.f800.0006
GigabitEthernet 0/1 l2protocol-tunnel gvrp enable
```

| Related Commands | Command | Description |

## 8.10 l2protocol-tunnel gvrp tunnel-dmac

Use this command to configure the MAC address for transparent transmission in GVRP PDUs TUNNEL. Use the **no** form of this command to restore the default setting.

**l2protocol-tunnel gvrp tunnel-dmac** *mac-address*

**no l2protocol-tunnel gvrp tunnel-dmac**

| Parameter Description | Parameter          | Description                                                       |
|-----------------------|--------------------|-------------------------------------------------------------------|
|                       | <i>mac-address</i> | The MAC address for transparent transmission in GVRP PDUs TUNNEL. |

**Defaults** The default is 01d0.f800.0006.

**Command mode** Global configuration mode

**Usage Guide** The available MAC address f ranges from 01d0.f800.0006 to 011a.a900.0006.

**Configuration Examples** The following example configures the MAC address for transparent transmission in GVRP PDUs TUNNEL.

```
Ruijie(config)# l2protocol-tunnel gvrp tunnel-dmac 011a.a900.0006
```

## 8.11 show gvrp configuration

Use this command to display the GVRP configuration.

**show gvrp configuration**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** N/A

**Command mode** Privileged EXEC mode.

**Usage Guide** Use the **show gvrp configuration** to display the configuration.

**Configuration Examples** The following example displays GVRP configuration.

Global GVRP Configuration:

GVRP Feature:enabled

GVRP dynamic VLAN creation:enabled

Join Timers(ms):200

Leave Timers(ms):600

Leaveall Timers(ms):1000

Port based GVRP Configuration:

| PORT                | Applicant Status | Registration Mode |
|---------------------|------------------|-------------------|
| -----               | -----            | -----             |
| GigabitEthernet 0/2 | normal           | normal            |

| Field                      | Description                             |
|----------------------------|-----------------------------------------|
| GVRP Feature               | Whether to enable GVRP                  |
| GVRP dynamic VLAN creation | Whether to enable dynamic VLAN creation |

|                   |                    |
|-------------------|--------------------|
| Join Timers       | Join timer         |
| Leave Timers      | Leave timer        |
| Leaveall Timers   | Leaveall timer     |
| PORT              | Port               |

**Description**

## 8.12 show gvrp statistics

Use this command to display the GVRP statistics of one interface or all interfaces.

**show gvrp statistics** { *interface-id* | **all** }

| Parameter Description | Parameter           | Description   |
|-----------------------|---------------------|---------------|
|                       | <i>interface-id</i> | Interface id. |

**Defaults** N/A

**Command mode** Privileged EXEC mode

**Usage Guide** Use the **show gvrp statistics** to display the statistics of one interface or all interfaces.

**Configuration** Ruijie# show gvrp statistics gigabitethernet 1/1

**Examples** Interface GigabitEthernet 3/1

```

RecValidGvrpPdu      0
RecInvalidGvrpPdu    0
RecJoinEmpty         0
RecJoinIn            0
RecEmpty             0
RecLeaveEmpty         0
RecLeaveIn            0
RecLeaveAll           0
SentGvrpPdu          0
SentJoinEmpty        0
SentJoinIn           0

```

```

## 9 LLDP Commands

### 9.1 civic-location

Use this command to configure a common LLDP address. Use the **no** form of this command to delete the address.

```
{ country | state | county | city | division | neighborhood | street-group | leading-street-dir |
trailing-street-suffix | street-suffix | number | street-number-suffix | landmark |
additional-location-information | name | postal-code | building | unit | floor | room |
type-of-place | postal-community-name | post-office-box | additional-code } ca-word
```

```
no { country | state | county | city | division | neighborhood | street-group | leading-street-dir |
trailing-street-suffix | street-suffix | number | street-number-suffix | landmark |
additional-location-information | name | postal-code | building | unit | floor | room |
type-of-place | postal-community-name | post-office-box | additional-code } ca-word
```

Parameter  
Description

| Parameter                              | Description                                                            |
|----------------------------------------|------------------------------------------------------------------------|
| <b>country</b>                         | Country code, two bytes. For example, the country code of China is CH. |
| <b>state</b>                           | Address information, CA type 1                                         |
| <b>county</b>                          | CA type 2                                                              |
| <b>city</b>                            | CA type 3                                                              |
| <b>division</b>                        | CA type 4                                                              |

| <b>additional-code</b> | CA type 32          |
| <i>ca-word</i>         | Address information |

**Defaults** N/A

**Command Mode** LLDP Civic address configuration mode

**Usage Guide** This command is used to configure a common LLDP address in LLDP Civic address configuration mode.

**Configuration** The following example configures an LLDP Civic Address (ID: 1).

**Examples**

```
Ruijie#config
Ruijie(config)# lldp location civic-location identifier 1
Ruijie(config-lldp-civic)# country CH
Ruijie(config-lldp-civic)# city Fuzhou
```

**Description**

## 9.2 clear lldp statistics

Use this command to clear LLDP statistics.

**clear lldp statistics [ interface interface-name ]**

**Parameter**

**Description**

| Parameter             | Description    |
|-----------------------|----------------|
| <i>interface-name</i> | Interface name |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** **interface** parameter: clear the LLDP statistics of the specified interface

**Configuration** The following example clears LLDP statistics of interface 1.

**Examples**

```
Ruijie# clear lldp statistics interface GigabitEthernet 0/1
Ruijie# show lldp statistics interface GigabitEthernet 0/1
Lldp statistics information of port [GigabitEthernet 0/1]
-----
```

```

The number of lldp frames transmitted : 0
The number of frames discarded      : 0
The number of error frames          : 0
The number of lldp frames received  : 0
The number of TLVs discarded        : 0
The number of TLVs unrecognized     : 0
The number of neighbor information aged out : 0

```

**Description**

### 9.3 clear lldp table

Use this command to clear LLDP neighbor information.

**clear lldp table** [ **interface** *interface-name* ]

| Parameter   | Parameter             | Description    |
|-------------|-----------------------|----------------|
| Description | <i>interface-name</i> | Interface name |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** If the **interface** parameter is specified, the LLDP neighbor information on the specified interface is cleared.  
If the **interface** parameter is not specified, the LLDP neighbor information on all interfaces is cleared.

**Configuration Examples** The following example clears the LLDP neighbor information on interface 1.

```

Ruijie# show lldp neighbors interface GigabitEthernet 0/1
Lldp statistics information of port [GigabitEthernet 0/1]
-----
The number of lldp frames transmitted : 0
The number of frames discarded      : 0
The number of error frames          : 0
The number of lldp frames received  : 0
The number of TLVs discarded        : 0
The number of TLVs unrecognized     : 0
The number of neighbor information aged out : 0
Ruijie# clear lldp table interface GigabitEthernet 0/1
Ruijie# show lldp neighbors interface GigabitEthernet 0/1

```

## 9.4 device-type

Use this command to configure the device type. Use the **no** form of this command to restore the default setting.

**device-type** *device-type*

**no device-type**

| Parameter   | Parameter          | Description                                                                                                                                                   |
|-------------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>device-type</i> | Device type. The value ranges from 0 to 2.<br>0: The device type is DHCP Server.<br>1: The device type is switch.<br>2: The device type is LLDP MED terminal. |

Defaults

Command LLDP Civic address configuration mode

Mode

**Usage Guide** This command is used to configure the device type in a common LLDP address in LLDP Civic address configuration mode.

**Configuration** The following example sets the device type to switch.

**Examples**

```
Ruijie#config
Ruijie(config)# lldp location civic-location identifier 1
Ruijie(config-lldp-civic)# device-type 1
```

| Related  | Command                                                                                                      | Description                              |
|----------|--------------------------------------------------------------------------------------------------------------|------------------------------------------|
| Commands | <b>show lldp location civic-location { identifier <i>id</i>   interface <i>interface-name</i>   static }</b> | Displays LLDP Civic Address information. |

Description

## 9.5 lldp compliance vendor

Use this command to enable detection of compatible neighbors.

**lldp compliance vendor**  
**no lldp compliance vendor**

| Parameter              | Parameter                                                                   | Description |
|------------------------|-----------------------------------------------------------------------------|-------------|
| Description            | N/A                                                                         | N/A         |
| Defaults               | This function is disabled by default.                                       |             |
| Command Mode           | Global configuration mode                                                   |             |
| Usage Guide            | N/A                                                                         |             |
| Configuration Examples | The following example enables detection of compatible neighbors.            |             |
|                        | <pre>Ruijie#configure terminal Ruijie(config)# lldp compliance vendor</pre> |             |
| Related Commands       | Command                                                                     | Description |
|                        | N/A                                                                         | N/A         |
| Platform Description   | N/A                                                                         |             |

## 9.6 lldp enable

Use this command to enable the LLDP globally or on the interface. Use **no** form of this command to disable this function.

**lldp enable**  
**no lldp enable**

| Parameter              | Parameter                                                             | Description |
|------------------------|-----------------------------------------------------------------------|-------------|
| Description            | N/A                                                                   | N/A         |
| Defaults               | This function is enabled by default.                                  |             |
| Command Mode           | Global (or interface) configuration mode                              |             |
| Usage Guide            | LLDP takes effect on an interface only when LLDP is enabled globally. |             |
| Configuration Examples | The following example disables LLDP globally and on the interface.    |             |
|                        | <pre>Ruijie#config Ruijie(config)#no lldp enable</pre>                |             |

```
Ruijie(config)#interface gigabitethernet 0/1
Ruijie(config-if)# no lldp enable
```

| Related Commands | Command                 | Description                       |
|------------------|-------------------------|-----------------------------------|
|                  | <b>show lldp status</b> | Displays LLDP status information. |

**Platform** N/A

**Description**

## 9.7 lldp encapsulation snap

Use this command to configure the encapsulation format of LLDP packets. Use the **no** form of this command to restore the default setting.

**lldp encapsulation snap**

**no lldp encapsulation snap**

| Parameter          | Parameter | Description |
|--------------------|-----------|-------------|
| <b>Description</b> | N/A       | N/A         |

**Defaults** By default, Ethernet II encapsulation format is used.

**Command Mode** Interface configuration mode.

**Usage Guide**  To guarantee the normal communication between local device and neighbor device, the same LLDP packet encapsulation format must be used.

**Configuration Examples** The following example sets LLDP packet encapsulation format to SNAP.

```
Ruijie#config
Ruijie(config)#interface gigabitethernet 0/1
Ruijie(config-if)#lldp encapsulation snap
```

| Related Commands | Command                 | Description                       |
|------------------|-------------------------|-----------------------------------|
|                  | <b>show lldp status</b> | Displays LLDP status information. |

**Platform** N/A

**Description**

## 9.8 lldp error-detect

Use this command to configure the LLDP error detection, including the detection of VLAN configurations on both sides of the link, port state detection, port aggregation configuration detection,

MTU configuration detection and loop detection. If any error is detected by LLDP, warning message will be printed to notify the administrator. Use the **no** form of this command to disable this function.

**lldp error-detect**

**no lldp error-detect**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command Mode** Interface configuration mode.

**Usage Guide** LLDP error detection relies on the specific TLV in the LLDP packets exchanged between devices on both sides of the link. To ensure normal functioning of the detection feature, correct TLVs must be advertised.

**Configuration** The following example configures LLDP error detection.

**Examples**

```
Ruijie#config
Ruijie(config)#interface gigabitethernet 0/1
Ruijie(config-if)#lldp error-detect
```

| Related Commands | Command                      | Description                       |
|------------------|------------------------------|-----------------------------------|
|                  | <b>show interface status</b> | Displays LLDP status information. |

**Platform Description** N/A

## 9.9 lldp fast-count

When a new neighbor is detected or when LLDP operating mode changes from shutdown or Rx to TxRx or Tx, to allow the neighbor device to quickly study the information about this device, the fast sending mechanism will be initiated. The fast sending mechanism shortens the LLDPDU sending interval to 1 second and continuously transmits a certain number of LLDPDUs before restoring to the normal transmit interval. Use the **no** form of this command to restore the default setting.

**lldp fast-count value**

**no lldp fast-count**

| Parameter   | Parameter    | Description                                                      |
|-------------|--------------|------------------------------------------------------------------|
| Description | <i>value</i> | The number of fast sent LLDP packets, in the range from 1 to 10. |

**Defaults** The default is 3.

**Command** Global configuration mode.

**Mode****Usage Guide** N/A**Configuration** The following example sets the number of fast sent LLDP packets to 5.**Examples**

```
Ruijie#config
Ruijie(config)#lldp fast-count 5
```

**Related****Commands**

| Command               | Description                       |
|-----------------------|-----------------------------------|
| show interface status | Displays LLDP status information. |

**Platform** N/A**Description**

## 9.10 lldp hold-multiplier

Use this command to set the TTL multiplier. Use the **no** form of this command to restore to default setting.

**lldp hold-multiplier** *value*

**no lldp hold-multiplier**

**Parameter****Description**

| Parameter    | Description                                |
|--------------|--------------------------------------------|
| <i>value</i> | TTL multiplier, in the range from 2 to 10. |

**Defaults**

The default is 4.

**Command**

Global configuration mode.

**Mode****Usage Guide**

The value of Time To Live (TLV) in LLDP packet = TTL multiplier × LLDP packet transmit interval + 1. Therefore, the TTL of local device information on the neighbor device can be controlled by adjusting TTL multiplier.

**Configuration** The following example sets TTL multiplier to 5.**Examples**

```
Ruijie#config
Ruijie(config)#lldp hold-multiplier 5
```

**Related****Commands**

| Command          | Description                       |
|------------------|-----------------------------------|
| show lldp status | Displays LLDP status information. |

**Platform** N/A**Description**

## 9.11 lldp ignore pvid-error-detect

Use this command to enable the function of ignoring PVID function. Use the **no** form of this command to disable the function of ignoring PVID function.

**lldp ignore pvid-error-detect**

**no lldp ignore pvid-error-detect**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** By default, it is disabled.

**Command Mode** Global configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example ignores PVID detection globally.

```
Ruijie# configure terminal
Ruijie(config)# lldp ignore pvid-error-detect
```

**Platform Description** N/A

## 9.12 lldp location civic-location identifier

Use this command to create a common address of a device connected to the network in LLDP Civic Address configuration mode. Use the **no** form of this command to delete the address.

**lldp location civic-location identifier *id***

**no lldp location civic-location identifier *id***

| Parameter   | Parameter | Description                                                              |
|-------------|-----------|--------------------------------------------------------------------------|
| Description | <i>id</i> | ID of a common address of a network device, in the range from 1 to 1024. |

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** This command can be used to enter the LLDP Civic Address configuration mode.

**Configuration Examples** The following example creates the Civic Address information in LLDP MED-TLV as follows: set *id* to 1.

```
Ruijie#config
Ruijie(config)#lldp location civic-location identifier 1
Ruijie(config-lldp-civic)#
```

| Related Commands | Command                                                                                                      | Description                                  |
|------------------|--------------------------------------------------------------------------------------------------------------|----------------------------------------------|
|                  | <b>show lldp location civic-location { identifier <i>id</i>   interface <i>interface-name</i>   static }</b> | Displays the LLDP Civic Address information. |

**Platform** N/A  
**Description**

## 9.13 lldp location elin identifier

Use this command to set an emergency number encapsulated in a Location Identification TLV. Use the **no** form of this command to delete the number.

**lldp location elin identifier *id* elin-location *tel-number***  
**no lldp location elin identifier *id***

| Parameter Description | Parameter         | Description                                             |
|-----------------------|-------------------|---------------------------------------------------------|
|                       | <i>id</i>         | ID of an emergency number, in the range from 1 to 1024. |
|                       | <i>tel-number</i> | Emergency number, in the range from 10 to 25 bytes.     |

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** This command is used to configure an emergency number.

**Configuration Examples** The following example sets an emergency number.

```
Ruijie#config
Ruijie(config)#lldp location elin identifier 1 elin-location 085283671111
```

**Description**

## 9.14 lldp management-address-tlv

Use this command to configure the management address advertised in LLDP packets. Use the **no**

form of this command to disable the advertisement of management address.

**lldp management-address-tlv** [ *ip-address* ]

**no lldp management-address-tlv**

| Parameter   | Parameter         | Description                                        |
|-------------|-------------------|----------------------------------------------------|
| Description | <i>ip-address</i> | The management address advertised in LLDP packets. |

**Defaults** N/A

**Command** Interface configuration mode.

**Mode**

**Usage Guide** By default, the management address is advertised in LLDP packets, and is the IPv4 address of the lowest-ID VLAN carried on the port. If IPv4 address is not configured for this VLAN, the next lowest-ID VLAN carried on the port will be tried until the IPv4 address is obtained.

If the IPv4 address is still not found, the IPv6 address of the lowest-ID VLAN carried on the port will be tried.

If the IPv6 address is still not found, the MAC address of the device will be advertised as the management address.

**Configuration** The following example configures the management address advertised in LLDP packets to

**Examples** 192.168.1.1.

```
Ruijie#config
Ruijie(config)#interface gigabitethernet 0/1
Ruijie(config-if)#lldp management-address-tlv 192.168.1.1
```

**Description**

## 9.15 lldp mode

Use this command to configure the LLDP operating mode. Use **no** form of this command to restore the default setting.

**lldp mode** { *rx* | *tx* | *txrx* }

**no lldp mode**

| Parameter   | Parameter   | Description                 |
|-------------|-------------|-----------------------------|
| Description | <b>rx</b>   | Only sends LLDPDUs.         |
|             | <b>tx</b>   | Only receives LLDPDUs.      |
|             | <b>txrx</b> | Sends and receives LLDPDUs. |

**Defaults** The default is **txrx**.

**Command Mode** Interface configuration mode

**Usage Guide** Disable LLDP operating mode on the interface. The interface won't send and receive LLDP packets. The precondition for enabling LLDP on the interface is that LLDP has been enabled globally and LLDP operates in tx, rx or txrx mode.

**Configuration Examples** The following example sets LLDP operating mode to tx on the interface.

```
Ruijie#config
Ruijie(config)#interface gigabitethernet 0/1
Ruijie(config-if)#lldp mode tx
```

**Description**

## 9.16 lldp network-policy profile

Use this command to create an LLDP network policy and enter the LLDP network policy configuration mode. Use the no form of this command to delete the policy.

**lldp network-policy profile** *profile-num*

**no lldp network-policy profile** *profile-num*

| Parameter          | Parameter          | Description                                                |
|--------------------|--------------------|------------------------------------------------------------|
| <b>Description</b> | <i>profile-num</i> | ID of an LLDP network policy, in the range from 1 to 1024. |

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** This command is used to enter the LLDP network policy configuration mode. When this command is run, the policy ID must be specified. In LLDP network-policy mode, the { **voice** | **voice-signaling** } **vlan** command can be used to configure the specific network policy.

**Configuration Examples** The following example creates an LLDP network policy whose ID is 1.

```
Ruijie#config
```

```
Ruijie(config)#lldp network-policy profile 1
Ruijie(config-lldp-network-policy)#
```

|------------------|----------------------------------------------------------------|----------------------------------|
|                  | <b>show lldp network-policy profile</b> [ <i>profile-num</i> ] | Displays an LLDP network policy. |

**Platform** N/A

**Description**

## 9.17 lldp notification remote-change enable

Use this command to configure LLDP Trap. Use the **no** form of this command to restore the default setting.

**lldp notification remote-change enable**

**no lldp notification remote-change enable**

| Parameter          | Parameter | Description |
|--------------------|-----------|-------------|
| <b>Description</b> | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode.

**Usage Guide** By configuring LLDP Trap, the LLDP information of local device (such as information about the detection of new neighbor or the fault on the communication link) can be sent to the network management server. The administrator can monitor the network operation status according to such information.

**Configuration Examples** The following example configures LLDP Trap.

```
Ruijie#config
Ruijie(config)#interface gigabitethernet 0/1
Ruijie(config-if)#lldp notification remote-change enable
```

**Description**

## 9.18 lldp timer notification-interval

Use this command to set an interval of sending LLDP Traps. Use the **no** form of this command to restore the default setting.

**lldp timer notification-interval** *seconds*

**no lldp timer notification-interval**

| Parameter   | Parameter      | Description                                                                         |
|-------------|----------------|-------------------------------------------------------------------------------------|
| Description | <i>seconds</i> | Interval of sending LLDP Traps, in the range from 5 to 3600 in the unit of seconds. |

**Defaults** The default is 5.

**Command** Global configuration mode.

**Mode**

**Usage Guide** To prevent excessive LLDP traps from being sent, you can set an interval of sending LLDP Traps. If LLDP information change is detected during this interval, traps will be sent to the network management server.

**Configuration Examples** The following example sets the interval of sending LLDP Traps to 10 seconds.

```
Ruijie#config
Ruijie(config)#lldp timer notification-interval 10
```

**Description**

## 9.19 lldp timer reinit-delay

Use this command to set port initialization delay. Use the **no** form of this command to restore the default setting.

**lldp timer reinit-delay** *seconds*

**no lldp timer reinit-delay**

| Parameter   | Parameter      | Description                                                                  |
|-------------|----------------|------------------------------------------------------------------------------|
| Description | <i>seconds</i> | Port initialization delay, in the range from 1 to 10 in the unit of seconds. |

**Defaults** The default is 2.

**Command** Global configuration mode.

**Mode**

**Usage Guide** To prevent LLDP from being initialized too frequently due to the frequent operating mode change, you can configure port initialization delay.

**Configuration Examples** The following example sets LLDP port initialization delay to 3 seconds.

**Examples**

```
Ruijie#config
Ruijie(config)#lldp timer reinit-delay 3
```

| Related Commands | Command                 | Description                       |
|------------------|-------------------------|-----------------------------------|
|                  | <b>show lldp status</b> | Displays LLDP status information. |

**Description**

## 9.20 lldp timer tx-delay

Use this command to set LLDP packet transmission delay. Use the **no** form of this command to restore the default setting.

**lldp timer tx-delay** *seconds*

**no lldp timer tx-delay**

| Parameter          | Parameter      | Description                                                                         |
|--------------------|----------------|-------------------------------------------------------------------------------------|
| <b>Description</b> | <i>seconds</i> | LLDP packet transmission delay, in the range from 1 to 8192 in the unit of seconds. |

**Defaults** The default is 2.

**Command** Global configuration mode.

**Mode**

**Usage Guide** An LLDP-enabled port will send LLDP packets when the local device information changes. To avoid frequently sending LLDP packets due to the frequent local device information change, configure the LLDP packet transmission delay to control the frequent transmission of LLDP packets.

**Configuration Examples** The following example sets LLDPDU transmission delay to 3 seconds.

**Examples**

```
Ruijie#config
Ruijie(config)#lldp timer tx-delay 3
```

### Defaults

By default, all TLVs other than Location Identification TLV can be advertised on the interface for products other than S12000. For the S12000 product series, only basic TLVs and IEEE 802.1 TLVs are advertised. To advertise IEEE 802.3 TLVs and LLDP-MED TLVs, run the **lldp tlv-enable** command.

**Command** Interface configuration mode

**Mode**

**Usage Guide** During configuration of basic management TLVs, IEEE 802.1 TLVs, and IEEE 802.3 TLVs, if the **all** parameter is specified, all optional TLVs of the types are advertised.

During configuration of LLDP-MED TLVs, if the **all** parameter is specified, all LLDP-MED TLVs except Location Identification TLVs are advertised.

When configuring LLDP-MED Capability TLVs, configure LLDP-MED MAC/PHY TLVs first. When canceling LLDP-MED MAC/PHY TLVs, cancel LLDP-MED Capability TLVs first.

When configuring LLDP-MED TLVs, configure LLDP-MED Capability TLVs first so that LLDP-MED TLVs of other types can be configured.

To cancel LLDP-MED TLVs, cancel LLDP-MED TLVs of other types first so that LLDP-MED Capability TLVs can be canceled.

**Configuration** The following example configures all IEEE 802.1 TLVs to be advertised.

**Examples**

```
Ruijie# configure terminal
Ruijie(config)#interface gigabitethernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)#lldp tlv-enable dot1-tlv all
```

The following example applies LLDP network policy 1 on the 0/1 interface.

```
Ruijie#config
Ruijie(config)#interface gigabitethernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)#lldp tlv-enable med-tlv network-policy
profile 1
```

The following example applies the LLDP Civic Address (ID: 1) configuration on the 0/1 interface.

```
Ruijie#config
Ruijie(config)#interface gigabitethernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)#lldp tlv-enable med-tlv location
civic-location identifier 1
```

The following example applies the emergency number (ID: 1) on the 0/1 interface.

```
Ruijie#config
Ruijie(config)#interface gigabitethernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)#lldp location elin identifier 1
```

**Description**

## 9.23 show lldp local-information

Use this command to display the LLDP information of local device. The information will be encapsulated in the TLVs and sent to the neighbor device.

**show lldp local-information** [ **global** | **interface** *interface-name* ]

| Parameter   | Parameter             | Description    |
|-------------|-----------------------|----------------|
| Description | <i>interface-name</i> | Interface name |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

- Usage Guide**
- **global** parameter: display the global LLDP information to be sent.
  - **Interface** parameter: displays the LLDP information to be sent out the interface specified.
  - No parameter: display all LLDP information, including global and interface-based LLDP information.

**Configuration Examples** The following example displays the device information to be sent to neighbor device.

```
Ruijie# show lldp local-information

**Description**

## 9.24 show lldp location

Use this command to display the common LLDP address or emergency number of the local device.

```
show lldp location { civic-location | elin-location } { identifier id | interface interface-name | static }
```

| Parameter          | Parameter             | Description                                               |
|--------------------|-----------------------|-----------------------------------------------------------|
| <b>Description</b> | <b>civic-location</b> | Encapsulates a common address of a network device.        |
|                    | <b>elin-location</b>  | Encapsulates an emergency number.                         |
|                    | <b>identifier</b>     | Displays one address or emergency number configured.      |
|                    | <i>id</i>             | Policy ID of configured information                       |
|                    | <b>interface</b>      | Displays the address or emergency number on an interface. |
|                    | <i>interface-name</i> | Interface name                                            |
|                    | <b>static</b>         | Displays all addresses or emergency numbers configured.   |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** If the policy ID is specified, the specified address or emergency number is displayed.  
If the interface name is specified, the address or emergency number configured on the interface is displayed.  
If no parameter is specified, all addresses or emergency numbers are displayed.

**Configuration Examples** The following example displays all addresses.

### Examples

```
Ruijie# show lldp location civic-location static
```

```

LLDP Civic location information
-----
Identifier      : testt
County         : china
City Division   : 22
Leading street direction : 44
Street number   : 68
Landmark       : 233
Name           : liuy
Building       : 19bui
Floor          : 1
Room           : 33
City           : fuzhou
Country        : 86
Additional location : aaa
Ports          : Gi0/1
-----
Identifier      : tee
-----
    
```

The following example displays all emergency numbers.

```

Ruijie# show lldp location elin-location static
Elin location information
-----
Identifier : t
Elin      : iiiiiviiii
Ports     : Gi1/0/3
-----
    
```

Description

## 9.25 show lldp neighbors

Use this command to display the LLDP information about a neighboring device.

**show lldp neighbors** [ **interface** *interface-name* ] [ **detail** ]

| Parameter Description | Parameter             | Description                                |
|-----------------------|-----------------------|--------------------------------------------|
|                       | <i>interface-name</i> | Interface name                             |
|                       | <b>detail</b>         | All information about a neighboring device |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** If the **detail** parameter is not specified, the brief information about a neighboring device is displayed. If the **detail** parameter is specified, the detailed information about a neighboring device is displayed. If the **interface** parameter is specified, the neighboring device information received on the specified interface is displayed.

**Configuration Examples** The following example displays the neighboring device information received on all ports.

```
Ruijie# show lldp neighbors detail
Lldp neighbor-information of port [GigabitEthernet 0/1]
Neighbor index      : 1
Device type        : LLDP Device
Update time        : 1hour 53minutes 30seconds
Aging time         : 5seconds

Chassis ID type    : MAC address
Chassis id        : 00d0.f822.33cd
System name       : System name
System description : System description
System capabilities supported : Repeater, Bridge, Router
System capabilities enabled : Repeater, Bridge, Router

Management address subtype : 802 mac address
Management address      : 00d0.f822.33cd

## 9.26 show lldp network-policy profile

Use this command to display the information about an LLDP network policy.

**show lldp network-policy** { **profile** [ *profile-num* ] | **interface** *interface-name* }

| Parameter          | Parameter             | Description                                          |
|--------------------|-----------------------|------------------------------------------------------|
| <b>Description</b> | <i>profile-num</i>    | ID of a network policy, in the range from 1 to 1024. |
|                    | <i>interface-name</i> | Interface name                                       |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** If *profile-num* is specified, the information about the specified network policy is displayed.  
If no parameter is specified, the information about all network policies is displayed.

**Configuration** The following example displays the information about a network policy.

**Examples**

```
Ruijie# show lldp network-policy profile
network-policy information:
-----
Network Policy Profile 1
  voice vlan 2 cos 4 dscp 6
  voice-signaling vlan 2000 cos 4 dscp 6
```

## 9.27 show lldp statistics

The following example displays LLDP statistics.

**show lldp statistics** [ **global** | **interface** *interface-name* ]

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

|                    |                       |                |
|--------------------|-----------------------|----------------|
| <b>Description</b> | <i>interface-name</i> | Interface name |
|--------------------|-----------------------|----------------|

**Defaults** N/A

**Command Mode** Privileged EXEC mode

- Usage Guide**
- **global** parameter: display the global LLDP statistics.
  - **Interface** parameter: display the LLDP statistics of the specified interface.

**Configuration** The following example displays all LLDP statistics.

**Examples**

```
Ruijie# show lldp statistics
lldp statistics global Information:
Neighbor information last changed time : 1hour 52minute 22second
The number of neighbor information inserted : 2
The number of neighbor information deleted : 0
The number of neighbor information dropped : 0
The number of neighbor information age out : 1

-----

Lldp statistics information of port [GigabitEthernet 0/1]
-----

The number of lldp frames transmitted : 26
The number of frames discarded : 0
The number of error frames : 0
The number of lldp frames received : 12
The number of TLVs discarded : 0
The number of TLVs unrecognized : 0
The number of neighbor information aged out : 0
```

**show lldp statistics** command output description:

| Field                                       | Description                                                   |
|---------------------------------------------|---------------------------------------------------------------|
| Neighbor information last change time       | Time the neighbor information is latest updated               |
| The number of neighbor information inserted | Number of times of adding neighbor information                |
| The number of neighbor information deleted  | Number of times of removing neighbor information              |
| The number of neighbor information dropped  | Number of times of dropping neighbor information              |
| The number of neighbor information aged out | Number of the neighbor information entries that have aged out |

|                                             |                                                               |
|---------------------------------------------|---------------------------------------------------------------|
| The number of lldp frames transmitted       | Total number of the LLDPDUs transmitted                       |
| The number of frames discarded              | Total number of the LLDPDUs discarded                         |
| The number of error frames                  | Total number of the LLDP error frames received                |
| The number of lldp frames received          | Total number of the LLDPDUs received                          |
| The number of TLVs discarded                | Total number of the LLDP TLVs dropped                         |
| The number of TLVs unrecognized             | Total number of the LLDP TLVs that cannot be recognized       |
| The number of neighbor information aged out | Number of the neighbor information entries that have aged out |

## 9.28 show lldp status

Use this command to display LLDP status information.

**show lldp status** [ **interface** *interface-name* ]

| Parameter          | Parameter             | Description    |
|--------------------|-----------------------|----------------|
| <b>Description</b> | <i>interface-name</i> | Interface name |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** **interface** parameter: display the LLDP status information of the specified interface.

**Configuration Examples** The following example displays LLDP status information of all ports.

```
Ruijie# show lldp status
Global status of LLDP      : Enable
Neighbor information last changed time : 1hour 52minute 22second
Transmit interval        : 30s
Hold multiplier          : 4
Reinit delay             : 2s
Transmit delay           : 2s
Notification interval    : 5s
Fast start counts        : 3
-----
```

```

Port [GigabitEthernet 0/1]
-----
Port status of LLDP      : Enable
Port state              : UP
Port encapsulation      : Ethernet II
Operational mode        : RxAndTx
Notification enable     : NO
Error detect enable     : YES
Number of neighbors     : 1
Number of MED neighbors : 0
    
```

**show lldp status** command output description:

| Field                                  | Description                                     |
|----------------------------------------|-------------------------------------------------|
| Global status of LLDP                  | Whether LLDP is globally enabled                |
| Neighbor information last changed time | Time the neighbor information is latest updated |
| Transmit interval                      | LLDPDU transmit interval                        |
| Hold multiplier                        | TTL multiplier                                  |
| Reinit delay                           | Port re-initialization delay                    |
| Transmit delay                         | LLDPDU transmit delay                           |
| Notification interval                  | Interval for sending LLDP Traps                 |
| Fast start counts                      | The number of fast sent LLDPDUs                 |
| Port status of LLDP                    | Whether LLDP is enabled on the port             |
| Port state                             | Link status of port: UP or DOWN                 |
| Port encapsulation                     | LLDPDU encapsulation format                     |
| Operational mode                       | Operating mode of LLDP                          |
| Notification enable                    | Whether LLDP Trap is enabled on the port        |
| Error detect enable                    | Whether error detection is enabled on the port  |
| Number of neighbors                    | Number of neighbors                             |
| Number of MED neighbors                | Number of MED neighbors                         |

## 9.29 show lldp tlv-config

Use this command to display the advertisable TLV configuration of a port.

**show lldp tlv-config** [ **interface** *interface-name* ]

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

|                    |                       |                |
|--------------------|-----------------------|----------------|
| <b>Description</b> | <i>interface-name</i> | Interface name |
|--------------------|-----------------------|----------------|

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** **Interface** parameter: display the LLDP TLV configuration of the specified interface.

**Configuration Examples** The following example displays TLV information of port 1.

```
Ruijie# show lldp tlv-config interface GigabitEthernet 0/1
LLDP tlv-config of port [GigabitEthernet 0/1]
-----
      NAME      STATUS DEFAULT
-----
Basic optional TLV:
Port Description TLV      YES YES
System Name TLV          YES YES
System Description TLV   YES YES
System Capabilities TLV  YES YES
Management Address TLV   YES YES

IEEE 802.1 extend TLV:
Port VLAN ID TLV         YES YES
Port And Protocol VLAN ID TLV YES YES

**Description**

## 9.30 { voice | voice-signaling } vlan

Use this command to configure the LLDP network policy. Use the **no** form of this command to delete the policy.

```
{ voice | voice-signaling } vlan { { vlan-id [ cos cvalue | dscp dvalue ] } | { dot1p [ cos cvalue | dscp dvalue ] } | none | untagged }
```

```
no { voice | voice-signaling } vlan
```

| Parameter   | Parameter              | Description                                                                                                           |
|-------------|------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Description | <b>voice</b>           | Voice application                                                                                                     |
|             | <b>voice-signaling</b> | Voice-signaling application                                                                                           |
|             | <i>vlan-id</i>         | (Optional) VLAN ID of voice flow. The value ranges from 1 to 4094.                                                    |
|             | <b>cos</b>             | (Optional) Class of service                                                                                           |
|             | <i>cvalue</i>          | (Optional) CoS of the configured voice flow. The value ranges from 0 to 7, and the default value is 5.                |
|             | <b>dscp</b>            | (Optional) Differentiated services code point                                                                         |
|             | <i>dvalue</i>          | (Optional) DSCP value of the configured voice flow. The value ranges from 0 to 63. The default value is 46.           |
|             | <b>dot1p</b>           | (Optional) 802.1p priority tagging. The tag frame includes user_priority and vlan id is 0.                            |
|             | <b>none</b>            | (Optional) The network policy is not advertised. VoIP determines the network policy based on its configuration.       |
|             | <b>untagged</b>        | (Optional) The untag frame is sent in the voice vlan in VoIP. In this case, the value of vlan id and cos are ignored. |

**Defaults** N/A

**Command** LLDP network policy configuration mode

**Mode**

**Usage Guide** In the LLDP network policy configuration mode, configure the LLDP network policy.

**Configuration Examples** The following example configures the LLDP network policy (profile-num is 1).

```
Ruijie#config
Ruijie(config)#lldp network-policy profile 1
Ruijie(config-lldp-network-policy)# voice vlan untagged
Ruijie(config-lldp-network-policy)# voice-signaling vlan 3 cos 4
Ruijie(config-lldp-network-policy)# voice-signaling vlan 3 dscp 6
```

---

**Platform** N/A

**Description**

## 10 QinQ Commands

### 10.1 dot1q-tunnel cos inner-cos-value remark-cos outer-cos-value

Use this command to map the priority from the outer tag to the inner tag for the packets on the interface. Use the **no** form of this command to restore the default setting.

**dot1q-tunnel cos inner-cos-value remark-cos outer-cos-value**

**no dot1q-tunnel cos inner-cos-value remark-cos outer-cos-value**

**default dot1q-Tunnel cos *inner-cos-value* remark-cos *outer-cos-value***

| Parameter   | Parameter              | Description                                                   |
|-------------|------------------------|---------------------------------------------------------------|
| Description | <i>inner-cos-value</i> | Indicates the CoS value of the inner tag.                     |
|             | <i>outer-cos-value</i> | Indicates the CoS value of the outer tag.                     |
|             | <b>no</b>              | Cancels the priority mapping of the packets on the interface. |

**Defaults** The policy list is null by default.

**Command Mode** Interface configuration mode.

**Usage Guide** If the QoS policy based on the COS value is set for the service provider's network to which a user network connects, the COS value of the outer tag can be set to different values based on the data packet importance. In this case, important services can be preferentially processed and transmitted.

**Configuration Examples** The following example configures the priority mapping from the outer tag to the inner tag.

```
ruijie# configure
ruijie(config)# interface gigabitEthernet 0/2
ruijie(config-if)# dot1q-tunnel cos 3 remark-cos 5
ruijie(config-if)# end
```

| Related Commands | Command                                | Description |
|------------------|----------------------------------------|-------------|
|                  | <b>show interface intf-name remark</b> | N/A         |

**Platform Description** N/A

### 10.2 frame-tag tpid

Use this command to set the packet TPID compatible with the manufacturer TPID. Use the **no** or **default** form of this command to restore the default setting.

**frame-tag tpid** *tpid*  
**no frame-tag tpid**  
**default frame-tag tpid**

| Parameter Description | Parameter | Description  |
|-----------------------|-----------|--------------|
|                       | tpid      | Packet TPID. |

**Defaults** The default is 0x8100.

**Command Mode** Interface configuration mode.

**Usage Guide** If the TPID value of the connected third-party device is not 0x8100 (default value) defined in IEEE802.1Q, the TPID value on the egress used to connect to the third-party device is the TPID value of the third-party device.

**Configuration Examples** The following example sets the packet TPID compatible with the manufacturer TPID.

```
Ruijie(config)# interface g0/3
Ruijie(config-if)# frame-tag tpid 0x9100
Ruijie(config-if)# end
Ruijie# show frame-tag tpid
Port      tpid
-----  -
Gi0/3     0x9100
```

| Related Commands | Command                    | Description |
|------------------|----------------------------|-------------|
|                  | <b>show frame-tag tpid</b> | N/A         |

**Platform Description** N/A

## 10.3 inner-priority-trust enable

Use this command to copy the priority of the inner tag to the outer tag of the packets on the interface. Use the **no** or **default** form of this command to restore the default setting.

**inner-priority-trust enable**  
**no inner-priority-trust enable**  
**default inner-priority-trust enable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|-----------------------|-----------|-------------|

|     |     |
|-----|-----|
| N/A | N/A |
|-----|-----|

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode.

**Usage Guide** If the QoS policy is configured based on the COS value of the user's VLAN tag for the service provider's network to which a user network connects, the user's VLAN tag priority can be copied to the outer VLAN tag, so that the user's packets are encapsulated with the outer VLAN tag and have the same priority as the user's VLAN tag. In this case, the user's packets can be preferentially processed and transmitted on the service provider's network.

**Configuration Examples** The following example copies the priority of the inner tag to the outer tag of the packets on the interface.

```
ruijie#configure terminal
ruijie(config)# interface gigabitEthernet 0/2
ruijie(config-if)# inner-priority-trust enable
ruijie(config-if)#end
```

**Related Commands**

| Command                          | Description |
|----------------------------------|-------------|
| <b>show inner-priority-trust</b> | N/A         |

**Platform Description** N/A

## 10.4 I2protocol-tunnel

Use this command to set the dot1q-tunnel port to receive L2 protocol message. Use the **no** or **default** form of this command to disable this function.

**I2protocol-tunnel { stp | gvrp }**

**no I2protocol-tunnel { stp | gvrp }**

**default I2protocol-tunnel { stp | gvrp }**

**Parameter Description**

| Parameter   | Description            |
|-------------|------------------------|
| <b>stp</b>  | Receives stp message.  |
| <b>gvrp</b> | Receives gvrp message. |

**Defaults** N/A

**Command** Global configuration mode.

**Mode**

**Usage Guide** If the STP and GVRP packets need to be transparently transmitted, this function must be enabled in global configuration mode.

**Configuration** The following example enables the function of receiving L2 protocol gvrp and stp.

**Examples**

```
Ruijie#configure
Ruijie(config)# l2protocol-tunnel stp
Ruijie(config)# l2protocol-tunnel gvrp
Ruijie(config)#end
```

**Related Commands**

| Command                                      | Description |
|----------------------------------------------|-------------|
| <b>show l2protocol-tunnel { gvrp   stp }</b> | N/A         |

**Platform** N/A

**Description**

## 10.5 l2protocol-tunnel enable

Use this command to enable transparent transmission of L2 protocol message. Use the **no** or **default** form of this command to restore the default setting.

**l2protocol-tunnel { stp | gvrp } enable**

**no l2protocol-tunnel { stp | gvrp } enable**

**Parameter Description**

| Parameter   | Description                           |
|-------------|---------------------------------------|
| <b>stp</b>  | Transparently transmits stp message.  |
| <b>gvrp</b> | Transparently transmits gvrp message. |

**Defaults** It is disabled by default.

**Command** Interface configuration mode.

**Mode****Usage Guide**

 If this function is enabled in global and interfa

**Configuration Examples** Here is an example of enabling transparent transmission of L2 protocol message :

```
Ruijie#configure
Ruijie(config)# interface fa 0/1
Ruijie(config-if)# l2protocol-tunnel gvrp enable
Ruijie(config-if)#end
```

**Related Commands**

| Command                                            | Description |
|----------------------------------------------------|-------------|
| <code>show l2protocol-tunnel { gvrp   stp }</code> | N/A         |

**Platform Description** N/A

## 10.6 I2protocol-tunnel tunnel-dmac

Use this command to set the MAC address for the transparent transmission of the corresponding protocol messages. Use the **no** or **default** form of this command to restore the default setting.

**I2protocol-tunnel** { **stp|gvrp** } **tunnel-dmac** *mac-address*

**no I2protocol-tunnel** { **stp|gvrp** } **tunnel-dmac** *mac-address*

**default I2protocol-tunnel** { **stp | gvrp** } **tunnel-dmac** *mac-address*

| Parameter Description | Parameter   | Description                                     |
|-----------------------|-------------|-------------------------------------------------|
|                       | <b>stp</b>  | Sets the STP transparent transmission address.  |
|                       | <b>gvrp</b> | Sets the GVRP transparent transmission address. |

**Defaults** The first three bytes of the address are 01d0f8 and the last three bytes are 000005 for **stp** and 000006 for **gvrp** by default.

**Command Mode** Global configuration mode.

**Usage Guide** N/A

**Configuration Examples** The following example sets the MAC address for the L2-protocol transparent transmission function:

```
ruijie# configure terminal
Ruijie(config-if)# I2protocol-tunnel gvrp tunnel-dmac 011AA9 000005
Ruijie(config-if)#end
```

| Related Commands | Command                                             | Description |
|------------------|-----------------------------------------------------|-------------|
|                  | <b>show I2protocol-tunnel</b> { <b>gvrp   stp</b> } | N/A         |

**Platform Description** N/A

## 10.7 show dot1q-tunnel

Use this command to display whether dot1q-tunnel of interface is enabled or not.

**show dot1q-tunnel** [ **interfaces** *intf-id* ]

| Parameter Description | Parameter      | Description              |
|-----------------------|----------------|--------------------------|
|                       | <i>intf-id</i> | The specified interface. |

**Defaults** N/A

**Command** Any mode

**Mode**

**Usage Guide** N/A

**Configuration** The following example displays whether dot1q-tunnel of interface is enabled or not.

**Examples**

```
Ruijie# show dot1q-tunnel
Ports   Dot1q-tunnel
-----  -
Gi0/1   Enable
```

## 10.10 show interfaces dot1q-tunnel

Use this command to display the VLAN configuration on the dot1q-tunnel port.

**show interfaces [ *intf-id* ] dot1q-tunnel**

| Parameter Description | Parameter | Description              |
|-----------------------|-----------|--------------------------|
|                       | intf-id   | Specifies the interface. |

**Defaults** N/A

**Command Mode** Any mode

**Usage Guide** N/A

**Configuration** The following example displays the VLAN configuration on the dot1q-tunnel port.

**Examples**

```
Ruijie# show interfaces dot1q-tunnel
Interface: Gi0/3
Native vlan: 10
Allowed vlan list: 4-6, 10, 30-60
Tagged vlan list: 4, 6, 30-60
```

## 10.11 show interfaces remark

Use this command to display the priority mapping configuration.

**show interfaces [ *intf-id* ] remark**

**Parameter Description**

| Parameter      | Description            |
|----------------|------------------------|
| <i>intf-id</i> | specifies an interface |

**Defaults** N/A

**Command Mode** Any mode

**Usage Guide** N/A

**Configuration** The following example displays the priority mapping configuration.

**Examples**

```
Ruijie# show interfaces remark
Ports          Type          From value  To value
-----
Gi0/1          Cos-To-Cos    3           5
```

## 10.12 show l2protocol-tunnel

Use this command to display transparent transmission configuration of L2 protocol.

**show l2protocol-tunnel { gvrp | stp }**

| Parameter Description | Parameter                                                          | Description                                                         |
|-----------------------|--------------------------------------------------------------------|---------------------------------------------------------------------|
|                       | <b>gvrp</b>                                                        | Displays configuration of transparently transmitting gvrp protocol. |
| <b>stp</b>            | Displays configuration of transparently transmitting stp protocol. |                                                                     |

**Defaults** N/A

**Command Mode** Any mode

**Usage Guide** N/A

**Configuration Examples** The following example displays transparent transmission configuration of L2 protocol.

```
Ruijie# show l2protocol-tunnel stp
L2protocol-tunnel: Stp Enable
Ruijie# show l2protocol-tunnel gvrp
L2protocol-tunnel: gvrp Disable
```

## 10.16 switchport dot1q-tunnel allowed vlan

Use this command to configure the allowed VLAN of dot1q-tunnel. Use the **no** or **default** form of this command to restore the default setting.

**switchport dot1q-tunnel allowed vlan** { [ **add** ] **tagged** *vlist* | [ **add** ] **untagged** *vlist* | **remove** *vlist* }  
**no switchport dot1q-tunnel allowed vlan**  
**default switchport dot1q-tunnel allowed vlan**

| Parameter Description | Parameter       | Description          |
|-----------------------|-----------------|----------------------|
|                       | <b>add</b>      | Add allowed VLAN.    |
|                       | <b>tagged</b>   | Tag-carried.         |
|                       | <b>untagged</b> | Not tag-carried.     |
|                       | <i>v_list</i>   | vlan id list.        |
|                       | <b>no</b>       | Remove the settings. |

**Defaults** The default is **untagged** 1.

**Command Mode** Interface configuration mode.

**Usage Guide** N/A

**Configuration Examples** The following example specifies vlan 3-6 of dot1q-tunnel port as allowed VLAN and outputting the frame with tag.

```
Ruijie(config)#interface gigabitEthernet 0/1
Ruijie(config-if)#switchport dot1q-tunnel allowed vlan tagged 3-6
Ruijie(config)#end
```

**Description**

## 10.17 switchport dot1q-tunnel native vlan

Use this command to configure the default vlan id of dot1q-tunnel. Use the **no** or **default** form of this command to restore the default setting.

**switchport dot1q-tunnel native vlan *vid***  
**no switchport dot1q-tunnel native vlan**  
**default switchport dot1q-tunnel native vlan**

| Parameter Description | Parameter | Description                 |
|-----------------------|-----------|-----------------------------|
|                       | vid       | Configures default vlan id. |

**Defaults** The default is VLAN 1.

**Command Mode** Interface configuration mode.

**Usage Guide** N/A

**Configuration Examples** The following example specifies default VLAN of dot1q-tunnel port as 8.

```
Ruijie(config)#interface gigabitEthernet 0/1
Ruijie(config-if)#switchport dot1q-tunnel native vlan 8
Ruijie(config)#end
```

| Related Commands | Command                            | Description |

## 10.18 switchport mode dot1q-tunnel

Use this command to configure the interface as the dot1q-tunnel interface. Use the **no** or **default** form of this command to restore the default setting.

**switchport mode dot1q-tunnel**  
**no switchport mode**  
**default switchport mode**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | -         | -           |

**Defaults** The interface is not a tunnel port by default.

**Command Mode** Interface configuration mode.

**Usage Guide** N/A

**Configuration** The following example configures the interface as the dot1q-tunnel interface.

**Examples**

```
ruijie(config)# interface gigabitEthernet 0/1
ruijie(config-if)# switchport mode dot1q-tunnel
ruijie(config)# end
```

## 11 ERPS Commands

### 11.1 associate sub-ring

Use this command to associate the ethernet ring with its sub-rings.

**associate sub-ring raps-vlan** *vlan-list*

**no associate sub-ring raps-vlan** *vlan-list*

#### Parameter Description

| Parameter        | Description            |
|------------------|------------------------|
| <i>vlan-list</i> | Sub-rings' R-APS VLAN. |

#### Defaults

By default, Ethernet ring is not associated with its sub-rings.

#### Command

ERPS configuration mode.

#### Mode

#### Usage Guide

1. You need to configure this command on all nodes of the Ethernet ring, so as to transmit its sub-ring's ERPS protocol packets in the Ethernet ring.
2. Configuring the association is mainly to make the sub-ring's protocol packets transmit in the Ethernet ring. Users can also adopt the configuration command provided by the VLAN module to configure elaborately the VLAN and the relation between ports and VLAN, so as to transmit the sub-ring's protocol packets in other Ethernet rings and not leak the packets to the user network.

#### Configuration

The following example associates the Ethernet sub-ring with other Ethernet rings:

#### Examples

```
#Enter the privileged EXEC mode
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

# Configure the link mode of the Ethernet ring port and the default VLAN.
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if)# switchport mode trunk
Ruijie(config-if)# exit
Ruijie(config)# interface fastEthernet 0/2
Ruijie(config-if)# switchport mode trunk
Ruijie(config-if)# exit

# Enter the erps configuration mode.
Ruijie(config)# erps raps-vlan 4093

#Add the ports that participate in the ERPS protocol computing to the Ethernet ring.
Ruijie(config-erps4093)# ring-port west fastEthernet 0/1 east fastEthernet
```

```

0/2

# Configure the Ethernet subring
Ruijie(config)# erps raps-vlan 100
Ruijie(config)# interface fastEthernet 0/3
Ruijie(config-if)# switchport mode trunk
Ruijie(config-if)# exit
Ruijie(config)# erps raps-vlan 100
Ruijie(config-erps100)# ring-port west fastEthernet 0/3 east virtual-channel
Ruijie(config-if)# exit

# Associate the subring with other Ethernet rings.
Ruijie(config)# erps raps-vlan 4093
Ruijie(config-erps4093)# associate sub-ring raps-vlan 100
    
```

**Related Commands**

| Command | Description |
|---------|-------------|
| N/A     | N/A         |

**Platform Description**

N/A

## 11.2 erps enable

Use this command to enable/disable the ERPS function in the global configuration mode.

**erps enable**

**no erps enable**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

Disabled

**Command Mode**

Global configuration mode.

**Usage Guide**

The ERPS protocol of the specified ring will begin running truly only after the global ERPS protocol and the ERPS protocol of the specified ring are both enabled.

**Configuration Examples**

The following example enables the ERPS protocol globally:

```

# Enter the privileged EXEC mode
Ruijie# configure terminal
    
```

```
Enter configuration commands, one per line. End with CNTL/Z.
```

```
# Enable the ERPS function globally.
Ruijie(config)# erps enable
```

```
# Enter the ERPS configuration mode
Ruijie(config)# erps raps-vlan 4093
```

```
# Enable the ERPS function for the specified ring.
Ruijie(config-erps4093)# state enable
```

**Related Commands**

| Command             | Description                                                                                                                                  |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>state enable</b> | After entering the ERPS configuration mode of the specified ring, configure this command to enable the ERPS protocol of this specified ring. |

**Platform** N/A  
**Description**

### 11.3 erps monitor link-state by oam

Use this command to configure the method of monitoring the ERPS link state.

**erps monitor link-state by oam vlan *vlan-id***  
**no erps monitor link-state by oam**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** By default, it adopts the directly monitoring the link physical state (up or down) rather than the oam method.

**Command Mode** Global configuration mode.

**Usage Guide** For the link state monitoring, use the method of directly monitoring the link physical state (up or down), also monitor the logic state (unidirectional fault, bidirectional fault or normal) of the link by the OAM. By default, the former is adopted. If the OAM method is used, the inefficient link state monitoring may cause the convergence time longer when the topology changes.

**Configuration Examples** The following example configures the method of monitoring the link state.

```
# Enter the privileged EXEC mode.
Ruijie# configure terminal
```

```
Enter configuration commands, one per line. End with CNTL/Z.

# Configure the method of monitoring the link state.
Ruijie(config)# erps monitor link-state by oam vlan 100
```

**Related Commands**

| Command | Description |
|---------|-------------|
| N/A     | N/A         |

**Platform** N/A  
**Description**

## 11.4 erps raps-vlan

Use this command to configure the R-APS VLAN of Ethernet ring.

```
erps raps-vlan vlan-id
no erps raps-vlan vlan-id
```

**Parameter Description**

| Parameter      | Description   |
|----------------|---------------|
| <i>vlan-id</i> | R-APS VLAN ID |

**Defaults** No R-APS VLAN is configured.

**Command Mode** Global configuration mode.

**Usage Guide** The R-APS VLAN must be the VLAN that is not used on the device. Cannot set the VLAN1 to the R-APS VLAN.  
 The same Ethernet ring of different devices needs the same R-APS VLAN.  
 If you want to transparently transmit the ERPS protocol packets on a device without the ERPS function configured, make sure that only the two ports connected to the Ethernet ring on this device allow the R-APSA VLAN packets corresponding to this ERPS ring passing through. Otherwise, the other VLAN packets may enter the R-APS VLAN through the transparent transmission, causing the shock to the ERPS ring.

**Configuration Examples**

```
# Enter the privileged EXEC mode.
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

#Configure the R-APS VLAN globally.
Ruijie(config)# erps raps-vlan 4093
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  |         | N/A         |

**Platform** N/A  
**Description**

## 11.5 protected-instance

Use this command to configure the VLAN protected by the Ethernet ring to implement the load balance function.

**protected-instance** *instance-id-list*

**no protected-instance**

| Parameter Description | Parameter | Description             |
|-----------------------|-----------|-------------------------|
|                       |           | <i>instance-id-list</i> |

**Defaults** By default, all VLANs are protected.

**Command Mode** ERPS configuration mode.

**Usage Guide** The protected VLAN consists of the R-APS VLAN of this Ethernet ring and the data VLAN protected by this Ethernet ring.

**Configuration Examples** Suppose that the ERP1 and ERP2 are configured on the switch to implement the load balance. The R-APS VLAN of the ERPS1 is 100, the protected data VLAN is in the range of 1 to 99 and 101-2000, the R-APS VLAN of the ERPS2 is 4093, and the protected data VLAN is in the range of 2001 to 4092 and 4094. Configuration for the load balance is shown as below:

```
# Enter the privileged EXEC mode.
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

```
# Configure the VLAN configured by the ERP1.
Ruijie(config)# spanning-tree mst configuration
Ruijie(config-mst)# instance 1 vlan 100, 1-99, 101-2000
Ruijie(config-mst)# exit
Ruijie(config)# erps raps-vlan 100
Ruijie(config-erps100)#protected-instance 1
```

```
# Configure the VLAN configured by the ERP2.
Ruijie(config)# spanning-tree mst configuration
```

```
Ruijie(config-mst)# instance 2 vlan 4093, 2001-4092, 4094
Ruijie(config-mst)# exit
Ruijie(config)# erps raps-vlan 4093
Ruijie(config-erps4093)#protected-instance 2
```

**Platform** N/A  
**Description**

## 11.6 ring-port

Use this command to configure the ERPS ring.

**ring-port west** { *interface-name1* | **virtual-channel** } **east** { *interface-name2* | **virtual-channel** }  
**no ring-port**

**Parameter Description**

| Parameter              | Description            |
|------------------------|------------------------|
| <i>interface-name1</i> | Name of the West port. |
| <i>interface-name2</i> | Name of the East port. |

**Defaults** No ERPS ring is configured.

**Command Mode** EPRS configuration mode.

- Usage Guide**
- 1) After adding the port to the ERP ring, the trunk attribute of the port is not allowed to be modified any more.
  - 2) If the ring port is configured on the virtual-channel, this ring will be considered as a sub-ring.
  - 3) Ports running the ERPS do not participate in the STP computing. ERPS, RERP and REUP do not share the port.

**Configuration Examples** The following example is for the ERPS ring.

```
# Enter the privileged EXEC mode.
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

# Configure the link mode of the Ethernet ring port and the default VLAN.
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if)# switchport mode trunk
Ruijie(config-if)# exit
Ruijie(config)# interface fastEthernet 0/2
```

```
Ruijie(config-if)# switchport mode trunk
Ruijie(config-if)# exit
```

```
# Enter the ERPS configuration mode.
Ruijie(config)# erps raps-vlan 4093
```

```
#Add the ports that participate in the ERPS protocol computing to the Ethernet ring.
Ruijie(config-erps4093)# ring-port west fastEthernet 0/1 east fastEthernet
0/2
```

| <b>sub-ring associate raps-vlan <i>vlan-id</i></b> | Establish the association between the subring and other Ethernet rings in the subring ERPS configuration mode. |

**Platform** N/A

### Description

## 11.7 rpl-port

Use this command to configure the RPL port and RPL owner.

```
rpl-port { west | east } [ rpl-owner ]
no rpl-port
```

### Parameter Description

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** No RPL port and RPL owner are configured.

**Command** EPRS configuration mode.

### Mode

**Usage Guide** Up to one RPL link and one RPL owner node are needed and configurable for each ring.

**Configuration** The following example configures the RPL port and RPL owner.

### Examples

```
# Enter the privileged EXEC mode.
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

```
# Configure the link mode of the Ethernet ring port and the default VLAN.
```

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if)# switchport mode trunk
Ruijie(config-if)# exit
Ruijie(config)# interface fastEthernet 0/2
Ruijie(config-if)# switchport mode trunk
Ruijie(config-if)# exit
```

```
# Enter the ERPS configuration mode.
Ruijie(config)# erps raps-vlan 4093
```

```
# Add the ports that participate in the ERPS protocol computing to the Ethernet ring.
Ruijie(config-erps4093)# ring-port west fastEthernet 0/1 east fastEthernet
0/2
```

```
# Specify the port where the RPL link is and the RPL owner.
Ruijie(config-erps4093)# rpl-port west rpl-owner
```

| <b>state enable</b>                                                                                                                       | Enable the ERPS protocol of the specified ring in the ERPS configuration mode of the specified ring. |

**Platform** N/A

**Description**

## 11.8 show erps

Use this command to show the parameters and states of the ERPS.

```
show erps [ { global | raps_vlan vlan-id [ sub-ring ] } ]
```

#### Parameter Description

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** N/A

**Configuration** The following example shows the use of this command.

**Examples**

```
Ruijie# show erps
ERPS Information
Global Status           : Enabled
Link monitored by      : Not Oam
-----
R-APS VLAN              : 4092

## 11.9 state enable

Use this command to enable/disable the specified R-APS ring.

**state enable**

**no state enable**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** Disabled

**Command Mode** EPRS configuration mode.

**Usage Guide** Only after the global ERPS protocol and the ERPS protocol of the specified ring are both enabled, the ERPS protocol of the specified ring will begin truly running.

**Configuration Examples** The following example enables the specified ERPS ring:

```

#Enter the privileged EXEC mode.
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

#Configure the link mode of the Ethernet ring port and the default VLAN.
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if)# switchport mode trunk
Ruijie(config-if)# exit
Ruijie(config)# interface fastEthernet 0/2
Ruijie(config-if)# switchport mode trunk
Ruijie(config-if)# exit

```

```
# Enter the ERPS configuration mode.
Ruijie(config)# erps raps-vlan 4093

# Add the ports that participate in the ERPS protocol computing to the Ethernet ring.
Ruijie(config-erps4093)# ring-port west fastEthernet 0/1 east fastEthernet
0/2

# Enable the ERPS function for the specified ring.
Ruijie(config-erps4093)#state enable

# Enable the global ERPS function.
Ruijie(config-erps4093)# exit
Ruijie(config)# erps enable
```

#### Related Commands

## 11.10 sub-ring tc-propagation

Use this command to specify the devices corresponding to the crossing node on the crossing ring whether to send out the notification when the subring topology changes.

**sub-ring tc\_propagation enable**  
**no sub-ring tc\_propagation**

#### Parameter Description

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** By default, the topology changing notification is not sent.

**Command Mode** EPRS configuration mode.

**Usage Guide** This command is just needed to be configured on the crossing nodes on the crossing ring.

**Configuration Examples** The following example is configured when the subring topology changes.

```
# Enter the privileged EXEC mode.
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

```

#Configure the link mode of the Ethernet ring port and the default VLAN.
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if)# switchport mode trunk
Ruijie(config-if)# exit
Ruijie(config)# interface fastEthernet 0/2
Ruijie(config-if)# switchport mode trunk
Ruijie(config-if)# exit

# Enter the ERPS configuration mode.
Ruijie(config)# erps raps-vlan 4093

# Add the ports that participate in the ERPS protocol computing to the Ethernet ring.
Ruijie(config-erps4093)# ring-port west fastEthernet 0/1 east fastEthernet
0/2

#Configure the Ethernet subring.
Ruijie(config)# erps raps-vlan 100
Ruijie(config)# interface fastEthernet 0/3
Ruijie(config-if)# switchport mode trunk
Ruijie(config-if)# exit
Ruijie(config)# erps raps-vlan 100
Ruijie(config-erps100)# ring-port west fastEthernet 0/3 east virtual-channel

# Associate the subring with other Ethernet rings.
Ruijie(config-erps100)# sub-ring associate raps-vlan 4093

# Enable the topology changing notification for the subring.
Ruijie(config-erps100)# sub-ring tc-propagation enable

```

## 11.11 timer

Use this command to configure the timer of the ERPS protocol.

```

timer { holdoff-time interval1 | guard-time interval2 | wtr-time interval3 }
no timer { holdoff-time | guard-time | wtr-time }

```

#### Parameter Description

| Parameter | Description |
|-----------|-------------|
|           |             |

|           |                                                                              |
|-----------|------------------------------------------------------------------------------|
| interval1 | Value of the Holdoff timer in 100 milliseconds, the valid range is 0 to 100. |
| Interval2 | Value of the Guard timer in 10 milliseconds, the valid range is 1 to 200.    |
| Interval3 | Value of the WTR in minute, the valid range is 5 to 12.                      |

**Defaults** Holdoff timer: 0.  
Guard timer: 500 milliseconds.  
WTP timer: 5 seconds.

**Command Mode** EPRS configuration mode.

**Usage Guide** **Holdoff timer:** This timer is used to avoid the ERPS from topology switching continuously due to the link intermittent fault. With this timer configured, if the link fault is detected, the ERPS does not perform the topology switching immediately until the timer times out and the link fault is verified.  
**Guard timer:** This timer is used to prevent the device receiving the timed-out R-APS messages. When the device detects the recovery from failure of the link, it sends out the message of link recovery and starts up the Guard timer. Before the Guard times out, except for the flush packets indicating the subring topology change, other packets are discarded directly without being handled.  
**WTR (Wait-to-restore) timer:** This timer is only valid for the RPL owner device. It is mainly used to prevent the RPL owner making the erroneous judgment to the ring network status. When the RPL detects the fault recovery, it does not perform the topology switching immediately until the WTR times out and the Ethernet ring indeed recovers from the fault. If the ring network fault is checked again before the WTR times out, then the WTR timer will be canceled and topology switching will be not executed any longer.

**Configuration Examples** The following example configures the timer of the ERPS protocol.

```
# Enter the privileged EXEC mode.
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
# Enter the ERPS configuration mode.
Ruijie(config)# erps raps-vlan 4093

# Configure the protocol timer.
Ruijie(config-erps4093)# timer holdoff-time 10
Ruijie(config-erps4093)# timer guard-time 10
Ruijie(config-erps4093)# timer wtr-time 10
```

## 1.1 gateway

Use this command to set the gateway address for the management port. Use the **no** form of this command to remove the setting.

**gateway** *address*

**no gateway**

| Parameter   | Parameter      | Description                                      |
|-------------|----------------|--------------------------------------------------|
| Description | <i>address</i> | Sets the gateway address for the management port |

**Defaults** N/A

**Command Mode** Interface configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example sets the gateway address for the management port to 1.1.1.1.

```
Ruijie(config)# interface mgmt 0
Ruijie(config-if-Mgmt 0)# gateway 1.1.1.1
Ruijie(config-if-Mgmt 0)#
```

## 1.2 ip-address

Use this command to configure the IP address of an interface. Use the **no** form of this command to restore the default setting.

**ip address** *ip-address network-mask* [ **secondary** ]

**no ip address** [ *ip-address network-mask* [ **secondary** ]

| Parameter   | Parameter         | Description                                                                                  |
|-------------|-------------------|----------------------------------------------------------------------------------------------|
| Description | <i>ip-address</i> | 32-bit IP address, with 8 bits in one group in decimal format. Groups are separated by dots. |

|                     |                                                                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>network-mask</i> | 32-bit network mask. 1 stands for the mask bit, 0 stands for the host bit, with 8 bits in one group in decimal format. Groups are separated by dots. |
| <b>secondary</b>    | Secondary IP address                                                                                                                                 |

**Defaults** No IP address is configured for the interface by default.

**Command Mode** Interface configuration mode

**Usage Guide** The equipment cannot receive and send IP packets before it is configured with an IP address. After an IP address is configured for the interface, the interface is allowed to run the Internet Protocol (IP).

The network mask is also a 32-bit value that identifies which bits among the IP address is the network portion. Among the network mask, the IP address bits that correspond to value “1” are the network address. The IP address bits that correspond to value “0” are the host address. For example, the network mask of Class A IP address is “255.0.0.0”. You can divide a network into different subnets using the network mask. Subnet division means to use the bits in the host address part as the network address part, so as to reduce the capacity of a host and increase the number of networks. In this case, the network mask is called subnet mask.

The RGOS software supports multiple IP address for an interface, in which one is the primary IP address and others are the secondary IP addresses. Theoretically, there is no limit for the number of secondary IP addresses. The primary IP address must be configured before the secondary IP addresses. The secondary IP address and the primary IP address must belong to the same network or different networks. Secondary IP addresses are often used in network construction. Typically, you can try to use secondary IP addresses in the following situations:

A network hasn't enough host addresses. At present, the LAN should be a class C network where 254 hosts can be configured. However, when there are more than 254 hosts in the LAN, another class C network address is necessary since one class C network is not enough. Therefore, the device should be connected to two networks and multiple IP addresses should be configured.

Many older networks are layer 2-based bridge networks that have not been divided into different subnets. Use of secondary IP addresses will make it very easy to upgrade this network to an IP layer-based routing network. The equipment configures an IP address for each subnet.

Two subnets of a network are separated by another network. You can create a subnet for the separated network, and connect the separated subnet by configuring a secondary IP address. One subnet cannot appear on two or more interfaces of a device.

**Configuration Examples** The following example configures the primary IP address and the network mask as 10.10.10.1 and 255.255.255.0 respectively .

```
Ruijie(config)# interface gigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)# ip address 10.10.10.1 255.255.255.0
```

### 1.3 ip address-pool local

Use this command to enable the IP address pool function. Use the **no** form of this command to disable this function.

**ip address-pool local**  
**no ip address-pool local**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command Mode** Global configuration mode

**Usage Guide** This function is enabled by default. PPP users can allocate an IP address to the peer end from the IP address pool configured. If you can use the **no ip address-pool local** command to disable this function and clear all configured IP address pools.

**Configuration Examples** The following example enables the IP address pool function.

```
Ruijie(config)# ip address-pool local
```

| <b>Defaults</b>               | The default IP broadcast address is 255.255.255.255.                                                                                                                                                                                                                          |                                 |
| <b>Command Mode</b>           | Interface configuration mode.                                                                                                                                                                                                                                                 |                                 |
| <b>Usage Guide</b>            | At present, the destination address of IP broadcast packet is all "1", represented as 255.255.255.255. The RGOS software can generate broadcast packets with other IP addresses through definition, and can receive both all "1" and the broadcast packets defined by itself. |                                 |
| <b>Configuration Examples</b> | The following example sets the destination address of IP broadcast packets generated by this interface to 0.0.0.0.                                                                                                                                                            |                                 |
|                               | <pre>Ruijie(config)# interface gigabitEthernet 0/1 Ruijie(config-if)# ip broadcast-address 0.0.0.0</pre>                                                                                                                                                                      |                                 |
| <b>Related Commands</b>       | <b>Command</b>                                                                                                                                                                                                                                                                | <b>Description</b>              |
|                               | N/A                                                                                                                                                                                                                                                                           | N/A                             |
| <b>Platform Description</b>   | N/A                                                                                                                                                                                                                                                                           |                                 |

## 1.5 ip icmp error-interval

Use this command to set the rate to send the ICMP destination unreachable packets triggered by DF in the IP header. Use the **no** form of this command to restore the default setting.

`ip icmp error-interval DF milliseconds [ bucket-size ]`

**no ip icmp error-interval DF milliseconds [ bucket-size ]**

Use this command to set the rate to send other ICMP error packets. Use the **no** form of this command to restore the default setting.

`ip icmp error-interval milliseconds [bucket-size]`

**no ip icmp error-interval milliseconds [ bucket-size ]**

|                    |                     |                                                                                                                                                                                            |
|--------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter</b>   | <b>Parameter</b>    | <b>Description</b>                                                                                                                                                                         |
| <b>Description</b> | <i>milliseconds</i> | The refresh period of the token bucket, in the range from 0 to 2147483647 in the unit of milliseconds. 0 indicates no limit on the rate to send ICMP error packets.<br>The default is 100. |
|                    | <i>bucket-size</i>  | The number of tokens in the bucket, in the range is from 1 to 200. The default is 10.                                                                                                      |

**Defaults** The default rate is 10 packets per 100 millisecond.

**Command Mode** Global configuration mode.

**Usage Guide** To prevent DoS attack, the token bucket algorithm is adopted to limit the rate to send ICMP error packets.

If IP packets need to be fragmented while the DF is set to 1, the device sends ICMP destination unreachable packets numbered 4 to the source IP address for path MTU discovery. Rate limits on ICMP destination unreachable packets and other error packets are needed to prevent path MTU discovery failure.

It is recommended to set the refresh period to an integral multiple of 10 milliseconds. If the refresh period is not an integral multiple of 10 milliseconds, it is adjusted automatically. For example, 1 per 5 milliseconds is adjusted to 2 per 10 milliseconds; 3 per 15 milliseconds is adjusted to 2 per 10 milliseconds.

**Configuration Examples** The following example sets the rate to send the ICMP destination unreachable packets triggered by DF in the IP header to 100 per second.

```
Ruijie(config)# ip icmp error-interval DF 1000 100
```

The following example sets the rate to send other ICMP error packets to 10 per second.

```
Ruijie(config)# ip icmp error-interval 1000 10
```

**Description**

## 1.7 ip directed-broadcast

Use this command to enable the conversion from IP directed broadcast to physical broadcast in the interface configuration mode. Use the **no** form of this command to restore the default setting.

**ip directed-broadcast** [ *access-list-number* ]

**no ip directed-broadcast**

| Parameter          | Parameter                 | Description                                                                                                                                                                                                      |
|--------------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>access-list-number</i> | (Optional) Access list number, in the range from 1 to 199 and from 1300 to 2699. After an access list number has been defined, only the IP directed broadcast packets that match this access list are converted. |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode.

**Usage Guide** IP directed broadcast packet is an IP packet whose destination address is an IP subnet broadcast address. For example, the packet with the destination address 172.16.16.255 is called a directed broadcast packet. However, the node that generates this packet is not a member of the destination subnet.

The device that is not directly connected to the destination subnet receives an IP directed broadcast packet and handles this packet in the same way as forwarding a unicast packet. After the directed broadcast packet reaches a device that is directly connected to this subnet, the device converts the directed broadcast packet into a flooding broadcast packet (typically the broadcast packet whose destination IP address is all "1"), and then sends the packet to all the hosts in the destination subnet in the manner of link layer broadcast.

You can enable conversion from directed broadcast into physical broadcast on a specified interface, so that this interface can forward a direct broadcast packet to a directly connected network. This command affects only the final transmission of directed broadcast packets that

have reached the destination subnet instead of normal forwarding of other directed broadcast packets.

You can also define an access list on an interface to control which directed broadcast packets to forward. After an access list is defined, only the packets that conform to the conditions defined in the access list undergo conversion from directed broadcast into physical broadcast.

If the **no ip directed-broadcast** command is configured on an interface, RGOS will discard the directed broadcast packets received from the directly connected network.

### Configuration

The following example enables forwarding of directed broadcast packet on the fastEthernet 0/1 port of a device.

### Examples

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if)# ip directed-broadcast
```

### Description

## 1.8 ip local pool

Use this command to create an IP address pool. Use the **no** form of this command to remove the setting.

**ip local pool** *pool-name* *low-ip-address* [ *high-ip-address* ]

**no ip local pool** *pool-name* [ *low-ip-address* [ *high-ip-address* ] ]

### Parameter

| Parameter              | Description                                                           |
|------------------------|-----------------------------------------------------------------------|
| <i>pool-name</i>       | Specifies the address pool name. The default name is <b>default</b> . |
| <i>low-ip-address</i>  | The start IP address in the address pool.                             |
| <i>high-ip-address</i> | (Optional) The end IP address in the address pool.                    |

### Description

### Defaults

No IP address pool is configured by default.

### Command

Global configuration mode

### Mode

### Usage Guide

This command is used to create one or multiple IP address pools for PPP to allocate addresses to users.

### Configuration

The following example creates an IP address pool named quark ranging from 172.16.23.0 to 172.16.23.255.

### Examples

```
Ruijie(config)#ip local pool quark 172.16.23.0 172.16.23.255
```

## 1.9 ip mask-reply

Use this command to configure the RGOS software to respond the ICMP mask request and send an ICMP response message in the interface configuration mode. Use the **no** form of this command to restore the default setting.

**ip mask-reply**  
**no ip mask-reply**

| <b>Parameter Description</b> | Parameter | Description |
|------------------------------|-----------|-------------|
|                              | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command mode** Interface configuration mode.

**Usage Guide** Sometimes, a network device needs the subnet mask of a subnet on the Internet. To obtain such information, the network device can send an ICMP mask request message, and the network device that receives this message will send a mask response message.

**Configuration Examples** The following example sets the FastEthernet 0/1 interface of a device to respond the ICMP mask request message.

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if)# ip mask-reply
```

## 1.10 ip mtu

Use this command to set the Maximum Transmission Unit (MTU) for an IP packet in the interface configuration mode. Use the **no** form of this command is restore the default setting.

**ip mtu bytes**

**no ip mtu**

| Parameter   | Parameter    | Description                                                                 |
|-------------|--------------|-----------------------------------------------------------------------------|
| Description | <i>bytes</i> | Maximum transmission unit of IP packet , in the range from 68 to 1500 bytes |

**Defaults** It is the same as the value configured in the interface command **mtu** by default.

**Command Mode** Interface configuration mode.

**Usage Guide** If an IP packet is larger than the IP MTU, the RGOS software will split this packet. All the devices in the same physical network segment must have the same IP MTU for the interconnected interface.

If the interface configuration command **mtu** is used to set the maximum transmission unit value of the interface, IP MTU will automatically match with the MTU value of the interface. However, if the IP MTU value is changed, the MTU value of the interface will remain unchanged.

**Configuration Examples** The following iexample sets the IP MTU value of the fastEthernet 0/1 interface to 512 bytes.

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if)# ip mtu 512
```

| Related Commands | Command    | Description                         |
|------------------|------------|-------------------------------------|
|                  | <b>mtu</b> | Sets the MTU value of an interface. |

**Platform** N/A

**Description**

## 1.11 ip redirects

Use this command to allow the RGOS software to send an ICMP redirection message in the interface configuration mode. Use the **no** form of this command to disable this function.

**ip redirects**

**no ip redirects**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command Mode** Interface configuration mode.

**Usage Guide** When the route is not optimum, it may make the device to receive packets through one interface and send it though the same interface. If the device sends the packet through the interface through which this packet is received, the device will send an ICMP redirection message to the data source, telling the data source that the gateway for the destination address is another device in the subnet. In this way the data source will send subsequent packets along the optimum path.

**Configuration** The following example disables ICMP redirection for the fastEthernet 0/1 interface.

**Examples**

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if)# no ip redirects
```

| Related Commands | Command | Description |

**Platform** N/A  
**Description**

## 1.12 ip source-route

Use this command to allow the RGOS software to process an IP packet with source route information in global configuration mode. Use the **no** form of this command to disable this function.

**ip source-route**  
**no ip source-route**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command Mode** Global configuration mode.

**Usage Guide** RGOS supports IP source route. When the device receives an IP packet, it will check the options of the IP packet, such as strict source route, loose source route and record route. Details about these options can be found in RFC 791. If an option is found to be enabled in this packet, a response will be made. If an invalid option is detected, an ICMP parameter problem message will be sent to the data source, and then this packet is discarded.

**Configuration** The following example disables the IP source route.

**Examples**

```
Ruijie(config)# no ip source-route
```

## 1.13 ip ttl

Use this command to set the TTL value of the unicast packet. Use the **no** form of this command to restore the default setting.

**ip ttl** *value*

**no ip ttl**

| Parameter          | Parameter    | Description                                                           |
|--------------------|--------------|-----------------------------------------------------------------------|
| <b>Description</b> | <i>value</i> | Sets the TTL value of the unicast packet, in the range from 0 to 255. |

**Defaults** The default is 64.

**Command Mode** Global configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example sets the TTL value of the unicast packet to 100.

```
Ruijie(config)# ip ttl 100
```

| Related Commands | Command | Description |
|------------------|---------|-------------|

**Platform Description** N/A

## 1.15 ip unnumbered

This command is used to configure unnumbered interfaces. After an interface is set to an unnumbered interface, IP can be run on the interface and packets can be sent or received on the interface. Use the **no** form of this command to restore the default setting.

**ip unnumbered** *interface-type interface-number*  
**no ip unnumbered**

**Parameter Description**

| Parameter               | Description                      |
|-------------------------|----------------------------------|
| <i>interface-type</i>   | Type of the associated interface |
| <i>interface-number</i> | No. of the associated interface  |

**Defaults** No unnumbered interface is configured by default.

**Command mode** Interface configuration mode

**Usage Guide** An unnumbered interface indicates that IP is enabled on the interface but no IP address is allocated for the interface. An unnumbered interface must associate with an interface with an IP address. The source IP address of the IP packets generated on an unnumbered interface is the IP address of the associated interface. In addition, the routing protocol process determines whether to send route update packets to the unnumbered interface according to the IP address of the associated interface. Pay attention to the following when using an unnumbered interface:

An Ethernet interface cannot be set to an unnumbered interface.

When SLIP, HDLC, PPP, LAPB, and Frame-relay are encapsulated on a serial port, the port can be set to an unnumbered interface. When a frame relay is encapsulated, only a point-to-point subinterface can be set to an unnumbered interface. In the case of X.25 encapsulation, unnumbered interface is not allowed.

The **ping** command cannot be used to check whether an unnumbered interface is working properly because the interface does not have an IP address. The status of an unnumbered interface can be remotely monitored over SNMP.

The network cannot be enabled using an unnumbered interface.

**Configuration Examples** The following example configures the local interface as an unnumbered interface and sets the associated interface to FastEthernet 0/1 (an IP address is configured for the interface).

```
Ruijie(config-if)# ip unnumbered fastEthernet 0/1
```

**Related Commands**

|-----------------------|--------------------------------------------------------|
| <b>show interface</b> | Displays the detailed information about the interface. |

**Platform Description** N/A

## 1.16 ip unreachable

Use this command to allow the RGOS software to generate ICMP destination unreachable messages. Use the **no** form of this command to disable this function.

**ip unreachable**

**no ip unreachable**

| Parameter          | Parameter | Description |
|--------------------|-----------|-------------|
| <b>Description</b> | N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command Mode** Interface configuration mode.

**Usage Guide** RGOS software will send a ICMP destination unreachable message if it receives unicast message with self-destination-address and can not process the upper protocol of this message.

RGOS software will send ICMP host unreachable message to source data if it can not forward a message due to no routing.

This command influences all ICMP destination unreachable messages.

**Configuration Examples** The following example disables sending ICMP destination unreachable message on FastEthernet 0/1.

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if)# no ip unreachable
```

## 1.17 show ip interface

Use this command to display the IP status information of an interface.

**show ip interface** [ *interface-type interface-number* | **brief** ]

| Parameter Description | Parameter               | Description                                                                                                                                     |
|-----------------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>interface-type</i>   | Specifies interface type.                                                                                                                       |
|                       | <i>interface-number</i> | Specifies interface number.                                                                                                                     |
|                       | <i>brief</i>            | Displays the brief configurations about the IP of the layer-3 interface (including the interface primary ip, secondary ip and interface status) |

**Defaults** N/A.

**Command Mode** Privileged EXEC mode.

**Usage Guide** When an interface is available, RGOS will create a direct route in the routing table. The interface is available in that the RGOS software can receive and send packets through this interface. If the interface changes from available status to unavailable status, the RGOS software removes the appropriate direct route from the routing table.

If the interface is unavailable, for example, two-way communication is allowed, the line protocol status will be shown as "UP". If only the physical line is available, the interface status will be shown as "UP".

The results shown may vary with the interface type, because some contents are the interface-specific options

**Configuration Examples** The following example displays the output of the **show ip interface brief** command.

```
Ruijie#show ip interface brief
Interface IP-Address(Pri) IP-Address(Sec) Status Protocol
GigabitEthernet 0/10 2.2.2.2/24 3.3.3.3/24 down down
```

```
GigabitEthernet 0/11 no address no address down down
VLAN 1 1.1.1.1/24 no address down down
```

Description of fields:

| Field    | Description                                                                                               |
|----------|-----------------------------------------------------------------------------------------------------------|
| Status   | Link status of an interface. The value can be <b>up</b> , <b>down</b> , or <b>administratively down</b> . |
| Protocol | IPv4 protocol status of an interface.                                                                     |

The following example displays the output of the **show ip interface vlan** command.

```
SwitchA#show ip interface vlan 1
VLAN 1
  IP interface state is: DOWN
  IP interface type is: BROADCAST
  IP interface MTU is: 1500
  IP address is:
  1.1.1.1/24 (primary)
  IP address negotiate is: OFF
  Forward direct-broadcast is: OFF
  ICMP mask reply is: ON
  Send ICMP redirect is: ON
  Send ICMP unreachable is: ON
  DHCP relay is: OFF
  Fast switch is: ON
  Help address is:
  Proxy ARP is: OFF
ARP packet input number: 0
  Request packet: 0
  Reply packet: 0
  Unknown packet: 0
TTL invalid packet number: 0
ICMP packet input number: 0
  Echo request: 0
Echo reply: 0
  Unreachable: 0
  Source quench: 0
  Routing redirect: 0
```

Description of fields in the results:

| Field                  | Description                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------|

## 1.18 show ip packet queue

Use this command to display the statistics of IP packet queues.

**show ip packet queue**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** N/A.

**Configuration** The following example displays the statistics of IP packet queues.

**Examples**

```
Ruijie#show ip packet queue
Receive 31925 packets(fragment=0):
  IP packet receive queue: length 0, max 1542, overflow 0.
  Receive 13 ICMP echo packets, 25 ICMP reply packets .
  Discards:
    Failed to alloc skb: 0.
    Receive queue overflow: 0.
    Unknow protocol drops: 0.
    ICMP rcv drops: 0. for skb check fail.
    ICMP rcv drops: 0. for skb is broadcast.
Sent packets:
  Success: 15644
  Generate 13 and send 8 ICMP reply packets, send 26 ICMP echo packets.
  It records 187 us as max time in ICMP reply process.
Failed to alloc ebuf: 0
  Dropped by EFMP: 0
  NoRoutes: 887
  Get vrf fails: 0
  Cannot assigned address drops: 0
  Failed to encapsulate ethernet head: 0
ICMP error queue: length 0, max 1542, overflow 0.
```

## 1.19 show ip packet statistics

Use this command to display the statistics of IP packets.

**show ip packet statistics** [ **total** | *interface-name* ]

| Parameter          | Parameter             | Description                                      |
|--------------------|-----------------------|--------------------------------------------------|
| <b>Description</b> | <i>interface-name</i> | Interface name                                   |
|                    | <i>total</i>          | Displays the total statistics of all interfaces. |

**Defaults** N/A.

**Command Mode** Privileged EXEC mode.

**Usage Guide** N/A.

**Configuration** The following example displays the output of this command.

### Examples

```
Ruijie# show ip packet statistics
Total
Received 1000 packets, 1000000 bytes
Unicast:1000,Multicast:0,Broadcast:0
Discards:0
HdrErrors:0 (BadChecksum:0,TTLExceeded:0,Others:0)
NoRoutes:0
Others:0
Sent 100 packets, 6000 bytes
Unicast:50,Multicast:50,Broadcast:0

VLAN 1
Received 1000 packets, 1000000 bytes
Unicast:1000,Multicast:0,Broadcast:0
Discards:0
HdrErrors:0 (BadChecksum:0,TTLExceeded:0,Others:0)
NoRoutes:0
Others:0

## 1.20 show ip pool

Use this command to display the IP address pool.

**show ip pool** [ *pool-name* ]

| Parameter          | Parameter        | Description                    |
|--------------------|------------------|--------------------------------|
| <b>Description</b> | <i>pool-name</i> | Specifies the IP address pool. |

**Defaults** N/A

**Command** Privileged EXEC mode

**Mode**

**Usage Guide** N/A

**Configuration** The following example displays all IP address ranges.

**Examples**

```
Ruijie# show ip pool
Ruijie(config)#show ip pool
Pool          Begin          End             Free   In use
default      1.1.1.1       1.1.1.1        1      0

## 1.21 show ip raw-socket

Use this command to display IPv4 raw sockets.

**show ip raw-socket [ num ]**

| Parameter   | Parameter  | Description |
|-------------|------------|-------------|
| Description | <i>num</i> | Protocol.   |

**Defaults** N/A.

**Command Mode** Privileged EXEC mode.

**Usage Guide** N/A.

**Configuration** The following example displays all IPv4 raw sockets.

**Examples**

```
Ruijie# show ip raw-socket
Number Protocol Process name
1 ICMP dhcp.elf
2 ICMP vrrp.elf
3 IGMP igmp.elf
4 VRRP vrrp.elf
Total: 4
```

**Description**

## 1.22 show ip sockets

Use this command to display all IPv4 sockets.

**show ip sockets**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A.      | N/A.        |

**Defaults** N/A.

**Command Mode** Privileged EXEC mode.

**Usage Guide** N/A.

**Configuration** The following displays all IPv4 sockets.

**Examples**

```
Ruijie# show ip sockets
Number Process name      Type      Protocol LocalIP:Port  ForeignIP:Port
State
1      dhcp.elf              RAW       ICMP       0.0.0.0:1     0.0.0.0:0
*
2      vrrp.elf              RAW       ICMP       0.0.0.0:1     0.0.0.0:0
*
3      igmp.elf              RAW       IGMP       0.0.0.0:2     0.0.0.0:0
*
4      vrrp.elf              RAW       VRRP       0.0.0.0:112   0.0.0.0:0
*
5      dhcpc.elf             DGRAM    UDP        0.0.0.0:68    0.0.0.0:0

## 1.23 show ip udp

Use this command to display IPv4 UDP sockets.

**show ip udp [ local-port num ]**

Use this command to display IPv4 UDP socket statistics.

**show ip udp statistics**

**Parameter  
Description**

| Parameter             | Description       |
|-----------------------|-------------------|
| <b>local-port num</b> | Local port number |

**Defaults**

N/A.

**Command Mode**

Privileged EXEC mode.

**Usage Guide**

N/A.

**Configuration**

The following example displays all IPv4 UDP sockets.

**Examples**

```
Ruijie# show ip udp
Number Local Address      Peer Address      Process name
1      0.0.0.0:68              0.0.0.0:0        dhcpc.elf
2      0.0.0.0:161             0.0.0.0:0        rg-snmpd
3      0.0.0.0:2000            0.0.0.0:0        wbav2
4      0.0.0.0:3333            0.0.0.0:0        vrrp_plus.elf
5      0.0.0.0:3503            0.0.0.0:0        mpls.elf
6      0.0.0.0:3799            0.0.0.0:0        rds_other_th
7      0.0.0.0:14800           0.0.0.0:0        rg-snmpd
```

## 2 ARP Commands

### 2.1 arp

Use this command to add a permanent IP address and MAC address mapping to the ARP cache table. Use the **no** form of this command to restore the default setting.

**arp** [ *vrf name* ] *ip-address* *MAC-address* *type*

**no arp** [ *vrf name* ] *ip-address*

| Parameter   | Parameter          | Description                                                                                                                                                             |
|-------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>vrf name</i>    | VRF instance. Set the <i>name</i> parameter to configure a name for the VRF instance.<br>By default, no VRF instance is specified. The configured static ARP is global. |
|             | <i>ip-address</i>  | The IP address that corresponds to the MAC address. It includes four parts of numeric values in decimal format separated by dots.                                       |
|             | <i>MAC-address</i> | 48-bit data link layer address                                                                                                                                          |
|             | <i>type</i>        | ARP encapsulation type. The keyword is arpa for the Ethernet interface.                                                                                                 |

**Defaults** There is no static mapping record in the ARP cache table by default.

**Command Mode** Global configuration mode.

**Usage Guide** RGOS finds the 48-bit MAC address according to the 32-bit IP address using the ARP cache table. Since most hosts support dynamic ARP resolution, usually static ARP mapping is not necessary. The **clear arp-cache** command can be used to delete the ARP mapping that is learned dynamically.

**Configuration Examples** The following example sets an ARP static mapping record for a host in the Ethernet.

```
Ruijie(config)# arp 1.1.1.1 4e54.3800.0002 arpa
```

| Related Commands | Command         | Description                |
|------------------|-----------------|----------------------------|
|                  | clear arp-cache | Clears the ARP cache table |

**Platform Description** N/A

### 2.2 arp-learning

Use this command to enable ARP learning. Use the **no** form of this command to disable this

function.

**arp-learning enable**

**no arp-learning enable**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** This function is enabled by default

**Command Mode** Interface configuration mode

**Usage Guide** After the device learns the dynamic ARP and turns it to the static ARP through Web, it is recommended to enable ARP learning. Otherwise, it is not recommended to enable this function. If this function is disabled with dynamic ARP existing, you can turn dynamic ARP to static ARP through Web. You can also clear the dynamic ARP using the clear arp command to deny the specified user's access to Internet. Otherwise, the dynamic ARP will be aged and then cleared. After this function is disabled, the AnyIP function and trust ARP detection are disabled.

**Configuration Examples** The following example enables ARP learning.

```
Ruijie(config)# interface gi 0/0
Ruijie(config-if-GigabitEthernet 0/0)# arp-learning enable
```

The following example disables ARP learning.

```
Ruijie(config)# interface gi 0/0
Ruijie(config-if-GigabitEthernet 0/0)# no arp-learning enable
```

**Platform Description** N/A

## 2.3 arp anti-ip-attack

Use this command to configure ARP anti-ip-attack. Use the **no** form of this command to restore the default setting.

**arp anti-ip-attack num**

**no arp anti-ip-attack**

| Parameter   | Parameter  | Description                                                                                                                                            |
|-------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>num</i> | The number of the IP message to trigger the ARP to discarded entry in the range from 0 to 100. 0 stands for disabling the arp anti-ip-attack function. |

**Defaults** By default, set the discarded entry after 3 unknown unicast messages are sent to the CPU.

**Command Mode** Global configuration mode.

**Usage Guide** For the messages corresponds to the directly-connected route, if the switch does not learn the ARP that corresponds to the destination IP address, it is not able to forward the message in hardware, and it needs to send the message to the CPU to resolve the address(that is the ARP learning). Sending large number of this message to the CPU will influence the other tasks of the switch. To prevent the IP messages from attacking the CPU, a discarded entry is set to the hardware during the address resolution, so that all sequential messages with that destination IP address are not sent to the CPU. After the address resolution, the entry is updated to the forwarding status, so that the switch could forward the message with that destination IP address in hardware.

In general, during the ARP request ,if the switch CPU receives three destination IP address messages corresponding to the ARP entry, it is considered to be possible to attack the CPU and the switch sets the discarded entry to prevent the unknown unicast message from attacking the CPU. User could set the *num* parameter of this command to decide whether it attacks the CPU in specific network environment or disable this function.

The arp anti-ip-attack function needs to occupy the switch hardware routing resources when attacked by the unknown unicast message. If there are enough resources, the **arp anti-ip-attack num** could be smaller. If not, in order to preferential ensure the use of the normal routing, the *num* could be larger or disable this function.

**Configuration Examples** The following example sets the IP message number that triggers to discard entry as 5.

```
Ruijie(config)# arp anti-ip-attack 5
```

The following example disables the ARP anti-ip-attack function.

```
Ruijie(config)# arp anti-ip-attack 0
```

**Platform Description** N/A

## 2.4 arp cache interface-limit

Use this command to set the maximum number of ARP learned on the interface.

Use the **no** form of this command to restore the default setting.

**arp cache interface-limit limit**

**no arp cache interface-limit**

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

| <b>Description</b>            | <i>limit</i>                                                                                                                                                                                                              | Sets the maximum number of ARP learned on the interface, including static and dynamic ARPs, in the range from 0 to the number supported on the interface. 0 indicates that the number is not limited. |             |     |     |  |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|-----|-----|--|
| <b>Defaults</b>               | The default is 0.                                                                                                                                                                                                         |                                                                                                                                                                                                       |             |     |     |  |
| <b>Command Mode</b>           | Interface configuration mode                                                                                                                                                                                              |                                                                                                                                                                                                       |             |     |     |  |
| <b>Usage Guide</b>            | This function can prevent ARP attacks from generating ARP entries to consume memory. <i>limit</i> must be no smaller than the number of ARPs learned on the interface. Otherwise, the configuration does not take effect. |                                                                                                                                                                                                       |             |     |     |  |
| <b>Configuration Examples</b> | The following example sets the maximum number of ARP learned on the interface to 300.                                                                                                                                     |                                                                                                                                                                                                       |             |     |     |  |
|                               | <pre>Ruijie(config)# interface gi 0/0 Ruijie(config-if-GigabitEthernet 0/0)# arp cache interface-limit 300</pre>                                                                                                          |                                                                                                                                                                                                       |             |     |     |  |
|                               | The following example restores the default setting.                                                                                                                                                                       |                                                                                                                                                                                                       |             |     |     |  |

| <b>Platform Description</b>   | N/A                                                                                                                                                                                                                       |                                                                                                                                                                                                       |             |     |     |  |

## 2.5 arp gratuitous-send interval

Use this command to set the interval of sending the free ARP request message on the interface. Use the **no** form of this command to restore the default setting.

**arp gratuitous-send interval** *seconds*

**no arp gratuitous-send**

| Parameter Description | Parameter      | Description                                                                                                |
|-----------------------|----------------|------------------------------------------------------------------------------------------------------------|
|                       | <i>seconds</i> | The time interval to send the free ARP request message in the range from 1 to 3600 in the unit of seconds. |
|                       | <i>number</i>  | The number of free ARP request message to be sent in the range from 1 to 100. The default value is 1.      |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode.

**Usage Guide** If an interface of the switch is used as the gateway of its downlink devices and counterfeit gateway behavior occurs in the downlink devices, you can configure to send the free ARP request message regularly on this interface to notify that the switch is the real gateway.

**Configuration Examples** The following example sets to send one free ARP request to SVI 1 per second.

```
Ruijie(config)# interface vlan 1
Ruijie(config-if)# arp gratuitous-send interval 1
```

The following example stops sending the free ARP request to SVI 1.

```
Ruijie(config)# interface vlan 1
Ruijie(config-if)# no arp gratuitous-send
```

**Description**

## 2.6 arp oob

Use this command to configure the static ARP on the management interface. Use the **no** form of this command to restore the default setting.

**arp oob** [ *mgmt.-name* ] *ip-address mac-address type*

**no arp oob** [ *mgmt.-name* ] *ip-address*

| Parameter          | Parameter          | Description                                                                                       |
|--------------------|--------------------|---------------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>ip-address</i>  | The IP address corresponding to the MAC address, written as four groups of dotted decimal values. |
|                    | <i>mac-address</i> | The data link layer address, composed of 48 bits.                                                 |
|                    | <i>type</i>        | The ARP encapsulation type. The key word for the Ethernet interface is <b>arpa</b> .              |
|                    | <i>mgmt.-name</i>  | Specifies the ARP-mapping management interface when there are multiple management interfaces.     |

**Defaults** No static ARP is configured by default.

**Command Mode** Global configuration mode

**Usage Guide** RGOS uses the ARP cache table to search for the 48-bit MAC address according to the 32-bit IP address.

Most hosts support dynamic ARP analysis, so static ARP mapping does not need to be configured. The `clear arp-cache oob` command is used to clear the ARP mapping learned by the management port dynamically.

If no management interface is specified, the static ARP is configured on the first management interface by default. If you specify the first management interface, the `mgmt-name` parameter is not displayed by running the `show run` command.

**Configuration** The following example configures a static ARP mapping record for the Ethernet host

**Examples**

```
Ruijie(config)# arp oob 1.1.1.1 4e54.3800.0002 arpa
```

## 2.7 arp proxy-resolved

Use this command to enable a device to judge the existence of the ARP entry corresponding to a destination IP address when the device responds to an ARP request as an ARP proxy. Use the `no` form of this command to disable this function.

**arp proxy-resolved**  
**no arp proxy-resolved**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command Mode** Global configuration mode

**Usage Guide** After the `arp proxy-resolved` command is configured, the active VRRP device first judges, upon receiving an ARP request, whether the ARP entry corresponding to the destination IP address exists. If yes, the active VRRP device acts as an ARP proxy. If no, the active VRRP device does not act as an ARP proxy. In addition, the gateway automatically requests the ARP entry corresponding to the destination IP address in broadcast mode. This prevents a case that the gateway fails to act as a proxy to respond to an ARP request of the destination IP address due to absence of the ARP entry corresponding to the destination IP address.

After the `no arp proxy-resolved` command is configured, if the proxy conditions are met, the active VRRP device directly acts as a proxy upon receiving an ARP request, with no need to judge whether the ARP entry corresponding to the destination IP address has been resolved.

**Configuration** The following example disables a device to judge the existence of the ARP entry corresponding to a destination IP address when the device responds to an ARP request as an ARP proxy.

**Examples**

```
Ruijie(config)# no arp proxy-resolved
```

**Description**

## 2.8 arp resolve vlan

Use this command to enable active sending of ARP resolution requests to a specific sub VLAN of a super VLAN. Use the **no** form of this command to disable the active sending of ARP resolution requests to a specific sub VLAN of a super VLAN. Use the **default** form of this command to restore the default settings.

**arp resolve vlan** {*vlan-list* | **none**}

**no arp resolve vlan** {*vlan-list* | **none**}

**default arp resolve vlan**

| Parameter          | Parameter        | Description                                                                                                 |
|--------------------|------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>vlan-list</i> | Sets the list of sub VLANs in a super VLAN, where ARP resolution requests are sent only to these sub VLANs. |
|                    | <b>none</b>      | Specifies that no ARP resolution request is sent to any sub VLAN of a super VLAN.                           |

**Defaults** This function is disabled by default.

**Command** Global configuration mode

**Mode**

**Usage Guide** By default, the device actively sends ARP resolution requests to the entire super VLAN by default. If many sub VLANs exist in a super VLAN, then a great number of packet replications are caused and therefore affect device performance.

Most terminals (such as PCs and servers) request ARP information from the gateway before accessing the network. Therefore, it is unnecessary to actively broadcast ARP resolution requests to the sub VLANs where these terminals reside. For dumb terminals that do not actively send free ARP requests, run the **arp resolve vlan** *vlan-list* command to actively send ARP resolution requests to VLANs in the specified VLAN list.

 After the **arp resolve vlan** *vlan-list* command is configured, ARP resolution requests are sent only to VLANs specified in the VLAN list. It should be particularly noted that if authentication-free VLANs are not included in the VLAN list specified in the **arp resolve vlan** command, ARP resolution requests are not broadcast to the authentication-free VLANs.

**Configuration** The following example enables active sending of ARP resolution requests from the device to VLANs 10–20 and VLANs 25–30.

**Examples**

```
Ruijie(config)# arp resolve vlan 10-20, 25-30
```

The following example disables active sending of ARP resolution requests from the device to VLANs 10–20.

```
Ruijie(config)# no arp resolve vlan 10-20
```

The following example configures the device not to actively send ARP resolution requests to any sub VLAN of a super VLAN.

```
Ruijie(config)# arp resolve vlan none
```

**Verification** Run the **show running-config** command to display configurations.

## 2.9 arp retry interval

Use this command to set the frequency for sending the arp request message locally, namely, the time interval between two continuous ARP requests sent for resolving one IP address. Use the **no** form of this command to restore the default setting.

**arp retry interval** *seconds*

**no arp retry interval**

| Parameter          | Parameter      | Description                                                                                         |
|--------------------|----------------|-----------------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>seconds</i> | Time for retransmitting the ARP request message in the range from 1 to 3600 in the unit of seconds. |

**Defaults** The default is 1.

**Command Mode** Global configuration mode.

**Usage Guide** The switch sends the ARP request message frequently, and thus causing problems like network busy. In this case, you can set the retry interval of the ARP request message longer. In general, it should not exceed the aging time of the dynamic ARP entry.

**Configuration** The following example sets the retry interval of the ARP request as 30 seconds.

**Examples**

```
Ruijie(config)# arp retry interval 30
```

| Related         | Command                | Description                                                |
|-----------------|------------------------|------------------------------------------------------------|
| <b>Commands</b> | <b>arp retry times</b> | Number of times for retransmitting an ARP request message. |

**Platform** N/A

**Description**

## 2.10 arp retry times

Use this command to set the local retry times of the ARP request message, namely, the times of sending the ARP request message to resolve one IP address. Use the **no** form of this command to restore the default setting.

**arp retry times** *number*

**no arp retry times**

| Parameter   | Parameter     | Description                                                                                                                                                                            |
|-------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>number</i> | The times of sending the same ARP request in the range from 1 to 100. When it is set as 1, it indicates that the ARP request is not retransmitted, only 1 ARP request message is sent. |

**Defaults** The default is 5.

**Command Mode** Global configuration mode.

**Usage Guide** The switch sends the ARP request message frequently, and thus causing problems like network busy. In this case, you can set the retry times of the ARP request smaller. In general, the retry times should not be set too large.

**Configuration Examples** The following example sets the local ARP request not to be retried.

```
Ruijie(config)# arp retry times 1
```

The following example sets the local ARP request to be retried for one time.

```
Ruijie(config)# arp retry times 2
```

| Related Commands | Command                   | Description                                        |

|                  | <b>arp retry interval</b> | Interval for retransmitting an ARP request message |

**Platform Description** N/A

## 2.11 arp suppress-auth-vlan-req

Use this command to disable the SVI interface from sending the ARP request to the authentication VLAN. Use the **no** form of this command to disable this function.

**arp suppress-auth-vlan-req**

**no arp suppress-auth-vlan-req**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command Mode** Interface configuration mode

**Usage Guide** In gateway authentication mode, all sub-VLANs of SuperVLAN are authentication VLANs by default. Users on authentication VLANs should pass the authentication before accessing the network. Static ARP table entries are generated on the device after users pass authentication. The device does not need to send ARP requests to the authentication VLAN when accessing these users. If the device accesses users on the authentication-exemption VLAN, it only needs to send ARP requests to the authentication-exemption VLAN.

In gateway authentication mode, the device enables suppression of ARP request sent to the authentication VLAN by default. If the device needs to access authentication-exemption users on the authentication VLAN, this function should be disabled.

**Configuration Examples** The following example disables VLAN 2 from sending the ARP request to the authentication VLAN.

```
Ruijie(config)# interface vlan 2
Ruijie(config-if-VLAN 2)# arp suppress-auth-vlan-req
```

| Related Commands | Command | Description |

**Platform Description** N/A

## 2.12 arp switch-over resolve

Use this command to enable active ARP resolution during active/standby switchovers in global configuration mode. Use the **no** form of this command to disable active ARP resolution during active/standby switchovers.

**arp switch-over resolve**  
**no arp switch-over resolve**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** Active ARP resolution during active/standby switchovers is disabled by default.

**Command Mode** Global configuration mode

**Default Level** 2

**Usage Guide** This command is used to quickly update ARP entries of the downlink device during VSU active/standby switchovers (especially when the downlink device is similar to a server with two NICs). When the standby host takes over the responsibilities of the active host, the new active host actively sends ARP resolution requests to a maximum of 1,000 terminals on a common SVI (not an interface in a super VLAN), to trigger the terminals to respond with ARP entries, thereby updating the ARP and MAC tables.

**Configuration** The following example enables active ARP resolution during active/standby switchovers.

**Examples**

```
Ruijie(config)# arp switch-over resolve
```

**Verification** Run the **show running-config** command to display configurations.

## 2.13 arp timeout

Use this command to configure the timeout for the ARP static mapping record in the ARP cache.

Use the **no** form of this command to restore the default setting.

**arp timeout** *seconds*

**no arp timeout**

| Parameter   | Parameter       | Description                                                           |
|-------------|-----------------|-----------------------------------------------------------------------|
| Description | <i>secondsv</i> | The timeout is in the range from 0 to 2147483 in the unit of seconds. |

**Defaults** The default is 3600.

**Command Mode** Interface configuration mode/Global configuration mode

**Usage Guide** The ARP timeout setting is only applicable to the IP address and the MAC address mapping that are learned dynamically. The shorter the timeout, the truer the mapping table saved in the ARP cache, but the more network bandwidth occupied by the ARP. Hence the advantages and disadvantages should be weighted. Generally it is not necessary to configure the ARP timeout unless there is a special requirement.

The ARP timeout configuration in interface configuration mode prevail over that in global configuration mode.

**Configuration Examples** The following example sets the timeout for the dynamic ARP mapping record that is learned dynamically from FastEthernet port 0/1 to 120 seconds.

```
Ruijie(config)# interface fastEthernet 0/1
```

```
Ruijie(config-if-GigabitEthernet 0/1)# arp timeout 120
```

The following example sets the ARP timeout to 3000 seconds in global configuration mode.

```
Ruijie(config)# arp timeout 3000
```

**Description**

## 2.14 arp trusted

Use this command to set the maximum number of trusted ARP entries. Use the **no** form of this command to restore the default setting.

**arp trusted** *number*  
**no arp trusted**

| Parameter<br>Description | Parameter     | Description                                                                                    |
|--------------------------|---------------|------------------------------------------------------------------------------------------------|
|                          | <i>number</i> | Maximum number of trusted ARP entries. It ranges from 10 to the maximum ARP volum minus 1,024. |

**Defaults** N/A

**Command Mode** Global configuration mode.

**Usage Guide** To make this command valid, enable the trusted ARP function firstly. The trusted ARP entries and other entries share the memory. Too much trusted ARP entries may lead to insufficient ARP entry space. In general, you should set the maximum number of trusted ARP entries according to your real requirements.

**Configuration Examples** The following example sets 1000 trusted ARPs.

```
Ruijie(config)# arp trusted 1000
```

| <b>Usage Guide</b>            | The egress gateway trusted ARP is different from GSN trusted ARP. With this function enabled, the device sends a unicast request for confirmation when learning an ARP table entry. The device learns the ARP table entry after receiving the response. When the device receives the ARP packet, only if the ARP table entry is aged or incomplete and the ARP packet is a response packet will the packet be handled. After egress gateway trusted ARP is enabled, the aging time of the ARP table entry turns to 60 seconds. After this function is disabled, the aging time restores to 3600 seconds. |                    |
| <b>Configuration Examples</b> | The following example enables egress gateway trusted ARP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                    |
|                               | <pre>Ruijie(config)# interface gi 0/0 Ruijie(config-if-GigabitEthernet 0/0)# arp trust-monitor enable</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                    |
|                               | The following example disables egress gateway trusted ARP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                    |

| <b>Description</b>  | N/A                                   | N/A                |
| <b>Defaults</b>     | This function is disabled by default. |                    |
| <b>Command Mode</b> | Global configuration mode.            |                    |

**Usage Guide** Use this command to set trusted ARP aging. Aging time is the same as dynamic ARP aging time. Use the **arp timeout** command to set aging time in interface mode.

**Configuration** The following example enables trusted ARP aging.

**Examples**

```
Ruijie(config)# arp trusted aging
```

| Related Commands | Command                   | Description                   |

**Description**

## 2.17 arp trusted user-vlan

Use this command to execute the VLAN transformation while setting the trusted ARP entries. Use the **no** form of this command to restore the default setting.

**arp trusted user-vlan** *vid1* **translated-vlan** *vid2*

**no arp trusted user-vlan** *vid1*

| Parameter          | Parameter   | Description                   |
|--------------------|-------------|-------------------------------|
| <b>Description</b> | <i>vid1</i> | VID set by the server.        |
|                    | <i>vid2</i> | VID after the transformation. |

**Defaults** This function is disabled by default.

**Command Mode** Global configuration mode.

**Usage Guide** In order to validate this command, enable the trusted ARP function first. This command is needed only when the VLAN sent by the server is different from the VLAN which takes effect in the trusted ARP entry.

**Configuration Examples** The following example sets the VLAN sent by the server to 3, but the VLAN which takes effect in the trusted ARP entry to 5.

```
Ruijie(config)# arp trusted user-vlan 3 translated-vlan 5
```

| Related Commands | Command                   | Description                       |
|------------------|---------------------------|-----------------------------------|
|                  | <b>service trustedarp</b> | Enables the trusted ARP function. |

**Platform** N/A

**Description**

## 2.18 arp unresolve

Use this command to set the maximum number of the unresolved ARP entries. Use **no** form of this command to restore the default setting.

**arp unresolve** *number*

**no arp unresolve**

| Parameter   | Parameter     | Description                                                                                                         |
|-------------|---------------|---------------------------------------------------------------------------------------------------------------------|
| Description | <i>number</i> | The maximum number of the unresolved ARP entries in the range from 1 to the ARP table size supported by the device. |

**Defaults** The default is the ARP table size supported by the device.

**Command** Global configuration mode.

**Mode**

**Usage Guide** If there are a large number of unresolved entries in the ARP cache table and they do not disappear after a period of time, this command can be used to limit the quantity of the unresolved entries.

**Configuration** The following example sets the maximum number of the unresolved items to 500.

**Examples**

```
Ruijie(config)# arp unresolve 500
```

**Description**

## 2.19 clear arp-cache

Use this command to remove a dynamic ARP mapping record from the ARP cache table and clear an IP route cache table.

**clear arp-cache** [ **vrf** *vrf\_name* | **trusted** ] [ *ip [mask]* ] | **interface** *interface-name* ]

| Parameter   | Parameter                  | Description                                                                                                                                                                                  |
|-------------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>trusted</i>             | Deletes trusted ARP entries. Dynamic ARP entries are deleted by default.                                                                                                                     |
|             | <b>vrf</b> <i>vrf_name</i> | Deletes dynamic ARP entries of the specified VRF instance. The default is the public instance.                                                                                               |
|             | <i>ip</i>                  | Deletes ARP entries of the specified IP address. If <i>trusted</i> value is specified, trusted ARP entries are deleted; otherwise, all dynamic ARP entries are deleted which is the default. |

|                                        |                                                                                                                                                                                                                                                          |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>mask</i>                            | Deletes ARP entries in a subnet mask. If <i>trusted</i> value is specified, trusted ARP entries in the subnet mask are deleted; otherwise, all dynamic ARP entries are deleted. The dynamic ARP entry specified by the IP address is deleted by default. |
| <b>interface</b> <i>interface-name</i> | Deletes dynamic ARP entries on the specified interface. Dynamic ARP entries are deleted on all interfaces by default.                                                                                                                                    |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command can be used to refresh an ARP cache table.

On a NFPP-based (Network Foundation Protection Policy) device, it receives one ARP packet for every mac/ip address per second by default. If the interval of two **clear arp** times is within 1s, the second response packet will be filtered and the ARP packet will not be resolved for a short time.

**Configuration Examples** The following example deletes all dynamic ARP mapping records.

```
Ruijie# clear arp-cache
```

The following deletes the dynamic ARP entry 1.1.1.1.

```
Ruijie# clear arp-cache 1.1.1.1
```

The following example deletes the dynamic ARP entry on interface SVI1.

```
Ruijie# clear arp-cache interface Vlan 1
```

| Related Commands | Command    | Description                                          |
|------------------|------------|------------------------------------------------------|
|                  | <b>arp</b> | Adds a static mapping record to the ARP cache table. |

**Platform Description** N/A

## 2.20 clear arp-cache oob

Use this command to clear dynamic ARP mapping records.

**clear arp-cache oob** [*ip* [*mask*]]

| Parameter Description | Parameter   | Description                                                                                                                                                     |
|-----------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>ip</i>   | Clears the ARP table entry of the specified IP address. All dynamic ARP table entries are cleared by default.                                                   |
|                       | <i>mask</i> | Clears the ARP table entry within the specified subnet. The dynamic ARP table entry of the specified IP address (the previous parameter) is cleared by default. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** On a device supporting Network Foundation Protection Policy (NFPP), every MAC / IP address receives an ARP packet per second by default. If the **clear arp oob** command is run twice within one second, the second response packet may be filtered, causing ARP uanalysis for a short time.

**Configuration Examples** The following example clears the cache table of dynamic ARP mapping records.

```
Ruijie# clear arp-cache oob
```

The following example clears dynamic ARP table entry 1.1.1.1.

```
Ruijie# clear arp-cache oob 1.1.1.1
```

The following example clears the dynamic ARP table entry within the specified subnet.

```
Ruijie# clear arp-cache oob 1.0.0.0 255.0.0.0
```

**Related Commands**

**Platform Description** N/A

## 2.21 ip proxy-arp

Use this command to enable ARP proxy function on the interface. Use the **no** form of this command to restore the default setting.

**ip proxy-arp**

**no ip proxy-arp**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** N/A

**Command Mode** Interface configuration mode.

**Usage Guide** Proxy ARP helps those hosts without routing message obtain MAC address of other networks or subnet IP address. For example, a device receives an ARP request. The IP addresses of request sender and receiver are in different networks. However, the device that knows the routing of IP address of request receiver sends ARP response, which is Ethernet MAC address of the device itself.

**Configuration** The following example enables ARP on FastEthernet port 0/1.

**Examples**

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if)# ip proxy-arp
```

## 2.22 local-proxy-arp

Use this command to enable local proxy ARP on the SVI interface. Use the **no** form of this command to restore the default setting.

**local-proxy-arp****no local-proxy-arp****Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

N/A

**Command  
Mode**

Interface configuration mode

**Usage Guide**

With local proxy ARP enabled, the device helps a host to obtain MAC addresses of other hosts on the subnet. If the device enables switchport protected, users on different ports are segregated on layer 2. After local proxy ARP is enabled, the device serves as a proxy to send a response after receiving an ARP request. The ARP response contains a MAC address which is the device's Ethernet MAC address, realizing communication between different hosts through L3 routes.

**Configuration**

The following example enables local proxy ARP on VLAN1.

**Examples**

```
Ruijie(config)# interface vlan 1
Ruijie(config-if-VLAN 1)# local-proxy-arp
```

**Description**

## 2.23 service trustedarp

Use this command to enable the trusted ARP function. Use the **no** form of this command to restore

the default setting.

**service trustedarp**

**no service trustedarp**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Global configuration mode

**Usage Guide** The trusted ARP function of the device is to prevent the ARP fraud function. As a part of the GSN scheme, it should be used together with the GSN scheme.

**Configuration Examples** The following example enables the trusted ARP function in global configuration mode.

```
Ruijie(config)# service trustedarp
```

2 static arp entries exist.
```

The meaning of each field in the ARP cache table is described as below:

Table 1 Fields in the ARP cache table

| Field     | Description                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Protocol  | Protocol of the network address, always to be Internet                                                                                  |
| Address   | IP address corresponding to the hardware address                                                                                        |
| Age (min) | Age of the ARP cache record, in minutes; If it is not locally or statically configured, the value of the field is represented with “-”. |
| Hardware  | Hardware address corresponding to the IP address                                                                                        |
| Type      | Hardware address type, ARPA for all Ethernet addresses                                                                                  |
| Interface | Interface associated with the IP addresses                                                                                              |
| Origin    | Origin of static ARP entries.                                                                                                           |

**Description**

## 2.26 show arp detail

Use this command to display the details of the Address Resolution Protocol (ARP) cache table.

**show arp detail** [ *interface-type interface-number* | **trusted** [ *ip [ mask ]* ] | [ **vrf vrf-name** ] [ *ip [ mask ]* ] | *mac-address* | **static** | **complete** | **incomplete** ] | **subvlan** { *subvlan-number* | **min-max min\_value max\_value** ]

**Parameter  
Description**

| Parameter                              | Description                                                                                |
|----------------------------------------|--------------------------------------------------------------------------------------------|
| <i>interface-type interface-number</i> | Displays the ARP of the layer 2 port or the layer 3 interface.                             |
| <b>vrf vrf_name</b>                    | VRF instance, which Displays the ARP entry with specified VRF.                             |
| <i>trusted</i>                         | Displays the trusted ARP entries. Currently, only the global VRF supports the trusted ARP. |
| <i>ip</i>                              | Displays the ARP entry of the specified IP address.                                        |
| <i>ip mask</i>                         | Displays the ARP entries of the network segment included within the mask.                  |
| <i>mac-address</i>                     | Displays the ARP entry of the specified MAC address.                                       |
| <i>static</i>                          | Displays all the static ARP entries.                                                       |
| <i>complete</i>                        | Displays all the resolved dynamic ARP entries.                                             |
| <i>incomplete</i>                      | Displays all the unresolved dynamic ARP entries.                                           |
| <b>subvlan</b>                         | Displays the ARP entries of the specified subvlan                                          |
| <i>subvlan-number</i>                  | Subvlan ID                                                                                 |
| <b>min-max</b>                         | Displays the minimum and maximum subvlan ID                                                |
| <i>min_value</i>                       | Minimum subvlan ID                                                                         |
| <i>max_value</i> ]                     | Maximum subvlan ID.                                                                        |

**Defaults**

N/A

**Command**

Privileged EXEC mode

**Mode**

**Usage Guide** Use this command to display the ARP details, such as the ARP type (Dynamic, Static, Local, Trust), the information on the layer2 port.

If you enter a *min\_value* greater than *max\_value*, no error message is prompted. Instead, ARP entries corresponding to the subvlan are displayed.

**Configuration** The following example displays the output result of the **show arp detail** command:

**Examples**

```
Ruijie# show arp detail
IP Address      MAC Address      Type      Age (min)  Interface  Port
SubVlan
20.1.1.2        0020.0101.0002   Static    --         Te2/5      --
20.1.1.1        00d0.f822.33bb   Local     --         Te2/5      --
1.1.1.2         00d0.1111.1112   Dynamic   1          V12        Te2/1      4
1.1.1.1         00d0.f822.33bb   Local     --         V12        --
```

The following example displays arp details including InnerVLAN on products supporting QinQ termination:

```
Ruijie# show arp detail
IP Address      MAC Address      Type      Age (min)  Interface  Port
SubVlan  InnerVlan
20.1.1.2        0020.0101.0002   Static    --         Te2/5      --
20.1.1.1        00d0.f822.33bb   Local     --         Te2/5      --
1.1.1.2         00d0.1111.1112   Dynamic   1          V12        Te2/1      4
300
1.1.1.1         00d0.f822.33bb   Local     --         V12        --
```

The meaning of each field in the ARP cache table is described as below:

Table 1 Fields in the ARP cache table

| Field       | Description                                                   |
|-------------|---------------------------------------------------------------|
| IP Address  | IP address corresponding to the hardware address              |
| MAC Address | hardware address corresponding to the IP address              |
| Age (min)   | Age of the ARP learning, in minutes                           |
| Port        | Layer2 port associated with the ARP                           |
| Type        | ARP type, includes the Static, Dynamic, Trust, Local          |
| Interface   | Layer 3 interface associated with the IP addresses            |
| SubVLAN     | SubVLAN corresponding to the ARP entries                      |
| InnerVLAN   | InnerVLAN or CE-VLAN corresponding to the ARP entries         |
| Subvni      | Vni corresponding to the ARP entries, namely ID of the VxLAN. |

|          |                                                                                                                           |
|----------|---------------------------------------------------------------------------------------------------------------------------|
| Location | Local: ARP entries are generated or learned on the local device.<br>Remote: ARP entries are synced from a remote gateway. |
|----------|---------------------------------------------------------------------------------------------------------------------------|

**Description**

## 2.27 show arp oob

Use this command to display the ARP cache table.

**show arp oob** [ *ip* [ *mask* ] | **static** | **complete** | **incomplete** | *mac-address* ]

| Parameter Description | Parameter          | Description                                              |
|-----------------------|--------------------|----------------------------------------------------------|
|                       | <i>ip</i>          | Displays ARP table entries of the specified IP address.  |
|                       | <i>mask</i>        | Displays ARP table entries within the IP subnet.         |
|                       | <b>static</b>      | Displays all static ARP table entries.                   |
|                       | <b>complete</b>    | Displays all analyzed ARP table entries.                 |
|                       | <b>incomplete</b>  | Displays all unanalyzed ARP table entries.               |
|                       | <i>mac-address</i> | Displays ARP table entries of the specified MAC address. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command is used to display the ARP cache table. The **complete** / **incomplete** key word represents analyzed / unanalyzed ARP table entries.

**Configuration Examples** The following example displays the outcome of the running the **show arp oob** command.

```
Ruijie# show arp oob
Total Numbers of Arp: 7
Protocol Address      Age (min)  Hardware      Type  Interface
Internet 192.168.195.68  0          0013.20a5.7a5f arpa  mgmt 0
Internet 192.168.195.67  0          001a.a0b5.378d arpa  mgmt 0
Internet 192.168.195.65  0          0018.8b7b.713e arpa  mgmt 0
Internet 192.168.195.64  0          0018.8b7b.9106 arpa  mgmt 0
Internet 192.168.195.63  0          001a.a0b5.3990 arpa  mgmt 0
Internet 192.168.195.62  0          001a.a0b5.0b25 arpa  mgmt 0
Internet 192.168.195.5   --         00d0.f822.33b1 arpa  mgmt 0
```

The following example displays the outcome of running the **show arp oob 192.168.195.68** command.

```
Ruijie# show arp oob 192.168.195.68
Protocol Address           Age(min)  Hardware           Type  Interface
Internet 192.168.195.68  1         0013.20a5.7a5f  arpa  mgmt 0
```

The following example displays the outcome of running the **show arp oob 192.168.195.0 255.255.255.0**.

```
Ruijie# show arp 192.168.195.0 255.255.255.0
Protocol Address           Age(min)  Hardware           Type  Interface
Internet 192.168.195.64  0         0018.8b7b.9106  arpa  mgmt 0

Internet 192.168.195.51  1         0018.8b82.8691  arpa  mgmt 0
```

The following example displays the outcome of running the **show arp oob 001a.a0b5.378d** command.

```
Ruijie# show arp 001a.a0b5.378d
Protocol Address           Age(min)  Hardware           Type  Interface
Internet 192.168.195.67  4         001a.a0b5.378d  arpa  mgmt 0
```

| Field     | Description                                                                                                                                                                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol  | Only "Internet" is available at present, which indicates the IP protocol.                                                                                                                                                                                                          |
| Address   | The IPv4 address.                                                                                                                                                                                                                                                                  |
| Age(min)  | The age of the table entry. For the local IP address, the field is displayed as '-'. For the static table entry, the field is displayed as <static>. For the dynamic table entry, the field indicates the time for which the table entry has been learned, in the unit of minutes. |
| Hardware  | 48-bit MAC address, written as a dotted triple of four-digit hexadecimal numbers.                                                                                                                                                                                                  |
| Type      | Only "arpa" is available at present.                                                                                                                                                                                                                                               |
| Interface | The L3 interface corresponding to the ARP table entry. The field is NULL for static ARP table entries for the IP address of the static ARP is not within any network segment directly connected with the device.                                                                   |

## 2.28 show arp packet statistics

Use this command to display the statistics of ARP packets.

**show arp packet statistics** [ *interface-name* ]

| Parameter          | Parameter             | Description                                                        |
|--------------------|-----------------------|--------------------------------------------------------------------|
| <b>Description</b> | <i>interface-name</i> | Displays the statistics of ARP packets on the specified interface. |

**Defaults** N/A.

**Command Mode** Privileged EXEC mode.

**Usage Guide** N/A.

**Configuration Examples** The following example displays the output information of the command.

```
Ruijie#show arp packet statistics
Interface          Received Requests  Received Replies  Received Others  Sent Requests  Sent Replies  Sent Others
Name              R
-----
GigabitEthernet 0/0  0      0      0      0      0
GigabitEthernet 0/1 143649 232    0      2      0
GigabitEthernet 0/2  0      0      0      0      0
GigabitEthernet 0/3  0      0      0      0      0
GigabitEthernet 0/4  0      0      0      0      0
GigabitEthernet 0/5  0      0      0      0      0
GigabitEthernet 0/6  0      0      0      0      0
Loopback 1        0      0      0      0      0
```

Description of fields:

| Field             | description                              |
|-------------------|------------------------------------------|
| Received Requests | Number of received ARP requests          |
| Received Replies  | Number of received ARP response messages |
| Received Others   | Number of other received ARP packets     |
| Sent Requests     | Number of sent ARP requests              |
| Sent Replies      | Number of sent ARP requests              |

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A.    | N/A.        |

**Platform Description** N/A

## 2.29 show arp timeout

Use this command to display the aging time of a dynamic ARP entry on the interface.

**show arp timeout**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A.      | N/A.        |

**Defaults** N/A.

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A.

**Configuration Examples** The following example displays the output of the **show arp timeout** command:

```
Ruijie# show arp timeout
Interface arp timeout(sec)
-----
VLAN 1 3600
```

The meaning of each field in the ARP cache table is described in Table 1.

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A.    | N/A.        |

**Platform Description** N/A

## 2.30 show ip arp

Use this command to display the Address Resolution Protocol (ARP) cache table.

**show ip arp [vrf vrf-name]**

| Parameter   | Parameter       | Description   |
|-------------|-----------------|---------------|
| Description | <i>vrf-name</i> | VRF instance. |

**Defaults** N/A.

**Command Mode** Privileged EXEC mode.

**Usage Guide** N/A.

**Configuration** The following example displays the output of **show ip arp**:

**Examples**

```
Ruijie# show ip arp
Protocol Address Age(min) Hardware Type Interface
Internet 192.168.7.233 23 0007.e9d9.0488 ARPA FastEthernet 0/0
Internet 192.168.7.112 10 0050.eb08.6617 ARPA FastEthernet 0/0
Internet 192.168.7.79 12 00d0.f808.3d5c ARPA FastEthernet 0/0
Internet 192.168.7.1 50 00d0.f84e.1c7f ARPA FastEthernet 0/0
Internet 192.168.7.215 36 00d0.f80d.1090 ARPA FastEthernet 0/0
Internet 192.168.7.127 0 0060.97bd.ebee ARPA FastEthernet 0/0
Internet 192.168.7.195 57 0060.97bd.ef2d ARPA FastEthernet 0/0
Internet 192.168.7.183 -- 00d0.f8fb.108b ARPA FastEthernet 0/0
```

The following example displays the output of **show ip arp vrf vpnv4**.

```
Ruijie#show ip arp vrf vpnv4
Protocol Address Age(min) Hardware Type Interface
Internet 11.1.1.1 0 78e3.b5b6.f4dc arpa GigabitEthernet
0/0
Internet 11.1.1.2 -- 1111.2222.1111 arpa GigabitEthernet
0/0
Total number of ARP entries: 2
```

Each field in the ARP cache table has the following meanings:

| Field     | Description                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Protocol  | Network address protocol, always Internet.                                                                                              |
| Address   | The IP address corresponding to the hardware address.                                                                                   |
| Age (min) | Age of the ARP cache record, in minutes; If it is not locally or statically configured, the value of the field is represented with "-". |
| Hardware  | Hardware address corresponding to the IP address                                                                                        |
| Type      | The type of hardware address. The value is ARPA for all Ethernet addresses.                                                             |
| Interface | Interface associated with the IP address.                                                                                               |

## 3 IPv6 Commands

### 3.1 clear ipv6 neighbors

Use this command to clear the dynamic IPv6 neighbors.

**clear ipv6 neighbors** [ **vrf** *vrf-name* ] [ **oob** ] [*interface-id*]

| Parameter   | Parameter           | Description                                                                              |
|-------------|---------------------|------------------------------------------------------------------------------------------|
| Description | <i>vrf-name</i>     | VRF name. All global IPv6 neighbors are cleared without specified VRF name by default.   |
|             | <b>oob</b>          | Clears the dynamic IPv6 neighbors discovered by neighbors on MGMT interface.             |
|             | <i>interface-id</i> | Interface name. Clear the dynamically learned IPv6 neighbors on the specified interface. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** This command does not clear all the dynamic neighbors on authentication VLAN. Note that the static neighbors will not be cleared.

**Configuration** The following example clears the dynamic IPv6 neighbors.

**Examples** Ruijie# clear ipv6 neighbors

The following example clears all dynamic neighbors on the MGMT port.

Ruijie# clear ipv6 neighbors oob

The following example clears all dynamic neighbors on the interface gigabitEthernet 0/1.

Ruijie# clear ipv6 neighbors gigabitEthernet 0/1

**Platform Description** N/A

## 3.2 ipv6 address

Use this command to configure an IPv6 address for a network interface. Use the **no** form of this command to restore the default setting.

**ipv6 address** *ipv6-address/prefix-length*

**ipv6 address** *ipv6-prefix/prefix-length eui-64*

**ipv6 address** *prefix-name sub-bits/prefix-length [ eui-64 ]*

**no ipv6 address**

**no ipv6 address** *ipv6-address/prefix-length*

**no ipv6 address** *ipv6-prefix/prefix-length eui-64*

**no ipv6 address** *prefix-name sub-bits/prefix-length [ eui-64 ]*

| Parameter          | Parameter            | Description                                                                                                                                                                     |
|--------------------|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>ipv6-prefix</i>   | IPv6 address prefix in the format defined in RFC4291. The address shall be in hex; the fields in the address shall be separated by comma, and each field shall contain 16 bits. |
|                    | <i>ipv6-address</i>  | IPv6 address in the format defined in RFC4291. The address shall be in hex; the fields in the address shall be separated by comma, and each field shall contain 16 bits.        |
|                    | <i>prefix-length</i> | Length of the IPv6 prefix, the network address of the IPv6 address.<br>Note: The prefix length range of the IPv6 address of the interface of S86 is 0 to 64 or 128 to 128.      |
|                    | <i>prefix-name</i>   | The general prefix name. Use the specified general prefix to generate the interface address.                                                                                    |
|                    | <i>sub-bits</i>      | The value of the sub-prefix bit and the host bit generates the interface address combining with the general prefix. The value shall be in the format defined in the RFC4291.    |
|                    | <b>eui-64</b>        | The generated IPV6 address consists of the address prefix and the 64 bit interface ID                                                                                           |

**Defaults** N/A

**Command** Interface configuration mode

**Mode**

**Usage Guide** When an IPv6 interface is created and the link status is UP, the system will automatically generate a local IP address for the interface.

The IPv6 address could also be generated using the general prefix. That is, the IPv6 address consists of the general prefix and the sub-prefix and the host bit. The general prefix could be configured using the **ipv6 general-prefix** command or may be learned through the DHCPv6 agent PD (Prefix Discovery) function (please refer to the *DHCPv6 Configuration*). Use the *sub-bits/prefix-length* parameter of this command to configure the sub-prefix and the host bit.

If no deleted address is specified when using **no ipv6 address**, all the manually configured

addresses will be deleted.

The **no ipv6 address** *ipv6-prefix/prefix-length eui-64* command can be used to delete the addresses configured with **ipv6 address** *ipv6-prefix/prefix-length eui-64*.

**Configuration** The following example configures an IPv6 address for the interface GigabitEthernet 0/1.

**Examples**

```
Ruijie(config-if)# ipv6 address 2001:1::1/64
Ruijie(config-if)# no ipv6 address 2001:1::1/64
Ruijie(config-if)# ipv6 address 2002:1::1/64 eui-64
Ruijie(config-if)# no ipv6 address 2002:1::1/64 eui-64
```

The following example applies general prefix to configure an IPv6 address for the interface GigabitEthernet 0/1.

```
Ruijie(config-if-GigabitEthernet 0/1)# ipv6 address my-prefix
0:0:0:7272::72/64
```

 If the prefix 2001:1111:2222::/48 is configured under the general prefix name *my-prefix*, then the generated IPv6 address of the interface is 2001:1111:2222:7272::72/64.

**Description**

### 3.3 ipv6 address autoconfig

Use this command to automatically configure an IPv6 stateless address for a network interface. Use the **no** form of this command to restore the default setting.

**ipv6 address autoconfig [ default ]**  
**no ipv6 address autoconfig**

| Parameter          | Parameter      | Description                                                                                                                                                                     |
|--------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <b>default</b> | (Optional) If this keyword is configured, a default routing is generated. Note that only one layer3 interface on the entire device is allowed to use the <b>default</b> keyword |

**Defaults** N/A

**Command Mode** Interface configuration mode

**Usage Guide** The stateless automatic address configuration is that when receiving the RA (Route Advertisement) message, the device could use the prefix information of the RA message to automatically generate the EUI-64 interface address.  
 If the RA message contains the flag of the “other configurations”, the interface will obtain these “other

configurations” through the DHCPv6. The “other configurations” usually means the IPv6 address of the DNS server, the IPv6 address of the NTP server, etc.

Use the **no ipv6 address autoconfig** command to delete the IPv6 address.

**Configuration Examples** The following example automatically configures an IPv6 stateless address for a network interface and generates a default route.

```
Ruijie(config-if-GigabitEthernet 0/1)# ipv6 address autoconfig default
```

The following example resotres the default setting.

```
Ruijie(config-if-GigabitEthernet 0/1)# no ipv6 address autoconfig
```

**Related Commands**

|----------------------------------------------------------|---------------------------------------------------------|
| <b>ipv6 address ipv6-prefix/prefix-length [ eui-64 ]</b> | Configures the IPv6 address for the interface manually. |

**Platform Description** N/A

### 3.4 ipv6 icmp error-interval

Use this command to set the frequency with which ICMPv6-oversize error packets are sent. Use the **no** form of this command to restore the default setting.

```
ipv6 icmp error-interval too-big milliseconds [ bucket-size ]
```

```
no ipv6 icmp error-interval too-big milliseconds [ bucket-size ]
```

Use this command to set the frequency with which other ICMPv6 error packets are sent. Use the **no** form of this command to restore the default setting.

```
ipv6 icmp error-interval milliseconds [ bucket-size ]
```

```
no ipv6 icmp error-interval milliseconds [ bucket-size ]
```

**Parameter Description**

| Parameter           | Description                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>milliseconds</i> | Sets the refresh interval of the token bucket, in the range from 0 to 2147483647 in the unit of seconds. Setting the value to 0 indicates that the frequency with which ICMPv6 error packets are sent is not fixed. |
| <i>bucket-size</i>  | Sets the number of tokens in the token bucket, in the range from 1 to 200.                                                                                                                                          |

**Defaults** The default *milliseconds* is 100 and *bucket-size* is 10.

**Command Mode** Global configuration mode

**Usage Guide** The token bucket algorithm is adopted to set the frequency with which ICMPv6 error packets are sent

so as to prevent Denial of Service (DoS) attack,  
 If the forwarded IPv6 packet is greater than the egress IPv6 MTU in size, the router discards the IPv6 packet and sends the ICMPv6-oversize error packet to the source IPv6 address. This kind of ICMPv6 error packet is used for IPv6 path MTU discovery. If there are too many ICMPv6 error packets, the ICMPv6-oversize error packet may not be sent, causing IPv6 path MTU discovery failure. Therefore, it is recommended to set the frequency of ICMPv6-oversize error packet and other ICMPv6 error packet respectively. Note that ICMPv6 redirect packet is not an ICMPv6 error packet and Ruijie sets the frequency of the ICMPv6 redirect packet the same as that of other ICMPv6 error packet.  
 For the timer is accurate to 10 milliseconds, it is recommended to set the refresh interval of the token bucket to an integer multiple of 10 milliseconds. If the refresh interval is not an integer multiple of 10 milliseconds, it is converted automatically. For example, the frequency of 1 per five milliseconds turns out to be 2 per 10 milliseconds; the frequency of 3 per 15 milliseconds is converted to 2 per 10 milliseconds.

**Configuration Examples** The following example sets the frequency with which ICMPv6-oversize error packets are sent to 100 per second.

```
Ruijie(config)# ipv6 icmp error-interval too-big 1000 100
```

The following example sets the frequency with which other ICMPv6 error packets are sent to 10 per second.

```
Ruijie(config)# ipv6 icmp error-interval 1000 10
```

### 3.5 ipv6 enable

Use this command to enable the IPv6 function on an interface. Use the **no** form of this command to restore the default setting.

**ipv6 enable**  
**no ipv6 enable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode

**Usage Guide** The IPv6 function of an interface can be enabled by configuring **ipv6 enable** or by configuring IPv6

address for the interface.

- i** If an IPv6 address is configured for the interface, the IPv6 function will be enabled automatically on the interface and cannot be disabled with **no ipv6 enable**.

**Configuration** The following example enables the IPv6 function on the interface GigabitEthernet 0/1.

**Examples**

```
Ruijie(config-if-GigabitEthernet 0/1)# ipv6 enable
```

| Related         | Command                    | Description                                       |

**Description**

### 3.6 Ipv6 gateway

Use this command to configure the default gateway IPv6 address on the management port.

**ipv6 gateway *ipv6-address***

| Parameter          | Parameter           | Description                                  |
|--------------------|---------------------|----------------------------------------------|
| <b>Description</b> | <i>ipv6-address</i> | Configures the default gateway IPv6 address. |

**Defaults** N/A

**Command Mode** Interface configuration mode

**Usage Guide** The management port is MGMT in type and 0 in ID.

**Configuration** The following example configures the default gateway IPv6 address on the management port.

**Examples**

```
Ruijie(config)# interface mgmt 0
Ruijie(config-int)# ipv6 gateway 2001:1::1
Ruijie(config-int)# exit
Ruijie(config)#
```

| Related         | Command | Description |

| <b>Commands</b> | N/A     | N/A         |

**Platform** N/A

**Description**

### 3.7 ipv6 general-prefix

Use this command to configure the IPv6 general prefix in the global configuration mode.

**ipv6 general-prefix** *prefix-name* *ipv6-prefix/prefix-length*

**no ipv6 general-prefix** *prefix-name* *ipv6-prefix/prefix-length*

| Parameter   | Parameter            | Description                                                                             |
|-------------|----------------------|-----------------------------------------------------------------------------------------|
| Description | <i>prefix-name</i>   | The general prefix name.                                                                |
|             | <i>pv6-prefix</i>    | The network prefix value of the general-prefix following the format defined in RFC4291. |
|             | <i>prefix-length</i> | The length of the general prefix.                                                       |

**Defaults** N/A

**Command Mode** Global configuration mode.

**Usage Guide** It is convenient to number the network by using the general prefix, which defines a prefix so that many longer specified prefixes could refer to it. These specified prefixes are updated whenever the general prefix changes. If the network number changes, just modify the general prefix.

A general prefix could contain multiple prefixes.

These longer specified prefixes are usually used for the Ipv6 address configuration on the interface.

**Configuration** The following example configures manually a general prefix as my-prefix.

**Examples** Ruijie(config)# ipv6 general-prefix my-prefix 2001:1111:2222::/48

| Related Commands | Command                                                                 | Description                                                |
|------------------|-------------------------------------------------------------------------|------------------------------------------------------------|
|                  | <b>ipv6 address</b> <i>prefix-name</i><br><i>sub-bits/prefix-length</i> | Configures the interface address using the general prefix. |

**Platform** N/A

**Description**

### 3.8 ipv6 hop-limit

Use this command to configure the default hopcount to send unicast messages in the global configuration mode.

**ipv6 hop-limit** *value*

**no ipv6 hop-limit**

| Parameter   | Parameter    | Description                     |
|-------------|--------------|---------------------------------|
| Description | <i>value</i> | Hopcount ranging from 1 to 255. |

| <b>Defaults</b>               | The default is 64.                                                                                                                                  |         |             |     |     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|-----|-----|
| <b>Command Mode</b>           | Global configuration mode.                                                                                                                          |         |             |     |     |
| <b>Usage Guide</b>            | This command takes effect for the unicast messages only, not for multicast messages.                                                                |         |             |     |     |
| <b>Configuration Examples</b> | The following example sets the default hopcount to 100.                                                                                             |         |             |     |     |
| <b>Examples</b>               | <pre>Ruijie(config)# ipv6 hop-limit 100</pre>                                                                                                       |         |             |     |     |

### 3.9 ipv6 mtu

Use this command to configure the MTU of IPv6 packets. Use the **no** form of this command to restore the default setting.

**ipv6 mtu** *bytes*  
**no ipv6 mtu**

| <b>Parameter Description</b>  | <table border="1"> <thead> <tr> <th>Parameter</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><i>bytes</i></td> <td>MTU of IPv6 packets, in bytes. The value ranges from 1,280 to 1,500.</td> </tr> </tbody> </table> | Parameter | Description | <i>bytes</i> | MTU of IPv6 packets, in bytes. The value ranges from 1,280 to 1,500. |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|-------------|--------------|----------------------------------------------------------------------|
| Parameter                     | Description                                                                                                                                                                                                                     |           |             |              |                                                                      |
| <i>bytes</i>                  | MTU of IPv6 packets, in bytes. The value ranges from 1,280 to 1,500.                                                                                                                                                            |           |             |              |                                                                      |
| <b>Defaults</b>               | The default configuration is the same as the configuration of the <b>mtu</b> command.                                                                                                                                           |           |             |              |                                                                      |
| <b>Command Mode</b>           | Interface configuration mode                                                                                                                                                                                                    |           |             |              |                                                                      |
| <b>Usage Guide</b>            | If the size of an IPv6 packet exceeds the IPv6 MTU, the RGOS software segments the packet. For all devices in the same physical network segment, the IPv6 MTU of the interconnected interface must be the same.                 |           |             |              |                                                                      |
| <b>Configuration Examples</b> | The following example sets the IPv6 MTU of the FastEthernet 0/1 interface to 1400 bytes.                                                                                                                                        |           |             |              |                                                                      |
| <b>Examples</b>               | <pre>Ruijie(config)# interface fastEthernet 0/1 Ruijie(config-if)# ipv6 mtu 1400</pre>                                                                                                                                          |           |             |              |                                                                      |

| <b>mtu</b>                    | Sets the MTU of an interface.                                                                                                                                                                                                   |           |             |              |                                                                      |

**Platform** This command cannot be used on Layer 2 devices.

**Description**

### 3.10 ipv6 nd cache interface-limit

Use this command to set the maximum number of neighbors learned on the interface. Use the **no** form of this command to restore the default setting.

**ipv6 nd cache interface-limit** *value*

**no ipv6 nd cache interface-limit**

| Parameter          | Parameter    | Description                                                                                                                                                                                                  |
|--------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>value</i> | Sets the maximum number of neighbors learned on the interface, including the static and dynamic neighbors, in the range from 0 to the number supported by the device. 0 indicates the number is not limited. |

**Defaults** The default is 0.

**Command** Interface configuration mode

**Mode**

**Usage Guide** This function can prevent neighbor entries generated by malicious neighbor attacks from consuming memory. *limit* must be no smaller than the number of neighbors learned on the interface. Otherwise, the configuration does not take effect.

**Configuration** The following example sets the number of neighbors learned on the interface to 100.

**Examples**

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1)# ipv6 nd cache interface-limit 100
```

If it is set to 0, it indicates that the IPv6 address collision check is disabled on the interface. The range is 0 to 600. |
| <b>Defaults</b>               | The default is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                      |

| <b>Usage Guide</b>            | When the interface is configured with a new IPv6 address, the address collision shall be checked before the address is assigned to the interface, and the address shall be in the "tentative" status. After the address collision check is completed, if no collision is detected, the address can be used normally; if collision is detected and the interface ID of the address is an EUI-64 ID, it indicates that the link-layer address is repeated, and the system will automatically shut down the interface (that is, to prohibit IPv6 operations on the interface). In this case, you shall modify and configure a new address manually, and restart address collision check for the <b>down/up</b> interface. Whenever the state of an interface changes from <b>down</b> to <b>up</b> , the address collision check function of the interface will be enabled. |                                                                                                                                                      |
| <b>Configuration Examples</b> | The following example sets the number of the NS packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                      |

**Mode**

**Usage Guide** Before configuring a new IPv6 address for an interface, enable address conflict detection on the interface. If a conflict address is detected, the device does not receive the IPv6 packet destined to the conflict address. This command is used to perform conflict detection again when the interval expires. If there is no conflict, the address can be used.

**Configuration** The following example sets the interval for address conflict detection to 10s.

**Examples**

```
Ruijie(config)# ipv6 nd dad retry 10
```

**Description**

### 3.13 ipv6 nd managed-config-flag

Use this command to set the “managed address configuration” flag bit of the RA message. Use the **no** form of this command to restore the default setting.

**ipv6 nd managed-config-flag**

**no ipv6 nd managed-config-flag**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command**

**Mode** Interface configuration mode.

**Usage Guide** This flag determines whether the host that receives the RA message obtains an IP address through stateful auto configuration. If the flag is set, the host obtains an IP address through stateful auto configuration, otherwise it does not be used.

**Configuration** The following example set the “managed address configuration” flag bit of the RA message.

**Examples**

```
Ruijie(config-if)# ipv6 nd managed-config-flag
```

**Description**

### 3.14 ipv4 nd max-opt

Use this command to set the maximum number of ND options. Use the **no** form of this command to restore the default setting.

**ipv4 nd max-opt** *value*

**no ipv4 nd max-opt**

| Parameter          | Parameter    | Description                                                        |
|--------------------|--------------|--------------------------------------------------------------------|
| <b>Description</b> | <i>value</i> | Sets the maximum number of ND options, in the range from 1 to 100. |

**Defaults** The default is 10.

**Command**

**Mode** Global configuration mode

**Usage Guide** This command is used to set the maximum number of ND options, such as source link layer address option, MTU option, redirection option and prefix option.

**Configuration** The following example sets the maximum of ND options to 20.

**Examples**

```
Ruijie(config)# ipv4 nd max-opt 20
```

**Description**

### 3.15 ipv6 nd ns-interval

Use this command to set the interval for the interface to retransmitting NS (Neighbor Solicitation). Use the **no** form of this command to restore the default setting.

**ipv6 nd ns-interval** *milliseconds*

**no ipv6 nd ns-interval**

| Parameter          | Parameter           | Description                                                                   |
|--------------------|---------------------|-------------------------------------------------------------------------------|
| <b>Description</b> | <i>milliseconds</i> | Interval for retransmitting NS in the range of 1000 to 429467295 milliseconds |

**Defaults** The default value in RA is 0 (unspecified); the interval for retransmitting NS is 1,000 milliseconds (1 second).

**Command** Interface configuration mode.  
**mode**

**Usage Guide** The configured value will be advertised through RA and will be used by the device itself. It is not recommended to set a too short interval.

**Configuration** The following example sets the interval to 2,000 milliseconds, namely 2 seconds.

**Examples**

```
Ruijie(config-if)# ipv6 nd ns-interval 2000
```

| Related         | Command                    | Description                         |

**Platform** N/A

**Description**

### 3.16 ipv6 nd other-config-flag

Use this command to set “other stateful configuration” flag bit of the RA message. Use the **no** form of this command to delete the flag bit.

**ipv6 nd other-config-flag**

**no ipv6 nd other-config-flag**

| Parameter          | Parameter | Description |
|--------------------|-----------|-------------|
| <b>Description</b> | N/A       | N/A         |

**Defaults** The flag bit is not set by default.

**Command** Interface configuration mode.  
**mode**

**Usage Guide** With this flag bit set, the flag bit of the RA message sent by the device is set. After receiving this flag bit, the host uses the dhcpv6 to acquire the information excluding the IPv6 address for the purpose of automatic configuration. When the **managed address configuration** is set, the default **other stateful configuration** is also set

**Configuration** The following example sets “other stateful configuration” flag bit of the RA message.

**Examples**

```
uijie(config-if-GigabitEthernet 0/1)# ipv6 nd other-config-flag
```

## Description

## 3.17 ipv6 nd prefix

Use this command to configure the address prefix included in the RA. Use the **no** form of this command to delete the set prefix or restore the default setting.

```

ipv6 nd prefix { ipv6-prefix/prefix-length | default } [ [ valid-lifetime preferred-lifetime ] ] [ at valid-date preferred-date ] [ [ infinite | preferred-lifetime ] ] [ no-advertise ] [ [ off-link ] [ no-autoconfig ] ]
no ipv6 nd prefix { ipv6-prefix/prefix-length | default }

```

| Parameter   | Parameter                           | Description                                                                                                                                                                                                                                                            |
|-------------|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>ipv6-prefix</i>                  | IPv6 network ID following the format defined in RFC4291                                                                                                                                                                                                                |
|             | <i>prefix-length</i>                | Length of the IPv6 prefix. “/” shall be added in front of the prefix                                                                                                                                                                                                   |
|             | <i>valid-lifetime</i>               | Valid lifetime of the RA prefix received by the host                                                                                                                                                                                                                   |
|             | <i>preferred-lifetime</i>           | Preferred lifetime of the RA prefix received by the host                                                                                                                                                                                                               |
|             | <i>at valid-date preferred-date</i> | Sets the dead line for the valid lifetime and that of the preferred lifetime, in day, month, year, hour, minute.                                                                                                                                                       |
|             | <b>infinite</b>                     | Indicates that the prefix is always valid.                                                                                                                                                                                                                             |
|             | <b>default</b>                      | Sets the default prefix.                                                                                                                                                                                                                                               |
|             | <b>no-advertise</b>                 | The prefix will not be advertised by the device.                                                                                                                                                                                                                       |
|             | <b>off-link</b>                     | When the host sends an IPv6 packet, if the prefix of the destination address matches the set prefix, it is considered that the destination is on-link and is directly reachable. If this option is set, it indicates that the prefix is not used for on-link judgment. |
|             | <b>no-autoconfig</b>                | Indicates that the RA prefix received by the host cannot be used for auto address configuration.                                                                                                                                                                       |

**Defaults** By default, the advertised prefix is the one set with **ipv6 address** on the interface. The default parameters of the prefix configured in the RA are as follows:

*valid-lifetime*: 2592000s (30 days)

*preferred-lifetime*: 604800s (7 days),

The prefix is advertised and is used for on-link judgment and auto address configuration.

**Command** Interface configuration mode.

**Mode**

**Usage Guide** This command can be used to configure the parameters of each prefix, including whether to advertise the prefix. By default, the prefix advertised in RA is the one set with **ipv6 address** on the interface. To add other prefixes, use this command.

**ipv6 nd prefix default**

Set the default parameters to be used by the interface. If no parameter is specified for an added prefix, the parameters set with **ipv6 nd prefix default** will be used. Note that after a parameter is specified for the prefix, the default configuration will not be used. That is to say, the configuration of

the prefix cannot be modified with **ipv6 nd prefix default**; only the prefix that uses all the default configurations can be modified with this command.

**at** *valid-date preferred-date*

The valid lifetime of a prefix can be specified in two ways. One way is to specify a fixed time for each prefix in the RA; the other way is to specify the end time (in this mode, the valid lifetime of the prefix sent in RA will be gradually reduced until the end time is 0).

**Configuration** The following example adds a prefix for SVI 1.

**Examples**

```
Ruijie(config)# interface vlan 1
Ruijie(config-if)# ipv6 nd prefix 2001::/64 infinite 2592000
```

The following example sets the default prefix parameters for SVI 1 (they cannot be used for auto address configuration):

```
Ruijie(config)# interface vlan 1
Ruijie(config-if)# ipv6 prefix default no-autoconfig
```

If no parameter is specified, the default parameters will be used, and the prefix cannot be used for auto address configuration.

**Description**

### 3.18 ipv6 nd ra-hoplimit

Use this command to set the hopcount of the RA message. Use the **no** form of this command to restore the default setting.

**ipv6 nd ra-hoplimit** *value*  
**no ipv6 nd ra-hoplimit**

| Parameter   | Parameter    | Description |
|-------------|--------------|-------------|
| Description | <i>value</i> | Hopcount    |

**Defaults** The default is 64.

**Command Mode** Interface configuration mode.

**Usage Guide** This command is used to set the hopcount of the RA message.

**Configuration** The following example sets the hopcount to 110.

**Examples**

```
Ruijie(config-if-GigabitEthernet 0/1)# ipv6 nd ra-hoplimit 110
```

|                  | <b>ipv6 nd ra-interval</b> | Sets the interval of sending the RA message. |
|                  | <b>ipv6 nd ra-mtu</b>      | Sets the MTU of the RA message.              |

**Platform** N/A

**Description**

### 3.19 ipv6 nd ra-interval

Use this command to set the interval of sending the RA. Use the **no** form of this command to restore the default setting.

**ipv6 nd ra-interval** { *seconds* | **min-max** *min\_value* *max\_value* }

**no ipv6 nd ra-interval**

| Parameter Description | Parameter        | Description                                                    |
|-----------------------|------------------|----------------------------------------------------------------|
|                       | <i>seconds</i>   | Interval of sending the RA message in seconds, 3-1800s.        |
|                       | <b>min-max</b>   | Maximum and minimum interval sending the RA message in seconds |
|                       | <i>min_value</i> | Minimum interval sending the RA message in seconds             |
|                       | <i>max_value</i> | Maximum interval sending the RA message in seconds             |

**Defaults** 200s. The actual interval of sending the RA message will be fluctuated 20% based on 200s.

**Command Mode** Interface configuration mode.

**Usage Guide** If the device serves as the default device, the set interval shall not be longer than the lifetime of the device. Besides, to ensure other devices along the link occupies network bandwidth while sending the RA message, the actual interval for sending the RA message will be fluctuated 20% based on the set value.

If the key word **min-max** is specified, the actual interval for sending the packet will be chosen between the range of minimum value and maximum value.

**Configuration** The following example sets the interval to 110 seconds.

**Examples**

```
Ruijie(config-if-GigabitEthernet 0/1)# ipv6 nd ra-interval 110
```

The following example sets the interval to between 110 and 120 seconds.

```
Ruijie(config-if-GigabitEthernet 0/1)# ipv6 nd ra-interval min-max 110 120
```

**Platform** N/A  
**Description**

### 3.20 ipv6 nd ra-lifetime

Use this command to set the device lifetime of the RA sent on the interface. Use the **no** form of this command to restore the default setting.

**ipv6 nd ra-lifetime** *seconds*

**no ipv6 nd ra-lifetime**

| Parameter Description | Parameter      | Description                                                                                           |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------|
|                       | <i>seconds</i> | Default life time of the device on the interface, in the range from 0 to 9000 in the unit of seconds. |

**Defaults** The default is 1,800.

**Command Mode** Interface configuration mode.

**Usage Guide** The router lifetime field is available in each RA. It specifies the time during which the hosts along the link of the interface can select the device as the default device. If the value is set to 0, the device will not serve as the default device any longer. If it is not set to 0, it shall be larger than or equal to the interval of sending the RA (ra-interval)

**Configuration Examples** The following example sets the device lifetime to 2,000 seconds.

```
Ruijie(config-if-GigabitEthernet 0/1)# ipv6 nd ra-lifetime 2000
```

| Related Commands | Command                    | Description                          |

|                  | <b>ipv6 nd ra-mtu</b>      | Sets the MTU of the RA.              |

**Platform** N/A  
**Description**

### 3.21 ipv6 nd ra-mtu

Use this command to set the MTU of the RA message. Use the **no** form of this command to restore the default setting.

**ipv6 nd ra-mtu** *value*

**no ipv6 nd ra-mtu**

| Parameter   | Parameter    | Description                                   |
|-------------|--------------|-----------------------------------------------|
| Description | <i>value</i> | MTU value, in the range from 0 to 4294967295. |

**Defaults** IPv6 MTU value of the network interface.

**Command Mode** Interface configuration mode.

**Usage Guide** If it is specified as 0, the RA will not have the MTU option

**Configuration Examples** The following example sets the MTU to 1,400 bytes.

```
Ruijie(config -if)# ipv6 nd ra-mtu 1400
```

| Related Commands | Command                    | Description                                  |

**Platform** N/A

**Description**

### 3.22 ipv6 nd reachable-time

Use this command to set the reachable time after the interface checks the reachability of the neighbor dynamically learned through NDP. Use the **no** form of this command to restore the default setting.

**ipv6 nd reachable-time** *milliseconds*

**no ipv6 nd reachable-time**

| Parameter   | Parameter           | Description                                                                                   |
|-------------|---------------------|-----------------------------------------------------------------------------------------------|
| Description | <i>milliseconds</i> | Reachable time for the neighbor in the range from 0 to 3,600,000 in the unit of milliseconds. |

**Defaults** The default value in RA is 0 (unspecified); the reachable time for the neighbor is 30,000 milliseconds (30 seconds) when the device discovers the neighbor.

**Command** Interface configuration mode.

**Mode**

**Usage Guide** The device checks the unreachable neighbor through the set time. A shorter time means that the device can check the neighbor failure more quickly, but more network bandwidth and device resource will be occupied. Therefore, it is not recommended to set a too short reachable time.

The configured value will be advertised through RA and will be used by the device itself. If the value is set to 0, it indicates that the time is not specified, that is, the default value is used.

**Configuration** The following example sets the reachable time to 1,000,000 milliseconds, namely 1,000 seconds.

**Examples**

```
Ruijie(config-if-GigabitEthernet 0/1)# ipv6 nd reachable-time 1000000
```

| Commands | show ipv6 interface | Displays the interface information. |

**Platform** N/A

**Description**

### 3.23 ipv6 nd resolve vlan

Use this command to enable active sending of NS resolution requests to a specific sub VLAN of a super VLAN. Use the no form of this command to disable the active sending of NS resolution requests to a specific sub VLAN of a super VLAN. Use the default form of this command to restore the default settings.

ipv6 nd resolve vlan {*vlan-list* | none}

no ipv6 nd resolve vlan {*vlan-list* | none}

default ipv6 nd resolve vlan

| Parameter   | Parameter        | Description                                                                                                |
|-------------|------------------|------------------------------------------------------------------------------------------------------------|
| Description | <i>vlan-list</i> | Sets the list of sub VLANs in a super VLAN, where NS resolution requests are sent only to these sub VLANs. |
|             | none             | Specifies that no NS resolution request is sent to any sub VLAN of a super VLAN.                           |

**Defaults** The function is disabled by default.

**Command Mode** Global configuration mode

**Default Level** 2

**Usage Guide** If many sub VLANs exist in a super VLAN, when the device sends NS resolution requests to learn ND entries of the peer, the NS resolution requests are sent to the entire super VLAN by default. In this case, too many sub VLANs may cause a great number of packet replications, and therefore affect device performance.

Most STAs (such as PCs and servers) request information about ND neighbors from the gateway before accessing the network. Therefore, it is unnecessary to actively broadcast NS resolution requests to the sub VLANs where these STAs reside. For dumb terminals that do not actively send NA advertisements, run the `ipv6 nd resolve vlan vlan-list` command to resolve and send ND entries to VLANs in the specified VLAN list.

**!** After the `ipv6 ns resolve vlan vlan-list` command is configured, NS resolution requests are sent only to VLANs in the VLAN list of a super VLAN. It should be particularly noted that if authentication-free VLANs are configured but not included in the VLAN list specified in the `ipv6 nd resolve vlan` command, NS resolution requests are not broadcast to the authentication-free VLANs.

**Configuration Examples** The following example enables the device to provide active NS resolution for VLANs 10–20 and VLANs 25–30.

```
Ruijie(config)# ipv6 nd resolve vlan 10-20, 25-30
```

The following example removes active NS resolution of VLANs 10–20.

```
Ruijie(config)# no ipv6 nd resolve vlan 10-20
```

The following example configures the device not to provide active NS resolution for any sub VLAN of a super VLAN.

```
Ruijie(config)# ipv6 nd resolve vlan none
```

**Verification** Run the `show running-config` command to display configurations.

### 3.24 ipv6 nd state-time

Use this command to set the period for the neighbor to maintain the state. Use the **no** form of this command to restore the default setting.

**ipv6 nd state-time *seconds***

**no ipv6 nd state-time**

| Parameter   | Parameter      | Description                                                                                                  |
|-------------|----------------|--------------------------------------------------------------------------------------------------------------|
| Description | <i>Seconds</i> | Sets the period for the neighbor to maintain the state, in the range from 0 to 86400 in the unit of seconds. |

**Defaults** The default is 3600.

**Command Mode** Global configuration mode

**Usage Guide** This command is used to set the period for the neighbor to maintain the state. After the period expires, neighbor unreachability detection is performed. The shorter the period, the faster the neighbor is found unreachable. On the other hand, more network bandwidth and device resources are consumed. Therefore, it is recommended to set a value not too small.

**Configuration** The following example sets the period to 600 seconds for the neighbor to maintain the state.

**Examples** `Ruijie(config)# ipv6 nd stale-time 600`

### 3.25 ipv6 nd suppress-auth-vlan-ns

Use this command to disable the SVI interface from sending the NS packet to the authentication VLAN. Use the **no** form of this command to disable this function.

**ipv6 nd suppress-auth-vlan-ns**

**no ipv6 nd suppress-auth-vlan-ns**

| Parameter          | Parameter | Description |
|--------------------|-----------|-------------|
| <b>Description</b> | N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command Mode** Interface configuration mode

**Usage Guide** This command is supported on the SVI interface in gateway authentication mode.

**Configuration Examples** The following example enables VLAN 2 to send the NS packet to the authentication VLAN.

**Examples** `Ruijie(config-if-VLAN 2)# no ipv6 nd suppress-auth-vlan-ns`

### 3.26 ipv6 nd suppress-ra

Use this command to disable the interface from sending the RA message. Use the **no** form of this command to enable the function.

**ipv6 nd suppress-ra**

**no ipv6 nd suppress-ra**

| Parameter          | Parameter | Description |
|--------------------|-----------|-------------|
| <b>Description</b> | N/A       | N/A         |

**Defaults** The **ipv6 nd suppress-ra** command is enabled by default.

**Command** Interface configuration mode.

**Mode**

**Usage Guide** This command suppresses the sending of the RA message on an interface.

**Configuration** The following example disables the interface from sending the RA message.

**Examples**

```
Ruijie(config-if-GigabitEthernet 0/1)# ipv6 nd suppress-ra
```

**Description**

### 3.27 ipv6 nd unresolved

Use this command to set the maximum number of the unresolved neighbor table entries. Use the **no** form of this command to restore the default setting.

**ipv6 nd unresolved** *number*

**no ipv6 nd unresolved**

| Parameter   | Parameter     | Description                                                                                                                               |
|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>number</i> | Sets the maximum number of the unresolved neighbor table entries, in the range from 1 to the neighbor table size supported by the device. |

**Defaults** The default is 0. (The maximum number is the neighbor table size supported by the device)

**Command** Global configuration mode

**Mode**

**Usage Guide** This command is used to prevent unresolved ND table entries generated by malicious scan attacks from consuming table entry resources,

**Configuration** The following example sets the maximum number of the unresolved neighbor table entries to 200.

**Examples**

```
Ruijie(config)# ipv6 nd unresolved 200
```

## 3.28 ipv6 neighbor

Use this command to configure a static neighbor. Use the **no** form of this command to delete a static neighbor.

**ipv6 neighbor** *ipv6-address interface-id hardware-address*

**no ipv6 neighbor** *ipv6-address interface-id*

| Parameter          | Parameter               | Description                                                                                                  |
|--------------------|-------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>ipv6-address</i>     | The neighbor IPv6 address, in the form as defined in RFC4291.                                                |
|                    | <i>interface-id</i>     | Specifies the network interface where the neighbor is (including Router Port, L3 AP port and SVI interface). |
|                    | <i>hardware-address</i> | The 48-bit MAC address, a dotted triple of four-digit hexadecimal numbers.                                   |

**Defaults** No static neighbor is configured by default.

**Command** Global configuration mode

**Mode**

**Usage Guide** This command can only be configured on the interface enabled with IPv6 protocol, similar to the ARP command.

If the neighbor to be configured has been learned through Neighbor Discovery Protocol (NDP) and stored in the NDP neighbor table, the dynamic neighbor turns to be static. If the static neighbor is valid, it is always reachable. An invalid static neighbor refers to the neighbor whose IPv6 address is not valid (not in the IPv6 network segment configured for the interface or interface address conflict). The packet is not forwarded to the MAC address as specified by the invalid static neighbor. The invalid static neighbor is in inactive state. Use the `show ipv6 neighbor static` command to display the state of the static neighbor.

Use the **clear ipv6 neighbors** command to clear all neighbors learned dynamically through NDP.

**Configuration** The following example configures a static neighbor on SVI 1.

**Examples**

```
Ruijie(config)# ipv6 neighbor 2001::1 vlan 1 00d0.f811.1111
```

### 3.29 ipv6 ns-linklocal-src

Use this command to set the local address of the link as the source IP address to send neighbor requests. Use the **no** form of this command to use the global IP address w as the source address to send neighbor requests.

**ipv6 ns-linklocal-src**

**no ipv6 ns-linklocal-src**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** The local address of the link is always used as the source address to send neighbor requests.

**Command Mode** Global configuration mode.

**Usage Guide** N/A

**Configuration Examples** The following example sets the local address of the link as the source IP address to send neighbor requests.

```
Ruijie(config)# no ipv6 ns-linklocal-src
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

### 3.30 ipv6 redirects

Use this command to control whether to send ICMPv6 redirect message when the switch receives and forwards an IPv6 packet through an interface. Use the **no** form of this command to restore the default setting.

**ipv6 redirects**

**no ipv6 redirects**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command Mode** Interface configuration mode.

**Usage Guide** The transmission rate of any ICMPv6 error message is limited. By default, it is 10pps.

**Configuration** The following example enables ICMPv6 redirection on interface GigabitEthernet 0/1.

**Examples**

```
Ruijie(config-if-GigabitEthernet 0/1)# ipv6 redirects
```

| Related Commands | Command                    | Description                         |
|------------------|----------------------------|-------------------------------------|
|                  | <b>show ipv6 interface</b> | Displays the interface information. |

**Description**

### 3.31 ipv6 source-route

Use this command to forward the IPv6 packet with route header. Use the **no** form of this command to restore the default setting.

**ipv6 source-route**

**no ipv6 source-route**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** The **ipv6 source-route** command is disabled by default.

**Command Mode** Global configuration mode.

**Usage Guide** Because of the potential security of the header of type 0 route, it's easy for the device to suffer from the denial service attack. Therefore, forwarding the IPv6 packet with route header is disabled by default. However, the IPv6 packet of route header with type 0 that destined to the local machine is processed.

**Configuration** The following example forwards the IPv6 packet with route header.

**Examples**

```
Ruijie(config)# no ipv6 source-route
```

| Related Commands | Command | Description |

### 3.32 show ipv6 address

Use this command to display the IPv6 addresses.

**show ipv6 address** [ *interface-name* ]

| Parameter   | Parameter             | Description    |
|-------------|-----------------------|----------------|
| Description | <i>interface-name</i> | Interface name |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** N/A

**Configuration** The following example displays all IPv6 address configured on the device.

#### Examples

```
Ruijie#show ipv6 addr
Global unicast address limit: 1024, Global unicast address count: 2
Tentative address count: 3,Duplicate address count: 0
Preferred address count: 0,Deprecated address count: 0
GigabitEthernet 0/5
  2003:1::23/64                Tentative
  Preferred lifetime: INFINITE, Valid lifetime: INFINITE
  fe80::2d0:f8ff:febf:deb2/64  Tentative
  Preferred lifetime: INFINITE, Valid lifetime: INFINITE
  2005:1::1111/64             Tentative
  Preferred lifetime: INFINITE, Valid lifetime: INFINITE
Ruijie#
```

The following example displays the IPv6 address configured on the GigabitEthernet 0/1.

```
Ruijie#show ipv6 addr gi 0/5
Global unicast address count: 2
Tentative address count: 3,Duplicate address count: 0
Preferred address count: 0,Deprecated address count: 0
GigabitEthernet 0/1
  2003:1::23/64                Tentative
  Preferred lifetime: INFINITE, Valid lifetime: INFINITE
  fe80::2d0:f8ff:febf:deb2/64  Tentative
  Preferred lifetime: INFINITE, Valid lifetime: INFINITE
  2005:1::1111/64             Tentative

### 3.33 show ipv6 general-prefix

Use this command to display the information of the general prefix.

**show ipv6 general-prefix**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** Use this command to display the information of the general prefix including the manually configured and learned from the DHCPv6 agent.

**Configuration Examples** The following example displays the information of the general prefix.

```
Ruijie#
show ipv6 general-prefix
There is 1 general prefix.
IPv6 general prefix my-prefix, acquired via Manual configuration
 2001:1111:2222::/48
 2001:1111:3333::/48
```

### 3.34 show ipv6 interface

Use this command to display the IPv6 interface information.

**show ipv6 interface** [ *interface-id* ] [ **ra-info** ] [ *brief* [ *interface-id* ] ]

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

|                    |                     |                                                                                             |
|--------------------|---------------------|---------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>interface-id</i> | Interface (including Ethernet interface, aggregate port, or SVI)                            |
|                    | <b>ra-info</b>      | Displays the RA information of the interface.                                               |
|                    | <i>brief</i>        | Displays the brief information of the interface (interface status and address information). |

**Defaults** N/A

**Command** Privileged EXEC mode.

**Mode**

**Usage Guide** Use this command to display the address configuration, ND configuration and other information of an IPv6 interface.

**Configuration** The following example displays the information of the IPv6 interface.

**Examples**

```
Ruijie# show ipv6 interface vlan 1
Interface vlan 1 is Up, ifindex: 2001
address(es):
Mac Address: 00:00:00:00:00:01
INET6: fe80::200:ff:fe00:1 , subnet is fe80::/64
Joined group address(es):
ff01:1::1
ff02:1::1
ff02:1::2
ff02:1::1:ff00:1
INET6: 2001::1 , subnet is 2001::/64 [TENTATIVE]
Joined group address(es):
ff01:1::1
ff02:1::1
ff02:1::2
ff02:1::1:ff00:1
MTU is 1500 bytes
ICMP error messages limited to one every 10 milliseconds
ICMP redirects are enabled
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND retransmit interval is 1000 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 200 seconds<240--160>
ND device advertisements live for 1800 seconds
```

The following line is included in the above information: 2001::1, subnet is 2001::/64 [TENTATIVE]. The flag bit in the [ ] following the INET6 address is explained as follows:

| Flag       | Meaning                                                                                                                |
|------------|------------------------------------------------------------------------------------------------------------------------|
| ANYCAST    | Indicate that the address is an anycast address.                                                                       |
| TENTATIVE  | Indicate that the DAD is underway. The address is a tentative before the DAD is completed.                             |
| DUPLICATED | Indicate that a duplicate address exists.                                                                              |
| DEPRECATED | Indicate that the preferred lifetime of the address expires.                                                           |
| NODAD      | Indicate that no DAD is implemented for the address.                                                                   |
| AUTOIFID   | Indicate that the interface ID of the address is automatically generated by the system, which is usually an EUI-64 ID. |
| PRE        | Indicate the IP stateless address that is automatically configured.                                                    |
| GEN        | Indicate the IP address that is generated by the general prefix.                                                       |

The following example displays the RA information of the IPv6 interface.

```
Ruijie# show ipv6 interface vlan 1 ra-info
vlan 1: DOWN
RA timer is stopped
waits: 0, initcount: 3
statistics: RA(out/in/inconsistent): 4/0/0, RS(input): 0
Link-layer address: 00:00:00:00:00:01
Physical MTU: 1500
ND device advertisements live for 1800 seconds
ND device advertisements are sent every 200 seconds<240--160>
Flags: !M!O, Adv MTU: 1500
ND advertised reachable time is 0 milliseconds
ND advertised retransmit time is 0 milliseconds
ND advertised CurHopLimit is 64
Prefixes: (total: 1)
fec0:1:1:1::/64(Def,Auto,vltime: 2592000, pltime: 604800, flags: LA)
```

Description of the fields in **ra-info**:

| Field                    | Meaning                                                                            |
|--------------------------|------------------------------------------------------------------------------------|
| RA timer is stopped (on) | Indicate whether the RA timer is started.                                          |
| waits                    | Indicate that the RS is received but the number of the responses is not available. |
| initcount                | Indicate the number of the RAs when the RA timer is restarted.                     |

|                          |                                                                                                                                                                                                                                                                      |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RA(out/in/ inconsistent) | out: Indicate the number of the RAs that are sent.<br>In: Indicate the number of the RAs that are received.<br>inconsistent: Indicate the number of the received RAs in which the parameters are different from those contained in the RAs advertised by the device. |
| RS(input)                | Indicate the number of the RSs that are received.                                                                                                                                                                                                                    |
| Link-layer address       | Link-layer address of the interface.                                                                                                                                                                                                                                 |
| Physical MTU             | Link MTU of the interface.                                                                                                                                                                                                                                           |
| !M   M                   | !M indicates the managed-config-flag bit in the RA is not set.<br>M: Conversely                                                                                                                                                                                      |
| !O   O                   | !O indicates the other-config-flag bit in the RA is not set.<br>O: Conversely                                                                                                                                                                                        |

Description of the fields of the prefix list in **ra-info**:

| Field           | Meaning                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| total           | The number of the prefixes of the interface.                                                                                                                                      |
| fec0:1:1:1::/64 | A specific prefix.                                                                                                                                                                |
| Def             | Indicate that the interfaces use the default prefix.                                                                                                                              |
| Auto   CFG      | Auto: Indicate the prefix is automatically generated after the interface is configured with the corresponding IPv6 address. CFG: Indicate that the prefix is manually configured. |
| !Adv            | Indicate that the prefix will not be advertised.                                                                                                                                  |
| vlttime         | Valid lifetime of the prefix, measured in seconds.                                                                                                                                |
| pltime          | Preferred lifetime of the prefix, measured in seconds.                                                                                                                            |
| L   !L          | L: Indicate that the on-link in the prefix is set.<br>!L: Indicate that the on-link in the prefix is not set.                                                                     |
| A   !A          | A: Indicate that the auto-configure in the prefix is set. !A: It indicates that the auto-configure in the prefix is not set.                                                      |

The following example displays the brief information of the IPv6 interface.

```
Ruijie#show ipv6 interface brief
GigabitEthernet 0/1          [down/down]
    2222::2
    FE80::1614:4BFF:FE5C:ED3A
```

**Description**

### 3.35 show ipv6 neighbors

Use this command to display the IPv6 neighbors.

**show ipv6 neighbors** [ *vrf vrf-name* ] [ **verbose** ] [ *interface-id* ] [ *ipv6-address* ] [ **static** ] [ **oob** ]

| Parameter   | Parameter           | Description                                           |
|-------------|---------------------|-------------------------------------------------------|
| Description | <b>verbose</b>      | Displays the neighbor details.                        |
|             | <b>static</b>       | Displays the validity status of static neighbors.     |
|             | <i>vrf-name</i>     | VRF name                                              |
|             | <i>interface-id</i> | Displays the neighbors of the specified interface.    |
|             | <i>ipv6-address</i> | Displays the neighbors of the specified IPv6 address. |
|             | <b>oob</b>          | Displays the IPv6 neighbors of the MGMT port.         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Mode**

**Usage Guide** N/A

**Configuration** The following example displays the neighbors on the SVI 1 interface.

**Examples**

```
Ruijie# show ipv6 neighbors vlan 1
IPv6 Address Linklayer Addr Interface
fa::1 00d0.0000.0002 vlan 1
fe80::200:ff:fe00:2 00d0.0000.0002 vlan 1
```

The following example displays the neighbor details.

```
Ruijie# show ipv6 neighbors verbose
IPv6 Address Linklayer Addr Interface
2001::1 00d0.f800.0001 vlan 1
  State: Reach/H Age: - asked: 0
fe80::200:ff:fe00:1 00d0.f800.0001 vlan 1
  State: Reach/H Age: - asked: 0
```

| Field          | Meaning                                                                             |
|----------------|-------------------------------------------------------------------------------------|
| IPv6 Address   | IPv6 address of the Neighbor                                                        |
| Linklayer Addr | Link address, namely, MAC address. If it is not available, incomplete is displayed. |
| Interface      | Interface the neighbor locates.                                                     |
| State          | State of the neighbor: state/H(R)                                                   |

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       | <p>The values of STATE are as below:</p> <p>INCMP (Incomplete): The address resolution of the neighbor is underway, the NS is sent, but the NA is not received.</p> <p>REACH (Reachable): The switch is connected with the neighbor. In this state, the switch takes no additional action when sending packets to the neighbor.</p> <p>STALE: The reachable time of the neighbor expires. In this state, the switch takes no additional action; it only starts NUD (Neighbor Unreachability Detection) after a packet is sent to the neighbor.</p> <p>DELAY: A packet is sent to the neighbor in STALE state. If the STALE state changes to DELAY, DELAY will be changed to PROBE if no neighbor reachability notification is received within DELAY_FIRST_PROBE_TIME seconds (5s), the NS will be sent to the neighbor to start NUD.</p> <p>PROBE: The NUD is started to check the reachability of the neighbor. The NS packets are sent to the neighbor at the interval of RetransTimer milliseconds until the response from the neighbor is received or the number of the sent NSs hits MAX_UNICAST_SOLICIT(3).</p> <p>?: Unknown state.</p> <p>/R—indicate the neighbor is considered as a device</p> <p>/H: The neighbor is a host.</p> |
| Age   | <p>The reachable time of the neighbor. '-' indicates that the neighbor is always reachable. Note that the reachability of a static neighbor depends on the actual situation. 'expired' indicates that the lifetime of the neighbor expires, and the neighbor is waits for the triggering of NUD.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Asked | <p>The number of the NSs that are sent to the neighbor for the resolution of the link address of the neighbor.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

The following example displays the status of static neighbors.

```
Ruijie# show ipv6 neighbors static
IPv6 Address      Linklayer Addr  Interface          State
2001:1::1         00d0.f822.33ab  GigabitEthernet 0/14  ACTIVE
2001:2::2         00d0.f822.33ac  VLAN 1             INACTIVE
```

**Description**

### 3.36 show ipv6 neighbors statistics

Use the following commands to display the statistics of one IPv6 neighbors.

**show ipv6 neighbors [ vrf vrf-name ] statistics**

|                               |                                                                                                                                                                            |                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| <b>Parameter</b>              | <b>Parameter</b>                                                                                                                                                           | <b>Description</b> |
| <b>Description</b>            | <i>vrf-name</i>                                                                                                                                                            | VRF name           |
| <b>Defaults</b>               | N/A                                                                                                                                                                        |                    |
| <b>Command Mode</b>           | Privileged EXEC mode.                                                                                                                                                      |                    |
| <b>Usage Guide</b>            | N/A                                                                                                                                                                        |                    |
| <b>Configuration Examples</b> | The following example displays the statistics of the global neighbors.                                                                                                     |                    |

| <b>Platform Description</b>   | Supported on all platforms.                                                                                                                                                |                    |

### 3.37 show ipv6 neighobr statistics per-mac

Use this command to display the number of neighbor entries of every MAC address.

**show ipv6 neighbor statistics per-mac** [*interface-name*] [*mac-address*]

|                     |                       |                    |
|---------------------|-----------------------|--------------------|
| <b>Parameter</b>    | <b>Parameter</b>      | <b>Description</b> |
| <b>Description</b>  | <i>interface-name</i> | Interface ID       |
|                     | <i>mac-address</i>    | MAC address        |
| <b>Defaults</b>     | N/A                   |                    |
| <b>Command Mode</b> | Privileged EXEC mode  |                    |
| <b>Usage Guide</b>  | N/A                   |                    |

**Configuration** The following example displays the number of neighbor entries of every MAC address..

**Examples**

```
Ruijie# show ipv6 neighbor statistics per-mac
Interface  MAC address      Statistics
-----
VLAN 1    0000:0000:0001      3
VLAN 1    0000:0000:0002      5
VLAN 2    0000:0000:0003     10
```

| Field       | Description      |
|-------------|------------------|
| Interface   | Interface ID.    |
| MAC address | MAC address.     |
| Statistics  | ND entry number. |

**Platform** N/A  
**Description**

### 3.38 show ipv6 packet statistics

Use this command to display the statistics of IPv6 packets.

**show ipv6 packet statistics [ total | interface-name ]**

**Parameter  
Description**

| Parameter             | Description                                  |
|-----------------------|----------------------------------------------|
| <b>total</b>          | Displays total statistics of all interfaces. |
| <i>interface-name</i> | Interface name                               |

**Defaults** N/A

**Command  
Mode** Privileged EXEC mode.

**Usage Guide** N/A

**Configuration  
Examples** The following example displays the total statistics of the Ipv6 packets and the statistics of each interface.

```
Ruijie#show ipv6 pack statistics
Total
  Received 0 packets, 0 bytes
  Unicast:0,Multicast:0
  Discards:0
  HdrErrors:0 (HoplimitExceeded:0,Others:0)
```

```

    NoRoutes:0
    Others:0
  Sent 0 packets, 0 bytes
    Unicast:0,Multicast:0
  GigabitEthernet 0/5
  Received 0 packets, 0 bytes
    Unicast:0,Multicast:0
  Discards:0
    HdrErrors:0 (HoplimitExceeded:0,Others:0)
    NoRoutes:0
    Others:0
  Sent 0 packets, 0 bytes
    Unicast:0,Multicast:0
Ruijie#

```

The following example displays the total statistics of the ipv6 packets.

```

Ruijie#show ipv6 pack statistics total
Total
  Received 0 packets, 0 bytes
    Unicast:0,Multicast:0
  Discards:0
    HdrErrors:0 (HoplimitExceeded:0,Others:0)
    NoRoutes:0
    Others:0
  Sent 0 packets, 0 bytes
    Unicast:0,Multicast:0
Ruijie#

```

**Platform** Supported on all platforms.

**Description**

### 3.39 show ipv6 raw-socket

Use this command to display all original IPv6 sockets.

**show ipv6 raw-socket** [*num*]

| Parameter   | Parameter  | Description     |
|-------------|------------|-----------------|
| Description | <i>num</i> | Protocol number |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** N/A

**Configuration Examples** The following example displays all original IPv6 sockets.

```
Ruijie# show ipv6 raw-socket
Number Protocol Process name
1      ICMPv6   vrrp.elf
2      ICMPv6   tcpip.elf
3      VRRP    vrrp.elf
Total: 3
```

| Field        | Description              |
|--------------|--------------------------|
| Number       | Number.                  |
| Process name | Process name.            |
| Protocol     | Protocol number          |
| Total        | Total number of sockets. |

| Related Commands | Command | Description |

**Platform** N/A

**Description**

### 3.40 show ipv6 routers

In the IPv6 network, some neighbor routers send out the advertisement messages. Use this command to display the neighbor routers and the advertisement.

**show ipv6 routers** [ *interface-type interface-number* ]

| Parameter          | Parameter                                        | Description                                                               |
|--------------------|--------------------------------------------------|---------------------------------------------------------------------------|
| <b>Description</b> | <i>interface-type</i><br><i>interface-number</i> | (Optional) Displays the routing advertisement of the specified interface. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** Use this command to display the neighbor routers and the routing advertisement. If no interface is specified, all the routing advertisement of this device will be displayed.

**Configuration** The following example displays the IPv6 router

**Examples**

```
Ruijie# show ipv6 routers
Router FE80::2D0:F8FF:FEC1:C6E1 on VLAN 2, last update 62 sec
  Hops 64, Lifetime 1800 sec, ManagedFlag=0, OtherFlag=0, MTU=1500
  Preference=MEDIUM
  Reachable time 0 msec, Retransmit time 0 msec
  Prefix 6001:3::/64 onlink autoconfig
    Valid lifetime 2592000 sec, preferred lifetime 604800 sec
  Prefix 6001:2::/64 onlink autoconfig
    Valid lifetime 2592000 sec, preferred lifetime 604800 sec
```

### 3.41 show ipv6 sockets

Use this command to display all IPv6 sockets.

**show ipv6 sockets**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command** Privileged EXEC mode.

**Mode**

**Usage Guide** N/A

**Configuration** The following example displays all IPv6 sockets.

**Examples**

```
Ruijie# show ipv6 sockets
Number Process name      Type  Protocol  LocalIP:Port  ForeignIP:Port  State
1    vrrp.elf             RAW   ICMPv6    :::58         :::0            *
2    tcpip.elf           RAW   ICMPv6    :::58         :::0            *
3    vrrp.elf             RAW   VRRP      :::112        :::0            *
4    rg-snmpd            DGRAM UDP        :::161        :::0            *
5    rg-snmpd            DGRAM UDP        :::162        :::0            *
6    dhcp6.elf           DGRAM UDP        :::547        :::0            *
7    rg-sshd             STREAM TCP      :::22         :::0            LISTEN
8    rg-telnetd          STREAM TCP      :::23         :::0            LISTEN
```

| Total: 8       |                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------|
| Field          | Description                                                                                                 |
| Number         | Number.                                                                                                     |
| Process name   | Process name.                                                                                               |
| Type           | Socket type. RAW indicates the raw socket. DGRAM indicates data packet type. STREAM indicates traffic type. |
| Protocol       | Protocol number                                                                                             |
| LocalIP:Port   | Local IPv6 address and port.                                                                                |
| ForeignIP:Port | Peer IPv6 address and port.                                                                                 |
| State          | State (for IPv6 TCP sockets).                                                                               |
| Total          | Total number of sockets.                                                                                    |

### 3.42 show ipv6 udp

Use this command to display all IPv6 UDP sockets.

**show ipv6 udp [ local-port *num* ] [ peer-port *num* ]**

Use this command to display IPv6 UDP socket statistics.

**show ipv6 udp statistics**

| Parameter Description | Parameter                    | Description        |
|-----------------------|------------------------------|--------------------|
|                       | <b>local-port <i>num</i></b> | Local port number. |
|                       | <b>peer-port <i>num</i></b>  | Peer port number.  |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays all IPv6 UDP sockets.

#### Examples

```
Ruijie# show ipv6 udp
Number Local Address Peer Address Process name
1      :::161      :::0      rg-snmpd
2      :::162      :::0      rg-snmpd
```

| 3             | :::547 | :::0                         | dhcp6.elf |
|---------------|--------|------------------------------|-----------|
| Filed         |        | Description                  |           |
| Number        |        | Number.                      |           |
| Local Address |        | Local IPv6 address and port. |           |
| Peer Address  |        | Peer IPv6 address and port.  |           |
| Process name  |        | Process name.                |           |

## 4 DHCP Commands

### 4.1 address range

Use this command to specify the network segment range of the addresses that can be allocated by CLASS associated with DHCP address pool. Use the **no** form of this command to restore the default setting.

**address range** *low-ip-address high-ip-address*

**no address range**

| Parameter   | Parameter              | Description                                 |
|-------------|------------------------|---------------------------------------------|
| Description | <i>low-ip-address</i>  | Start address in the network segment range. |
|             | <i>high-ip-address</i> | End address in the network segment range.   |

**Defaults** By default, the associated CLASS is not configured with the network segment range. The default is the address pool range.

**Command Mode** Address pool CLASS configuration mode.

**Usage Guide** Each CLASS corresponds to one network range which must be from low address to high address, so as to allow the duplication of network segment range between multiple CLASSES. If the CLASS associated with the address pool is specified without configuring the corresponding network segment range, the default network segment range of this CLASS is same as the range of the address pool where this CLASS is.

**Configuration Examples** The following example configures the network segment of class1 associated with address pool mypool0 ranging from 172.16.1.1 to 172.16.1.8.

```
Ruijie(config)# ip dhcp pool mypool0
Ruijie(dhcp-config)# class class1
Ruijie (config-dhcp-pool-class)# address range 172.16.1.1 172.16.1.8
```

| Related Commands | Command             | Description                                                                                                      |
|------------------|---------------------|------------------------------------------------------------------------------------------------------------------|
|                  | <b>ip dhcp pool</b> | Defines the name of the DHCP address pool and enters the DHCP address pool configuration mode.                   |
|                  | <b>class</b>        | Configures the CLASS associated with the DHCP address pool and enters the address pool CLASS configuration mode. |

**Platform Description** N/A

## 4.2 address-manage

Use this command to enter the AM rule configuration mode.

**address-manage**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** This command is configured on the DHCP server and used in combination with Super VLAN.

**Configuration Examples** The following example enters the AM rule configuration mode.

```
Ruijie(config)#address-manage
```

| Related Commands | Command | Description |

|                  | N/A     | N/A         |

**Platform** N/A

**Description**

## 4.3 bootfile

Use this command to define the startup mapping file name of the DHCP client. Use the **no** or **default** form of this command to restore the default setting.

**bootfile** *file-name*

**no bootfile**

**default bootfile**

| Parameter   | Parameter        | Description        |
|-------------|------------------|--------------------|
| Description | <i>file-name</i> | Startup file name. |

**Defaults** No startup file name is defined by default.

**Command Mode** DHCP address pool configuration mode

**Usage Guide** Some DHCP clients need to download the operating system and configure the file during the startup. The DHCP server should provide the mapping file name required for the startup, so that DHCP clients

can download the file from the corresponding server (such as TFTP). Other servers are defined by the **next-server** command.

**Configuration** The following example defines the device.conf as the startup file name.

**Examples** `bootfile device.conf`

| Related Commands | Command             | Description                                                                                   |
|------------------|---------------------|-----------------------------------------------------------------------------------------------|
|                  | <b>ip dhcp pool</b> | Defines the name of the DHCP address pool and enter the DHCP address pool configuration mode. |
|                  | <b>next-server</b>  | Configures the next server IP address of the DHCP client startup process.                     |

**Platform** N/A

**Description**

## 4.4 class

Use this command to configure the associated CLASS in the DHCP address pool. Use the **no** form of this command to restore the default setting.

**class** *class-name*

**no class**

| Parameter Description | Parameter         | Description                                                                    |
|-----------------------|-------------------|--------------------------------------------------------------------------------|
|                       | <i>class-name</i> | Class name, which can be the character string or numeric such as myclass or 1. |

**Defaults** By default, no CLASS is associated with the address pool.

**Command Mode** DHCP address pool configuration mode

**Usage Guide** Each DHCP address pool performs the address assignment according to the Option82 matching information. We can divide this Option82 information into classes and specify the available network segment range for these classes in the DHCP address pool. These classes are called CLASS. One DHCP address pool can map to multiple CLASSES, and each CLASS can specify different network segment range.

During the address assignment, firstly, ensure the assignable address pool through the network segment where the client is, then according to the Option82 information further ensure the CLASS and assign the IP address from the network segment range corresponding to the CLASS. If one request packet matches multiple CLASSES in the address pool, perform the address assignment according to the sequencing of configuring the CLASS in the address pool. If this CLASS's assigned addresses have been to the upper limit, then continue to assign the address from the next CLASS, and so on. Each CLASS corresponds to one network segment range that must be from low addresses to high addresses and the duplicated network ranges between multiple CLASSES are allowed. If the CLASS corresponding to the address pool is specified and the network segment corresponding to the CLASS is not configured, this CLASS's default network segment range is same

as the range of address pool where the CLASS is.

**Configuration** The following example configures the address *mypool0* to associate with class1.

**Examples**

```
Ruijie(config)# ip dhcp pool mypool0
Ruijie(dhcp-config)# class class1
```

**Description**

## 4.5 clear ip dhcp binding

Use this command to clear the DHCP binding table in the privileged user mode.

**clear ip dhcp binding** { \* | *ip-address* }

| Parameter          | Parameter         | Description                                        |
|--------------------|-------------------|----------------------------------------------------|
| <b>Description</b> | *                 | Deletes all DHCP bindings.                         |
|                    | <i>ip-address</i> | Deletes the binding of the specified IP addresses. |

**Defaults** N/A.

**Command Mode** Privileged EXEC mode.

**Usage Guide** This command can only clear the automatic DHCP binding, but the manual DHCP binding can be deleted by the **no ip dhcp pool** command.

**Configuration** The following example clears the DHCP binding with the IP address 192.168.12.100.

**Examples**

```
clear ip dhcp binding 192.168.12.100
```

## 4.8 clear ip dhcp server detect

Use this command to clear statistics about the fake DHCP server.

**clear ip dhcp server detect** { \* | *ip-address* }

| Parameter          | Parameter         | Description                                             |
|--------------------|-------------------|---------------------------------------------------------|
| <b>Description</b> | *                 | Clears statistics about all fake DHCP servers.          |
|                    | <i>ip-address</i> | Clears statistics about the specified fake DHCP server. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** The detected fake DHCP server addresses are saved on the server. You can use the **clear ip dhcp server detect** command to clear statistics about the fake DHCP server.

**Configuration** The following example clears statistics about all fake DHCP servers.

**Examples**

```
Ruijie#clear ip dhcp server detect *
```

**Description**

## 4.9 clear ip dhcp server rate

Use this command to clear statistics about the packet processing rate of every module.

**clear ip dhcp server rate**

| Parameter          | Parameter | Description |
|--------------------|-----------|-------------|
| <b>Description</b> | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command is used to clear statistics about the packet processing rate of every module, including arp, hot backup, lsm, and socket.

**Configuration** The following example clears statistics about the packet processing rate of every module.

**Examples** Ruijie# clear ip dhcp server rate

## 4.10 clear ip dhcp server statistics

Use this command to reset the counter of the DHCP server in the privileged user mode.

**clear ip dhcp server statistics**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** The DHCP server carries out the statistics counter, records the DHCP address pool, automatic binding, manual binding and expired binding. Furthermore, it also carries out the statistics to the number of sent and received DHCP messages. The **clear ip dhcp server statistics** command can be used to delete the history counter record and carry out the statistics starting from scratch.

**Configuration** The following example clears the statistics record of the DHCP server.

**Examples** clear ip dhcp server statistics

| Related Commands | Command                        | Description                                        |
|------------------|--------------------------------|----------------------------------------------------|
|                  | show ip dhcp server statistics | Displays the statistics record of the DHCP server. |

**Platform** N/A

**Description**

## 4.11 clear ip dhcp relay statistics

Use this command to clear the DHCP relay statistics.

**clear ip dhcp relay statistics**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** The DHCP relay is configured with the counter to count various packets received or transmitted by the relay. This command is used to clear the counters.

**Configuration** The following example clears the DHCP relay statistics.

**Examples** Ruijie# clear ip dhcp relay statistics

| Related Commands | Command | Description |

**Platform Description** N/A

## 4.12 client-identifier

Use this command to define the unique ID of the DHCP client (indicated in hex, separated by dot) in the DHCP address pool configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**client-identifier** *unique-identifier*

**no client-identifier**

**default client-identifier**

| Parameter   | Parameter                | Description                                                                                                                                |
|-------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>unique-identifier</i> | The DHCP client ID is indicated in hex and separated by dot, for instance, 0100.d0f8.2233.b467.6967.6162.6974.4574.6865.726e.6574.302f.31. |

**Defaults** N/A.

**Command** DHCP address pool configuration mode.

**Mode**

**Usage Guide** When some DHCP clients request the DHCP server to assign IP addresses, they use their client IDs rather than their hardware addresses. The client ID consists of media type, MAC addresses and interface name. For instance, the MAC address is 00d0.f822.33b4, the interface name is GigabitEthernet 0/1, and the corresponding client ID is 0100.d0f8.2233.b467.6967.6162.6974.4574.6865.726e.6574.302f.31, where, 01 denotes the type of the Ethernet media.

The 67.6967.6162.6974.4574.6865.726e.6574.302f.31 is the hex code of GigabitEthernet0/1. For the definition of the media code, refer to the Address Resolution Protocol Parameters section in RFC1700. This command is used only when the DHCP is defined by manual binding.

**Configuration Examples** The following example defines the client ID of the Ethernet DHCP client whose MAC address is 00d0.f822.33b4.

```
client-identifier
0100.d0f8.2233.b467.6967.6162.6974.4574.6865.726e.6574.302f.31
```

**Related Commands**

| Command                 | Description                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------|
| <b>hardware-address</b> | Defines the hardware address of DHCP client.                                                   |
| <b>host</b>             | Defines the IP address and network mask, which is used to configure the DHCP manual binding.   |
| <b>ip dhcp pool</b>     | Defines the name of the DHCP address pool and enters the DHCP address pool configuration mode. |

**Platform** N/A

**Description**

## 4.13 client-name

Use this command to define the name of the DHCP client in the DHCP address pool configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**client-name** *client-name*

**no client-name**

**default client-name**

**Parameter Description**

| Parameter   | Description                                                                                                                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client-name | Name of DHCP client, a set of standards-based ASCII characters. The name should not include the suffix domain name. For instance, you can define the name of the DHCP client as river, not river.i-net.com.cn. |

**Defaults** No client name is defined by default.

**Command Mode** DHCP address pool configuration mode.

**Usage Guide** This command can be used to define the name of the DHCP client only when the DHCP is defined by manual binding. This name should not include the suffix domain name.

**Configuration Examples** The following example defines a string river as the name of the client.

```
Ruijie(dhcp-config)# client-name river
```

| Related Commands | Command             | Description                                                                                    |
|------------------|---------------------|------------------------------------------------------------------------------------------------|
|                  | <b>host</b>         | Defines the IP address and network mask, which is used to configure the DHCP manual binding.   |
|                  | <b>ip dhcp pool</b> | Defines the name of the DHCP address pool and enters the DHCP address pool configuration mode. |

**Platform Description** N/A

### 4.14 default-router

Use this command to define the default gateway of the DHCP client in the DHCP address pool configuration mode. Use the **no** or **default** form of this command to restore the default setting.

```
default-router ip-address [ ip-address2...ip-address8 ]
no default-router
default default-router
```

| Parameter Description | Parameter                        | Description                                                                                   |
|-----------------------|----------------------------------|-----------------------------------------------------------------------------------------------|
|                       | <i>ip-address</i>                | Defines the IP address of the equipment. It is required to configure one IP address at least. |
|                       | <i>ip-address2...ip-address8</i> | (Optional) Up to 8 gateways can be configured.                                                |

**Defaults** No gateway is defined by default.

**Command Mode** DHCP address pool configuration mode.

**Usage Guide** In general, the DHCP client should get the information of the default gateway from the DHCP server. The DHCP server should specify one gateway address for the client at least, and this address should be of the same network segment as the address assigned to the client.

**Configuration Examples** The following example defines 192.168.12.1 as the default gateway.

```
default-router 192.168.12.1
```

| Related Commands | Command             | Description                                                                                    |
|------------------|---------------------|------------------------------------------------------------------------------------------------|
|                  | <b>ip dhcp pool</b> | Defines the name of the DHCP address pool and enters the DHCP address pool configuration mode. |

**Platform** N/A

**Description**

## 4.15 dns-server

Use this command to define the DNS server of the DHCP client in the DHCP address pool configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**dns-server** { *ip-address* [ *ip-address2*...*ip-address8* ]

**no dns-server**

**default dns-server**

| Parameter          | Parameter                                 | Description                                                                             |
|--------------------|-------------------------------------------|-----------------------------------------------------------------------------------------|
| <b>Description</b> | <i>ip-address</i>                         | Defines the IP address of the DNS server. At least one IP address should be configured. |
|                    | <i>ip-address2</i> ... <i>ip-address8</i> | (Optional) Up to 8 DNS servers can be configured.                                       |

**Defaults** No DNS server is defined by default.

**Command** DHCP address pool configuration mode.

**Mode**

**Usage Guide** When more than one DNS server is defined, the former will possess higher priority, so the DHCP client will select the next DNS server only when its communication with the former DNS server fails.

**Configuration** The following example specifies the DNS server 192.168.12.3 for the DHCP client.

**Examples**

```
Ruijie(dhcp-config)# dns-server 192.168.12.3
```

| Related Commands | Command                | Description                                                                                    |
|------------------|------------------------|------------------------------------------------------------------------------------------------|
|                  | <b>domain-name</b>     | Defines the suffix domain name of the DHCP client.                                             |
|                  | <b>ip address dhcp</b> | Enables the DHCP client on the interface to obtain the IP address information.                 |
|                  | <b>ip dhcp pool</b>    | Defines the name of the DHCP address pool and enters the DHCP address pool configuration mode. |

**Platform** N/A

**Description**

## 4.16 domain-name

Use this command to define the suffix domain name of the DHCP client in the DHCP address pool

configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**domain-name** *domain-name*

**no domain-name**

**default domain-name**

| Parameter   | Parameter          | Description                                               |
|-------------|--------------------|-----------------------------------------------------------|
| Description | <i>domain-name</i> | Defines the suffix domain name string of the DHCP client. |

**Defaults** No suffix domain name by default.

**Command** DHCP address pool configuration mode.

**Mode**

**Usage Guide** After the DHCP client obtains specified suffix domain name, it can access a host with the same suffix domain name by the host name directly.

**Configuration** The following example defines the suffix domain name i-net.com.cn for the DHCP client.

**Examples** Ruijie (dhcp-config) #domain-name ruijie.com.cn

| Related  | Command             | Description                                                                                   |
|----------|---------------------|-----------------------------------------------------------------------------------------------|
| Commands | <b>dns-server</b>   | Defines the DNS server of the DHCP client.                                                    |
|          | <b>ip dhcp pool</b> | Defines the name of the DHCP address pool and enter the DHCP address pool configuration mode. |

**Platform** N/A

**Description**

## 4.17 force-no-router

Use this command to cancel gateway allocation to the client. Use the **no** or **default** form of this command to restore the default setting.

**force-no-router**

**no force-no-router**

**default force-no-router**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command** DHCP address pool configuration mode

**Mode**

**Usage Guide** N/A

**Configuration** The following example cancels gateway allocation to the client.

**Examples** Ruijie (dhcp-config) # force-no-router

| Related  | Command | Description |
|----------|---------|-------------|
| Commands | N/A     | N/A         |

**Platform** N/A

**Description**

## 4.18 hardware-address

Use this command to define the hardware address of the DHCP client in the DHCP address pool configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**hardware-address** *hardware-address* [ *type* ]

**no hardware-address**

**default hardware-address**

| Parameter   | Parameter               | Description                                                                                                                                                                                                   |
|-------------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>hardware-address</i> | Define the MAC address of the DHCP client.                                                                                                                                                                    |
|             | <i>type</i>             | To indicate the hardware platform protocol of the DHCP client, use the string definition or digits definition.<br>String option:<br>Ethernet<br>ieee802<br>Digits option:<br>1 (10M Ethernet)<br>6 (IEEE 802) |

**Defaults** No hardware address is defined by default.

If there is no option when the hardware address is defined, it is the Ethernet by default.

**Command** DHCP address pool configuration mode.

**Mode**

**Usage Guide** This command can be used only when the DHCP is defined by manual binding.

**Configuration** The following example defines the MAC address 00d0.f838.bf3d with the type ethernet.

**Examples** hardware-address 00d0.f838.bf3d

| Related  | Command           | Description                                                |
|----------|-------------------|------------------------------------------------------------|
| Commands | client-identifier | Defines the unique ID of the DHCP client (Indicated by the |

|                       |                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------|
|                       | hexadecimal numeral, separated by dot).                                                       |
| <b>host</b>           | Defines the IP address and network mask, which is used to configure the DHCP manual binding.  |
| <b>ip dhcp pool</b>   | Defines the name of the DHCP address pool and enter the DHCP address pool configuration mode. |
| <b>default-router</b> | Defines the default route of the DHCP client.                                                 |

**Platform** N/A

**Description**

## 4.19 host

Use this command to define the IP address and network mask of the DHCP client host in the DHCP address pool configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**host** *ip-address* [ *netmask* ]

**no host**

**default host**

| Parameter          | Parameter         | Description                              |
|--------------------|-------------------|------------------------------------------|
| <b>Description</b> | <i>ip-address</i> | Defines the IP address of DHCP client.   |
|                    | <i>netmask</i>    | Defines the network mask of DHCP client. |

**Defaults** No IP address or network mask of the host is defined.

**Command** DHCP address pool configuration mode.

**Mode**

**Usage Guide** If the network mask is not defined definitely, the DHCP server will use the natural network mask of this IP address: 255.0.0.0 for class A IP address, 255.255.0 for class B IP address, and 255.255.255.0 for class C IP address.

This command can be used only when the DHCP is defined by manual binding.

**Configuration Examples** The following example sets the client IP address as 192.168.12.91, and the network mask as 255.255.255.240.

```
host 192.168.12.91 255.255.255.240
```

| Related Commands | Command                  | Description                                                                                    |
|------------------|--------------------------|------------------------------------------------------------------------------------------------|
|                  | <b>client-identifier</b> | Defines the unique ID of the DHCP client (Indicated in hex and separated by dot).              |
|                  | <b>hardware-address</b>  | Defines the hardware address of DHCP client.                                                   |
|                  | <b>ip dhcp pool</b>      | Defines the name of the DHCP address pool and enters the DHCP address pool configuration mode. |

|                       |                                              |                       |
|-----------------------|----------------------------------------------|-----------------------|
| <b>default-router</b> | Define the default route of the DHCP client. | <b>default-router</b> |
|-----------------------|----------------------------------------------|-----------------------|

**Platform** N/A

**Description**

## 4.20 ip address dhcp

Use this command to make the Ethernet interface or the PPP, HDLC and FR encapsulated interface obtain the IP address information by the DHCP in the interface configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**ip address dhcp**

**no ip address dhcp**

**default ip address dhcp**

| Parameter          | Parameter | Description |
|--------------------|-----------|-------------|
| <b>Description</b> | N/A       | N/A         |

**Defaults** The interface cannot obtain the IP address by the DHCP by default.

**Command** Interface configuration mode.

**Mode**

**Usage Guide** When requesting the IP address, the DHCP client of the RGOS software also requires the DHCP server provide 5 configuration parameter information: 1) DHCP option 1, client subnet mask, 2) DHCP option 3, it is the same as the gateway information of the same subnet, 3) DHCP option 6, the DNS server information, 4) DHCP option 15, the host suffix domain name, and 5) DHCP option 44, the WINS server information (optional).

The client of the RGOS software is allowed to obtain the address on the PPP, FR or HDL link by the DHCP, which should be supported by the server. At present, our server can support this function.

**Configuration** The following example makes the FastEthernet 0 port obtain the IP address automatically.

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if-GigabitEthernet 0/1) ip address dhcp
```

| Related         | Command             | Description                                                                                    |
|-----------------|---------------------|------------------------------------------------------------------------------------------------|
| <b>Commands</b> | <b>dns-server</b>   | Defines the DNS server of DHCP client.                                                         |
|                 | <b>ip dhcp pool</b> | Defines the name of the DHCP address pool and enters the DHCP address pool configuration mode. |

**Platform** N/A

**Description**

## 4.21 ip dhcp arp-probe

Use this command to check ARP entries of the local host to prevent IP address conflict of an STA configured with a static IP address. Use the **no** form of this command to disable the function. Use the **default** form of this command to restore the default setting.

**ip dhcp arp-probe**

**no ip dhcp arp-probe**

**default ip dhcp arp-probe**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** The ARP entry check function is disabled by default.

**Command Mode** Global configuration mode

**Default Level** 14

**Usage Guide** This function is a supplement to the ping conflict detection function. If there is an STA with a static IP address and L2 isolation in the environment and the ping conflict detection function becomes invalid (for example, the firewall is enabled on the STA), an STA that applies for a dynamic address may be assigned with this IP address, resulting in IP conflict.

This function can be enabled only in the preceding scenario. If ARP attack exists, this function cannot be enabled. Otherwise, the DHCP IP address assignment service is affected. As a result, it takes a long time for an STA to apply for an IP address or the STA cannot apply for an IP address.

**Configuration Examples** The following example enables the function in global configuration mode.

```
Ruijie(config)# ip dhcp arp-probe
```

**Verification** Run the **show run** command to check whether the configuration is successful.

## 4.22 ip dhcp class

Use this command to define a CLASS and enter the global CLASS configuration mode. Use the **no** form of this command to restore the default setting.

**ip dhcp class** *class-name*

**no ip dhcp class** *class-name*

| Parameter Description | Parameter         | Description                                                                |
|-----------------------|-------------------|----------------------------------------------------------------------------|
|                       | <i>class-name</i> | Class name, which can be character string or numeric such as myclass or 1. |

- Defaults** By default, the class is not configured.
- Command Mode** Global configuration mode.
- Usage Guide** After executing this command, it enters the global CLASS configuration mode which is shown as "Ruijie (config-dhcp-class)#". In this configuration mode, user can configure the Option82 information that matches the CLASS and the CLASS identification information.

**Configuration** The following example configures a global CLASS.

**Examples**

```
Ruijie(config)# ip dhcp class myclass
```

**Description**

## 4.23 ip dhcp excluded-address

Use this command to configure excluded IP address. Use the **no** or **default** form of this command to restore the default setting.

**ip dhcp excluded-address** *low-ip-address* [*high-ip-address*]

**no ip dhcp excluded-address** *low-ip-address* [*high-ip-address*]

**default ip dhcp excluded-address** *low-ip-address* [*high-ip-address*]

| Parameter Description | Parameter              | Description                   |
|-----------------------|------------------------|-------------------------------|
|                       | <i>low-ip-address</i>  | Indicates a start IP address. |
|                       | <i>high-ip-address</i> | Indicates an end IP address.  |

**Defaults** By default, the DHCP server assigns all IP addresses of the address pool.

**Command Mode** Global configuration mode.

**Usage Guide** Unless otherwise specified, a DHCP server assigns all the addresses from an IP address pool to DHCP clients. To reserve some addresses(e.g., addresses already assigned to the server or devices), you need to configure these addresses as excluded addresses. To configure a DHCP server, it is recommended to configure excluded addresses to avoid address conflict and shorten detection time during address assignment.

**Configuration** The following example configures 192.168.12.100~150 as excluded IP address.

**Examples**

```
Ruijie(config)#ip dhcp excluded-address 192.168.12.100 192.168.12.150
```

The following example restores the default setting.

```
Ruijie(config)#no ip dhcp excluded-address 192.168.12.100 192.168.12.150
```

**Description**

## 4.24 ip dhcp force-send-nak

Use this command to configure the forcible NAK packet sending function. Use the **no** or **default** form of this command to restore the default setting.

**ip dhcp force-send-nak**

**no ip dhcp force-send-nak**

**default ip dhcp force-send-nak**

| Parameter          | Parameter | Description |
|--------------------|-----------|-------------|
| <b>Description</b> | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Global configuration mode.

**Usage Guide** The DHCP client checks the previously used IP address every time it is started and sends a DHCPREQUEST packet to continue leasing this IP address. If the address is not available, the DHCP server sends an NAK packet to let the client resend a DHCPDISCOVER packet to apply for a new IP address. If no corresponding lease record can be found on the server, the client keeps sending DHCPDISCOVER packets.

**Configuration Examples** The following example enables the forcible NAK packet sending function in global configuration mode.

```
Ruijie(config)# ip dhcp force-send-nak
```

## 4.25 ip dhcp ping packets

Use this command to configure the times of pinging the IP address when the DHCP server detects address conflict in the global configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**ip dhcp ping packets** [ *number* ]

**no ip dhcp ping packets**

**default ip dhcp ping packets**

| Parameter          | Parameter     | Description                                                                                                                                            |
|--------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>number</i> | (Optional) Number of packets in the range of 0 to 10, where 0 indicates disabling the ping operation. The Ping operation sends two packets by default. |

**Defaults** The Ping operation sends two packets by default.

**Command Mode** Global configuration mode.

**Usage Guide** When the DHCP server attempts to assign the IP address from the DHCP address pool, use the ping operation to check whether this address is occupied by other hosts. Record it if the address is occupied, otherwise, assign it to the DHCP client. The Ping operation will send up to 10 packets, two packets by default.

**Configuration Examples** The following example sets the number of the packets sent by the ping operation as 3.

**Examples** Ruijie(config)# ip dhcp ping packets 3

| Related Commands | Command                       | Description                                                                                                                                                                                                                                           |
|------------------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <b>clear ip dhcp conflict</b> | Clears the DHCP history conflict record.                                                                                                                                                                                                              |
|                  | <b>ip dhcp ping packet</b>    | Configures the timeout time that the DHCP server waits for the Ping response. If all the ping packets are not responded within the specified time, it indicates that this IP address can be assigned. Otherwise, it will record the address conflict. |
|                  | <b>show ip dhcp conflict</b>  | Displays the DHCP server detects address conflict when it assigns an IP address.                                                                                                                                                                      |

**Platform** N/A

**Description**

## 4.26 ip dhcp ping timeout

Use this command to configure the timeout that the DHCP server waits for response when it uses the ping operation to detect the address conflict in the global configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**ip dhcp ping timeout** *milli-seconds*  
**no ip dhcp ping timeout**  
**default ip dhcp ping timeout**

| Parameter          | Parameter            | Description                                                                               |
|--------------------|----------------------|-------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>milli-seconds</i> | Time that the DHCP server waits for ping response in the range 100 to 10000 milliseconds. |

**Defaults** The default is 500 seconds.

**Command Mode** Global configuration mode.

**Usage Guide** This command defines the time that the DHCP server waits for a ping response packet.

**Configuration Examples** The following example configures the waiting time of the ping response packet to 600ms.

```
ip dhcp ping timeout 600
```

| Related Commands | Command                       | Description                                                                                                                                             |
|------------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <b>clear ip dhcp conflict</b> | Clears the DHCP history conflict record.                                                                                                                |
|                  | <b>ip dhcp ping packets</b>   | Defines the number of the data packets sent by the ping operation for the detection of the address conflict when the DHCP server assigns an IP address. |
|                  | <b>show ip dhcp conflict</b>  | Displays the address conflict the DHCP server detects when it assigns an IP address.                                                                    |

**Platform** N/A

**Description**

## 4.27 ip dhcp pool

Use this command to define a name of the DHCP address pool and enter the DHCP address pool configuration mode in the global configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**ip dhcp pool** *pool-name*  
**no ip dhcp pool** *pool-name*  
**default ip dhcp pool** *pool-name*

| Parameter          | Parameter        | Description                                                              |
|--------------------|------------------|--------------------------------------------------------------------------|
| <b>Description</b> | <i>pool-name</i> | A string of characters and positive integers, for instance, mypool or 1. |

**Defaults** No DHCP address pool is defined by default.

**Command** Global configuration mode.  
**Mode**

**Usage Guide** Execute the command to enter the DHCP address pool configuration mode:

```
Ruijie(dhcp-config)#
```

In this configuration mode, configure the IP address range, the DNS server and the default gateway.

**Configuration** The following example defines a DHCP address pool named mypool0.

**Examples**

```
Ruijie(config)#ip dhcp pool mypool0
```

## 4.28 ip dhcp relay check server-id

Use this command to enable the **ip dhcp relay check server-id** function. Use the **no** form of this command to restore the default setting.

**ip dhcp relay check server-id**

**no ip dhcp relay check server-id**

| Parameter          | Parameter | Description |
|--------------------|-----------|-------------|
| <b>Description</b> | N/A       | N/A         |

**Defaults** The **ip dhcp relay check server-id** command is disabled.

**Command** Global configuration mode.  
**Mode**

**Usage Guide** Switch will select the server to be sent according to server-id option when forwarding DHCP REQUEST via this command. Without this command configured, the switch forwards the DHCP REQUEST to all configured DHCP servers.

**Configuration** The following example enables the ip dhcp relay check server-id function.

**Examples**

```
Ruijie(config)# ip dhcp relay check server-id
```

The following example disables the ip-dhcp relay check server-id function.

```
Ruijie(config)# no ip dhcp relay check server-id
```

## 4.29 ip dhcp relay information option82

Use this command to enable the **ip dhcp relay information option82** function. Use the **no** form of this command to restore the default setting.

**ip dhcp relay information option82**

**no ip dhcp relay information option82**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** The **ip dhcp relay information option82** command is disabled.

**Command** Global configuration mode.

**Mode**

**Usage Guide** This command is exclusive with the **option dot1x** command.

**Configuration** The following example enables the option82 function on the DHCP relay.

**Examples**

```
Ruijie(config)# Ip dhcp relay information option82
```

The following example disables the option82 function on the DHCP relay.

```
Ruijie(config)# no ip dhcp relay information option82
```

## 4.30 ip dhcp relay suppression

Use this command to enable the DHCP binding globally. Use the **no** form of this command to disable the DHCP binding globally and enable the **DHCP relay** suppression on the port.

**ip dhcp relay suppression**  
**no ip dhcp relay suppression**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** The **ip dhcp relay suppression** command is disabled.

**Command** Interface configuration mode.

**Mode**

**Usage Guide** After executing this command, the system will not relay the DHCP request message on the interface.

**Configuration** The following example enables the relay suppression function.

**Examples**

```
Ruijie(config-if)# ip dhcp relay suppression
```

The following example enables the relay suppression function.

```
Ruijie(config-if)# no ip dhcp relay suppression
```

## 4.34 ip helper-address

Use this command to add an IP address of the DHCP server. Use the **no** form of this command to delete an IP address of the DHCP server.

The server address can be configured globally or on a specific interface. Therefore, this command can run in the global configuration mode or the interface configuration mode to add the DHCP server information.

**ip helper-address { cycle-mode | [ vrf {vrf-name}] A.B.C.D }**

**no ip helper-address { cycle-mode | [ vrf {vrf-name}] A.B.C.D }**

|                    |                                                                                                                                                |                                                                        |

| <b>Parameter</b>   | <b>Parameter</b>                                                                                                                               | <b>Description</b>                                                     |
| <b>Description</b> | <b>cycle-mode</b>                                                                                                                              | Indicates that DHCP request packets are forwarded to all DHCP servers. |
|                    | <b>vrf {vrf-name}</b>                                                                                                                          | Indicates a VPN Routing & Forwarding (VRF) name.                       |
|                    | <b>A.B.C.D</b>                                                                                                                                 | Indicates the IP address of a DHCP server.                             |
| <b>Defaults</b>    | N/A                                                                                                                                            |                                                                        |
| <b>Command</b>     | Global configuration mode, interface configuration mode.                                                                                       |                                                                        |
| <b>Mode</b>        |                                                                                                                                                |                                                                        |
| <b>Usage Guide</b> | DHCP request packets are sent to the DHCP server whose IP address is configured, while DHCP response packets are forwarded to the DHCP client. |                                                                        |

Up to 20 DHCP server IP addresses can be configured globally or on a layer-3 interface. When an interface receives a DHCP request packet, the DHCP server configuration on the interface prevails over that configured globally. If the interface is not configured with DHCP server addresses, the global configuration takes effect.

DHCP relay is based on vrf.

In global configuration mode, you can enable **cycle-mode**. When it is enabled, DHCP request packets are forwarded to all DHCP servers. If it is not enabled, DHCP request packets are sent to the first DHCP server configured under this rule. This parameter can only be enabled in global configuration mode and take effect both globally and on interfaces. By default, **cycle-mode** is enabled.

**Configuration** The following example sets the address for a DHCP server, in the interface vlan 1, to 192.168.11.1.

**Examples**

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# interface vlan 1
Ruijie(config-if)# ip helper-address 192.168.11.1
```

The following example deletes the configured address of a DHCP server, 192.168.11.1.

```
Ruijie(config-if)# no ip helper-address 192.168.11.1
```

The following example sets the IP address for the global server to 192.168.100.1.

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# ip helper-address 192.168.100.1
```

The following example deleted the configured IP address for the global server, 192.168.100.1.

```
Ruijie(config)# no ip helper-address 192.168.100.1
```

The following example enables DHCP request packets to be forwarded to all servers.

```
Ruijie(config)# ip helper-address cycle-mode
```

The following example disables DHCP request packets to be forwarded to all servers.

```
Ruijie(config)# no ip helper-address cycle-mode
```

**Description**

## 4.35 lease

Use this command to define the lease time of the IP address that the DHCP server assigns to the client in the DHCP address pool configuration mode. Use the **no** or **default** form of this command to restore the default setting. A limited lease time ranges from 1 minute to 23 hours and 59 minutes.

**lease** { *days* [ *hours* ] [ *minutes* ] | **infinite** }

**no lease**

**default lease**

| Parameter   | Parameter       | Description                                                                                                 |
|-------------|-----------------|-------------------------------------------------------------------------------------------------------------|
| Description | <i>days</i>     | Lease time in days                                                                                          |
|             | <i>hours</i>    | (Optional) Lease time in hours. It is necessary to define the days before defining the hours.               |
|             | <i>minutes</i>  | (Optional) Lease time in minutes. It is necessary to define the days and hours before defining the minutes. |
|             | <b>infinite</b> | Infinite lease time.                                                                                        |

**Defaults** The lease time for a static address pool is infinite. The lease time for other address pools is 1 day.

**Command** DHCP address pool configuration mode.

**Mode**

**Usage Guide** When the lease is getting near to expire, the DHCP client will send the request of renewal of lease. In general, the DHCP server will allow the renewal of lease of the original IP address.

**Configuration** The following example sets the DHCP lease to 1 hour.

**Examples**

```
Ruijie(dhcp-config)# lease 0 1
```

The following example sets the DHCP lease to 1 minute.

```
Ruijie(dhcp-config)# lease 0 0 1
```

**Description**

## 4.36 lease-threshold

Use this command in DHCP address pool configuration mode to define the DHCP alarm threshold. Use the **default** or **no** form of this command to restore the default setting.

**lease-threshold** *percentage*

**default lease-threshold****no lease-threshold**

| Parameter   | Parameter         | Description                                                      |
|-------------|-------------------|------------------------------------------------------------------|
| Description | <i>percentage</i> | Usage of the address pool, ranging from 60 to 100 in percentage. |

**Defaults** 90**Command** DHCP address pool configuration mode.**Mode**

**Usage Guide** If the maximum IP usage of the address pool reaches the threshold, the DHCP Server generates a SYSLOG alarm. The IP usage indicates the ratio of the number of assigned address pools to the total number of assignable address pools. If the number of assigned pools stays above the alarm threshold, an alarm is generated every 5 minutes.

**Configuration** The following example sets the alarm threshold to 80%.**Examples** Ruijie(dhcp-config)# lease-threshold 80

The following example disables the address pool alarm function.

Ruijie(dhcp-config)# no lease-threshold

| Related Commands | Command             | Description                                                                                    |

## 4.37 match ip

Use this command to define an AM matching rule.

Use the **no** form of this command to remove the configuration.

Use the clear form of this command to clear all configurations.

**match ip** ip-address netmask [interface] [**add/remove**] vlan vlan-list**no match ip** ip-address netmask [interface] [**add/remove**] vlan vlan-list**clear match ip** [interface]

| Parameter   | Parameter         | Description                         |
|-------------|-------------------|-------------------------------------|
| Description | <i>ip-address</i> | IP address                          |
|             | <i>netmask</i>    | Subnet mask                         |
|             | <i>interface</i>  | Interface ID                        |
|             | <i>add/remove</i> | Adds or removes the specified VLAN. |

|                  |         |
|------------------|---------|
| <i>vlan-list</i> | VLAN ID |
|------------------|---------|

**Defaults** N/A

**Command Mode** AM rule configuration mode

**Usage Guide** With this function enabled, all DHCP clients with specified *vlan-list* and interface obtain addresses in the rule.  
If a DHCP client obtains a static address, it is not subject to AM matching rules in whichever Sub VLAN unless the AM rule configuration is based on VLAN instead of Sub VLAN. This type of matching rules applies to only static addresses.

**Configuration** The following example defines an AM matching rule.

**Examples**

```
Ruijie (config-address-manage) #match ip 192.168.11.0 255.255.255.0
GigabitEthernet 0/10 vlan 10
```

**Platform Description** N/A

## 4.38 match ip default

Use this command to define a default AM matching rule.  
Use the no form of this command to remove the configuration,  
**match ip default ip-address netmask**  
**no match ip default ip-address netmask**

| Parameter Description | Parameter         | Description |
|-----------------------|-------------------|-------------|
|                       | <i>ip-address</i> | IP address  |
|                       | <i>netmask</i>    | Subnet mask |

**Defaults** N/A

**Command Mode** AM rule configuration mode

**Usage Guide** With this function enabled, all DHCP clients with specified *vlan-list* and interface obtain addresses in the default rule.

**Configuration** The following example defines a default AM matching rule.

**Examples** `Ruijie (config-address-manage) #match ip default 192.168.12.0 255.255.255.0`

| Related Commands | Command | Description |

### 4.39 netbios-name-server

Use this command to configure the WINS name server of the Microsoft DHCP client NETBIOS in the DHCP address pool configuration mode. The **no** or **default** form of this command can be used to restore the default setting.

**netbios-name-server** *ip-address* [ *ip-address2...ip-address8* ]

**no netbios-name-server**

**default netbios-name-server**

| Parameter Description | Parameter                        | Description                                                                         |
|-----------------------|----------------------------------|-------------------------------------------------------------------------------------|
|                       | <i>ip-address</i>                | IP address of the WINS server. It is required to configure one IP address at least. |
|                       | <i>ip-address2...ip-address8</i> | (Optional) IP addresses of WINS servers. Up to 8 WINS servers can be configured.    |

**Defaults** No WINS server is defined by default.

**Command Mode** DHCP address pool configuration mode.

**Usage Guide** When more than one WINS server is defined, the former has higher priority. The DHCP client will select the next WINS server only when its communication with the former WINS server fails.

**Configuration Examples** The following example specifies the WINS server 192.168.12.3 for the DHCP client.

```
netbios-name-server 192.168.12.3
```

| Related Commands | Command                  | Description                                                                                   |
|------------------|--------------------------|-----------------------------------------------------------------------------------------------|
|                  | <b>ip address dhcp</b>   | Enables the DHCP client on the interface to obtain the IP address.                            |
|                  | <b>ip dhcp pool</b>      | Defines the name of the DHCP address pool and enter the DHCP address pool configuration mode. |
|                  | <b>netbios-node-type</b> | Defines the netbios node type of the client host.                                             |

**Platform Description** N/A

## 4.40 netbios-node-type

Use this command to define the node type of the master NetBIOS of the Microsoft DHCP client in the DHCP address configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**netbios-node-type** *type*

**no netbios-node-type**

**default netbios-node-type**

| Parameter   | Parameter   | Description                                                                                                                                                                                                                                                                                        |
|-------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>type</i> | Type of node in two modes:<br>Digit in hexadecimal form in the range of 0 to FF. Only the following numerals are available:<br>1: b-node.<br>2: p-node.<br>4: m-node.<br>8: h-node.<br>String:<br>b-node: broadcast node<br>p-node: peer-to-peer node<br>m-node: mixed node<br>h-node: hybrid node |

**Defaults** No type of the NetBIOS node is defined by default.

**Command Mode** DHCP address pool configuration mode.

**Usage Guide** There are 4 types of the NetBIOS nodes of the Microsoft DHCP client: 1) Broadcast, which carries out the NetBIOS name resolution by the broadcast method, 2) Peer-to-peer, which directly requests the WINS server to carry out the NetBIOS name resolution, 3) Mixed, which requests the name resolution by the broadcast method firstly, and then carry out the name resolution by the WINS server connection, 4) Hybrid, which requests the WINS server to carry out the NetBIOS name resolution firstly, and it will carry out the NetBIOS name resolution by the broadcast method if the response is not received.  
By default, the node type for Microsoft operating system is broadcast or hybrid. If the WINS server is not configured, broadcast node is used. Otherwise, hybrid node is used. It is recommended to set the type of the NetBIOS node as Hybrid.

**Configuration Examples** The following example sets the NetBIOS node of Microsoft DHCP client as Hybrid.

```
Ruijie(dhcp-config)# netbios-node-type h-node
```

**Description**

## 4.41 network

Use this command to define the network number and network mask of the DHCP address pool in the DHCP address pool configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**network** *net-number net-mask* [*low-ip-address high-ip-address* ]

**no network**

**default network**

| Parameter          | Parameter              | Description                                                                                                                  |
|--------------------|------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>net-number</i>      | Network number of the DHCP address pool                                                                                      |
|                    | <i>net-mask</i>        | Network mask of the DHCP address pool. If the network mask is not defined, the natural network mask will be used by default. |
|                    | <i>low-ip-address</i>  | Start IP address.                                                                                                            |
|                    | <i>high-ip-address</i> | End IP address.                                                                                                              |

**Defaults** No network number or network mask is defined by default.

**Command** DHCP address pool configuration mode.

**Mode**

**Usage Guide** This command defines the subnet and subnet mask of a DHCP address pool, and provides the DHCP server with an address space which can be assigned to the clients. Unless excluded addresses are configured, all the addresses of the DHCP address pool can be assigned to the clients. The DHCP server assigns the addresses in the address pool orderly. If the DHCP server found an IP address is in the DHCP binding table or in the network segment, it checks the next until it assigns an effective IP address.

The **show ip dhcp binding** command can be used to view the address assignment, and the **show ip dhcp conflict** command can be used to view the address conflict detection configuration.

**Configuration Examples** The following example defines the network number of the DHCP address pool as 192.168.12.0, and the network mask as 255.255.255.240.

```
network 192.168.12.0 255.255.255.240
```

| <b>ip dhcp pool</b> | Defines the name of the DHCP address pool and enters the DHCP address pool configuration mode. |

**Platform** N/A

**Description**

## 4.42 next-server

Use this command to define the startup sever list that the DHCP client accesses during startup in the DHCP address configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**next-server** *ip-address* [ *ip-address2...ip-address8* ]

**no next-server**

**default next-server**

| Parameter          | Parameter                        | Description                                                                                                                          |
|--------------------|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>ip-address</i>                | Defines the IP address of the startup server, which is usually the TFTP server. It is required to configure one IP address at least. |
|                    | <i>ip-address2...ip-address8</i> | (Optional) Up to 8 startup servers can be configured.                                                                                |

**Defaults** N/A

**Command** DHCP address pool configuration mode.

**Mode**

**Usage Guide** When more than one startup server is defined, the former will possess higher priory. The DHCP client will select the next startup server only when its communication with the former startup server fails.

**Configuration** The following example specifies the startup server 192.168.12.4 for the DHCP client.

**Examples**

```
Ruijie(dhcp-config)# next-server 192.168.12.4
```

| Related         | Command                | Description                                                                                   |
|-----------------|------------------------|-----------------------------------------------------------------------------------------------|
| <b>Commands</b> | <b>bootfile</b>        | Defines the default startup mapping file name of the DHCP client.                             |
|                 | <b>ip dhcp pool</b>    | Defines the name of the DHCP address pool and enter the DHCP address pool configuration mode. |
|                 | <b>ip help-address</b> | Defines the Helper address on the interface.                                                  |
|                 | <b>option</b>          | Configures the option of the RGOS software DHCP server.                                       |

**Platform** N/A

**Description**

## 4.43 option

Use this command to configure the option of the DHCP server in the DHCP address pool configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**option** *code* { **ascii** *string* | **hex** *string* | **ip** *ip-address* }

**no option**

**default option**

| Parameter Description | Parameter                   | Description                    |
|-----------------------|-----------------------------|--------------------------------|
|                       | <i>code</i>                 | Defines the DHCP option codes. |
|                       | <b>ascii</b> <i>string</i>  | Defines an ASCII string.       |
|                       | <b>hex</b> <i>string</i>    | Defines a hex string.          |
|                       | <b>ip</b> <i>ip-address</i> | Defines an IP address list.    |

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** The DHCP provides a mechanism to transmit the configuration information to the host in the TCP/IP network. The DHCP message has a variable option field that can be defined according to the actual requirement. The DHCP client needs to carry the DHCP message with 32 bytes of option information at least. Furthermore, the fixed data field in the DHCP message is also referred to as an option. For the definition of current DHCP option, refer to RFC 2131.

**Configuration Examples** The following example defines the option code 19, which determines whether the DHCP client can enable the IP packet forwarding. 0 indicates to disable the IP packet forwarding, and 1 indicates to enable the IP packet forwarding. The configuration below enable the IP packet forwarding on the DHCP client.

```
Ruijie(dhcp-config)# option 19 hex 1
```

The following example defines the option code 33, which provides the DHCP client with the static route information. The DHCP client will install two static routes: 1) the destination network 172.16.12.0 and the gateway 192.168.12.12, 2) the destination network 172.16.16.0 and the gateway 192.168.12.16.

```
option 33 ip 172.16.12.0 192.168.12.12 172.16.16.0 192.168.12.16
```

| Related Commands | Command             | Description                                                                                    |
|------------------|---------------------|------------------------------------------------------------------------------------------------|
|                  | <b>ip dhcp pool</b> | Defines the name of the DHCP address pool and enters the DHCP address pool configuration mode. |

**Platform** N/A

**Description**

## 4.44 pool-status

Use this command to enable or disable the DHCP address pool.

**pool-status { enable | disable }**

| Parameter          | Parameter      | Description                |
|--------------------|----------------|----------------------------|
| <b>Description</b> | <b>enable</b>  | Enables the address pool.  |
|                    | <b>disable</b> | Disables the address pool. |

**Defaults** By default, the address pool is enabled after it is configured.

**Command Mode** DHCP address pool configuration mode

**Usage Guide** This command is configured on the DHCP server.

**Configuration** The following example disables the address pool.

**Examples** Ruijie (dhcp-config) # pool-status disable

**Description**

## 4.45 relay agent information

Use this command to enter the Option82 matching information configuration mode in the global CLASS configuration mode. Use the **no** form of this command to delete the Option82 matching information of the CLASS.

**relay agent information**

**no relay agent information**

| Parameter          | Parameter | Description |
|--------------------|-----------|-------------|
| <b>Description</b> | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Global CLASS configuration mode

**Usage Guide** After executing this command, it enters the Option82 matching information configuration mode which is shown as "Ruijie (config-dhcp-class-relayinfo)#".  
In this configuration mode, user can configure the class matching multiple Option82 information.

**Configuration Examples** The following example configures a global CLASS and enters the Option82 matching information configuration mode.

```
Ruijie(config)# ip dhcp class myclass
Ruijie(config-dhcp-class)# relay agent information
Ruijie(config-dhcp-class-relayinfo)#
```

| Related Commands | Command              | Description                                                     |
|------------------|----------------------|-----------------------------------------------------------------|
|                  | <b>ip dhcp class</b> | Defines a CLASS and enters the global CLASS configuration mode. |

**Platform** N/A  
**Description**

### 4.46 relay-information hex

Use this command to enter the Option82 matching information configuration mode. Use the **no** form of this command to delete a piece of matching information.

**relay-information hex** *aabb.ccdd.eeff...* [ \* ]  
**no relay-information hex** *aabb.ccdd.eeff...* [ \* ]

| Parameter Description | Parameter                   | Description                                                                                                                                                             |
|-----------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>aabb.ccdd.eeff...[*]</i> | Hexadecimal Option82 matching information. The "*" symbol means partial matching which needs the front part matching only. Without the "*" means needing full matching. |

**Defaults** N/A

**Command Mode** Global CLASS configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example configures a global CLASS which can match multiple Option82 information.

```
Ruijie(config)# ip dhcp class myclass
Ruijie(config-dhcp-class)# relay agent information
Ruijie(config-dhcp-class-relayinfo)# relay-information
hex 0102256535
Ruijie(config-dhcp-class-relayinfo)# relay-information
hex 010225654565
Ruijie(config-dhcp-class-relayinfo)# relay-information
hex 060225654565
```

```
Ruijie(config-dhcp-class-relayinfo)# relay-information
hex 060223*
```

|------------------|--------------------------------|----------------------------------------------------------------|
|                  | <b>ip dhcp class</b>           | Defines a CLASS and enter the global CLASS configuration mode. |
|                  | <b>relay agent information</b> | Enters the Option82 matching information configuration mode.   |

**Platform** N/A

**Description**

## 4.47 remark

Use this command to configure the identification which is used to describe the CLASS in this global CLASS configuration mode. Use the **no** form of this command to delete the identification.

**remark** *class-remark*

**no remark**

| Parameter Description | Parameter    | Description                                                                                    |
|-----------------------|--------------|------------------------------------------------------------------------------------------------|
|                       | class-remark | Information used to identify the CLASS, which can be the character strings with space in them. |

**Defaults** N/A.

**Command Mode** Global CLASS configuration mode.

**Usage Guide** N/A

**Configuration Examples** The following example configures the identification information for a global CLASS.

```
Ruijie(config)# ip dhcp class myclass
Ruijie(config-dhcp-class)# remark used in #1 build
```

| Related Commands | Command              | Description                                                    |
|------------------|----------------------|----------------------------------------------------------------|
|                  | <b>ip dhcp class</b> | Defines a CLASS and enter the global CLASS configuration mode. |

**Platform** N/A

**Description**

## 4.48 service dhcp

Use this command to enable the DHCP server and the DHCP relay on the device in global configuration mode. Use the **no** or **default** form of this command to restore the default setting.

**service dhcp**

**no service dhcp**  
**default service dhcp**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** The **service dhcp** command is disabled.

**Command Mode** Global configuration mode

**Usage Guide** The DHCP server can assign the IP addresses to the clients automatically, and provide them with the network configuration information such as DNS server and default gateway. The DHCP relay can forward the DHCP requests to other servers, and the returned DHCP responses to the DHCP client, serving as the relay for DHCP packets.

**Configuration Examples** The following example enables the DHCP server and the DHCP relay feature.

```
Ruijie(config)# service dhcp
```

| Related Commands | Command                                  | Description                                                 |
|------------------|------------------------------------------|-------------------------------------------------------------|
|                  | <b>show ip dhcp server statistics</b>    | Displays various statistics information of the DHCP server. |
|                  | <b>ip helper-address [ vrf ] A.B.C.D</b> | Adds an IP address of the DHCP server.                      |

**Platform Description** N/A

## 4.49 show dhcp lease

Use this command to display the lease information of the IP address obtained by the DHCP client.

**show dhcp lease**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** If the IP address is not defined, display the binding condition of all addresses. If the IP address is defined, display the binding condition of this IP address.

**Configuration** The following example displays the result of the show dhcp lease.

**Examples**

```
Ruijie# show dhcp lease
Temp IP addr: 192.168.5.71 for peer on Interface: FastEthernet0/0
Temp sub net mask: 255.255.255.0
  DHCP Lease server: 192.168.5.70, state: 3 Bound
  DHCP transaction id: 168F
  Lease: 600 secs, Renewal: 300 secs, Rebind: 525 secs
Temp default-gateway addr: 192.168.5.1
Next timer fires after: 00:04:29
Retry count: 0 Client-ID: redgaint-00d0.f8fb.5740-Fa0/0
```

## 4.50 show ip dhcp binding

Use this command to display the binding condition of the DHCP address.

**show ip dhcp binding** [ *ip-address* ]

**Parameter  
Description**

| Parameter         | Description                                                                   |
|-------------------|-------------------------------------------------------------------------------|
| <i>ip-address</i> | (Optional) Only displays the binding condition of the specified IP addresses. |

**Defaults**

N/A

**Command  
Mode**

Privileged EXEC mode.

**Usage Guide**

If the IP address is not defined, show the binding condition of all addresses. If the IP address is defined, show the binding condition of this IP address

**Configuration**

The following is the result of the show ip dhcp binding.

**Examples**

```
Ruijie# show ip dhcp binding
Total number of clients   : 4
Expired clients           : 3
Running clients           : 1

IP address      Hardware address      Lease expiration      Type
20.1.1.1        2000.0000.2011      000 days 23 hours 59 mins  Automatic
```

The meaning of various fields in the show result is described as follows.

| Field                                  | Description                                                                                                                                                                                                           |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP address                             | The IP address to be assigned to the DHCP client.                                                                                                                                                                     |
| Client-Identifier<br>/Hardware address | The client identifier or hardware address of the DHCP client.                                                                                                                                                         |
| Lease expiration                       | The expiration date of the lease. The Infinite indicates it is not limited by the time. The IDLE indicates the address is in the free status currently for it is not renewed or the DHCP client releases it actively. |
| Type                                   | The type of the address binding. The Automatic indicates an IP address is assigned automatically, and the Manual indicates an IP address is assigned by manual.                                                       |

| Related Commands | Command                      | Description                            |

|                  | <b>clear ip dhcp binding</b> | Clears the DHCP address binding table. |

**Platform** N/A  
**Description**

## 4.51 show ip dhcp conflict

Use this command to show the conflict history record of the DHCP sever.

**show ip dhcp conflict**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** This command can display the conflict address list detected by the DHCP server.

**Configuration Examples** The following example displays the output result of the **show ip dhcp conflict** command.

```
Ruijie# show ip dhcp conflict
IP address  Detection Method
192.168.12.1 Ping
```

The meaning of various fields in the show result is described as follows.

| Field            | Description                                                   |
|------------------|---------------------------------------------------------------|
| IP address       | The IP addresses which cannot be assigned to the DHCP client. |
| Detection Method | The conflict detection method.                                |

| Related  | Command                       | Description                      |
|----------|-------------------------------|----------------------------------|
| Commands | <b>clear ip dhcp conflict</b> | Clears the DHCP conflict record. |

**Platform** N/A

**Description**

## 4.52 show ip dhcp database

Use this command to display backup status of DHCP database.

**show ip dhcp database**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command** Privileged EXEC mode.

**Mode**

**Usage Guide** This command is configured on the DHCP server. Run this command to display information about the DHCP database.

**Configuration** The following example displays status of the DHCP database..

**Examples**

```
Ruijie#show ip dhcp database
Enable           :No
Status           :ready
Save File        :Default
Successs         :0
Failures         :0
Interval Time    :86400
```

The meaning of various fields in the show result is described as follows.

| Field     | Description                          |
|-----------|--------------------------------------|
| Enable    | The status of the database.          |
| Status    | The status of data recovery.         |
| Save File | The path where data is saved.        |
| Successs  | The times of successful data saving. |
| Failures  | The times of failed data saving.     |

|               |                                    |
|---------------|------------------------------------|
| Interval Time | The interval time for data saving. |
|---------------|------------------------------------|

### 4.53 show ip dhcp history

Use this command to display the DHCP lease history.

**show ip dhcp history**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command is configured on the DHCP server.

**Configuration Examples** The following example displays the DHCP lease history.

```
Ruijie#show ip dhcp history
Expired clients          : 3
IP address              Hardware address      Lease expiration      Vlan/Relay
10.1.1.5                2222.abcd.47ac      IDLE                  4097
10.1.1.4                2222.abcd.47ae      IDLE                  4097
10.1.1.3                2222.abcd.47ad      IDLE                  4097
Running clients         : 0
```

### 4.54 show ip dhcp identifier

Use this command to display the DHCP address pool ID and address usage.

**show ip dhcp identifier**

| Parameter    | Parameter            | Description |
|--------------|----------------------|-------------|
| Description  | N/A                  | N/A         |
| Defaults     | N/A                  |             |
| Command Mode | Privileged EXEC mode |             |
| Usage Guide  | N/A                  |             |

**Configuration** The following example displays the DHCP address pool ID and address usage.

**Examples**

```
Ruijie# show ip dhcp identifier
```

| Pool name | Identifier | Total | Distributed | Remained |
|-----------|------------|-------|-------------|----------|
| wwp       | 597455782  | 65533 | 0           | 65533    |

|             |                                |
|-------------|--------------------------------|
| Pool name   | Address pool name.             |
| Identifier  | Address pool ID.               |
| Total       | Total number of addresses.     |
| Distributed | Number of allocated addresses. |
| Remained    | Number of remained addresses.  |

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 4.55 show ip dhcp pool

Use this command to display the address statistics of an address pool.

**show ip dhcp pool** [ *poolname* ]

| Parameter   | Parameter       | Description                                                           |
|-------------|-----------------|-----------------------------------------------------------------------|
| Description | <i>poolname</i> | (Optional) Address pool whose address statistics are to be displayed. |

**Defaults** Privileged EXEC mode.

**Command Mode** N/A

**Usage Guide** Use this command to show the address statistics of an address pool.

**Configuration** The following example displays the output result of the **show ip dhcp pool *poolname*** command.

**Examples**

```
Ruijie# show ip dhcp pool
Ruijie#sh ip dh pool
Pool name      Total      Distributed  Remained    Percentage
-----
net20          253        11           242         4.34782
test           0          0            0           0.00000
```

**Related  
Commands**

| Command      | Description                                                                                    |
|--------------|------------------------------------------------------------------------------------------------|
| ip dhcp pool | Defines the name of the DHCP address pool and enters the DHCP address pool configuration mode. |

**Platform** N/A

**Description**

## 4.56 show ip dhcp relay-statistics

Use this command to display the statistics of the DHCP relay.

**show ip dhcp relay-statistics**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** N/A

**Command  
Mode** Privileged EXEC mode

**Usage Guide** This command is used to display the statistics of the DHCP relay.

**Configuration** The following example displays the statistics of the DHCP relay.

**Examples**

```
Ruijie# show ip dhcp relay-statistics
Cycle mode          0

Message            Count
Discover            0
Offer               0
Request             0
Ack                 0
Nak                 0
Decline             0
Release             0
Info                0
Bad                 0
```

| Direction     | Count |
|---------------|-------|
| Rx client     | 0     |
| Rx client uni | 0     |
| Rx client bro | 0     |
| Tx client     | 0     |
| Tx client uni | 0     |
| Tx client bro | 0     |
| Rx server     | 0     |
| Tx server     | 0     |

## 4.57 show ip dhcp server detect

Use this command to display the fake DHCP server detected.

**show ip dhcp server detect**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration Examples** The following example displays the fake DHCP server detected.

```
Ruijie#show ip dhcp server detect
The DHCP Server information:
Server IP = 10.1.10.40, DHCP server interface = GigabitEthernet 0/1
```

## 4.58 show ip dhcp server statistics

Use this command to display the statistics of the DHCP server.

**show ip dhcp server statistics**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command** Privileged EXEC mode

**Mode**

**Usage Guide** This command displays the statistics of the DHCP server.

**Configuration** The following example displays the output result of the **show ip dhcp server statistics** command.

### Examples

```
Ruijie# show ip dhcp server statistics
Address pools          2
Lease counter         4
Active Lease Counter   0
Expired Lease Counter  4
Malformed messages    0
Dropped messages      0

Message                Received
BOOTREQUEST            216
DHCPDISCOVER           33
DHCPREQUEST            25
DHCPDECLINE            0
DHCPRELEASE            1
DHCPINFORM             150

Message                Sent
BOOTREPLY              16
DHCPOFFER              9
DHCPACK                7
DHCPNAK                0
DHCPREQUESTTIMES      0
DHCPREQUESTSUCTIMES   0
DISCOVER-PROCESS-ERROR 0
LEASE-IN-PINGSTATE     0
NO-LEASE-RESOURCE     0
SERVERID-NO-MATCH     0
```

```
-----
recv                0
send                0
```

The meaning of various fields in the show result is described as follows.

| Field                    | Description                                                               |
|--------------------------|---------------------------------------------------------------------------|
| Address pools            | Number of address pools.                                                  |
| Automatic bindings       | Number of automatic address bindings.                                     |
| Manual bindings          | Number of manual address bindings.                                        |
| Expired bindings         | Number of expired address bindings.                                       |
| Malformed messages       | Number of malformed messages received by the DHCP.                        |
| Message Received or Sent | Number of the messages received and sent by the DHCP server respectively. |

| Related Commands | Command                                | Description                        |

## 4.59 show ip dhcp socket

Use this command to display the socket used by the DHCP server.

**show ip dhcp socket**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration Examples** The following example displays the socket used by the DHCP server.

```
ruijie#show ip dhcp socket
dhcp socket = 47.
```

## 5 DHCPv6 Commands

### 5.1 clear ipv6 dhcp binding

Use this command to clear the DHCPv6 binding information.

**clear ipv6 dhcp binding** [ *ipv6-address* ]

| Parameter   | Parameter           | Description                          |
|-------------|---------------------|--------------------------------------|
| Description | <i>ipv6-address</i> | Sets the IPv6 address or the prefix. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** If the *ipv6-address* is not specified, all DHCPv6 binding information is cleared. If the *ipv6-address* is specified, the binding information for the specified address is cleared.

**Configuration Examples** The following example clears the DHCPv6 binding information:

```
Ruijie(config)# clear ipv6 dhcp binding
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

### 5.2 clear ipv6 dhcp client

Use this command to reset the DHCPv6 client.

**clear ipv6 dhcp client***interface-type interface-number*

| Parameter   | Parameter                                        | Description                                       |
|-------------|--------------------------------------------------|---------------------------------------------------|
| Description | <i>interface-type</i><br><i>interface-number</i> | Sets the interface type and the interface number. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command is used to reset the DHCPv6 client, which may lead the client to request for the configurations from the server again.

**Configuration** The following example resets DHCP client VLAN 1.

**Examples**

```
Ruijie# clear ipv6 dhcp client vlan 1
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform** N/A

**Description**

### 5.3 clear ipv6 dhcp conflict

Use this command to clear the DHCPv6 address conflicts.

**clear ipv6 dhcp conflict** { *ipv6-address* | \* }

| Parameter          | Parameter           | Description                       |
|--------------------|---------------------|-----------------------------------|
| <b>Description</b> | <i>ipv6-address</i> | Specifies IPv6 address or prefix. |
|                    | *                   | All IPv6 addresses or prefixes    |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** If an IPv6 address conflict is detected, the DHCPv6 client will send the Decline message. Then the DHCPv6 server will add the address in this message into the address conflict queue. The addresses added into the address conflict queue cannot be assigned any longer.

If the \* parameter is not specified, all conflicts of IPv6 addresses or prefixes will be deleted.

If the *ipv6-address* parameter is specified, only the specified address conflict will be deleted.

**Configuration** The following example clears a DHCPv6 address conflict.

**Examples**

```
Ruijie# clear ipv6 dhcp conflict 2008:50::2
```

| Related Commands | Command                        | Description                 |
|------------------|--------------------------------|-----------------------------|
|                  | <b>show ipv6 dhcp conflict</b> | Displays address conflicts. |

**Platform** N/A

**Description**

## 5.4 clear ipv6 dhcp relay statistics

Use this command to clear the packet sending and receiving condition with the DHCPv6 Relay function enabled.

**clear ipv6 dhcp relay statistics**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration Examples** The following example clears the packet sending and receiving condition with the DHCPv6 Relay function enabled.

```
Ruijie# clear ipv6 dhcp relay statistics
```

| Related Commands | Command                                | Description                           |
|------------------|----------------------------------------|---------------------------------------|
|                  | <b>show ipv6 dhcp relay statistics</b> | Displays the statistical information. |

**Platform Description** N/A

## 5.5 clear ipv6 dhcp server statistics

Use this command to clear the DHCPv6 server statistics.

**clear ipv6 dhcp server statistics**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command is used to clear the DHCPv6 server statistics.

**Configuration** The following example clears the DHCPv6 server statistics.

**Examples** `Ruijie(config)# clear ipv6 dhcp server statistics`

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform** N/A

**Description**

## 5.6 dns-server

Use this command to set the DNS Server list information for the DHCPv6 Server.

Use the **no** form of this command to restore the default setting.

**dns-server** *ipv6-address*

**no dns-server** *ipv6-address*

| Parameter          | Parameter           | Description                              |
|--------------------|---------------------|------------------------------------------|
| <b>Description</b> | <i>ipv6-address</i> | Sets the IPv6 address or the DNS server. |

**Defaults** By default, no DNS server list is configured.

**Command Mode** DHCPv6 pool configuration mode

**Usage Guide** To configure several DNS Server addresses, use the **dns-server** command for several times. The newly-configured DNS Server address will not overwrite the former ones.

**Configuration Examples** The following example configures the DNS server address.

**Examples** `Ruijie(config-dhcp)# dns-server 2008:1::1`

| Related Commands | Command               | Description                              |
|------------------|-----------------------|------------------------------------------|
|                  | <b>domain-name</b>    | Sets the DHCPv6 domain name information. |
|                  | <b>ipv6 dhcp pool</b> | Sets a DHCPv6 pool.                      |

**Platform** N/A

**Description**

## 5.7 domain-name

Use this command to set the domain name for the DHCPv6 server.

Use the **no** form of this command to restore the default setting.

**domain-name** *domain*

**no domain-name** *domain*

|                               |                                                                                                                                                                     |                                  |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| <b>Parameter</b>              | <b>Parameter</b>                                                                                                                                                    | <b>Description</b>               |
| <b>Description</b>            | <i>domain</i>                                                                                                                                                       | Sets the domain name.            |
| <b>Defaults</b>               | By default, no domain name is configured.                                                                                                                           |                                  |
| <b>Command Mode</b>           | DHCPv6 pool configuration mode                                                                                                                                      |                                  |
| <b>Usage Guide</b>            | To configure several domain names, use the <code>domain-name</code> command for several times. The newly-configured domain name will not overwrite the former ones. |                                  |
| <b>Configuration Examples</b> | The following example sets the domain name for the DHCPv6 server to <code>example.com</code> .                                                                      |                                  |

|                               | <b>ipv6 dhcp pool</b>                                                                                                                                               | Sets the DHCPv6 pool.            |
| <b>Platform</b>               | N/A                                                                                                                                                                 |                                  |
| <b>Description</b>            |                                                                                                                                                                     |                                  |

## 5.8 iana-address prefix

Use this command to set the IA\_NA address prefix for the DHCPv6 Server. Use the **no** form of this command to restore the default setting.

**iana-address prefix** *ipv6-prefix/prefix-length* [ **lifetime** { *valid-lifetime* | *preferred-lifetime* } ]

**no iana-address prefix**

|                    |                                  |                                                                                                                                                                                                    |
|--------------------|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter</b>   | <b>Parameter</b>                 | <b>Description</b>                                                                                                                                                                                 |
| <b>Description</b> | <i>ipv6-prefix/prefix-length</i> | Sets the IPv6 prefix and prefix length.                                                                                                                                                            |
|                    | <b>lifetime</b>                  | Sets the lifetime of the address allocated to the client.<br>With the keyword <b>lifetime</b> configured, both parameters <i>valid-lifetime</i> and <i>preferred-lifetime</i> shall be configured. |
|                    | <i>valid-lifetime</i>            | Sets the valid lifetime of using the allocated address for the client.                                                                                                                             |
|                    | <i>preferred-lifetime</i>        | Sets the preferred lifetime of the address allocated to the client.                                                                                                                                |

**Defaults**

By default, no IA\_NA address prefix is configured.

The default *valid-lifetime* is 3,600s(1 hour).

The default *preferred-lifetime* is 3,600s(1 hour).

**Command Mode**

DHCPv6 pool configuration mode

**Usage Guide** This command is used to set the IA\_NA address prefix for the DHCPv6 Server, and allocate the IA\_NA address to the client.  
 The Server attempts to allocate a usable address within the IA\_NA address prefix range to the client upon receiving the IA\_NA address request from the client. That address will be allocated to other clients if the client no longer uses that address again.

**Configuration** The following example sets the IA\_NA address prefix for the DHCPv6 Server.

**Examples**

```
Ruijie(config-dhcp)# iana-address prefix 2008:50::/64 lifetime 2000 1000
```

**Platform** N/A  
**Description**

## 5.9 ipv6 dhcp client ia

Use this command to enable DHCPv6 client mode and request the IANA address from the DHCPv6 server. Use the **no** form of this command to restore the default setting.

**ipv6 dhcp client ia [rapid-commit]**  
**no ipv6 dhcp client ia**

| Parameter          | Parameter           | Description                                 |
|--------------------|---------------------|---------------------------------------------|
| <b>Description</b> | <b>rapid-commit</b> | Allows the two-message interaction process. |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode

**Usage Guide** This command is used to enable DHCPv6 client mode and request the IANA address from the DHCPv6 server,  
 The **rapid-commit** key allows the two-message interaction process between the client and the server. After the key is configured, the solicit message transmitted by the client contains the rapid-commit option.

**Configuration** The following example enables the request for the IANA address on the interface.

**Examples**

```
Ruijie(config)# interface fastethernet 0/1
Ruijie(config-if)# ipv6 dhcp client ia
```

**Description**

## 5.10 ipv6 dhcp client pd

Use this command to enable the DHCPv6 client and request for the prefix address information.

Use the **no** form of this command to restore the default setting.

**ipv6 dhcp client pd** *prefix-name* [ **rapid-commit** ]

**no ipv6 dhcp client pd**

| Parameter          | Parameter           | Description                                 |
|--------------------|---------------------|---------------------------------------------|
| <b>Description</b> | <i>prefix-name</i>  | Defines the IPv6 prefix name.               |
|                    | <b>rapid-commit</b> | Allows the two-message interaction process. |

**Defaults** This function is disabled by default.

**Command** Interface configuration mode

**Mode**

**Usage Guide** With the DHCPv6 client mode disabled, use this command to enable the DHCPv6 client mode on the interface.

With the **ipv6 dhcp client pd** command enabled, the DHCPv6 client sends the prefix request to the DHCPv6 server

The keyword **rapid-commit** allows the client and the server two-message interaction process. With this keyword configured, the solicit message sent by the client includes the **rapid-commit** item.

**Configuration** The following example enables the prefix information request on the interface.

**Examples**

```
Ruijie(config)# interface fastethernet 0/1
Ruijie(config-if)# ipv6 dhcp client pd pd_name
```

**Platform** N/A

**Description**

## 5.11 ipv6 dhcp pool

Use this command to set the DHCPv6 server pool.

Use the **no** form of this command to restore the default setting.

**ipv6 dhcp pool** *poolname*  
**no ipv6 dhcp pool** *poolname*

| Parameter   | Parameter       | Description                   |
|-------------|-----------------|-------------------------------|
| Description | <i>poolname</i> | Defines the DHCPv6 pool name. |

**Defaults** By default, no DHCPv6 server pool is configured.

**Command Mode** Global configuration mode

**Usage Guide** This command is used to create a DHCPv6 Server configuration pool. After configuring this command, it enters the DHCPv6 pool configuration mode, in which the administrator can set the pool parameters, such as the prefix and the DNS Server information, ect.  
 After creating the DHCPv6 Server configuration pool, use the **ipv6 dhcp server** command to associate the pool and the DHCPv6 Server on one interface.

**Configuration Examples** The following example sets the DHCPv6 server pool.

```
Ruijie# configure terminal
Ruijie(config)# ipv6 dhcp pool pool1
Ruijie(config-dhcp)#
```

| Related Commands | Command                    | Description                                          |
|------------------|----------------------------|------------------------------------------------------|
|                  | <b>ipv6 dhcp server</b>    | Enables the DHCPv6 server function on the interface. |
|                  | <b>show ipv6 dhcp pool</b> | Displays the DHCPv6 pool information.                |

**Platform Description** N/A

## 5.12 ipv6 dhcp relay destination

Use this command to enable the DHCPv6 relay service and configure the destination address to which the messages are forwarded.

Use the **no** form of this command to restore the default setting.

**ipv6 dhcp relay destination** *ipv6-address* [ *interface-type interface-number* ]  
**no ipv6 dhcp relay destination** *ipv6-address* [ *interface-type interface-number* ]

| Parameter   | Parameter                                        | Description                                                                                               |
|-------------|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| Description | <i>ipv6-address</i>                              | Sets the DHCPv6 relay destination address.                                                                |
|             | <i>interface-type</i><br><i>interface-number</i> | (Optional) Specifies the forwarding output interface if the forwarding address is the local link address. |

**Defaults** By default, the relay and forward function is disabled, and the forwarding destination address and the output interface are not configured.

**Command Mode** Interface configuration mode

**Usage Guide** With the DHCPv6 relay service enabled on the interface, the DHCPv6 message received on the interface can be forwarded to all configured destination addresses. Those received DHCPv6 messages can be from the client, or from another DHCPv6 relay service.

The forwarding output interface configuration is mandatory if the forwarding address is the local link address or the multicast address. And the forwarding output interface configuration is optional if the forwarding address is global or station unicast or multicast address.

Without the forwarding output interface configured, the interface is selected according to the unicast or multicast routing protocol.

The relay reply message can be forwarded without the relay function enabled on the interface.

**Configuration Examples** The following example enables DHCPv6 Relay and sets the relay destination address on the interface to 3001::2.

```
Ruijie# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)# interface vlan 1
Ruijie(config-if)# ipv6 dhcp relay destination 3001::2
Ruijie(config-if)# end
```

| Related Commands | Command                         | Description                                |
|------------------|---------------------------------|--------------------------------------------|
|                  | <b>show ipv6 dhcp interface</b> | Displays the DHCPv6 interface information. |

**Platform Description** N/A

### 5.13 ipv6 dhcp server

Use this command to enable the DHCPv6 server on the interface.

Use the **no** form of this command to restore the default setting.

**ipv6 dhcp server *poolname* [ rapid-commit ] [ preference *value* ]**  
**no ipv6 dhcp server**

| Parameter Description | Parameter                      | Description                                                                                                       |
|-----------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------|
|                       | <i>poolname</i>                | Defines the DHCPv6 pool name.                                                                                     |
|                       | <b>rapid-commit</b>            | Allows the two-message interaction process.                                                                       |
|                       | <b>preference <i>value</i></b> | Sets the preference level for the advertise message. The valid range is from 1 to 100 and the default value is 0. |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode

**Usage Guide** Use the **ipv6 dhcp server** command to enable the DHCPv6 service. Configuring the keyword **rapid-commit** allows the two-message interaction for the server and the client when allocating the address prefix and setting other configurations. With this keyword configured, if the client solicit message includes the **rapid-commit** item, the DHCPv6 Server will send the Reply message immediately.

DHCPv6 Server carries with the **preference** value when sending the advertise message if the **preference** level is not 0.

If the **preference** level is 0, the advertise message will not include this field. If the **preference** value is 255, the client sends the request message to the server to obtain the configurations.

DHCPv6 Client, Server and Relay functions are exclusive, and only one of the functions can be configured on the interface.

**Configuration** The following example enables the DHCPv6 server on the interface.

**Examples**

```
Ruijie(config)# interface fastethernet 0/1
Ruijie(config-if)# ipv6 dhcp server pool1
```

| Related Commands | Command                    | Description                           |
|------------------|----------------------------|---------------------------------------|
|                  | <b>ipv6 dhcp pool</b>      | Sets the DHCPv6 pool.                 |
|                  | <b>show ipv6 dhcp pool</b> | Displays the DHCPv6 pool information. |

**Platform** N/A

**Description**

## 5.14 ipv6 local pool

Use this command to configure the local prefix pool of the DHCPv6 server prefix.

Use the **no** form of this command to restore the default setting.

**ipv6 local pool** *poolname prefix/prefix-length assigned-length*

**no ipv6 local pool** *poolname*

| Parameter Description | Parameter                   | Description                  |
|-----------------------|-----------------------------|------------------------------|
|                       | <i>poolname</i>             | The local prefix pool name   |
|                       | <i>prefix/prefix-length</i> | The prefix and prefix length |
|                       | <i>assigned-length</i>      | The assigned prefix length   |

**Defaults** By default, no local prefix pool of the DHCPv6 server prefix is configured.

**Command Mode** Global configuration mode

**Usage Guide** The **ipv6 local pool** command is used to create the local prefix pool. If the DHCPv6 server requires prefix delegation, you can use the **prefix-delegation pool** command to specify the local prefix pool and then assign prefixes from the prefix pool.

**Configuration** The following example configures the local prefix pool.

```
Ruijie(config)# ipv6 local pool client-prefix-pool 2001::db8::/64 80
```

The following example specifies the local prefix pool.

```
Ruijie(config-dhcp)# prefix-delegation pool client-prefix-pool lifetime 2000 1000
```

### 5.15 option52

Use this command to configure the DHCPv6 Server to set the CAPWAP AC IPv6 address. Use the **no** form of this command to restore the default setting.

**option52** *ipv6-address*  
**no option52** *ipv6-address*

| Parameter Description | Parameter           | Description                      |
|-----------------------|---------------------|----------------------------------|
|                       | <i>ipv6-address</i> | Sets the CAPWAP AC IPv6 address. |

**Defaults** By default, no option52 is created after pool configuration on the DHCPv6 server is complete.

**Command Mode** DHCPv6 pool configuration mode

**Usage Guide** This command can be used to set multiple CAPWAP AC IPv6 addresses. The newly added IPv6 address does not overwrite the old one.

**Configuration** The following example configures the domain-name address.

```
Ruijie(config-dhcp)# option52 2008:1::1
```

| Related Commands | Command | Description |

**Description**

## 5.16 prefix-delegation

Use this command to set the static binding address prefix information for the DHCPv6 server.

Use the **no** form of this command to restore the default setting.

**prefix-delegation** *ipv6-prefix/prefix-length client-DUID [ lifetime ]*

**no prefix-delegation** *ipv6-prefix/prefix-length client-DUID [ lifetime ]*

| Parameter          | Parameter                        | Description                                          |
|--------------------|----------------------------------|------------------------------------------------------|
| <b>Description</b> | <i>ipv6-prefix/prefix-length</i> | Sets the IPv6 address prefix and the prefix length.  |
|                    | <i>client-DUID</i>               | Sets the client DUID.                                |
|                    | <i>lifetime</i>                  | Sets the interval of using the prefix by the client. |

**Defaults** By default, no address prefix information is configured.  
The default *lifetime* is 3,600 seconds (one hour).

**Command Mode** DHCPv6 pool configuration mode

**Usage Guide** The administrator uses this command to manually set the address prefix information list for the client IA\_PD and set the valid lifetime for those prefixes.  
The parameter *client-DUID* allocates the address prefix to the first IA\_PD in the specified client.  
Before receiving the request message for the address prefix from the client, DHCPv6 Server searches for the corresponding static binding first. If it succeeds, the server returns to the static binding; otherwise, the server will attempt to allocate the address prefix from other prefix information sources.

**Configuration** The following example sets the prefix information for a DHCPv6 client.

**Examples**

```
Ruijie(config-dhcp)# prefix-delegation 2008:2::/64 0003000100d0f82233ac
```

| Related         | Command                       | Description                             |
|-----------------|-------------------------------|-----------------------------------------|

|                 | <b>prefix-delegation pool</b> | Specifies the DHCPv6 local prefix pool. |
|                 | <b>show ipv6 dhcp pool</b>    | Displays the DHCPv6 pool information.   |

**Platform** N/A

**Description**

## 5.17 prefix-delegation pool

Use this command to specify the local prefix pool for the DHCPv6 server.

Use the **no** form of this command to restore the default setting.

**prefix-delegation pool** *poolname* [ **lifetime** { *valid-lifetime* | *preferred-lifetime* } ]

**no prefix-delegation pool** *poolname*

| Parameter   | Parameter                 | Description                                                                                                                                                                                               |
|-------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <i>poolname</i>           | Sets the local prefix pool name.                                                                                                                                                                          |
|             | <b>lifetime</b>           | Sets the lifetime of the address prefix allocated to the client.<br>With the keyword <b>lifetime</b> configured, both parameters <i>valid-lifetime</i> and <i>preferred-lifetime</i> shall be configured. |
|             | <i>valid-lifetime</i>     | Sets the valid lifetime of using the allocated address prefix for the client.                                                                                                                             |
|             | <i>preferred-lifetime</i> | Sets the preferred lifetime of the address prefix allocated to the client.                                                                                                                                |

**Defaults** By default, no address prefix pool is specified.  
The default *valid-lifetime* is 3,600s(1 hour).  
The default *preferred-lifetime* is 3,600s(1 hour).

**Command Mode** DHCPv6 pool configuration mode

**Usage Guide** Use the **prefix-delegation pool** command to set the prefix pool for the DHCPv6 Server and allocate the prefix to the client. Use the **ipv6 local pool** command to set the prefix pool.  
The Server attempts to allocate a usable prefix from the prefix pool to the client upon receiving the prefix request from the client. That prefix will be allocated to other clients if the client no longer uses that prefix again.

**Configuration Examples** The following example specifies the local prefix pool for the DHCPv6 server.

```
Ruijie(config-dhcp)# prefix-delegation pool client-prefix-pool lifetime 2000
1000
```

| Related Commands | Command                    | Description                                          |

|                  | <b>ipv6 local pool</b>     | Sets a local prefix pool.                            |
|                  | <b>prefix-delegation</b>   | Statically binds the client with the address prefix. |
|                  | <b>show ipv6 dhcp pool</b> | Displays the DHCPv6 pool information.                |

**Platform Description** N/A

## 5.18 show ipv6 dhcp

Use this command to display the device DUID.

**show ipv6 dhcp**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode/Interface configuration mode/Global configuration mode

**Usage Guide** The server, client and relay on the same device share a DUID.

**Configuration Examples** The following example displays the device DUID.

```
Ruijie# show ipv6 dhcp
This device's DHCPv6 unique identifier(DUID): 00:03:00:01:00:d0:f8:22:33:b0
```

## 5.19 show ipv6 dhcp binding

Use this command to display the address binding information for the DHCPv6 server.

**show ipv6 dhcp binding [ ipv6-address ]**

| Parameter   | Parameter           | Description                          |
|-------------|---------------------|--------------------------------------|
| Description | <i>ipv6-address</i> | Sets the IPv6 address or the prefix. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** If the *ipv6-address* is not specified, all prefixes dynamically assigned to the client and IANA address binding information are shown. If the *ipv6-address* is specified, the binding information for the specified address is shown.

**Configuration** The following example displays the address binding information for the DHCPv6 server.

**Examples**

```
Ruijie# show ipv6 dhcp binding
Client DUID: 00:03:00:01:00:d0:f8:22:33:ac
  IAPD: iaaid 0, T1 1800, T2 2880
  Prefix: 2001:20::/72
        preferred lifetime 3600, valid lifetime 3600
        expires at Jan 1 2008 2:23 (3600 seconds)
```

## 5.21 show ipv6 dhcp interface

Use this command to display the DHCPv6 interface information.

**show ipv6 dhcp interface** [ *interface-name* ]

| Parameter   | Parameter             | Description              |
|-------------|-----------------------|--------------------------|
| Description | <i>interface-name</i> | Sets the interface name. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** If the *interface-name* is not specified, all DHCPv6 interface information is displayed. If the *interface-name* is specified, the specified interface information is displayed.

**Configuration** The following example displays the DHCPv6 interface information.

**Examples**

```
Ruijie# show ipv6 dhcp interface
VLAN 1 is in server mode
  Server pool dhcp-pool
  Rapid-Commit: disable
```

## 5.22 show ipv6 dhcp pool

Use this command to display the DHCPv6 pool information.

**show ipv6 dhcp pool** [ *poolname* ]

| Parameter   | Parameter       | Description                   |
|-------------|-----------------|-------------------------------|
| Description | <i>poolname</i> | Defines the DHCPv6 pool name. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Mode**

**Usage Guide** If the *poolname* is not specified, all DHCPv6 interface information is displayed. If the *poolname* is specified, the specified interface information is displayed.

**Configuration** The following example displays the DHCPv6 pool information.

```

Examples
Ruijie# show ipv6 dhcp pool
DHCPv6 pool: dhcp-pool
  DNS server: 2011:1::1
  DNS server: 2011:1::2
  Domain name: example.com
    
```

### 5.23 show ipv6 dhcp relay destination

Use this command to display the destination information about DHCPv6 Relay Agent.

**show ipv6 dhcp relay destination** { *all* | *interface-type interface-number* }

| Parameter description | Parameter                                        | Description                                                                                 |
|-----------------------|--------------------------------------------------|---------------------------------------------------------------------------------------------|
|                       | <i>all</i>                                       | Displays information about all configured destination addresses and relay exits.            |
|                       | <i>interface-type</i><br><i>interface-number</i> | Displays the relay destination address and relay exit configured for a specified interface. |

**Defaults** N/A

**Command mode** Privileged EXEC mode

**Usage guideline** Use this command to show the relay destination address to which DHCPv6 packets sent from a client are forwarded through a specified relay exit (optional) by an interface for which the relay function has been enabled by Relay Agent.

```

Examples
The following example displays all the relay destination addresses.
Ruijie# show ipv6 dhcp relay destination all
Interface:VLAN 1
Destination address(es)          Output Interface
3001::2
ff02::1:2                        VLAN 2
    
```

## 5.24 show ipv6 dhcp relay statistics

Use this command to display the packet sending and receiving condition with the DHCPv6 Relay function enabled.

**show ipv6 dhcp relay statistics**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A.      | N/A.        |

**Defaults** N/A.

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A.

**Configuration Examples** The following example displays the packet sending and receiving condition with the DHCPv6 Relay function enabled.

```
Ruijie# show ipv6 dhcp relay statistics
Packets dropped          : 2
  Error                  : 2
  Excess of rate limit   : 0
Packets received        : 28
  SOLICIT                : 0
  REQUEST                : 0
  CONFIRM                : 0
  RENEW                  : 0
  REBIND                 : 0
  RELEASE                : 0
  DECLINE                : 0
  INFORMATION-REQUEST   : 14
  RELAY-FORWARD          : 0
  RELAY-REPLY            : 14
Packets sent            : 16
  ADVERTISE              : 0
  RECONFIGURE            : 0
  REPLY                  : 8
  RELAY-FORWARD          : 8
  RELAY-REPLY            : 0
```

| Related  | Command                                       | Description                         |
|----------|-----------------------------------------------|-------------------------------------|
| Commands | <code>clear ipv6 dhcp relay statistics</code> | Clears the statistical information. |

**Description**

## 5.25 show ipv6 dhcp server statistics

Use this command to display the DHCPv6 server statistics.

**show ipv6 dhcp server statistics**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command** Privileged EXEC mode

**Mode**

**Usage Guide** This command is used to display the DHCPv6 server statistics.

**Configuration** The following example displays the DHCPv6 server statistics.

**Examples**

```
Ruijie# show ipv6 dhcp server statistics
DHCPv6 server statistics:

Packet statistics:
DHCPv6 packets received:          7
Solicit received:                  7
Request received:                  0
Confirm received:                  0
Renew received:                    0
Rebind received:                   0
Release received:                  0
Decline received:                  0
Relay-forward received:            0
Information-request received:      0
Unknown message type received:     0
Error message received:            0

DHCPv6 packet sent:                0
Advertise sent:                    0
Reply sent:                         0
Relay-reply sent:                  0
Send reply error:                  0
Send packet error:                 0

Binding statistics:
Bindings generated:                0
IAPD assigned:                     0
IANA assigned:                     0

Configuration statistics:
DHCPv6 server interface:           1
DHCPv6 pool:                       0
DHCPv6 iapd binding:               0
```

**Related****Commands**

| Command               | Description         |

## 5.26 show ipv6 local pool

Use this command to display the local prefix pool configuration and usage.

**show ipv6 local pool** [*poolname* ]

| Parameter   | Parameter       | Description                |
|-------------|-----------------|----------------------------|
| Description | <i>poolname</i> | The local prefix pool name |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command is used to display the local prefix pool configuration and usage.

**Configuration Examples** The following example displays all local prefix pool information.

```
Ruijie#show ipv6 local pool
Pool                               Prefix
Free           In use
client-prefix-pool                2001:db8::/64
65536           0
```

| Field  | Description                   |
|--------|-------------------------------|
| Pool   | The local address pool name.  |
| Prefix | The prefix and prefix length. |
| Free   | The available prefix.         |
| In use | The prefix in use.            |

The following example displays the information about the specified local prefix pool.

```
Ruijie#show ipv6 local pool client-prefix-pool
Prefix is 2001:db8::/64 assign /80 prefix
1 entries in use, 65535 available
Prefix                               Interface
2001:db8::/80                        GigabitEthernet 0/0
```

| Field     | Description                            |
|-----------|----------------------------------------|
| Prefix    | The assigned prefix and prefix length. |
| Interface | The assigning interface.               |

## 6 DNS Commands

### 6.1 clear host

Use this command to clear the dynamically learned host name.

**clear host** [ \* | *host-name* ]

| Parameter Description | Parameter        | Description                                       |
|-----------------------|------------------|---------------------------------------------------|
|                       | <i>host-name</i> | Deletes the specified dynamic domain name buffer. |
|                       | *                | Deletes all dynamic domain name buffer.           |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** You can obtain the mapping record of the host name buffer table in two ways: 1) the **ip host** static configuration, 2) the DNS dynamic learning. Execute this command to delete the host name records learned by the DNS dynamically.

**Configuration Examples** The following configuration deletes the dynamically learned mapping records from the host name-IP address buffer table.

```
Ruijie(config)#clear host *
```

| Related Commands | Command           | Description                          |
|------------------|-------------------|--------------------------------------|
|                  | <b>show hosts</b> | Displays the host name buffer table. |

**Platform Description** N/A

### 6.2 ip domain-lookup

Use this command to enable DNS domain name resolution. Use the **no** form of this command to disable the DNS domain name resolution function. Use the default form of this command to restore the default settings.

**ip domain-lookup**

**no ip domain-lookup**

**default ip domain-lookup**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command Mode** Global configuration mode.

**Usage Guide** N/A

**Configuration** The following example disables the DNS domain name resolution function.

**Examples** Ruijie(config)# no ip domain-lookup

| Related Commands | Command           | Description                                         |
|------------------|-------------------|-----------------------------------------------------|
|                  | <b>show hosts</b> | Displays the DNS related configuration information. |

**Platform Description** N/A

## 6.3 ip host

Use this command to configure the mapping of the host name and the IP address. Use the **no** form of the command to remove the host list.

**ip host** *host-name ip-address*

**no ip host** *host-name ip-address*

| Parameter Description | Parameter         | Description                     |
|-----------------------|-------------------|---------------------------------|
|                       | <i>host-name</i>  | The host name of the equipment  |
|                       | <i>ip-address</i> | The IP address of the equipment |

**Defaults** N/A

**Command Mode** Global configuration mode.

**Usage Guide** N/A

**Configuration** The following example configures IPv4 address 192.168.5.243 for domain name www.test.com.

**Examples** Ruijie(config)# ip host www.test.com 192.168.5.243

| Related Commands | Command | Description       |
|------------------|---------|-------------------|
|                  |         | <b>show hosts</b> |

**Platform** N/A  
**Description**

## 6.4 ip name-server

Use this command to configure the IP address of the domain name server. Use the **no** form of this command to delete the configured domain name server.

**ip name-server** [ **oob** ] { *ip-address* | *ipv6-address* } [ **via** *mgmt-name* ]

**no ip name-server** [ **oob** ] { *ip-address* | *ipv6-address* } [ **via** *mgmt-name* ]

| Parameter Description | Parameter           | Description                                 |
|-----------------------|---------------------|---------------------------------------------|
|                       |                     | <b>oob</b>                                  |
|                       | <i>ip-address</i>   | The IP address of the domain name server.   |
|                       | <i>ipv6-address</i> | The IPv6 address of the domain name server. |
|                       | <b>via</b>          | Configures MGMT port.                       |
|                       | <i>mgmt-name</i>    | Specifies the MGMT port in <b>oob</b> mode. |

**Defaults** No domain name server is configured by default.

**Command Mode** Global configuration mode.

**Usage Guide** Add the IP address of the DNS server. Once this command is executed, the equipment will add a DNS server. When the device cannot obtain the domain name from a DNS server, it will attempt to send the DNS request to subsequent servers until it receives a response.  
 Up to 6 DNS servers are supported. You can delete a DNS server with the *ip-address* option or all the DNS servers.

**Configuration Examples** The following example configures the IPv4 and IPv6 DNS servers.

```
Ruijie(config)# ip name-server 192.168.5.134 via mgmt 2/0
Ruijie(config)# ip name-server 2001:0DB8::250:8bff:fee8:f800
2001:0DB8:0:f004::1 via mgmt 2/0
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  |         |             |

|                   |                                                     |
|-------------------|-----------------------------------------------------|
| <b>show hosts</b> | Displays the DNS related configuration information. |
|-------------------|-----------------------------------------------------|

**Platform** N/A

**Description**

## 6.5 ipv6 host

Use this command to configure the mapping of the host name and the IPv6 address by manual. Use the **no** form of the command to remove the host list.

**ipv6 host** *host-name ipv6-address*

**no ipv6 host** *host-name ipv6-address*

| Parameter Description | Parameter           | Description                       |
|-----------------------|---------------------|-----------------------------------|
|                       | <i>host-name</i>    | The host name of the equipment    |
|                       | <i>ipv6-address</i> | The IPv6 address of the equipment |

**Defaults** N/A

**Command Mode** Global configuration mode.

**Usage Guide** To delete the host list, use the **no ipv6 host** *host-name ipv6-address* command.

**Configuration** The following example configures the IPv6 address for the domain name.

**Examples** Ruijie(config)# ipv6 host switch 2001:0DB8:700:20:1::12

| Related Commands | Command           | Description                                         |

|                  | <b>show hosts</b> | Displays the DNS related configuration information. |

**Platform** N/A

**Description**

## 6.6 show hosts

Use this command to display DNS configuration.

**show hosts** [ *hostname* ]

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|-----------------------|-----------|-------------|

|                       |                                                 |
|-----------------------|-------------------------------------------------|
| <code>hostname</code> | Displays the specified domain name information, |
|-----------------------|-------------------------------------------------|

**Defaults** All domain name information is displayed by default.

**Command** Privileged EXEC mode.

**Mode**

**Usage Guide** This command is used to display the DNS related configuration information.

**Configuration**

```
Ruijie# show hosts
```

**Examples**

```
Name servers are:
192.168.5.134 static
```

| Host           | type    | Address       | TTL (sec) |
|----------------|---------|---------------|-----------|
| switch         | static  | 192.168.5.243 | ---       |
| www.ruijie.com | dynamic | 192.168.5.123 | 126       |

| Field        | Description                                                   |
|--------------|---------------------------------------------------------------|
| Name servers | Domain name server                                            |
| Host         | Domain name                                                   |
| type         | Resolution type:<br>Static resolution and dynamic resolution. |
| Address      | IP address corresponding to the domain name                   |
| TTL          | TTL of entries corresponding to the domain name/IP address.   |

**Related  
Commands**

| Command               | Description                                                  |

**Description**

# 7 FTP Server Commands

## 7.1 ftp-server enable

Use this command to enable the FTP server. Use the **default** form of this command to restore the default setting.

**ftp-server enable**  
**default ftp-server enable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Global configuration mode

**Usage Guide** This command is used to enable the FTP server to connect the FTP client to upload/download the files.

 To enable the FTP client to access to the FTP server files, this command shall be co-used with the **ftp-server topdir** command.

**Configuration Examples** The following example enables the FTP Server and confines the FTP client access to the syslog subdirectory:

```
Ruijie(config)# ftp-server topdir /syslog
Ruijie(config)# ftp-server enable
```

Ruijie(config)# ftp-server enableThe following example disables the FTP Server:

```
Ruijie(config)# no ftp-server enable
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 7.2 ftp-server login timeout

Use this command to set the timeout interval for login to the FTP server. Use the **no** or **default** form of this command to restore the default setting.

**ftp-server login timeout** *time*

**no ftp-server login timeout**

**default ftp-server login timeout**

| Parameter Description | Parameter   | Description                                                                                              |
|-----------------------|-------------|----------------------------------------------------------------------------------------------------------|
|                       | <i>time</i> | Sets the timeout interval for login to the FTP server, in the range from 1 to 30 in the unit of minutes. |

**Defaults** The default is 2 minutes.

**Command Mode** Global configuration mode

**Usage Guide** The timeout interval refers to the maximum time when your account is allowed online after you login to the server. If you don't perform authentication again before the timeout interval expires, you will be forced offline.

**Configuration Examples** The following example sets the timeout interval for login to the FTP server to 5 minutes.

```
Ruijie(config)# ftp-server login timeout 5
```

The following example restores the default setting.

```
Ruijie(config)# no ftp-server login timeout
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

## 7.3 ftp-server login times

Use this command to set the number of login attempts. Use the **no** or **default** form of this command to restore the default setting.

**ftp-server login times** *time*

**no ftp-server login times**

**default ftp-server login times**

|                               |                                                                                                                                                                                 |                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| <b>Parameter Description</b>  | <b>Parameter</b>                                                                                                                                                                | <b>Description</b>                                            |
|                               | <i>time</i>                                                                                                                                                                     | Sets the number of login attempts, in the range from 1 to 10. |
| <b>Defaults</b>               | The default is 3.                                                                                                                                                               |                                                               |
| <b>Command Mode</b>           | Global configuration mode                                                                                                                                                       |                                                               |
| <b>Usage Guide</b>            | The number of login attempts refers to the maximum count you are allowed to perform authentication. If the number of your login attempts exceeds 3, you will be forced offline. |                                                               |
| <b>Configuration Examples</b> | The following example sets the number of login attempts to 5.                                                                                                                   |                                                               |
|                               | <pre>Ruijie(config)# ftp-server login times 5</pre>                                                                                                                             |                                                               |
|                               | The following example restores the default setting.                                                                                                                             |                                                               |

## 7.4 ftp-server timeout

Use this command to set the FTP session idle timeout. Use the **no** or **default** form of this command to restore the default setting.

**ftp-server timeout** *time*

**no ftp-server timeout**

**default ftp-server timeout**

|                              |                  |                                                                                    |
|------------------------------|------------------|------------------------------------------------------------------------------------|
| <b>Parameter Description</b> | <b>Parameter</b> | <b>Description</b>                                                                 |
|                              | <i>time</i>      | Sets the session idle timeout, in the range from 1 to 3600 in the unit of minutes. |

**Defaults** The default is 10 minutes.

**Command Mode** Global configuration mode.

**Usage Guide** Use this command to set the FTP session idle timeout. If the session is idle, the FTP server deems the session connection is invalid and disconnects with the user.

 The session idle time refers to the time for the FTP session between two FTP operations.

**Configuration** The following example sets the session idle timeout to 5 minutes:

**Examples**

```
Ruijie(config)# ftp-server timeout 5
```

The following example restores the default setting.

```
Ruijie(config)# no ftp-server timeout
```

**Description**

## 7.5 ftp-server topdir

Use this command to set the directory range for the FTP client to access to the FTP server files. Use the **no** or **default** form of this command to restore the default setting.

- ftp-server topdir** *directory*
- no ftp-server topdir**
- default ftp-server topdir**

**Parameter Description**

| Parameter        | Description             |
|------------------|-------------------------|
| <i>directory</i> | Sets the top-directory. |

**Defaults** No top-directory is configured by default.

**Command Mode** Global configuration mode.

**Usage Guide** The FTP server top directory specifies the directory range of the files accessed by the client. Can the FTP client accesses to the files on the FTP server with the top directory correctly specified. Without this command configured, FTP client fails to access to any file or directory on the FTP server.

**Configuration Examples** The following example enables the FTP Server and confines the FTP client access to the syslog subdirectory.

```
Ruijie(config)# ftp-server topdir /syslog
```

```
Ruijie(config)# ftp-server enable
```

The following example restores the default setting.

```
Ruijie(config)# no ftp-server topdir
```

## 7.6 ftp-server username password

Use this command to set the login username and password for the FTP server. Use the **no** form of this command to restore the default setting.

**ftp-server username** *username* **password** [*type*] *password*

**no ftp-server username** *username*

**default ftp-server username** *username*

#### Parameter Description

| Parameter       | Description              |
|-----------------|--------------------------|
| <i>username</i> | Sets the login username. |
| <i>password</i> | Sets the log password    |

**Defaults** No username or password is set by default.

**Command  
Mode** Global configuration mode

**Usage Guide** Use this command to set the login username for the FTP server. To log in to the FTP server, the correct username and password shall be provided.

The maximum length of the username is 64 characters and the spaces are not allowed in the middle of the username. The username consists of letters, semiangle number and semiangle mark. Ten usernames can be configured for the FTP server at most.

The password must contain letters or numbers. Spaces before or behind the password are allowed but will be ignored. The spaces within are part of the password.

The plaintext password is in the range from 1 to 25 characters. The encrypted password is in the range from 4 to 52 characters.

 The anonymous user login is not supported on the FTP server. The client fails to pass the identity verification if the username is removed.

**Configuration** The following example sets the username to user:

**Examples**

```
Ruijie(config)# ftp-server username user password pass
```

The following example restores the default setting:

```
Ruijie(config)# no ftp-server username user
```

## 7.7 show ftp-server

Use this command to show the status information of the FTP server.

**show ftp-server**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** The FTP server status information includes:

- Enabled/Disabled server
- The FTP server top directory
- The FTP server user information, including username, password and connection number. If connection is set up, the IP address, port, transmission type, active/passive mode is shown

**Configuration Examples** The following example displays the related status information of the FTP server:

**Examples**

```
Ruijie#show ftp-server
ftp-server information
=====
enable : Y
topdir : tmp:/
timeout: 10min
```

```

username:aaaa          password:(PLAIN)bbbb          connect num[2]

## 8 FTP CLIENT Commands

### 8.1 copy flash

Use this command to upload the file from the server to the device through FTP Client.

**copy flash:** *[ local-directory/ ] local-file ftp://username:password@dest-address [ /remote-directory ] / remote-file*

| Parameter Description | Parameter               | Description                                                                                                                                                                                                                                                                                                                         |
|-----------------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>username</i>         | The username for logging into FTP Server. It is limited to 40 bytes and must not contain ":", "@", "/" and space, neither can it be omitted.                                                                                                                                                                                        |
|                       | <i>password</i>         | The password for logging into FTP Server. It is limited to 32 bytes and must not contain ":", "@", "/" and space, neither can it be omitted.                                                                                                                                                                                        |
|                       | <i>dest-address</i>     | IP address of the target FTP Server.                                                                                                                                                                                                                                                                                                |
|                       | <i>remote-directory</i> | File directory of FTP Server. It is optional and limited to 255 bytes. No space or Chinese character is supported. If left blank, it implies the current directory of FTP server.                                                                                                                                                   |
|                       | <i>remote-file</i>      | Filename on the remote server. It is limited to 255 bytes and doesn't support space or Chinese character.                                                                                                                                                                                                                           |
|                       | <i>local-directory</i>  | Directory of local folder (optional). If this directory is specified, this directory must have been created beforehand. This command doesn't support automatic directory creation. If left blank, it implies the current directory on the local device. It is limited to 255 bytes and doesn't support space or Chinese characters. |
|                       | <i>local-file</i>       | Filename on the local device. It is limited to 255 bytes and doesn't support space or Chinese character.                                                                                                                                                                                                                            |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example uploads the file named "local-file" in directory "home" of local device to directory "root" on the FTP Server whose user name is user, password is pass and IP address is 192.168.23.69, and changes the filename to "remote-file".

**Examples**

```
Ruijie# copy flash:home/local-file
ftp://user:pass@192.168.23.69/root/remote-file
```

## 8.2 copy ftp

Use this command to download the file from the server to the device through FTP Client.

```
copy ftp://username:password@dest-address [ /remote-directory ] / remote-file
flash:[ local-directory/ ] local-file]
```

**Parameter Description**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                         |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>username</i>         | The username for logging into FTP Server. It is limited to 40 bytes and must not contain ":", "@", "/" and space, neither can it be omitted.                                                                                                                                                                                        |
| <i>password</i>         | The password for logging into FTP Server. It is limited to 32 bytes and must not contain ":", "@", "/" and space, neither can it be omitted.                                                                                                                                                                                        |
| <i>dest-address</i>     | IP address of the target FTP Server.                                                                                                                                                                                                                                                                                                |
| <i>remote-directory</i> | File directory of FTP Server. It is optional and limited to 255 bytes. No space or Chinese character is supported. If left blank, it implies the current directory of FTP server.                                                                                                                                                   |
| <i>remote-file</i>      | Filename on the remote server. It is limited to 255 bytes and doesn't support space or Chinese character.                                                                                                                                                                                                                           |
| <i>local-directory</i>  | Directory of local folder (optional). If this directory is specified, this directory must have been created beforehand. This command doesn't support automatic directory creation. If left blank, it implies the current directory on the local device. It is limited to 255 bytes and doesn't support space or Chinese characters. |
| <i>local-file</i>       | Filename on the local device. It is limited to 255 bytes and doesn't support space or Chinese character.                                                                                                                                                                                                                            |

|                               |                                                                                                                                                                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>               | N/A                                                                                                                                                                                                                                                              |
| <b>Command Mode</b>           | Privileged EXEC mode                                                                                                                                                                                                                                             |
| <b>Usage Guide</b>            | N/A                                                                                                                                                                                                                                                              |
| <b>Configuration Examples</b> | The following example uses username of "user" and password of "pass" to download a file named "remote-file" from the directory "root" on FTP Server with IP address 192.168.23.69 to directory "home" on the local device, and changes the name to "local-file". |

```
Ruijie# copy ftp://user:pass@192.168.23.69/root/remote-file flash:home/local-file
```

The following example uploads a file named "local-file" from directory "home" on the local device to directory "root" on FTP Server, and changes the name to "remote-file".

```
Ruijie# copy flash:home/local-file ftp://user:pass@192.168.23.69/root/remote-file
```

### 8.3 ftp-client ascii

Use this command to use ASCII mode for FTP transfer.

Use the **no** or **default** form of this command to restore the default setting.

**ftp-client [ vrf vrfname ] ascii**

**no ftp-client [ vrf vrfname ] ascii**

**default ftp-client [ vrf vrf-name ]**

| Parameter Description | Parameter                 | Description                                              |
|-----------------------|---------------------------|----------------------------------------------------------|
|                       | <code>vrf vrf-name</code> | Configures the file transfer mode for the specified VRF. |

|                      |                                                                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>      | The default FTP transfer mode is binary.                                                                                                                                                 |
| <b>Command Mode</b>  | Global configuration mode                                                                                                                                                                |
| <b>Usage Guide</b>   | The <b>default</b> command is used to restore the FTP client setting. Specifically, data connection is in PASV mode and file transfer BINARY. The client source IP address is not bound. |
| <b>Configuration</b> | The following example configures ASCII FTP transfer.                                                                                                                                     |

**Examples**

```
Ruijie (config)# ftp-client ascii
```

The following example configures ASCII FTP transfer for *vrf-name*.

```
Ruijie(config)# ftp-client vrf vrf-name ascii
```

The following example configures binary FTP transfer.

```
Ruijie(config)# no ftp-client ascii
```

The following example configures binary FTP transfer for *vrf-name*.

```
Ruijie(config)# no ftp-client vrf vrf-name ascii
```

The following example restores the default setting of the FTP Client.

```
Ruijie(config)# default ftp-client
```

The following example restores the default setting of the FTP Client vrf-name,

```
Ruijie(config)# default ftp-client vrf vrf-name
```

**Description**

## 8.4 ftp-client port

Use this command to configure PORT mode used for FTP data connection. Use the **no** or **default** form of this command to restore the default setting.

**ftp-client [ vrf vrf-name ] port**  
**no ftp-client [ vrf vrf-name ] port**  
**default ftp-client [ vrf vrf-name ]**

| Parameter Description | Parameter           | Description |
|-----------------------|---------------------|-------------|
|                       | <b>vrf vrf-name</b> |             |

**Defaults** The default is PASV mode for FTP data connection.

**Command Mode** Global configuration mode.

**Usage Guide** This command is used to configure the connection mode to PORT mode, in which the server will actively connect with the client.  
 The **default** command is used to restore the FTP client setting. Specifically, data connection is in PASV mode and file transfer BINARY. The client source IP address is not bound.

**Configuration Examples** The following example configures PORT mode used for FTP data connection

```
Ruijie (config)# ftp-client port
```

The following example configures PORT mode used for FTP *vrf-name* data connection.

```
Ruijie(config)# ftp-client vrf vrf-name port
```

The following example configures PASV mode for FTP data connection.

```
Ruijie(config)# no ftp-client port
```

The following example configures PASV mode used for FTP *vrf-name* data connection.

```
Ruijie(config)# no ftp-client vrf vrf-name port
```

The following example restores the default setting of the FTP Client.

```
Ruijie(config)# default ftp-client
```

The following example restores the default setting of the FTP Client vrf-name,

```
Ruijie(config)# default ftp-client vrf vrf-name
```

## 8.5 ftp-client source

Use this command to bind FTP Client with the source IP address of client and use this IP address to communicate with server. Use the **no** form of this command to disable source IP address binding. Use the **default** form of this command to restore the default setting.

**ftp-client** [ vrf *vrf-name* ] **source** { *ip-address* | *ipv6-address* | *interface* }

**no ftp-client** [ vrf *vrf-name* ] **source**

**default ftp-client** [ vrf *vrf-name* ]

**Parameter Description**

| Parameter           | Description                                           |
|---------------------|-------------------------------------------------------|
| vrf <i>vrf-name</i> | VRF name. The default is the public network instance. |

**Defaults** By default, the IP address is not bound with the client locally. Instead, it is selected by the route.

**Command Mode** Global configuration mode

**Usage Guide** The **default** command is used to restore the FTP client setting. Specifically, data connection is in PASV mode and file transfer BINARY. The client source IP address is not bound. The **ftp-client** [ vrf *vrfname* ] **source-address** {*ip-address* | *ipv6-address*} command will be converted to this command automatically

**Configuration Examples** The following example binds FTP Client with source IP address 192.168.23.236.

```
Ruijie(config)# ftp-client source 192.168.23.236
```

The following example binds FTP Client with source IP address 2003:0:0:0::2.

```
Ruijie(config)# ftp-client source 2003:0:0:0::2
```

The following example binds FTP Client *vrf-name* with source IP address 192.168.23.236.

```
Ruijie(config)# ftp-client vrf vrf-name source 192.168.23.236
```

The following example binds FTP Client *vrf-name* with source IP address 2003:0:0:0::2.

```
Ruijie(config)# ftp-client vrf vrf-name source 2003:0:0:0::2
```

The following example disables source IP address binding.

```
Ruijie(config)# no ftp-client source
```

The following example disables source IP address binding.

```
Ruijie(config)# no ftp-client vrf vrf-name source
```

The following example restores the default setting of the FTP Client.

```
Ruijie(config)# default ftp-client
```

The following example restores the default setting of the FTP Client *vrf-name*,

```
Ruijie(config)# default ftp-client vrf vrf-name
```

## 9 TFTP Server Commands

### 9.1 tftp-server enable

Use this command to enable the TFTP server.

Use the **no** form of this command to disable the TFTP server.

**tftp-server enable**

**no tftp-server enable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** The TFTP server is disabled by default.

**Command** Global configuration mode

**Modes**

**Usage Guide** Only with the TFTP server enabled and the top directory configured meanwhile, TFTP clients are able to upload or download files.

**Configuration Examples** The following example enables the TFTP server and sets the top directory of the TFTP server to **/syslog**.

```
Ruijie(config)# tftp-server topdir /syslog
Ruijie(config)# tftp-server enable
```

The following example disables the TFTP server.

```
Ruijie(config)# no tftp-server enable
```

**Platform Description** N/A

### 9.2 tftp-server topdir

Use this command to configure the top directory for TFTP clients.

Use the **no** or **default** form of this command to restore the default setting.

**tftp-server topdir** *directory*

**no tftp-server topdir**

**default tftp-server topdir**

| Parameter Description | Parameter        | Description                                                                 |
|-----------------------|------------------|-----------------------------------------------------------------------------|
|                       | <i>directory</i> | The top directory for TFTP clients to access. "/" means the root directory. |

**Defaults** By default, the top directory is **/flash**.

**Command** Global configuration mode

**Modes**

**Usage Guide** The top directory on the TFTP server defines what files and folders the client is able to access. And the client cannot access the TFTP server before a top directory is correctly configured for the server.

**Configuration Examples** The following example enables the TFTP servicer and sets the top directory for TFTP clients to **/syslog**.

```
Ruijie(config)# tftp-server topdir /syslog
Ruijie(config)# tftp-server enable
```

The following example restores the default top directory.

```
Ruijie(config)# no tftp-server topdir
```

**Platform Description** N/A

### 9.3 show tftp-server

Use this command to display the configuration of the TFTP server.

**show tftp-server**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command Modes** Global configuration mode/Privileged configuration mode/Interface configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example displays the progress of downloading the TFTP client.

```
Ruijie# show tftp-server
tftp-server information
-----
enable : Y
topdir : flash:/
```

**Platform** N/A

**Description**

## 9.4 show tftp-server updating-list

Use this command to display the progress of downloading the TFTP client.

**show tftp-server updating-list**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command** Global configuration mode/Privileged configuration mode/Interface configuration mode

**Modes**

**Usage Guide** This command is supported only on AM5528 products.

**Configuration** The following example displays the progress of downloading the TFTP client.

**Examples**

```
Ruijie# show tftp-server updating-list
IP Address           Interface           File Name           TX           Elapsed
-----
171.208.208.2       GigabitEthernet 0/7  main_map552.bin     6.28392%    00:00:05
```

**Platform Description** N/A

## 10 TCP Commands

### 10.1 ip tcp keepalive

Use this command to enable the TCP keepalive function. Use the **no** form of this command to restore the default setting,

```
ip tcp keepalive [ interval num1 ] [ times num2 ] [ idle-period num3 ]
```

| Parameter Description | Parameter                      | Description                                                                                                                                                              |
|-----------------------|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>interval</b> <i>num1</i>    | The interval of sending the keepalive packet, in the range from 1 to 120 in the unit of seconds, The default is 75.                                                      |
|                       | <b>times</b> <i>num2</i>       | Keepalive packet sending times, in the range from 1 to 10. The default is 6.                                                                                             |
|                       | <b>idle-period</b> <i>num3</i> | Idle time, the time period during which the peer end does not send any packet to the local end, in the range from 60 to 1800 in the unit of seconds. The default is 900. |

**Defaults** The function is disabled by default.

**Command Mode** Global configuration mode

**Usage Guide** The keepalive function enables TCP to detect whether the peer end is operating properly. Suppose the keepalive function is enabled together with default **interval**, **times** and **idle-period** settings. TCP begins to send the keepalive packet at an interval of 75 seconds if it does not receive any packet from the peer end in 900 seconds. The TCP connection is considered invalid and then disconnected automatically if the device sends the keepalive packet for six consecutive times without receiving any TCP packet from the peer end. This command applies to both IPv4 and IPv6 TCP.

**Configuration Examples** The following example enables the TCP keepalive function on the device and sets the **idle-period** and **interval** to 180 and 60 respectively. If the device sends the keepalive packet for four consecutive times without receiving any TCP packet from the peer end, the TCP connection is considered invalid.

```
Ruijie(config)# ip tcp keepalive interval 60 times 4 idle-period 180
```

## 10.2 ip tcp mss

Use this command to set the upper limit of the MSS value. Use the **no** form of this command to restore the default setting.

**ip tcp mss** *max-segment-size*

**no ip tcp mss**

| Parameter Description | Parameter               | Description                                                       |
|-----------------------|-------------------------|-------------------------------------------------------------------|
|                       | <i>max-segment-size</i> | Upper limit of the MSS value in the range from 68 to 10,000 bytes |

**Defaults** The default MSS = Outgoing IPv4/v6 MTU- IPv4/v6 header-TCP header.

**Command Mode** Global configuration mode

**Usage Guide** This command is used to limit the maximum value of MSS for the TCP connection to be created. The negotiated MSS cannot exceed the configured value. You can use this command to reduce the maximum value of MSS. However, this configuration is not needed in general. This command applies to both IPv4 and IPv6 TCP.

**Configuration Examples** The following example sets the upper limit of the MSS value to 1,300 bytes.

```
Ruijie(config)# ip tcp mss 1300
```

## 10.3 ip tcp path-mtu-discovery

Use this command to enable Path Maximum Transmission Unit (PMTU) discovery function for TCP in global configuration mode. Use the **no** form of this command to restore the default setting.

**ip tcp path-mtu-discovery** [ **age-timer** *minutes* | **age-timer infinite** ]

**no ip tcp path-mtu-discovery**

| Parameter Description | Parameter                       | Description                                                                                                                      |
|-----------------------|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>age-timer</b> <i>minutes</i> | The time interval for further discovery after discovering PMTU. Its value ranges from 10 to 30 minutes. The default value is 10. |
|                       | <b>age-timer infinite</b>       | No further discovery after discovering PMTU                                                                                      |

**Defaults** This function is disabled by default.

**Command Mode** Global configuration mode

**Usage Guide** Based on RFC1191, the TCP path MTU function improves the network bandwidth utilization and data transmission when the user uses TCP to transmit the data in batch. Enabling or disabling this function takes no effect for existent TCP connections and is only effective for TCP connections to be created. This command applies to only IPv4 TCP. This function is enabled for IPv6 TCP constantly and cannot be disabled. According to RFC1191, after discovering the PMTU, the TCP uses a greater MSS to detect the new PMTU at a certain interval, which is specified by the parameter **age-timer**. If the PMTU discovered is smaller than the MSS negotiated between two ends of the TCP connection, the device will be trying to discover the greater PMTU at the specified interval until the PMTU value reaches the MSS or the user stops this timer. Use the parameter **age-timer infinite** to stop this timer.

**Configuration** The following example enables PMTU discovery.

**Examples** Ruijie(config)# ip tcp path-mtu-discovery

|------------------|---------|----------------------|
|                  |         | <b>show tcp pmtu</b> |

**Platform Description** N/A

## 10.4 ip tcp send-reset

Use this command to enable the device to send the reset packet when receiving the TCP port unreachable packet. Use the **no** form of this command to disable this function,

**ip tcp send-reset**  
**no ip tcp send-reset**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       |           | N/A         |

**Defaults** This function is enabled by default.

**Command Mode** Global configuration mode

**Usage Guide** In general, when dispatching the TCP packet, the TCP module replies a reset packet automatically to disconnect the TCP connection with the peer end if the TCP connection that this packet belongs to is not found. However, flooding TCP port unreachable packets pose an attack threat to the device. This command can be used to disable the device from sending the reset packet when receiving the TCP port unreachable packet. This command applies to both IPv4 and IPv6 TCP.

**Configuration Examples** The following example disables the device from sending the reset packet when receiving the TCP port unreachable packet.

```
Ruijie(config)# no ip tcp send-reset
```

## 10.5 ip tcp synwait-time

Use this command to set the timeout value for SYN packets (the maximum time from SYN transmission to successful three-way handshake). Use the **no** form of this command to restore the default setting.

**ip tcp synwait-time** *seconds*

**no ip tcp synwait-time** *seconds*

**Parameter Description**

| Parameter      | Description                                                                      |
|----------------|----------------------------------------------------------------------------------|
| <i>seconds</i> | Timeout value for SYN packets in the range from 5 to 300 in the unit of seconds. |

**Defaults** The default is 20.

**Command Mode** Global configuration mode

**Usage Guide** If there is an SYN attack in the network, reducing the SYN timeout value can prevent resource consumption, but it takes no effect for successive SYN attacks. When the device actively requests a connection with an external device, reducing the SYN timeout value can shorten the time for the user to wait, such as telnet login. For poor network conditions, the timeout value can be increased properly. This command applies to both IPv4 and IPv6 TCP.

**Configuration Examples** The following example set the timeout value for SYN packets to 10 seconds.

```
Ruijie(config)# ip tcp syntime-out 10
```

## 10.6 ip tcp window-size

Use this command to change the size of receiving buffer and sending buffer for TCP connections. Use the **no** form of this command to restore the default setting.

**ip tcp window-size** *size*

**no ip tcp window-size**

| Parameter Description | Parameter   | Description |
|-----------------------|-------------|-------------|
|                       | <i>size</i> |             |

**Defaults** The default is 65535.

**Command Mode** Global configuration mode

**Usage Guide** The TCP receiving buffer is used to buffer the data received from the peer end. These data will be subsequently read by application programs. Generally, the window size of TCP packets implies the size of free space in the receiving buffer. For connections involving a large bandwidth and mass data, increasing the size of receiving buffer will remarkably improve TCP transmission performance.

**Configuration Examples** The following example sets the TCP window size to 16386 bytes.

```
Ruijie(config)# ip tcp window-size 16386
```

## 10.7 show ipv6 tcp connect

Use this command to display the current IPv6 TCP connection information.

```
show ipv6 tcp connect [ local-ipv6 X:X:X:X::X ] [ local-port num ] [ peer-ipv6 X:X:X:X::X ]
[ peer-port num ]
```

Use this command to display the current IPv6 TCP connection statistics.

```
show ipv6 tcp connect statistics
```

| Parameter Description | Parameter                    | Description                             |
|-----------------------|------------------------------|-----------------------------------------|
|                       | <b>local-ipv6</b> X:X:X:X::X | Local IPv6 address                      |
|                       | <b>local-port</b> num        | Local port                              |
|                       | <b>peer-ipv6</b> X:X:X:X::X  | Peer IPv6 address                       |
|                       | <b>peer-port</b> num         | Peer port                               |
|                       | <b>statistics</b>            | Displays IPv6 TCP connection statistics |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration Examples** The following example displays the current IPv6 TCP connection information.

```
Ruijie#show ipv6 tcp connect
Number Local Address      Foreign Address      State      Process name
1      :::22          :::0                LISTEN     rg-sshd
2      :::23          :::0                LISTEN     rg-telnetd
3      1000::1:23    1000::2:64201      ESTABLISHED rg-telnetd
```

The following example displays the current IPv6 TCP connection statistics.

```
Ruijie#show ipv6 tcp connect statistics
State      Count
-----
ESTABLISHED 1
SYN_SENT   0
SYN_RECV   0
FIN_WAIT1  0
FIN_WAIT2  0
TIME_WAIT  0
CLOSED     0
CLOSE_WAIT 0
LAST_ACK   0
LISTEN     1
CLOSING    0
Total: 2
```

## 10.9 show ipv6 tcp port

Use this command to display the current IPv6 TCP port status.

**show ipv6 tcp port** [ *num* ]

| Parameter Description | Parameter  | Description |
|-----------------------|------------|-------------|
|                       | <i>num</i> | Port number |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays the current IPv6 TCP port status.

**Examples**

```
Ruijie#show ipv6 tcp port
TCP connections on port 23:
Number Local Address Foreign Address State
1      1000::1:23    1000::2:64571 ESTABLISHED
Total: 1

TCP connections on port 2650:
Number Local Address Foreign Address State
Total: 0
```

| Field           | Description                     |
|-----------------|---------------------------------|
| Number          | Number                          |
| Local Address   | Local address and port number.  |
| Foreign Address | Remote address and port number. |

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 10.10 show tcp connect

Use this command to display basic information about the current TCP connections.

**show tcp connect** [ **local-ip** *a.b.c.d* ] [ **local-port** *num* ] [ **peer-ip** *a.b.c.d* ] [ **peer-port** *num* ]

Use this command to display the current IPv4 TCP connection statistics.

**show tcp connect statistics**

**Parameter  
Description**

| Parameter                      | Description                              |
|--------------------------------|------------------------------------------|
| <b>local-ip</b> <i>a.b.c.d</i> | Local IP address.                        |
| <b>local-port</b> <i>num</i>   | Local port.                              |
| <b>peer-ip</b> <i>a.b.c.d</i>  | Peer IP address.                         |
| <b>peer-port</b> <i>num</i>    | Peer port.                               |
| <b>statistics</b>              | Displays IPv4 TCP connection statistics. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays the current IPv4 TCP connection information.

**Examples**

```
Ruijie#show tcp connect
Number Local Address      Foreign Address      State      Process name
1      0.0.0.0:22              0.0.0.0:0           LISTEN     rg-sshd
2      0.0.0.0:23              0.0.0.0:0           LISTEN     rg-telnetd
3      1.1.1.1:23              1.1.1.2:64201       ESTABLISHED rg-telnetd
```

| Field           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Description**

### 10.11 show tcp parameter

Use this command to show TCP parameters.

**show tcp parameter**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example shows TCP parameters.

**Examples**

```
Ruijie#show tcp parameter
Hash table information:
  Established hash bucket size: 16384
  Bind hash bucket size: 16384
Memory information:
  Global memory limit: low=92160, pressure=122880, high=184320 (unit: pages)
  Per-socket receive buffer size: min=4096, default=87380, max=3932160 (unit:
bytes)
  Per-socket send buffer size: min=4096, default=16384, max=3932160 (unit:
bytes)
  Current allocated memory: 0
  Current memory pressure flag: 0
SYN specific information:
  Max SYN_RECV sockets per LISTEN socket: 65535
  Max SYN retries: 5
  Max SYN ACK retries: 5
Timewait specific information:
  Max timewait sockets: 180000
  Current timewait sockets: 0
  Timewait recycle: 0
  Reuse timewait port: 0
Keepalive information:
  Keepalive on: 0
  Idle period: 900 seconds
  Interval: 75 seconds
  Max probes: 6
MTU probing:
  Enable mtu probing: 0
FIN specific information:
  FIN_WAIT_2 timeout: 60 seconds
Orphan socket information:
  Max orphans: 16384
  Max orphan retries: 0
Current orphans: 0
```

## 10.12 show tcp pmtu

Use this command to display information about TCP PMTU.

```
show tcp pmtu [ local-ip a.b.c.d ] [ local-port num ] [ peer-ip a.b.c.d ] [ peer-port num ]
```

| Parameter Description | Parameter                      | Description       |
|-----------------------|--------------------------------|-------------------|
|                       | <b>local-ip</b> <i>a.b.c.d</i> | Local IP address. |
|                       | <b>local-port</b> <i>num</i>   | Local port.       |
|                       | <b>peer-ip</b> <i>a.b.c.d</i>  | Peer IP address.  |
|                       | <b>peer-port</b> <i>num</i>    | Peer port.        |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays PMTU of IPv4 TCP connection.

**Examples**

```
Ruijie# show tcp pmtu
Number  Local Address          Foreign Address          PMTU
1       192.168.195.212.23     192.168.195.112.13560  1440
```

| Field           | Description                                                                                                                                                               |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Number          | Sequence number.                                                                                                                                                          |
| Local Address   | The local address and the port number. The number after the last "." is the port number. For example, in "2002::2.23" and "192.168.195.212.23", "23" is the port number.  |
| Foreign Address | The remote address and the port number. The number after the last "." is the port number. For example, in "2002::2.23" and "192.168.195.212.23", "23" is the port number. |
| PMTU            | PMTU value.                                                                                                                                                               |

|------------------|----------------------------------|------------------------------------------|
|                  | <b>ip tcp path-mtu-discovery</b> | Enables the TCP PMTU discovery function. |

**Platform Description** N/A

## 10.13 show tcp port

Use this command to display information about the current TCP port.

**show tcp port** [ *num* ]

| Parameter Description | Parameter  | Description |
|-----------------------|------------|-------------|
|                       | <i>num</i> | Port number |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays the current IPv4 TCP port status.

```

Examples
Ruijie#show tcp port
TCP connections on port 23:
Number  Local Address Foreign Address  State
1       1.1.1.1:23    1.1.1.2:64571   ESTABLISHED
Total: 1

TCP connections on port 2650:
Number  Local Address Foreign Address  State
Total: 0
    
```

Tcpv6 listen on 23 have total 1 connections.

## 10.14 show tcp statistics

Use this command to show TCP statistics on received packets, three way handshake and time-wait.  
**show tcp parameter**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example shows TCP parameters.

### Examples

```
Ruijie#show tcp statistics
TCP Packets
  Received: 1103
  Errors : 0(checksum: 0)
Three way handshake
  Request queue overflow: 0
  Accept backlog full: 0
  Web authentication limit per user: 0
  Failed to alloc memory for request sock: 0
```

```
Failed to create open request child: 0
SYN ACK retransmits: 0
Timeouted requests: 0
Time-wait
Time-wait bucket table overflow: 0
```

Field Description

| Field               | Description                                                                                                                                                                                                                                                                                                                                    |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TCP Packets         | Normal packets and error packets                                                                                                                                                                                                                                                                                                               |
| Three way handshake | Three way handshake information, including session request count, server-client connection count, three way handshake failure count caused by Web authentication limit, TCP socket failure count caused by memory shortage, sub-session failure count, packet retransmission count and session failure count caused by retransmission timeout. |
| Time-wait           | Session in TIMEWAIT state                                                                                                                                                                                                                                                                                                                      |

## 11 IPv4/IPv6 REF Commands

### 11.1 clear ip ref packet statistics

Use this command to clear IPv4 Ruijie Express Forwarding (REF) packet statistics.

**clear ip ref packet statistics**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration Examples** The following example clears IPv4 REF packet statistics.

```
Ruijie #clear ip ref packet statistics
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

### 11.2 clear ipv6 ref packet statistics

Use this command to clear IPv6 REF packet statistics.

**clear ipv6 ref packet statistics**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example clears IPv6 REF packet statistics.

**Examples**

```
Ruijie #clear ipv6 ref packet statistics
```

| Related Commands | Command | Description |

**Description**

## 11.3 hash-disturb

Use this command to enable hash disturbance factor. Use the **no** form of this command to disable settings.

**hash-disturb** *string*

**no hash-disturb**

| Parameter Description | Parameter     | Description                 |
|-----------------------|---------------|-----------------------------|
|                       | <i>string</i> | Enables disturbance factor. |

**Defaults** Hash disturbance factor is disabled by default.

**Command Mode** REF load balancing enhanced profile configuration mode

**Usage Guide** N/A

**Configuration** The following example enables hash disturbance factor.

**Examples**

```
Ruijie# configure terminal
Ruijie(config)# ip-ref-load-balance-profile
Ruijie(ref-ip-config-load-balance-profile)# hash-disturb A
Ruijie(ref-ip-config-load-balance-profile)#
```

## 11.5 ip ref load-sharing original

Use this command to configure the algorithm that is used for load balancing during forwarding based on the source and destination IPv4 addresses. Use the **no** form of this command to restore the default setting.

**ip ref load-sharing original**

**no ip ref load-sharing original**

|                     |                                                                                                     |                    |
|---------------------|-----------------------------------------------------------------------------------------------------|--------------------|
| <b>Parameter</b>    | <b>Parameter</b>                                                                                    | <b>Description</b> |
| <b>Description</b>  | N/A                                                                                                 | N/A                |
| <b>Defaults</b>     | The default algorithm is based on the destination IPv4 address.                                     |                    |
| <b>Command Mode</b> | Global configuration mode                                                                           |                    |
| <b>Usage Guide</b>  | The REF is responsible for data forwarding and supports two load balancing algorithms. One is based |                    |

on destination IP addresses and the other is based on the source and destination IP addresses. When IP packets are forwarded on multiple paths, for example, when load balancing based on destination IP addresses is configured, the REF forwards packets based on a path matching the destination IP address of packets. By default, load balancing based on destination IP addresses is used.

**Configuration Examples** The following example configures the load balancing algorithm based on source and destination IP addresses.

```
Ruijie(config)# ip ref load-sharing original
```

The following example configures the load balancing algorithm based on destination IP addresses of packets.

```
Ruijie(config)# no ip ref load-sharing original
```

## 11.6 ip ref load-balance

Use this command to configure ECMP load balancing algorithm. Use the **no** or **default** form of this command to restore the default setting.

```
ip ref load-balance [ src-dst-ip | src-ip | src-ip-src-dst-l4port | src-dst-ip-src-dst-l4port ]  
no ip ref load-balance
```

| Parameter Description | Parameter                        | Description                                                                                                                                                                                                                                                                                                       |
|-----------------------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>src-dst-ip</b>                | Configures ECMP load balancing based on the source and destination IP address. The packets containing the same source and destination IP address are routed over the same link. This algorithm is recommended for a layer-3 network scenario.                                                                     |
|                       | <b>src-ip</b>                    | Configures ECMP load balancing based on the source IP address. The packets containing the same source IP address are routed over the same link.                                                                                                                                                                   |
|                       | <b>src-ip-src-dst-l4port</b>     | Configures ECMP load balancing based on the source IP address, layer-4 source port and layer-4 destination port. The packets containing the same the source IP address, layer-4 source port and layer-4 destination port are routed over the same link. The other packets are evenly distributed over ECMP paths. |
|                       | <b>src-dst-ip-src-dst-l4port</b> | Configures ECMP load balancing based on the source IP address, destination IP address, layer-4 source port and layer-4 destination port.                                                                                                                                                                          |

**Defaults** ECMP load balancing is based on the source and the destination IP address by default.

**Command Mode** Global configuration mode

**Usage Guide**

**Configuration** The following example configures ECMP load balancing based on the destination IP address.

**Examples**

```
Ruijie(config)# ip ref load-balance dst-ipe
```

The following example restores the default ECMP load balancing algorithm.

```
Ruijie(config)# no ip ref load-balance
```

## 11.7 ip ref hash-elasticity enable

Use this command to enable ECMP elastic hash. Use the **no** or **default** form of this command to restore the default setting.

- ip ref hash-elasticity enable**
- no ip ref hash-elasticity enable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** ECMP elastic hash is disabled by default.

**Command Mode** Global configuration mode

**Usage Guide** N/A

**Configuration** The following example enables ECMP elastic hash.

**Examples**

```
ip ref hash-elasticity enable
```

The following example disables ECMP elastic hash.

```
no ip ref hash-elasticity enable
```

## 11.8 ipv6 ref load-sharing original

Use this command to configure the algorithm that is used for load balancing during forwarding based on the source and destination IPv6 addresses. Use the **no** form of this command to restore the default setting.

**ipv6 ref load-sharing original**  
**no ipv6 ref load-sharing original**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** The default algorithm is based on the destination IPv6 address.

**Command Mode** Global configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example restores the algorithm that is used for load balancing during forwarding to the default setting.

```
Ruijie(config)#no ipv6 ref load-sharing original
```

**Description**

## 11.9 show ip ref adjacency

Use this command to display the information about the specified adjacent node or all adjacent nodes.  
**show ip ref adjacency [ glean | local | ip-address | interface interface\_type interface\_number | discard | statistics ]**

| Parameter   | Parameter    | Description                                               |
|-------------|--------------|-----------------------------------------------------------|
| Description | <b>glean</b> | Aggregate adjacent node, which is used for a direct route |

|                         |                                                      |
|-------------------------|------------------------------------------------------|
| <b>local</b>            | Local adjacent node, which is used by the local host |
| <i>ip-address</i>       | Next-hop IP address                                  |
| <i>interface_type</i>   | Interface type                                       |
| <i>interface_number</i> | Interface number                                     |
| <b>discard</b>          | Displays discarded adjacent nodes.                   |
| <b>statistics</b>       | Statistics                                           |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command can be used to display the information about the adjacent node table in the current REF module. By specifying parameters, the information about the aggregate adjacent node, local adjacent node, adjacent node of the specified IP address, adjacent node associated with the specified interface, and all adjacent nodes can be displayed.

**Configuration Examples** The following example displays the information about all adjacent nodes in the adjacent node table.

```
Ruijie#show ip ref adjacency
id state      type    rfct chg ip          interface          linklayer(header
data)
1  unresolved mcast  1    0  224.0.0.0
9  resolved  forward 1    0  192.168.50.78 GigabitEthernet 0/0 00 25 64 C5
9D 6A 00 D0 F8 98 76 54 08 00
7  resolved  forward 1    0  192.168.50.200 GigabitEthernet 0/0 00 04 5F 87
69 66 00 D0 F8 98 76 54 08 00
6  unresolved glean  1    0  0.0.0.0          GigabitEthernet 0/0
4  unresolved local  3    0  0.0.0.0          Local 1
```

| Related Commands | Command                  | Description                                               |
|------------------|--------------------------|-----------------------------------------------------------|
|                  | <b>show ip ref route</b> | Displays all route information in the current REF module. |

**Platform** N/A

**Description**

## 11.10 show ip ref exact-route

This command is used to display the IPv4 REF exact route.

**show ip ref exact-route** [ **oob** | **vrf vrf\_name** ] *source\_ipaddress dest\_ipaddress*

| Parameter Description | Parameter               | Description                                                                                                                                  |
|-----------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>oob</b>              | Out of band, namely, the network that the management interface belongs to, supported only by the device supporting the management interface. |
|                       | <b>vrf vrf_name</b>     | VRF name, supported only by the VRF-supported device.                                                                                        |
|                       | <i>source_ipaddress</i> | Source IP address of the packet                                                                                                              |
|                       | <i>dest_ipaddress</i>   | Destination IP address of the packet                                                                                                         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command is used to specify the source and the destination IP address of the IP packets, and to display the path of forwarding the current packet with REF

**Configuration Examples** The following example displays the IPv4 REF exact route from 192.168.217.74 to 192.168.13.1.

```
Ruijie# show ip ref exact-route 192.168.217.74 192.168.13.1
192.168.217.74 --> 192.168.13.1 (vrf global):
id state   type    rfct chg ip           interface      linklayer(header
data)
9  resolved forward 1     0   192.168.17.1 GigabitEthernet 0/0 00 25 64 C5 9D
6A 00 D0 F8 98 76 54 08 00
```

Description of fields:

| Field | Description  |
|-------|--------------|
| id    | Adjacency ID |

|           |                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|

| type      | Adjacency type<br>Local: local adjacency<br>Forward: forward adjacency<br>Discard: discard adjacency<br>Glean: glean adjacency<br>Mcast: multicast adjacency |
| rfct      | Reference count of the adjacency                                                                                                                             |
| chg       | Whether the adjacency is on the changing link.                                                                                                               |
| ip        | Adjacency IP address                                                                                                                                         |
| interface | Interface                                                                                                                                                    |
| linklayer | Layer 2 head                                                                                                                                                 |

| Related  | Command                  | Description                                                 |
|----------|--------------------------|-------------------------------------------------------------|
| Commands | <b>show ip ref route</b> | Displays all routing information in the current REF module. |

**Platform** N/A

**Description**

## 11.11 show ip ref packet statistics

Use this command to display IPv4 REF packet statistics.

**show ip ref packet statistics**

| Parameter   | Parameter | Description |
|-------------|-----------|-------------|
| Description | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays IPv4 REF packet statistics.

**Examples**

```
Ruijie #show ip ref pkt-statistic
ref packet statistic:
  bad head      : 0
  lookup fib fail : 0
```

```

local adj      : 0
glean adj     : 0
forward       : 0
redirect      : 0
punt adj      : 0
outif not in ef : 0
ttl expiration : 0
no ip routing : 0

```

| Field           | Description                                                          |
|-----------------|----------------------------------------------------------------------|
| total recved    | Number of total packets received by REF                              |
| bad head        | Number of the packets with false header                              |
| lookup fib fail | Number of the packets with failed REF routing                        |
| drop adj        | Number of the packets matching the dropped adjacency                 |
| local adj       | Number of the packets matching the local adjacency                   |
| glean adj       | Number of the packets matching the gleaned adjacency                 |
| forward         | Number of the packets matching the forwarded adjacency               |
| no ip routing   | Number of the packets not allowed to be forwarded and sent to local. |

## 11.13 show ip ref route

Use this command to display all the routing information in the IPv4 REF table.

**show ip ref route [ oob | vrf vrf\_name ] [ default | ip mask | statistics ]**

**Parameter  
Description**

| Parameter           | Description                                                                                                                                  |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>oob</b>          | Out of band, namely, the network that the management interface belongs to, supported only by the device supporting the management interface. |
| <b>vrf vrf_name</b> | VRF name, supported only by the VRF-supported device.                                                                                        |
| <b>default</b>      | Specifies the default route.                                                                                                                 |
| <i>ip</i>           | Specifies the destination IP address of the route                                                                                            |
| <i>mask</i>         | Specifies the mask of the route.                                                                                                             |
| <b>statistics</b>   | Statistics                                                                                                                                   |

**Defaults** N/A**Command** Privileged EXEC mode**Mode**

**Usage Guide** This command is used to display the related routing information on the current REF table, and specify the default route and all the routing information matching IP/MASK.

**Configuration** The following example displays all the routing information in the IPv4 REF table.

**Examples**

```
Ruijie#show ip ref route
Codes: * - default route
      # - zero route

ip      mask      weight path-id  next-hop  interface
255.255.255.255 255.255.255.255 1 4 0.0.0.0 Local 0
224.0.0.0      240.0.0.0      1 1 224.0.0.0
224.0.0.0      255.255.255.0  1 4 0.0.0.0 Local 0
192.168.50.0   255.255.255.0   1 6 0.0.0.0 FastEthernet 0/0
192.168.50.255 255.255.255.255 1 2 0.0.0.0
192.168.50.200 255.255.255.255 1 7 192.168.50.200 FastEthernet 0/0
192.168.50.122 255.255.255.255 1 4 0.0.0.0 Local 0
192.168.50.78 255.255.255.255 1 9 192.168.50.78 FastEthernet 0/0
```

| Field     | Description            |
|-----------|------------------------|
| ip        | Destination IP address |
| mask      | Mask                   |
| path-id   | Adjacent identity      |
| next-hop  | Address of next hop    |
| weight    | Routing weight         |
| interface | Egress                 |

**Description**

## 11.14 show ipv6 ref adjacency

Use this command to display the information about the IPv6 adjacent node.

**show ipv6 ref adjacency** [**glean** | **local** | *ipv6-address* | **interface** *interface\_type interface\_number* | **discard** | **statistics** ]

**Parameter Description**

| Parameter    | Description                                               |
|--------------|-----------------------------------------------------------|
| <b>glean</b> | Aggregate adjacent node, which is used for a direct route |
| <b>local</b> | Local adjacent node, which is used by the local host      |

|                         |                                    |
|-------------------------|------------------------------------|
| <i>ipv6-address</i>     | Next-hop IP address                |
| <i>interface_type</i>   | Interface type                     |
| <i>interface_number</i> | Interface number                   |
| <b>discard</b>          | Displays discarded adjacent nodes. |
| <b>statistics</b>       | Statistics                         |

**Defaults** N/A

**Command** Privileged EXEC mode

**Mode**

**Usage Guide** This command can be used to display the information about the adjacent node table in the privileged EXEC mode and global configuration mode.

**Configuration** The following example displays the information about the IPv6 adjacent node..

**Examples**

```
Ruijie#show ipv6 ref adjacency
id  state      type  rfct chg ip  interface  linklayer(header
data)
1   unresolved glean  1   0  ::  GigabitEthernet 0/0
2   unresolved local  2   0  ::1 Local 1
```

Description of fields:

| Field                  | Description                                                                                                                                                      |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                     | Adjacent node ID                                                                                                                                                 |
| state                  | Adjacent node state:<br>Unresolved<br>Resolved                                                                                                                   |
| type                   | Adjacent node type<br>Local: local adjacency<br>Forward: forward adjacency<br>Discard: discard adjacency<br>Glean: glean adjacency<br>Mcast: multicast adjacency |
| rfct                   | Reference count of the adjacent node                                                                                                                             |
| chg                    | Whether the adjacent node is on the changing link.                                                                                                               |
| ip                     | IP address of the adjacent node                                                                                                                                  |
| interface              | Interface                                                                                                                                                        |
| linklayer(header data) | Layer 2 head                                                                                                                                                     |

For distributed routers, id is divided into two fields, namely, gid and lid, standing for global adjacent node ID and local adjacent node ID respectively.

## 11.16 show ipv6 ref packet statistics

Use this command to display IPv6 REF packet statistics.

**show ipv6 ref packet statistics**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays IPv6 REF packet statistics.

**Examples** Ruijie#show ipv6 ref packet statistics

```
ref packet statistic:
  bad head      : 0
  lookup fib fail : 0
  local adj     : 0
  glean adj     : 0
```

```

forward      : 0
redirect     : 0
hop-limit expiration : 0
no ipv6 unicast-routing : 0

```

| Field           | Description                                                          |
|-----------------|----------------------------------------------------------------------|
| bad head        | Number of the packets with false header                              |
| lookup fib fail | Number of the packets with failed REF routing                        |
| drop adj        | Number of the packets matching the dropped adjacency                 |
| local adj       | Number of the packets matching the local adjacency                   |
| glean adj       | Number of the packets matching the gleaned adjacency                 |
| forward         | Number of the packets matching the forwarded adjacency               |
| no ip routing   | Number of the packets not allowed to be forwarded and sent to local. |

## 11.18 show ipv6 ref route

Use this command to display all the routing information in the IPv6 REF table.

**show ipv6 ref route [ oob | vrf *vrf-name* ] [ default | statistics | prefix/len ]**

**Parameter Description**

| Parameter                  | Description                                                                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>oob</b>                 | Out of band, namely, the network that the management interface belongs to, supported only by the device supporting the management interface. |
| <b>vrf <i>vrf_name</i></b> | VRF name, supported only by the VRF-supported device.                                                                                        |
| <b>default</b>             | Specifies the default route.                                                                                                                 |
| <b>statistics</b>          | Statistics                                                                                                                                   |
| <b>prefix/len</b>          | Displays the route with the specified prefix (X:X:X:X:/<0-128>).                                                                             |

**Defaults**

N/A

**Command Mode**

Privileged EXEC mode

**Usage Guide**

This command is used to display all routing information in the IPv6 REF table. If there is no VRF parameter, information about the global REF table is displayed; if there is VRF parameter, information about the specified VRF table is displayed. The command can also be used to display information

about the default route, the route with the specified prefix, and statistics of all types of routes.

**Configuration** The following example displays all the routing information in the REF IPv6 table.

**Examples**

```
Ruijie#show ipv6 ref route
Codes: * - default route
prefix/len          weight path_id next_hop interface
2001:da8:ffe:2::/64    1      3      ::      GigabitEthernet 0/0
2001:da8:ffe:2::3/128  1      2      :::1    Local 1
fe80::/10            1      6      ::      Null 0
fe80::21a:a9ff:fe3b:fa41/128  1      2      :::1    Local 1
```

| Field      | Description                    |
|------------|--------------------------------|
| prefix/len | IPv6 prefix and prefix length. |
| path-id    | Adjacent identity              |
| next-hop   | Address of next hop            |
| weight     | Routing weight                 |
| interface  | Interface                      |

## 11.19 show ip ref load-balance

Use this command to display ECMP load balancing configuration.

**show ip ref load-balance**

**Parameter**  
**Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays ECMP load balancing configuration..

**Examples**

```
Ruijie#
Ruijie#show ip ref load-balance
  load-balance          : src-dst-ip.
  hash-elasticity      : enable.
Ruijie#
```

| Field           | Description                                                    |
|-----------------|----------------------------------------------------------------|
| load-balance    | ECMP load balancing algorithm                                  |
| hash-elasticity | Enable: Enable elastic hash.<br>Disable: Disable elastic hash. |

# 1 RIP Commands

## 1.1 address-family

Use this command to configure the RIP protocol in address family configuration sub-mode. Use the **no** form of this command to restore the default setting.

**address-family ipv4 vrf** *vrf-name*

**no address-family ipv4 vrf** *vrf-name*

| Parameter Description | Parameter                  | Description                                                  |
|-----------------------|----------------------------|--------------------------------------------------------------|
|                       | <b>vrf</b> <i>vrf-name</i> | Specifies the VRF name associated with the sub-mode command. |

**Defaults** The address family of the RIP protocol is not configured by default.

**Command Mode** Route configuration mode

**Usage Guide** Use the **address-family** command to enter the address family configuration sub-mode. The prompt is (config-router-af) #. When you specify the VRF associated with the sub-mode for the first time, the RIP instance corresponding to the VRF will be created. In the sub-mode, you can configure the VRF RIP routing information.

To remove the address family sub-mode and return to the route configuration mode, use the **exit-address-family** or **exit** command.

**Configuration Examples** The following example creates a VRF with the name of vpn1 and creates its RIP instance.

```
Ruijie(config)# ip vrf vpn1
Ruijie(config-vrf)# exit
Ruijie(config)# interface fastEthernet 1/0
Ruijie(config-if-FastEthernet 0/1)# ip vrf forwarding vpn1
Ruijie(config-if-FastEthernet 0/1)# ip address 192.168.1.1 255.255.255.0
Ruijie(config)# router rip
Ruijie(config-router)# address-family ipv4 vrf vpn1
Ruijie(config-router)# network 192.168.1.0
Ruijie(config-router)# exit-address-family
```

| Related Commands | Command                    | Description                                      |
|------------------|----------------------------|--------------------------------------------------|
|                  | <b>exit-address-family</b> | Exits the address family configuration sub-mode. |
|                  | <b>ip vrf</b>              | Creates a VRF.                                   |

**Platform** N/A  
**Description**

## 1.2 auto-summary

Use this command to enable automatic summary of RIP routes. Use the **no** form of this command to disable this function

**auto-summary**  
**no auto-summary**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** Automatic summary of RIP routes is enabled by default

### Command

**Mode** Routing progress configuration mode

**Usage Guide** Automatic RIP route summary means the subnet routes will be automatically summarized into the routes of the classified network when they traverse through the subnet. Automatic route summary is enabled by default for RIPv1 and RIPv2.

Automatic RIP route summary improves the flexibility and effectiveness of the network. If the summarized route exists, the sub-routes contained in the summarized route cannot be seen in the routing table, reducing the size of the routing table significantly.

Advertising the summarized route is more efficient than advertising individual routes in light of the following factors:

- The summarized route is always processed preferentially when you query the RIP database.
- Any sub-route is ignored when you query the RIP database, reducing the processing time.
- If you want to learn the specific sub-routes instead of the summarized route, disable the automatic route summary function. Only when RIPv2 is configured, the automatic route summary function can be disabled. For the RIPv1, the automatic route summary function is always enabled.

---

 The range of the supernet route is wider than that of the classful network. Therefore, this command takes no effect on the supernet route.

---

**Configuration** The following example disables automatic route summary of RIPv2.

```
Ruijie (config)# router rip
Ruijie (config-router)# version 2
Ruijie (config-router)# no auto-summary
```

| Related Commands | Command | Description    |

|                  |         | <b>version</b> |

**Platform** N/A  
**Description**

### 1.3 bfd all-interfaces

Use this command to enable all interfaces running RIP to use the BFD function. Use the **no** form of this command to restore the default setting.

**bfd all-interfaces**  
**no bfd all-interfaces**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       |           | N/A         |

**Defaults** BFD is not configured by default.

**Command Mode** Routing process configuration mode

**Usage Guide** With the BFD function enabled on the RIP, one BFD session will be established for the RIP routing information source (the source address of the RIP route update packet). Once the BFD neighbor fails, the RIP routing information will be invalid directly and no longer join routing or forwarding. You can also use the interface configuration mode command **ip rip bfd [disable]** to enable or disable the BFD function on the specified interface, which takes precedence over the command **bfd all-interfaces** in the routing process configuration mode.

#### Configuration

**Examples** N/A

| Related Commands | Command                       | Description                                                                                     |
|------------------|-------------------------------|-------------------------------------------------------------------------------------------------|
|                  | <b>route ip</b>               | Creates the RIP routing process and enters the routing process configuration mode.              |
|                  | <b>ip rip bfd [ disable ]</b> | Configures a specified interface running RIP to enable or disable link detection using the BFD. |

**Platform** N/A  
**Description**

## 1.4 default-information originate

Use this command to generate a default route in the RIP process. Use the **no** form of this command to delete the generated default route.

**default-information originate** [**always**] [**metric** *metric-value*] [**route-map** *map-name* ]

**no default-information originate** [ **always**] [**metric**] [**route-map** *map-name*]

| Parameter Description | Parameter                         | Description                                                                                              |
|-----------------------|-----------------------------------|----------------------------------------------------------------------------------------------------------|
|                       | <b>always</b>                     | (Optional) Enables RIP to generate the default route, no matter whether the default route exists or not. |
|                       | <b>metric</b> <i>metric-value</i> | (Optional) The original metric value of the default route with the value range 1-15 of metric-value.     |
|                       | <b>route-map</b> <i>map-name</i>  | (Optional) Name of the associated route-map. Route-map is not associated by default.                     |

**Defaults** No default route is generated by default.  
The default metric value is 1.

### Command

**Mode** Routing process configuration mode

### Usage Guide

By default, RIP will not advertise the default route if the default route exists in the routing table of the router. In this case, use the **default-information originate** command to notify the neighbor of the default route.

With the parameter **always** configured, no matter whether the default route exists in the RIP routing process or not, the default route will be advertised to the neighbor but is not shown in the local routing table. You can use the **show ip rip database** command to view the RIP routing information database to confirm whether the default route is generated.

Use the parameter **route-map** to control more about the default route advertised to RIP. For example, use the **set metric** command to set the metric value of the default route.

The route-map set metric rule takes precedence over the parameter metric value configuration of the default route. If the parameter metric is not configured, the default metric value is used by the default route.

 If the default route can be generated in the RIP process by using this command, RIP will not learn the default route advertised from the neighbor.

 For the default route generated by using the **ip default-network** command, the **default-information originate** command is required to add the default route to RIP.

**Configuration** The following example generates a default route to the RIP routing table.

**Examples**

```
Ruijie(config-router)# default-information originate always
```

| Commands                          |                                                       |
|-----------------------------------|-------------------------------------------------------|
| <b>ip rip default-information</b> | Notifies the default route through an interface.      |
| <b>redistribute</b>               | Redistributes the routes from other protocols to RIP. |

**Platform** N/A

**Description**

## 1.5 default-metric

Use this command to define the default RIP metric value. Use the **no** form of this command to restore the default setting.

**default-metric** *metric-value*

**no default-metric**

| Parameter Description | Parameter           | Description                                                                                                                                                  |
|-----------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>metric-value</i> | Indicates the default metric value with the range from 1 to 16. If the metric value is greater than or equal to 16, the RGNOS regards the route unreachable. |

**Defaults** The default is 1.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** This command needs to work with the command **redistribute**. When the routes are redistributed to the RIP routing process from a routing protocol process, the route metric value cannot be converted due to the incompatibility of the metric calculation mechanisms for different protocols. During the conversion, therefore, it is required to redefine the metric values of redistributed routes in the RIP routing domain. If there is no clear definition of the metric value in redistributing a routing protocol process, the RIP uses the metric value defined with **default-metric**. If the metric value is defined, this value overwrites the metric value defined with default-metric. If this command is not configured, the default value of default-metric is 1.

**Configuration Examples** The following example enables the RIP routing protocol to redistribute the routes learned by the OSPF routing protocol, whose initial RIP metric value is set to 3.

```
Ruijie (config)# router rip
Ruijie (config-router)# default-metric 3
Ruijie (config-router)# redistribute ospf 100
```

**Platform** N/A  
**Description**

## 1.6 distance

Use this command to set the management distance of the RIP route. Use the **no** form of this command to restore the default setting.

**distance** *distance* [ *ip-address wildcard* ]  
**no distance** [ *distance ip-address wildcard* ]

| Parameter Description | Parameter         | Description                                                                                              |
|-----------------------|-------------------|----------------------------------------------------------------------------------------------------------|
|                       | <i>distance</i>   | Sets the management distance of a RIP route, an integer in the range from 1 to 255.                      |
|                       | <i>ip-address</i> | Indicates the prefix of the source IP address of the route.                                              |
|                       | <i>wildcard</i>   | Defines the comparison bit of the IP address, where 0 means accurate matching and 1 means no comparison. |

**Defaults** The default is 120.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** Use this command to set the management distance of the RIP route. You can use this command to create several management distances with source address prefixes. When the source address of the RIP route is within the range specified by the prefixes, the corresponding management distance is applied; otherwise, the route uses the management distance configured by the RIP.

**Configuration Examples** The following example sets the management distance of the RIP route to 160, and specifies the management distance of the route learned from 192.168.2.1 as 123.

```
Ruijie(config)# router rip
Ruijie(config-router)# distance 160
Ruijie(config-router)# distance 123 192.168.12.1 0.0.0.0
```

**Description**

## 1.7 distribute-list in

Use this command to control route update for route filtering. Use the **no** form of this command to restore the default setting.

**distribute-list** { [ *access-list-number* | *name* ] | **prefix** *prefix-list-name* [ **gateway** *prefix-list-name* ] | [ **gateway** *prefix-list-name* ] } **in** [ *interface-type* *interface-number* ]

**no distribute-list** { [ *access-list-number* | *name* ] | **prefix** *prefix-list-name* [ **gateway** *prefix-list-name* ] | [ **gateway** *prefix-list-name* ] } **in** [ *interface-type* *interface-number* ]

### Parameter Description

| Parameter                                        | Description                                                                     |
|--------------------------------------------------|---------------------------------------------------------------------------------|
| <i>access-list-number</i>   <i>name</i>          | Specifies the ACL. Only the routes that are allowed by the ACL can be accepted. |
| <b>prefix</b> <i>prefix-list-name</i>            | Uses the prefix list to filter the routes.                                      |
| <b>gateway</b> <i>prefix-list-name</i>           | Uses the prefix list to filter the source of the routes.                        |
| <i>interface-type</i><br><i>interface-number</i> | (Optional) Applies the distribution list only to a specified interface.         |

**Defaults** The distribution list is not defined by default.

**Command Mode** Routing process configuration mode

**Usage Guide** To deny receiving some specified routes, you can process all the received route update packets by configuring the route distribute control list.  
Without any interface specified, the system will process the route update packets received on all the interfaces.

**Configuration Examples** The following example enables RIP to control the routes received from the FastEthernet 0/0, only permitting the routes starting with 172.16.

```
Ruijie (config)# router rip
Ruijie (config-router)# network 200.168.23.0
Ruijie (config-router)# distribute-list 10 in fastethernet 0/0
Ruijie (config-router)# no auto-summary
Ruijie (config-router)# access-list 10 permit 172.16.0.0 0.0.255.255
```

### Related Commands

| Command            | Description              |
|--------------------|--------------------------|
| <b>access-list</b> | Defines the ACL rule.    |
| <b>prefix-list</b> | Defines the prefix list. |

**Platform Description** N/A

## 1.8 distribute-list out

Use this command to control route update advertisement for filtering routes. Use the **no** form of this command to restore the default setting.

**distribute-list** { [ *access-list-number* | *name* ] | **prefix** *prefix-list-name* } **out** [ *interface* [ [ **bgp** | **connected** | **isis** [ *area-tag* ] | **ospf** *process-id* | **rip** | **static** ] ]

**no distribute-list** { [ *access-list-number* | *name* ] | **prefix** *prefix-list-name* } **out** [ *interface* [ [ **bgp** | **connected** | **isis** [ *area-tag* ] | **ospf** *process-id* | **rip** | **static** ] ]

### Parameter Description

| Parameter                               | Description                                                                                                                                                        |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>access-list-number</i>   <i>name</i> | Specifies the ACL.                                                                                                                                                 |
| <b>prefix</b> <i>prefix-list-name</i>   | Uses the prefix list to filter routes.                                                                                                                             |
| <i>interface</i>                        | (Optional) Applies route update advertisement control to a specified interface in the distribution list.                                                           |
| <b>bgp</b>                              | (Optional) Applies route update advertisement control to only routes introduced from bgp in this distribution list.                                                |
| <b>connected</b>                        | (Optional) Applies route update advertisement control to only connected routes in this distribution list.                                                          |
| <b>isis</b> [ <i>area-tag</i> ]         | (Optional) Applies route update advertisement control to only routes introduced from ISIS in this distribution list. <i>area-tag</i> specifies an ISIS instance.   |
| <b>ospf</b> <i>process-id</i>           | (Optional) Applies route update advertisement control to only routes introduced from OSPF in this distribution list. <i>process-id</i> specifies an OSPF instance. |
| <b>rip</b>                              | (Optional) Applies route update advertisement control to only RIP routes in this distribution list.                                                                |
| <b>static</b>                           | (Optional) Applies route update advertisement control to only static routes in this distribution list.                                                             |

**Defaults** No route update advertisement is configured by default.

### Command

**Mode** Routing process configuration mode

**Usage Guide** If this command relates to none of optional parameters, route update advertisement control applies to all interfaces. If this command relates to interface options, route update advertisement control applies to only the specified interface. If this command relates to other route process parameters, route update advertisement control applies to only the specific route process.

**Configuration** The following example advertises only the 192.168.12.0/24 route.

### Examples

```
Ruijie (config)# router rip
Ruijie (config-router)# network 200.4.4.0
Ruijie (config-router)# network 192.168.12.0
```

```
Ruijie (config-router)# distribute-list 10 out
Ruijie (config-router)# version 2
Ruijie (config-router)#access-list 10 permit 192.168.12.0 0.0.0.255
```

**Description**

## 1.9 enable mib-binding

Use this command to bind a MIB with a specified RIP instance. Use the **no** form of this command to restore the default setting

**enable mib-binding**

**no enable mib-binding**

#### Parameter Description

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** By default, the MIB is bound with the RIP instance of the default VRF.

#### Command

**Mode** Routing process configuration mode.

**Usage Guide** As RIP MIB does not have RIP instance information, you can only operate only one RIP instance using SNMP. By default, RIP MIB is bound with the RIP instance of the default VRF. You can only operate this RIP instance. If you want to operate another RIP instance of a specified VRF through SNMP, you can use this command to bind the MIB with this instance.

**Configuration** The following example operates the RIP instance of a specified VRF, vpn1.

#### Examples

```
Ruijie(config)# router rip
Ruijie(config-router)# address-family ipv4 vrf vpn1
Ruijie(config-router-af)# enable mib-binding
```

**Description**

## 1.10 exit-address-family

Use this command to exit the address family configuration mode

**exit-address-family**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** N/A

**Command**

**Mode** Address family configuration mode

**Usage Guide** Use this command to exit the address family configuration mode.  
The abbreviation of this command is exit.

**Configuration** The following example enters or exits the address family configuration mode.

**Examples**

```
Ruijie(config-router)# address-family ipv4 vrf vpn1
Ruijie(config-router-af)# exit-address-family
```

**Description**

## 1.11 fast-reroute

Use this command to enable the RIP FRR (Fast Reroute) function for the device. Use the **no** form of this command to restore the default setting.

**fast-reroute route-map** *route-map-name*

**no fast-reroute**

**Parameter Description**

| Parameter             | Description                                      |
|-----------------------|--------------------------------------------------|
| <i>route-map-name</i> | Specifies the backup path through the route map. |

**Defaults** This function is disabled by default.

**Command****Mode** Routing process configuration mode**Usage Guide**

Use the **route-map** command to specify the backup path for the matched routes.

It is recommended to enable the BFD function when the RIP fast reroute function is enabled. BFD allows the device to detect the link fault faster, so as to reduce the interruption time. In the scenario where the port is up/down, it is recommended to configure **carrier-delay 0** in interface configuration mode to achieve the fastest switchover speed, reducing the interruption time.

Currently, the restrictions of the RIP FRR are as follows:

Only one backup next hop is generated for each route.

The backup next hop is not generated for the ECMP route.

**Configuration**

The following example enables FRR for RIP instance 1 and associates route map *fast reroute*.

**Examples**

```
Ruijie(config)# route-map fast-reroute
match interface gigabitEthernet 0/2
set fast-reroute backup-interface GigabitEthernet 0/1 backup-nexthop
192.168.1.1
Ruijie(config)# router rip
Ruijie(config-router)# fast-reroute route-map fast-reroute
```

**Description**

## 1.12 graceful-restart

Use this command to configure the RIP graceful restart (GR) function for a device. Use the **no** form of this command to restore the default configuration.

**graceful-restart** [ **grace-period** *grace-period* ]

**no graceful-restart** [ **grace-period** ]

**Parameter  
Description**

| Parameter               | Description                                                                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>graceful-restart</b> | Enables the GR function.                                                                                                                                                                      |
| <b>grace-period</b>     | (Optional) Configures the grace period.                                                                                                                                                       |
| <i>grace-period</i>     | (Optional) Indicates the user-defined GR period.<br>The default value is the smaller value between twice the update time and 60 seconds.<br>The range is from 1 to 1,800. The unit is second. |

**Defaults** This function is enabled by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** The GR function is configured on the RIP instances. Different parameters can be configured for different RIP instances.

The GR period refers to the time from the startup to the end of RIP GR. During this period, the forwarding table remains unchanged and the RIP route is restored to the state before protocol restart. When the GR period expires, RIP exits the GR state and performs normal RIP operation.

The **graceful-restart grace-period** command enables users to modify GR period. Note: Make sure that GR is completed before the RIP route is validate and after an RIP route update cycle elapses. If an improper value is configured, non-stop data forwarding cannot be ensured during the GR process. For example, if the GR period is longer than the time when the neighbor's route is unavailable and GR is not completed before the route is validated, then the neighbor is not re-informed of the route and forwarding of the neighbor's route is terminated when it is validated, which results in data forwarding interruption. Therefore, unless otherwise specified, it is not recommended to adjust the GR period. If the period needs to changed, determine that the grace period is longer than the route update cycle and shorter than the time when the route is unavailable in combination with the configuration of the **timers basic** command.

 During the RIP GR period, the network must be stable.

**Configuration Examples** The following example enables the RIP GR function and configures the GR period parameters of the GR function.

```
Ruijie(config)# router rip
Ruijie(config-router)# graceful-restart grace-period 90
```

**Related Commands**

| Command             | Description            |
|---------------------|------------------------|
| <b>timers basic</b> | Configures RIP timers. |

**Platform** N/A

**Description**

## 1.13 ip rip authentication key-chain

Use this command to enable RIP authentication and specify the keychain used for RIP authentication. Use the **no** form of this command to restore the default setting.

**ip rip authentication key-chain** *name-of-keychain*

**no ip rip authentication key-chain**

**Parameter**

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|                    |                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> |                                                                                                                       |
|                    | <i>name-of-keychain</i> Indicates the name of the keychain, which specifies the keychain used for RIP authentication. |

**Defaults** The keychain is not associated by default.

**Command**

**Mode** Interface configuration mode

**Usage Guide** If the keychain is specified in the interface configuration, use the key chain global configuration command to define the keychain. Otherwise, RIP data packet authentication fails. RIPv2 instead of RIPv1 supports authentication of the RIP data packet.

**Configuration Examples** The following example enables RIP authentication on the fastEthernet 0/1 with the associated keychain ripchain.

```
Ruijie (config)#interface fastEthernet 0/1
Ruijie (config-if-FastEthernet 0/1)#ip rip authentication key-chain ripchain
```

Meanwhile, use the **key chain** command to define this keychain in global configuration mode.

```
Ruijie(config)#key chain ripchain
Ruijie(config-keychain)#key 1
Ruijie(config-keychain-key)#key-string Hello
```

|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip rip authentication mode</b>          | Defines the RIP authentication mode.                                                                                                                 |
| <b>ip rip authentication text-password</b> | Enables RIP authentication, and sets the password string of RIP plaintext authentication. RIP data packet authentication is supported only by RIPv2. |
| <b>ip rip receive version</b>              | Defines the version of RIP packets received on the interface.                                                                                        |
| <b>ip rip send version</b>                 | Defines the version of RIP packets sent on the interface.                                                                                            |
| <b>key chain</b>                           | Defines the keychain and enters keychain configuration mode.                                                                                         |

**Platform Description** N/A

## 1.14 ip rip authentication mode

Use this command to define the RIP authentication mode. Use the **no** form of this command to restore the default setting.

**ip rip authentication mode { text | md5 }**

**no ip rip authentication mode**

| Parameter Description | Parameter   | Description                                                |
|-----------------------|-------------|------------------------------------------------------------|
|                       | <b>text</b> | Configures RIP authentication as plaintext authentication. |
|                       | <b>md5</b>  | Configures RIP authentication as MD5 authentication.       |

**Defaults** It is plaintext authentication by default.

**Command**

**Mode** Interface configuration mode

**Usage Guide** During the RIP authentication configuration process, the RIP authentication modes of all devices requiring exchange of RIP routing information must be the same. Otherwise, RIP packet exchange will fail.

If the plaintext authentication mode is adopted, but the password string of the plaintext authentication or the associated keychain is not configured, no authentication occurs. In the same way, if the MD5 authentication mode is adopted, but the associated keychain is not configured, no authentication occurs.

RIPv2 instead of RIPv1 supports authentication of the RIP data packet.

**Configuration** The following example configures the RIP authentication mode on the fastEthernet 0/1 as MD5.

**Examples**

```
Ruijie (config)#interface fastEthernet 0/1
Ruijie (config-if-FastEthernet 0/1)# ip rip authentication mode md5
```

**Related Commands**

| Command                                    | Description                                                                                                                                                   |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip rip authentication key-chain</b>     | Enables the RIP authentication mode and specifies the keychain used for RIP authentication. Only RIPv2 supports authentication of the RIP data packet.        |
| <b>ip rip authentication text-password</b> | Enables the RIP authentication mode, and sets the password string of RIP plaintext authentication. Only RIPv2 supports authentication of the RIP data packet. |
| <b>key chain</b>                           | Defines the keychain and enters the keychain configuration mode                                                                                               |

**Platform** N/A

**Description**

## 1.15 ip rip authentication text-password

Use this command to enable RIP authentication and set the password string of RIP plaintext

authentication. Use the **no** form of this command to restore the default setting.

**ip rip authentication text-password** [ 0 | 7 ] *password-string*

**no ip rip authentication text-password**

| Parameter Description | Parameter              | Description                                                                                 |
|-----------------------|------------------------|---------------------------------------------------------------------------------------------|
|                       | 0                      | Specifies that the key is displayed as plaintext.                                           |
|                       | 7                      | Specifies that the key is displayed as cipher text.                                         |
|                       | <i>password-string</i> | Indicates the password string of the plaintext authentication, in the length of 1-16 bytes. |

**Defaults** No password string of RIP plaintext authentication is configured by default.

#### Command

**Mode** Interface configuration mode

#### Usage Guide

This command works only in plaintext authentication mode.

To enable the RIP plaintext authentication function, use this command to configure the corresponding password string, or use the associated key chain to obtain the password string. The latter takes the precedence over the former one.

RIPv1 does not support RIP authentication but RIPv2 does.

**Configuration Examples** The following example enables the RIP plaintext authentication on fastEthernet 0/1 and sets the password string to hello.

```
Ruijie(config)#interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ip rip authentication text-password hello
```

#### Related Commands

| Command                                | Description                                                                                                                     |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>ip rip authentication mode</b>      | Defines the RIP authentication mode.                                                                                            |
| <b>ip rip authentication key-chain</b> | Enables the RIP authentication mode and specifies the keychain used for RIP authentication. Only RIPv2 supports authentication. |

**Platform** N/A

**Description**

## 1.16 ip rip bfd

Use the **ip rip bfd** [ **disable** ] command to configure the specified interface running RIP to enable or disable link detection using the BFD. Use the **no** form of this command to restore the default setting.

**ip rip bfd** [ **disable** ]

**no ip rip bfd**

| Parameter Description | Parameter      | Description                                                                                        |
|-----------------------|----------------|----------------------------------------------------------------------------------------------------|
|                       | <b>disable</b> | Disables the specified interface running RIP and uses the BFD mechanism to perform link detection. |

**Defaults** Interfaces running RIP are not configured by default. The BFD configuration in RIP process configuration mode is a reference.

**Command**

**Mode** Interface configuration mode

**Usage Guide** The priority of the interface is higher that of the `bfd all-interfaces` command in process configuration mode.

You can use the `ip rip bfd` command to enable the BFD to perform link detection on the specified interface according to the actual environment or use the `bfd all-interfaces` command to configure all interfaces running RIP and enable the BFD to perform link detection. In addition, you can use the `ip rip bfd disable` command to disable the BFD detection function on the specified interface.

**Configuration**

**Examples** N/A

| Related Commands | Command                   | Description                                                                        |
|------------------|---------------------------|------------------------------------------------------------------------------------|
|                  | <b>route ip</b>           | Enables the RIP routing process and enters the routing process configuration mode. |
|                  | <b>bfd all-interfaces</b> | Configures all interfaces running RIP to use the BFD to perform link detection.    |

**Platform** N/A

**Description**

## 1.17 ip rip default-information

Use this command to advertise the default route through a RIP interface. Use the **no** form of this command to restore the default setting.

**ip rip default-information** { **only** | **originate** } [**metric** *metric-value* ]

**no ip rip default-information**

| Parameter Description | Parameter        | Description                                          |
|-----------------------|------------------|------------------------------------------------------|
|                       | <b>only</b>      | Notifies the default route rather than other routes. |
|                       | <b>originate</b> | Notifies the default route and other routes.         |

|                                   |                                                                             |
|-----------------------------------|-----------------------------------------------------------------------------|
| <b>metric</b> <i>metric-value</i> | Specifies the metric value of the default route, in the range from 1 to 15. |
|-----------------------------------|-----------------------------------------------------------------------------|

**Defaults** No default route is configured by default. The default metric value is 1.

**Command**

**Mode** Interface configuration mode

**Usage Guide** After you configure this command on a specified interface, a default route is generated and notified through the interface. If the **ip rip default-information** command of the interface and the **default-information originate** command of the RIP process are configured at the same time, only the default route of the interface is advertised.

 RIP will no longer learn the default route notified by the neighbor if any interface is configured with the ip rip default-information command.

**Configuration** The following example creates a default route which is notified on ethernet0/1 only.

**Examples**

```
Ruijie(config)#interface ethernet 0/1
Ruijie(config-if-Ethernet 0/1)#ip rip default-information only
```

**Related Commands**

| Command                              | Description                                   |
|--------------------------------------|-----------------------------------------------|
| <b>default-information originate</b> | Generates a default route in the RIP process. |

**Platform** N/A

**Description**

## 1.18 ip rip receive enable

Use this command to enable RIP to receive the RIP data package on a specified interface. Use the **no** form of this command to restore the default setting.

**ip rip receive enable**

**no ip rip receive enable**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** RIP packages can be received through the interface by default.

**Command**

**Mode** Interface configuration mode

**Usage Guide** To prevent an interface from receiving RIP packets, use the **no** form of this command in interface configuration mode. This command works on interfaces configured with this command. You can use the **default** form of this command to enable the interface to receive the RIP data package.

**Configuration** The following example prohibits receiving RIP data packages on fastEthernet 0/1.

**Examples**

```
Ruijie (config)# interface fastEthernet 0/1
Ruijie (config-if-FastEthernet 0/1)# no ip rip receive enable
```

**Related Commands**

| Command                   | Description                                                  |
|---------------------------|--------------------------------------------------------------|
| <b>ip rip send enable</b> | Enables or disables the interface to send RIP data packages. |
| <b>passive-interface</b>  | Configures a passive RIP interface.                          |

**Platform** N/A

**Description**

## 1.19 ip rip receive version

Use this command to define the version of RIP packets received on an interface. Use the **no** form of this command to restore the default setting.

**ip rip receive version [ 1 ] [ 2 ]**

**no ip rip receive version**

**Parameter Description**

| Parameter | Description                             |
|-----------|-----------------------------------------|
| <b>1</b>  | (Optional) Receives only RIPv1 packets. |
| <b>2</b>  | (Optional) Receives only RIPv2 packets. |

**Defaults** The default behavior depends on the configuration with the version command.

**Command**

**Mode** Interface configuration mode

**Usage Guide** This command overwrites the default configuration of the **version** command. It affects only RIP packet receiving through the interface and allows RIPv1 and RIPv2 packets to be received on the interface at the same time. If the command is configured without parameters, data package receiving depends on the configuration of the version.

**Configuration** The following example enables receiving both RIPv1 and RIPv2 data packages.

**Examples**

```
Ruijie (config)#interface fastEthernet 0/1
Ruijie (config-if-FastEthernet 0/1)# ip rip receive version 1 2
```

**Related**

| Command | Description |

|----------------|--------------------------------------------------------------------------------|
| <b>version</b> | Defines the default version of the RIP packets received/sent on the interface. |

**Platform** N/A

**Description**

## 1.20 ip rip send enable

Use this command to enable RIP to send a RIP data package on a specified interface. Use the **no** form of this command to restore the default setting.

**ip rip send enable**

**no ip rip send enable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** RIP packages can be sent through the interface by default.

**Command**

**Mode** Interface configuration mode

**Usage Guide** To prevent an interface from sending RIP packets, use the **no** form of this command in interface configuration mode. This command works on interfaces configured with this command. You can use the **default** form of this command to enable the interface to send the RIP data package.

**Configuration** The following example prohibits sending RIP data packages on fastEthernet 0/1.

**Examples**

```
Ruijie (config)# interface fastEthernet 0/1
Ruijie (config-if-FastEthernet 0/1)# no ip rip send enable
```

| Related Commands | Command                      | Description                                                 |
|------------------|------------------------------|-------------------------------------------------------------|
|                  | <b>ip rip receive enable</b> | Enables or disables receiving RIP packets on the interface. |
|                  | <b>passive-interface</b>     | Configures a passive RIP interface.                         |

**Platform** N/A

**Description**

## 1.21 ip rip send supernet-routes

Use this command to enable RIP to send the supernet route on a specified interface. Use the **no** form

of this command to disable this function.

**ip rip send supernet-routes**

**no ip rip send supernet-routes**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|                          | N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command**

**Mode** Interface configuration mode

**Usage Guide** When the RIPv1 router monitors a RIPv2 router response packet and if the supernet routing information is monitored, incorrect route information is learned because the RIPv1 ignores the subnet mask of the routing information. In this case, you are advised to use the **no** form of this command on the RIPv2 router to disable advertising the supernet route on the corresponding interface. This command works only on interfaces configured with this command.

 This command is only valid upon sending the RIPv2 packets on the interface and it is used to control sending the supernet route.

**Configuration** The following example disables sending RIP supernet routes on the fastEthernet 0/1 interface.

**Examples**

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# no ip rip send supernet-routes
```

**Related  
Commands**

| Command                   | Description                                                   |
|---------------------------|---------------------------------------------------------------|
| <b>version</b>            | Defines the RIP version                                       |
| <b>ip rip send enable</b> | Enables or disables sending the RIP package on the interface. |

**Platform** N/A

**Description**

## 1.22 ip rip send version

Use this command to define the version of the RIP packets sent on the interface. Use the **no** form of this command to restore the default setting.

**ip rip send version [ 1 ] [ 2 ]**

**no ip rip send version**

| Parameter<br>Description | Parameter | Description |
|--------------------------|-----------|-------------|
|--------------------------|-----------|-------------|

|   |                                         |
|---|-----------------------------------------|
| 1 | (Optional) Receives only RIPv1 packets. |
| 2 | (Optional) Receives only RIPv2 packets. |

**Defaults** The default behavior depends on the configuration with the version command.

**Command**

**Mode** Interface configuration mode

**Usage Guide** This command overwrites the default configuration of the **version** command. It affects only RIP packet sending through the interface and allows RIPv1 and RIPv2 packages sent on the interface at the same time. If the command is configured without parameters, package receiving depends on the configuration of the version.

**Configuration Examples** The following example enables sending both RIPv1 and RIPv2 packages on the fastEthernet 0/1 interface.

```
Ruijie (config)# interface fastEthernet 0/1
Ruijie (config-if-FastEthernet 0/1)# ip rip send version 1 2
```

**Related Commands**

| Command        | Description                                                                     |
|----------------|---------------------------------------------------------------------------------|
| <b>version</b> | Defines the default version of the RIP packets received/sent on the interfaces. |

**Platform** N/A

**Description**

## 1.23 ip rip split-horizon

Use this command to enable split horizon. Use the **no** form of this command to disable this function.

**ip rip split-horizon [ poisoned-reverse ]**

**no ip rip split-horizon [ poisoned-reverse ]**

**Parameter Description**

| Parameter               | Description                                             |
|-------------------------|---------------------------------------------------------|
| <b>poisoned-reverse</b> | (Optional) Enables split horizon with poisoned reverse. |

**Defaults** This function is enabled by default.

**Command**

**Mode** Interface configuration mode

**Usage Guide** When multiple devices are connected to the IP broadcast network and run a distance vector routing protocol, the split horizon mechanism is required to prevent loop. The split horizon prevents the

device from advertising routing information from the interface that learns that information, which optimizes routing information exchange between multiple devices.

For non-broadcast multi-path access networks (such as frame relay and X.25), split horizon may cause some devices to be unable to learn all routing information. Split horizon may need to be disabled in this case. If an interface is configured the secondary IP address, attentions shall be paid also for split horizon.

If the **poisoned-reverse** parameter is configured, split horizon with poisoned reverse is enabled. In this case, devices still advertise the route information through the interface from which the route information is learned. However, the metric value of the route information is set to unreachable.

The RIP routing protocol is a distance vector routing protocol, and the split horizon issue shall be cautioned in practical applications. If it is unsure whether split horizon is enabled on the interface, use the show ip rip command to judge. This function makes no influence on the neighbor defined with the **neighbor** command.

**Configuration** The following example disables the RIP split horizon function on the interface fastethernet 0/0.

**Examples**

```
Ruijie (config)# interface fastethernet 0/1
Ruijie (config-if)# no ip rip split-horizon
```

**Related  
Commands**

| Command                       | Description                                                                |
|-------------------------------|----------------------------------------------------------------------------|
| <b>neighbor (RIP)</b>         | Defines the IP address of the neighbor of RIP.                             |
| <b>validate-update-source</b> | Enables the source address authentication of the RIP route update message. |

**Platform** N/A

**Description**

## 1.24 ip rip subvlan

Use this command to enable RIP on super VLANs. Use the **no** form of this command to restore the default setting.

**ip rip subvlan [all | vid]**

**no ip rip subvlan**

**Parameter  
Description**

| Parameter | Description                                                     |
|-----------|-----------------------------------------------------------------|
| all       | Indicates that packets are allowed to be sent to all sub VLANs. |
| vid       | Specifies the sub VLAN ID. The value ranges from 1 to 4094.     |

**Defaults** The default setting takes effect only on super VLANs with RIP disabled.

**Command**

**Mode** Interface configuration mode

**Usage Guide** In normal cases, a super VLAN contains multiple sub VLANs. Multicast packets of a super VLAN are also sent to its sub VLANs. In this case, when RIPng multicast packets are sent over a super VLAN containing multiple sub VLANs, the RIPng multicast packets are replicated multiple times, and the device processing capability is insufficient. As a result, a large number of packets are discarded, causing the neighbor down error. In most scenarios, the RIPng function does not need to be enabled on a super VLAN. Therefore, the RIPng function is disabled by default. However, in some scenarios, the RIPng function must be run on the super VLAN, but packets only need to be sent to one sub VLAN. In this case, run this command to specify a particular sub VLAN. You must be cautious in configuring packet transmission to all sub VLANs, as the large number of sub VLANs may cause a device processing bottleneck, which will lead to the neighbor down error.

**Configuration** The following example sends the RIP multicast packets to sub VLAN 1024 of super VLAN 300.

**Examples**

```
Ruijie(config)# interface vlan 300
Ruijie(config-if-VLAN 300)# ip rip subvlan 1024
```

**Platform Description** N/A

## 1.25 ip rip summary-address

Use this command to configure port-level convergence through an interface. Use the **no** form of this command to disable this function.

**ip rip summary-address** *ip-address ip-network-mask*

**no ip rip summary-address** *ip-address ip-network-mask*

**Parameter Description**

| Parameter              | Description                                                                  |
|------------------------|------------------------------------------------------------------------------|
| <i>ip-address</i>      | Indicates the IP addresses to be converged.                                  |
| <i>ip-network-mask</i> | Indicates the subnet mask of the specified IP address for route convergence. |

**Defaults** The RIP routes are automatically converged to the classful network edge by default.

**Command**

**Mode** Interface configuration mode

**Usage Guide** The **ip rip summary-address** command converges an IP address or a subnet on a specified port.

RIP routes are automatically converged to the classful network edge. The classful subnet can be configured through only port convergence.

**i** The summary range configured by this command cannot be a super class network, that is, the configured mask length is greater than or equal to the natural mask length of the network.

**Configuration Examples** The following example disables the automatic route convergence function of RIPv2. Interface convergence is configured so that fastEthernet 0/1 advertises the converged route 172.16.0.0/16.

```
Ruijie (config)# interface fastEthernet 0/1
Ruijie (config-if-FastEthernet 0/1)# ip rip summary-address 172.16.0.0
255.255.0.0
Ruijie (config-if-FastEthernet 0/1)# ip address 172.16.1.1 255.255.255.0
Ruijie (config)# router rip
Ruijie (config-router)# network 172.16.0.0
Ruijie (config-router)# version 2
Ruijie (config-router)# no auto-summary
```

**Related Commands**

| Command             | Description                                      |
|---------------------|--------------------------------------------------|
| <b>auto-summary</b> | Enables the automatic convergence of RIP routes. |

**Platform** N/A

**Description**

## 1.26 ip rip triggered

Use this command to enable triggered RIP based on links. Use the **no** form of this command to restore the default setting.

- ip rip triggered**
- ip rip triggered retransmit-timer *timer***
- ip rip triggered retransmit-count *count***
- no ip rip triggered**
- no ip rip triggered retransmit-timer**
- no ip rip triggered retransmit-count**

**Parameter Description**

| Parameter                            | Description                                                                                                                                                               |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>retransmit-timer <i>timer</i></b> | Configures the interval at which the Update Request and Update Response packets are retransmitted. The range is from 1 to 3,600. The unit is second. The default is five. |
| <b>retransmit-count <i>count</i></b> | Configures the maximum times that the Update Request and Update Response packets are retransmitted. The range is from 1 to 3600. The default is 36.                       |

**Defaults** This function is disabled by default.

**Command**

**Mode** Interface configuration mode

**Usage Guide** Triggered RIP (TRIP) is the extension of RIP on the wide area network (WAN), mainly used for demand-based links.

With the TRIP function enabled, RIP no longer sends route updates periodically and sends route updates to the WAN interface only if:

Update Request packets are received.

RIP routing information is changed.

Interface state is changed.

The router is started.

As periodical RIP update is disabled, the confirmation and retransmission mechanism is required to ensure that update packets are sent and received successfully over the WAN. The **retransmit-timer** and **retransmit-count** commands can be used to specify the retransmission interval and maximum retransmission times for request and update packets.

 The function can be enabled in the case of the following conditions: a) The interface has only one neighbor. b) There are multiple neighbors but they interact information using unicast packets. You are advised to enable the function for link layer protocols such as PPP, frame relay, and X.25.

 You are advised to enable split horizon with poison reverse on the interface enabled with the function; otherwise invalid routing information might be left.

 Make sure that the function is enabled on all routers on the same link; otherwise the function will be invalid and the routing information cannot be exchanged correctly.

 The function cannot be enabled at the same time with BFD and RIP functions.

 To enable the function, make sure that the RIP configuration is the same on both ends of the link, such as RIP authentication and the RIP version supported by the interface.

 If this function is enabled on this interface, the source address of packets on this interface will be checked no matter whether the source IP address verification function (validate-update-source) is enabled.

**Configuration** The following example enables TRIP and sets the retransmission interval and maximum

**Examples** retransmission time to 10 seconds and 18 respectively for Update Request and Update Response packets.

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ip rip triggered
Ruijie(config-if-FastEthernet 0/1)# ip rip triggered retransmit-timer 10
Ruijie(config-if-FastEthernet 0/1)# ip rip triggered retransmit-count 18
```

| Related Commands | Command                      | Description                                                      |
|------------------|------------------------------|------------------------------------------------------------------|
|                  | <b>show ip rip database</b>  | Displays the summarized routing information of the RIP database. |
|                  | <b>show ip rip interface</b> | Displays the RIP interface information.                          |
|                  | <b>ip rip split-horizon</b>  | Configures RIP split horizon.                                    |

**Platform** N/A  
**Description**

## 1.27 ip rip v2-broadcast

Use this command to send RIPv2 packets in broadcast rather than multicast mode. Use the **no** form of this command to restore the default setting.

**ip rip v2-broadcast**  
**no ip rip v2-broadcast**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** The default behavior depends on the configuration of the version command.

### Command

**Mode** Interface configuration mode

**Usage Guide** This command overwrites the default of the **version** command. This command affects only sending RIP packets on the interface. This command allows RIPv1 and RIPv2 packages sent on the interface simultaneously. If this command is configured without parameters, package receiving depends on the version setting.

**Configuration** The following example sends RIPv2 packets in broadcast mode on the fastEthernet 0/1 interface.

**Examples**

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# no ip rip split-horizon
```

| Related Commands | Command        | Description                                                                        |
|------------------|----------------|------------------------------------------------------------------------------------|
|                  | <b>version</b> | Defines the default version of the RIP packets received and sent on the interface. |

**Platform** N/A  
**Description**

## 1.28 neighbor

Use this command to define the IP address of a RIP neighbor. Use the **no** form of this command to restore the default setting.

**neighbor** *ip-address*

**no neighbor** *ip-address*

| Parameter Description | Parameter         | Description                                                                                                         |
|-----------------------|-------------------|---------------------------------------------------------------------------------------------------------------------|
|                       | <i>ip-address</i> | Indicates the IP address of the neighbor. The IP address must be that of the network connected to the local device. |

**Defaults** The neighbor is not defined by default.

### Command

**Mode** Routing process configuration mode

**Usage Guide** By default, RIPv1 uses the IP broadcast address (255.255.255.255) to advertise routing information, and RIPv2 uses the multicast address 224.0.0.9 to do so. If you do not want to allow all the devices on the broadcast network or non-broadcast multi-path access network to receive routing information, use the **passive-interface** command to configure related interfaces as passive interfaces and then define only some neighbors who can receive the routing information. This command has no impact on the receiving of RIP information. The passive interface is configured. No request packet is sent after the interface is enabled.

**Configuration** The following example creates a VRF with the name of vpn1 and creates its RIP instance.

### Examples

```
Ruijie(config)# router rip
Ruijie(config-router)# passive-interface default
Ruijie(config-router)# neighbor 192.168.1.2
```

| Related Commands | Command                  | Description                                      |
|------------------|--------------------------|--------------------------------------------------|
|                  | <b>passive-interface</b> | Configures the interface as a passive interface. |

**Platform** N/A

**Description**

## 1.29 network

Use this command to define the list of networks to be advertised in the RIP routing process. Use the **no** form of this command to delete the defined network.

**network** *network-number* [ *wildcard* ]

**no network** *network-number* [ *wildcard* ]

| Parameter Description | Parameter             | Description                                                                                                                                                                                          |
|-----------------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>network-number</i> | Indicates the network number of the directly-connected network. The network number is a natural one. All interfaces whose IP addresses belong to that natural network can send/receive RIP packages. |
|                       | <i>wildcard</i>       | Defines the IP address comparing bit: 0 refers to accurate matching, and 1 refers to no comparison.                                                                                                  |

**Defaults** N/A

**Command**

**Mode** Routing process configuration mode

**Usage Guide** The *network-number* and *wildcard* parameters can be configured simultaneously to enable the IP address of the interface within the IP address range to join RIP running. Without the *wildcard* parameter, RGOS make the interface IP address within the classful address range join the RIP running. Only when the IP address of an interface is in the network list defined by RIP, RIP route update packets can be received and sent on the interface.

**Configuration Examples** The following example defines two network numbers associated with RIP and allows the interface IP address between 192.168.12.0/24 and 172.16.0.0/24 to join RIP running.

```
Ruijie (config)# router rip
Ruijie (config-router)# network 192.168.12.0
Ruijie (config-router)# network 172.16.0.0 0.0.0.255
```

**Description**

### 1.30 offset-list

Use this command to increase the metric value of received or sent RIP routes. Use the **no** form of this command to restore the default setting.

**offset-list** { *access-list-number* | *name* } { **in** | **out** } *offset* [ *interface-type interface-number* ]

**no offset-list** { *access-list-number* | *name* } { **in** | **out** } *offset* [ *interface-type interface-number* ]

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|-----------------------|-----------|-------------|

|                                  |                                                                                       |
|----------------------------------|---------------------------------------------------------------------------------------|
| <i>access-list-number   name</i> | Specifies the ACL.                                                                    |
| <b>in</b>                        | Modifies the metric of the received routes using the ACL.                             |
| <b>out</b>                       | Modifies the metric of the sent routes using the ACL.                                 |
| <i>offset</i>                    | Indicates the offset of changed metric values. The value is in the range from 0 to16. |
| <i>interface-type</i>            | Applies the ACL to a specified interface.                                             |
| <i>interface-number</i>          | Specifies the interface number.                                                       |

**Defaults** No offset is specified by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** If a RIP route matches against both the offset-list of the specified interface and the global offset-list, it will increase the metric value of the offset-list of the specified interface.

**Configuration** The following example increases the metric of the RIP routes by 7 in the range specified by ACL 7.

**Examples**

```
Ruijie (config-router)# offset-list 7 out 7
```

The following example increases the metric of the RIP routes by 7 in the range specified by ACL 7 and learned by fastethernet 0/1.

```
Ruijie (config-router)# offset-list 8 in 7 fastethernet 0/1
```

**Platform** N/A

**Description**

## 1.31 output-delay

Use this command to modify the delay to send RIP update packets. Use the **no** form of this command to restore the default setting.

**output-delay** *delay*

**no output-delay**

**Parameter Description**

| Parameter    | Description                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------|
| <i>delay</i> | Sets the delay to send RIP update packets, in the range from 8 to 50 in the unit of milliseconds. |

**Defaults** No sending delay is configured by default.

**Command****Mode** Routing process configuration mode**Usage Guide** In normal cases, the size of a RIP update packet is 512 bytes including 25 routes. If the number of updated routes is greater than 25, update packets will be sent through multiple routes. Note that the update packets should be sent as fast as possible.

However, when a high-speed device sends a large number of packets to a low-speed device, the low-speed device may not process all the packets timely, resulting in packet loss. In this case, you can use this command to increase the delay to send packets on the high-speed device so that the low-speed device can process all the update packets.

**Configuration** The following example sets the delay to send RIP update packets to 30 milliseconds.**Examples**

```
Ruijie(config)# router rip
Ruijie(config-router)# output-delay 30
```

## 1.32 passive-interface

Use this command to disable the function of sending update packets on an interface. Use the **no** form of this command to restore the default setting.

**passive-interface** { **default** | *interface-type interface-num* }**no passive-interface** { **default** | *interface-type interface-num* }**Parameter Description**

| Parameter                           | Description                                    |
|-------------------------------------|------------------------------------------------|
| <b>default</b>                      | Sets all interfaces to the passive interfaces. |
| <i>interface-type interface-num</i> | Indicates the interface type and number.       |

**Defaults** Interfaces are set to the non passive interfaces by default.**Command****Mode** Routing process configuration mode**Usage Guide** The **passive-interface default** command sets all interfaces to the passive interfaces. You can use **no passive-interface interface-type interface-num** command to set specified interfaces as non-passive interfaces.

After you set an interface to the passive interface, RIP route update packets will no longer be sent but

can be received through the interface. In this case, route update packets can be sent to a specified neighbor through the interfaces by using the **neighbor** command. You can use the **ip rip send enable** and **ip rip receive enable** commands to control whether route update packets can be sent or received through the interface.

**Configuration Examples** The following example sets all interfaces to the passive interfaces and then sets ethernet0/1 to the non-passive interface.

```
Ruijie(config-router)# passive-interface default
Ruijie(config-router)# no passive-interface gigabitEthernet 0/1
```

**Platform** N/A

**Description**

## 1.33 redistribute

Use this command to redistribute external routes in route configuration mode. Use the **no** form of this command to restore the default setting.

```
redistribute { bgp | connected | isis [ area-tag ] | ospf process-id | static } [ { level-1 | level-1-2 | level-2 } ] [ match { internal | external [ 1|2 ] | nssa-external [ 1|2 ] } ] [ metric metric-value ] [ route-map route-map-name ]
```

```
no redistribute { bgp | connected | isis [ area-tag ] | ospf process-id | static } [ { level-1 | level-1-2 | level-2 } ] [ match { internal | external [ 1|2 ] | nssa-external [ 1|2 ] } ] [ metric metric-value ] [ route-map route-map-name ]
```

#### Parameter Description

| Parameter                                          | Description                                                                                                              |
|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>bgp</b>                                         | Is redistributed from bgp.                                                                                               |
| <b>connected</b>                                   | Is redistributed from a connected route.                                                                                 |
| <b>isis</b> <i>area-tag</i>                        | Is redistributed from ISIS and specifies an ISIS instance through area-tag.                                              |
| <b>ospf</b> <i>process-id</i>                      | Is redistributed from OSPF and specifies an OSPF instance through process-id. The value is in the range from 1 to 65535. |
| <b>static</b>                                      | Is redistributed from static routes.                                                                                     |
| <b>level-1</b>   <b>level-1-2</b>   <b>level-2</b> | Is used when ISIS route redistribution is configured and specifies a route with a specific level for redistribution.     |
| <b>match</b>                                       | Is used when OSPF route redistribution is configured and filters a                                                       |

|                                        |                                                                                                                                                              |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                        | route with a specific level for redistribution.                                                                                                              |
| <b>metric</b> <i>metric-value</i>      | Sets the metric value of the redistributed route and specifies the metric value by using the metric-value parameter. The value is in the range from 1 to 16. |
| <b>route-map</b> <i>route-map-name</i> | Sets the redistribution filtering rule.                                                                                                                      |

**Defaults**

By default:

All the routes of the sub types of the instance are redistributed when you configure redistributing OSPF.

The routes of Level-2 sub-types of the instance are redistributed when you configure ISIS redistribution.

All the routes of the protocol are redistributed for other routing protocols.

The metric of the redistributed routes is 1 by default.

The route-map is not associated.

**Command****Mode**

Routing process configuration mode

**Usage Guide**

This command is executed to redistribute external routes to RIP.

It is unnecessary to convert the metric of one routing protocol into that of another routing protocol for route redistribution, since different routing protocols use different metric measurement methods. For RIP, the metric value is calculated based on hop counts; for OSPF, the metric value is calculated based on bandwidths. Therefore, their metrics are not comparable. However, a symbolic metric value must be set for route redistribution. Otherwise, route redistribution will fail.

When you configure ISIS route redistribution without the level parameter, only level-2 routes are redistributed by default. If the redistribution configuration is initialized with the level parameter, then all routes with level configured are redistributed. When the configuration is saved and level 1 and level 2 are configured at the same time, level 1 and level 2 are combined into the level-1-2 parameter to be saved.

When you configure redistribution of OSPF routes without the match parameter, the OSPF routes of all sub types are redistributed by default. Then the first configured match parameter is used as the original one. Only the routes matching the specific type can be redistributed. The no form of this command restores the setting to the default value.

The rule of configuring the no form of the redistribute command is as follows:

1. If the no form of this command specifies certain parameters, the parameters must be restored to the default configuration.
2. If the **no** form of this command does not specify any parameter, the command must be deleted.

Assume that the following configurations are available.

```
redistribute isis 112 level-2
```

You can use the no redistribute isis 112 level-2 command to modify the configuration.

According to the preceding rule, this command only restores the level-2 parameter to the default value. However, level-2 is also the default parameter value. Therefore, the configuration is still be saved as redistribute isis 112 level-2 after you use the no form of this command.

To delete this command, use the following command:

no redistribute isis 112

 The redistribute command cannot redistribute the default route of other protocol to the RIP process. To this end, use the **default-information originate** command.

**Configuration** The following example redistributes static routes to RIP.

**Examples** Ruijie(config-router)# redistribute static

| Related Commands | Command                              | Description                                               |
|------------------|--------------------------------------|-----------------------------------------------------------|
|                  | <b>default-metric</b> <i>metric</i>  | Sets the default metric of the route to be redistributed. |
|                  | <b>default-information originate</b> | Generates the default route in the RIP process.           |

**Platform** N/A

**Description**

### 1.34 router rip

Use this command to create the RIP routing process and enter the routing process configuration mode. Use the **no** form of this command to restore the default setting.

**router rip**

**no router rip**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** No RIP process is running by default.

**Command**

**Mode** Global configuration mode

**Usage Guide** One RIP routing process must be defined with one network number. If a dynamic routing protocol runs on asynchronous lines, configure the **async default routing** command on the asynchronous interface.

**Configuration Examples** The following example creates the RIP routing process and enters the routing process configuration mode.

```
Ruijie (config)# router rip
Ruijie(config-router)#
```

**Description**

## 1.35 show ip rip

Use this command to display the RIP process information.

**show ip rip [ vrf vrf-name ]**

| Parameter Description | Parameter    | Description                                                       |
|-----------------------|--------------|-------------------------------------------------------------------|
|                       | vrf vrf-name | ( Optional ) Displays the RIP information with the specified VRF. |

**Defaults** N/A

**Command**

**Mode** Privileged EXEC mode/ Global configuration mode/ Routing process configuration mode

**Usage Guide** It is used to display the three timers, routing distribution status, routing re-distribution status, interface RIP version, RIP interface and network range, metric, and distance of the RIP process quickly. If the VRF is specified, the name of VRF and VRF ID are displayed.

**Configuration Examples** The following example displays the basic information of the RIP process such as the update time and management distance.

```
Ruijie#show ip rip
Routing Protocol is "rip"
  Sending updates every 10 seconds,
  Invalid after 20 seconds, flushed after 10 seconds
  Outgoing update filter list for all interface is: not set
  Incoming update filter list for all interface is: not set
  Default redistribution metric is 2
  Redistributing: connected
  Default version control: send version 2, receive version 2
    Interface          Send  Recv
    FastEthernet 0/1      2    2
    FastEthernet 0/2      2    2
  Routing for Networks:
    192.168.26.0 255.255.255.0
    192.168.64.0 255.255.255.0
  Distance: (default is 50)
  Graceful-restart enabled
  Restart grace period 60 secs
```

```
Current Restart remaining time 16 secs
```

The following example specifies the VRF and displays the corresponding basic information of RIP instance.

```
Ruijie(config-router)# sh ip rip vrf 1
VRF 1 VRF-id:1
Routing Protocol is "rip"
  Sending updates every 30 seconds, next due in 4 seconds
  Invalid after 180 seconds, flushed after 120 seconds
  Outgoing update filter list for all interface is: not set
  Incoming update filter list for all interface is: not set
  Default redistribution metric is 1
  Redistributing:
  Default version control: send version 1, receive any version
  Routing for Networks:
  Distance: (default is 120)
```

**Platform Description** N/A

### 1.36 show ip rip database

Use this command to display the route summary information in the RIP routing database.

**show ip rip database** [ *vrf vrf-name* ] [ *network-number network-mask* ] [ *count* ]

**Parameter Description**

| Parameter             | Description                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------|
| <i>vrf vrf-name</i>   | ( Optional ) Displays the RIP routing information of specified VRF.                        |
| <i>network-number</i> | ( Optional ) Indicates the ID of the subnet on which route information is to be displayed. |
| <i>network-mask</i>   | Indicates the subnet mask. It must be specified if the network number is specified.        |
| <b>count</b>          | ( Optional ) Displays the abstract of the route statistics in the RIP database.            |

**Command**

**Mode** Privileged EXEC mode/ Global configuration mode/ Routing process configuration mode

**Usage Guide** Only when the related sub-routes are converged, the converged address entries appear in the RIP

routing database. When the last sub-route information in the converged address entries becomes invalid, the converged address information will be deleted from the database.

**Configuration** The following example displays all converged address entries in the RIP routing database.

**Examples**

```
Ruijie# show ip rip database
192.168.1.0/24    auto-summary
192.168.1.0/30    directly connected, Loopback 3
192.168.1.8/30    directly connected, FastEthernet 0/1
192.168.121.0/24  auto-summary
192.168.121.0/24  redistributed
[1] via 192.168.2.22, FastEthernet 0/2
192.168.122.0/24  auto-summary
192.168.122.0/24
[1] via 192.168.4.22, Serial 0/1 00:28 permanent
```

The following example displays the converged address entries related with 192.168.121.0/24 in the RIP routing database.

```
Ruijie# show ip rip database 192.168.121.0 255.255.255.0
192.168.121.0/24  redistributed
[1] via 192.168.2.22, FastEthernet 0/1
```

The following example displays the statistical information summary of various routes in the RIP routing database.

```
Ruijie# show ip rip database count
           All      Valid  Invalid
database      5        5        0
auto-summary  5         5         0

connected     1         1         0
rip           4         4         0
```

**Related Commands**

| Command            | Description                                                                 |
|--------------------|-----------------------------------------------------------------------------|

**Platform** N/A

**Description**

## 1.37 show ip rip external

Use this command to display the information of the external routes redistributed by the RIP protocol.

**show ip rip external [ bgp | connected | isis [ process-id ] | ospf process-id | static ] [ vrf vrf-name ]**

| Parameter Description | Parameter                     | Description                                                                                                           |
|-----------------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------|
|                       | <b>bgp</b>                    | Displays redistributed BGP routes.                                                                                    |
|                       | <b>connected</b>              | Displays redistributed directly-connected routes.                                                                     |
|                       | <b>isis <i>process-id</i></b> | Displays redistributed ISIS routes. The process-id parameter indicates ISIS process ID.                               |
|                       | <b>ospf <i>process-id</i></b> | Displays redistributed OSPF routes. The process-id parameter indicates OSPF process ID. The range is from 1 to 65535. |
|                       | <b>static</b>                 | Displays redistributed static routes.                                                                                 |
|                       | <b>vrf <i>vrf-name</i></b>    | Displays the RIP external route of the specified VRF ( optional ).                                                    |

**Defaults** N/A

**Command**

**Mode** Privileged EXEC mode/ Global configuration mode/ Routing process configuration mode

**Usage Guide** N/A

**Configuration** The following example displays direct routes redistributed by the RIP process.

**Examples**

```
Ruijie# show ip rip external
Protocol connected route:
[connected] 192.100.3.0/24 metric=0
    nhop=0.0.0.0, if=2
[connected] 192.101.1.0/24 metric=0
    nhop=0.0.0.0, if=3
Protocol static route:
[static] 10.1.1.1/32 metric=0
    nhop=0.0.0.0, if=4096
[static] 10.1.2.1/32 metric=0
    nhop=0.0.0.0, if=4096
Protocol ospf 1 route:
[ospf] 1.1.1.1/32 metric=2
    nhop=192.100.3.2, if=2
[ospf] 90.1.1.1/32 metric=2
    nhop=192.100.3.2, if=2
```

**Related Commands**

| Command            | Description                                                                 |
|--------------------|-----------------------------------------------------------------------------|
| <b>show ip rip</b> | Displays the information of the currently running routing protocol process. |
| <b>ip vrf</b>      | Creates a VRF.                                                              |

**Platform Description** N/A

## 1.38 show ip rip interface

Use this command to display the RIP interface information.

***show ip rip interface [ vrf vrf-name ] [ interface-type interface-number ]***

| Parameter Description | Parameter                                  | Description                                                              |
|-----------------------|--------------------------------------------|--------------------------------------------------------------------------|
|                       | <b>vrf vrf-name</b>                        | Displays the RIP interface of specified VRF ( optional ).                |
|                       | <b>[ interface-type interface-number ]</b> | Displays the specified interface type and interface number ( optional ). |

**Defaults** N/A

### Command

**Mode** Privileged EXEC mode/ Global configuration mode/ Routing process configuration mode

**Usage Guide** This command is used to display the information about RIP interfaces. If no RIP interface exists, no information is displayed.

**Configuration** The following example displays the RIP interface information.

### Examples

```
Ruijie# show ip rip interface
FastEthernet 0/1 is up, line protocol is up
Routing Protocol: RIP
Receive RIPv2 packets only
Send RIPv2 packets only
Recv RIP packet total: 0
Send RIP packet total: 3
Passive interface: Disabled
Split Horizon with Poisoned Reverse: Enabled
Triggered RIP Enabled:
Retransmit-timer: 5, Retransmit-count: 36
V2 Broadcast: Disabled
Multicast registe: Registered
Interface Summary Rip:
Not Configured
Authentication mode: Text
Authentication key-chain: ripk1
Authentication text-password: ruijie
Default-information: only, metric 5
IP interface address:
192.168.64.100/24, next update due in 14 seconds
2.2.1.1/24, next update due in 24 seconds
  neighbor 2.2.1.6, next update due in 3 seconds
  neighbor 2.2.1.77, next update due in 13 seconds
```

```
2.2.2.57/24, next update due in 16 seconds
```

If the BFD has been configured for RIP, the BFD information is also displayed.

```
Ruijie#show ip rip interface
Serial 0/1 is up, line protocol is up
  Routing Protocol: RIP
    Receive RIPv1 and RIPv2 packets
    Send RIPv1 packets only
    Receive RIP packet: Enabled
    Send RIP packet: Enabled
    Send RIP supernet routes: Enabled
    Recv RIP packet total: 0
    Send RIP packet total: 3
    Passive interface: Disabled
  Split Horizon: Enabled
  Triggered RIP Disabled
    BFD: Enabled
    V2 Broadcast: Disabled
    Multicast registe: Registered
  Interface Summary Rip:
    Not Configured
  IP interface address:
    2.2.2.111/24, next update due in 14 seconds
```

**Related Commands**

| Command            | Description                                                                 |
|--------------------|-----------------------------------------------------------------------------|
| <b>show ip rip</b> | Displays the information of the currently running routing protocol process. |

**Platform** N/A

**Description**

### 1.39 show ip rip peer

Use this command to show the RIP peer information. RIP records a summary for the RIP routing information source learnt ( source addresses of RIP route update packets ) for the convenience of user monitoring. This routing information source is called RIP neighbor information.

**show ip rip peer** [ *ip-address* ] [ **vrf** *vrf-name* ]

**Parameter Description**

| Parameter                  | Description                                                       |
|----------------------------|-------------------------------------------------------------------|
| <i>ip-address</i>          | ( Optional ) Displays the IP address of a specified RIP neighbor. |
| <b>vrf</b> <i>vrf-name</i> | ( Optional ) Displays the RIP interface of a specified VRF.       |

**Defaults** N/A

**Command****Mode** Privileged EXEC mode/ Global configuration mode/ Routing process configuration mode**Usage Guide** This command is used to display the RIP neighbor information. If no RIP neighbor exists, no information will be displayed.**Configuration** The following example displays the RIP neighbor information.**Examples**

```
Ruijie# show ip rip peer
Peer 192.168.3.2:
  Local address: 192.168.3.1
  Input interface: GigabitEthernet 0/2
  Peer version: RIPv1
  Received bad packets: 3
  Received bad routes: 0
  BFD session state up
```

|--------------------|---------------------------------------------------------------------------|
| <b>show ip rip</b> | Displays the information of the routing protocol process that is running. |

**Platform** N/A**Description**

## 1.40 timers basic

Use this command to adjust the RIP clock. Use the **no** form of this command to restore the default setting.

**timers basic** *update invalid flush***no timers basic****Parameter Description**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>update</i>  | Indicates the route update time in seconds. The update keyword defines the period at which the device sends route update packets. Each time an update packet is received, the "Invalid" and "Flush" clocks are reset. By default, a route update packet is sent every 30 seconds.                                                                               |
| <i>invalid</i> | Indicates the route invalid time in seconds, starting from the last valid update packet. The "invalid" defines the period when the route in the routing table becomes invalid due to no update. The invalid period of route shall be at least three times the route update period. If no update packet is received within the route invalid period, the related |

|              |                                                                                                                                                                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | route becomes invalid and enters into the "invalid" state. If an update packet is received within the period, the clock resets. By default, the Invalid time is 180 seconds.                                                                          |
| <i>flush</i> | Indicates the route flushing time in seconds, starting when a RIP route enters into the invalid status. When the flush time is due, the routes in the invalid status will be cleared out of the routing table. The default Flush time is 120 seconds. |

**Defaults** By default, the update time is 30 seconds, the invalid time is 180 seconds, and the flushing time is 120 seconds.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** Adjusting the above clocks may speed up routing protocol convergence and fault recovery. Devices connected to the same network must have consistent RIP clock values. Adjustment of RIP clocks is not recommended unless otherwise specified.

To check the current RIP clock parameters, use the **show ip rip** command.

 If you set the clock to a small value on low-speed links, some risks will be caused because numerous update packets may use up the bandwidth. In general, the clocks can be configured with smaller values on Ethernet or the lines of above 2 Mbit/s to reduce the convergence time of routes.

**Configuration Examples** The following example enables the RIP update packets that are sent every 10 seconds. If no update packet is received within 30 seconds, related routes become invalid and enter the invalid status. When another 90s elapses, they will be cleared.

```
Ruijie (config)# router rip
Ruijie (config-router)# timers basic 10 30 90
```

## 1.41 validate-update-source

Use this command to validate the source address of the received RIP route update packet. Use the **no** form of the command to disable this function.

**validate-update-source**

**no validate-update-source**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is enabled by default.

### Command

**Mode** Routing process configuration mode

**Usage Guide** You can validate the source address of the RIP route update packet. The validation aims to ensure that the RIP routing process receives only the route update packets from the same IP subnet neighbor.

Disabling split horizon on the interface causes the RIP routing process to enable update message source address validation, no matter whether it has been configured with the **validate-update-source** command in routing process configuration mode.

In addition, for the ip unnumbered interface, the RIP routing process does not implement update message source address validation, no matter whether it has been configured with the command **validate-update-source**.

**Configuration** The following example disables verification of the source IP address of the update packet.

### Examples

```
Ruijie (config)# router rip
Ruijie (config-router)# no validate-update-source
```

| <b>neighbor (RIP)</b>   | Defines the IP address of a RIP neighbor. |

**Platform** N/A

### Description

## 1.42 version

Use this command to define the RIP version of a device. Use the **no** form of this command to restore the default setting.

**version { 1 | 2 }**

**no version**

| Parameter Description | Parameter | Description                |
|-----------------------|-----------|----------------------------|
|                       | 1         | Defines the RIP version 1. |
|                       | 2         | Defines the RIP version 2. |

**Defaults** The route update packets of RIPv1 and are received by default, but only the RIPv1 route update packets are sent.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** This command defines the RIP version running on the device. It is possible to redefine the messages of which RIP version are processed on every interface by using the **ip rip receive version** and **ip rip send version** commands.

**Configuration** The following example configures the RIP version as version 2.

**Examples**

```
Ruijie (config)# router rip
Ruijie (config-router)# version 2
```

## 2 OSPFv2 Commands

### 2.1 area

Use this command to configure the specified OSPF area. Use the **no** form of this command to restore the default setting.

**area** *area-id*

**no area** *area-id*

| Parameter Description | Parameter      | Description                                                               |
|-----------------------|----------------|---------------------------------------------------------------------------|
|                       | <i>area-id</i> | ID of the OSPF area. The value can be a decimal integer or an IP address. |

**Defaults** No OSPF area is configured by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** Use the no form of this command to remove the specified OSPF area and its configuration, including the area-based **area authentication**, **area default-cost**, **area filter-list**, and **area nssa** commands.

- Do not remove the OSPF area configuration under the following conditions:
- Virtual links exist in the backbone area. The virtual links must be removed at first.
- The corresponding network area command exists in any area. All network segment commands added to an area must be removed at first.

**Configuration** The following example removes the configuration of OSPF area 2.

**Examples**

```
Ruijie(config)# router ospf 2
Ruijie(config-router)# no area 2
```

| Related Commands | Command             | Description                                                                    |
|------------------|---------------------|--------------------------------------------------------------------------------|
|                  | <b>network area</b> | Defines the interface where OSPF runs and the belonging area of the interface. |

**Platform Description** N/A

## 2.2 area authentication

Use this command to enable OSPF area authentication. Use the **no** form of this command to restore the default setting.

**area** *area-id* **authentication** [ **message-digest** ]

**no area** *area-id* **authentication**

| Parameter Description | Parameter             | Description                                                                                      |
|-----------------------|-----------------------|--------------------------------------------------------------------------------------------------|
|                       | <i>area-id</i>        | Specifies ID of the area enabled with OSPF. The value can be a decimal integer or an IP address. |
|                       | <b>message-digest</b> | (Optional) Enables MD5 (message digest 5) authentication mode.                                   |

**Defaults** No authentication is enabled by default.

### Command

**Mode** Routing process configuration mode

### Usage Guide

The RGOS software supports three authentication types:

1) 0, no authentication. The authentication type in the OSPF packet is 0 when this command is not executed to enable OSPF authentication. 2) 1, plain text authentication mode. When this command is configured, the message-digest option is not used. 3) 2, MD5 authentication mode. When this command is configured, the message-digest option is used.

All devices in the same OSPF area must use the same authentication type. If authentication is enabled, the authentication password must be configured on an interface connecting neighbors. You can use the **ip ospf authentication-key** command to configure the plain text authentication password, and the **ip ospf message-digest-key** command to configure the MD5 authentication password in interface configuration mode.

**Configuration Examples** The following example uses MD5 authentication and the authentication password backbone in area 0 (backbone area) of the OSPF routing process.

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ip address 192.168.12.1 255.255.255.0
Ruijie(config-if-FastEthernet 0/1)# ip ospf message-digest-key 1 md5 backbone
Ruijie(config)# router ospf 1
Ruijie(config-router)# network 192.168.12.0 0.0.0.255 area 0
Ruijie(config-router)# area 0 authentication message-digest
```

|--------------------------|-------------------------|

**Platform** N/A

**Description**

## 2.3 area default-cost

Use this command to define the cost ( OSPF metric ) of the default aggregate route advertised to the stub area or not-so-stubby area ( NSSA ) in routing process configuration mode. Use the **no** form of this command to restore the default setting.

**area** *area-id* **default-cost** *cost*

**no area** *area-id* **default-cost**

| Parameter Description | Parameter      | Description                                                                                                  |
|-----------------------|----------------|--------------------------------------------------------------------------------------------------------------|
|                       | <i>area-id</i> | ID of the stub area or NSSA                                                                                  |
|                       | <i>cost</i>    | Cost of the default aggregate route advertised to the stub area or NSSA.<br>The range is from 0 to 16777215. |

**Defaults** The default is 1.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** This command takes effect only on the Area Border Router ( ABR ) of the stub area or the ABR/Autonomous System Border Router ( ASBR ) of the NSSA. The ABR can advertise a Link State Advertisement ( LSA ) indicating the default route in the stub area. The ABR/ASBR can advertise an LSA indicating the default route in the NSSA. You can use the **area default-cost** command to modify the LSA cost.

**Configuration** The following example sets the cost of the default aggregate route to 50.

**Examples**

```
Ruijie(config)# router ospf 1
Ruijie(config-router)# network 172.16.0.0 0.0.255.255 area 0
Ruijie(config-router)#network 192.168.12.0 0.0.0.255 area 1
Ruijie(config-router)# area 1 stub
Ruijie(config-router)# area 1 default-cost 50
```

**Related Commands**

| Command          | Description                       |
|------------------|-----------------------------------|
| <b>area stub</b> | Sets an OSPF area as a stub area. |
| <b>area nssa</b> | Sets an OSPF area as an NSSA.     |

**Platform** N/A

## Description

## 2.4 area filter-list

Use this command to filter the inter-area routes on the ABR. Use the **no** form of this command to restore the default setting.

**area** *area-id* **filter-list** { **access** *acl-name* | **prefix** *prefix-name* } { **in** | **out** }

**no area** *area-id* **filter-list** { **access** *acl-name* | **prefix** *prefix-name* } { **in** | **out** }

### Parameter Description

| Parameter              | Description                                                    |
|------------------------|----------------------------------------------------------------|
| <i>area-id</i>         | Area ID                                                        |
| <i>acl-name</i>        | Name of an Access Control List ( ACL )                         |
| <i>prefix-name</i>     | Prefix-list name                                               |
| <b>in</b>   <b>out</b> | Applies the ACL rule to the routes incoming/outgoing the area. |

**Defaults** No filtering is configured by default.

### Command

**Mode** Routing process configuration mode

**Usage Guide** This command can be configured only on an ABR.

You can use this command when it is required to filter the inter-area routes on the ABR.

**Configuration** The following example sets area 1 to learn only the inter-area routes of 172.22.0.0/8.

### Examples

```
Ruijie# configure terminal
Ruijie(config)# access-list 1 permit 172.22.0.0 0.255.255.255
Ruijie(config)# router ospf 100
Ruijie(config-router)# area 1 filter-list access 1 in
```

### Description

## 2.5 area nssa

Use this command to set an OSPF area as an NSSA in routing process configuration mode. Use the **no** form of this command to delete the NSSA or the NSSA configuration.

**area** *area-id* **nssa** [ **no-redistribution** ] [ **default-information-originate** [ **metric** *value* ]

[ **metric-type** *type* ] ] [ **no-summary** ] [ **translator** [ **stability-interval** *seconds* | **always** ] ]

```
no area area-id nssa [ no-redistribution ] [ default-information-originate [ metric value ]
[ metric-type type ] ] [ no-summary ] [ translator [ stability-interval | always ] ]
```

**Parameter  
Description**

| Parameter                                | Description                                                                                                                                                                             |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-id</i>                           | NSSAID                                                                                                                                                                                  |
| <b>no-redistribution</b>                 | Imports the routing information to a common area other than the NSSA for the NSSA ABR.                                                                                                  |
| <b>default-information originate</b>     | Generates and imports the default Type 7 LSA to the NSSA. This option takes effect only on the NSSA ABR or ASBR.                                                                        |
| <b>metric <i>value</i></b>               | Sets the metric of the generated default LSA. The range is from 0 to 16777214. The default value is 1.                                                                                  |
| <b>metric-type <i>type</i></b>           | Sets the type of the generated LSA to N-1 or N-2. The default value is N-2.                                                                                                             |
| <b>no-summary</b>                        | Prevents the NSSA ABR from sending summary LSAs ( Type-3 LSA ).                                                                                                                         |
| <b>translator</b>                        | Configures the translator for the NSSA ABR.                                                                                                                                             |
| <b>stability-interval <i>seconds</i></b> | Configures the stability interval in seconds for the NSSA ABR that functions as a translator to change to a non-translator. The range is from 0 to 2147483647. The default value is 40. |
| <b>always</b>                            | Configures that an NSSA ABR always functions as a translator. The NSSA ABR is the backup translator by default.                                                                         |

**Defaults** No NSSA is defined by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** The default-information-originate parameter is used to generate the default Type-7 LSA. However, on the NSSA ABR, the default Type-7 LSA will always be generated; On the ASBR (which is not an ABR at the same time), the default Type-7 LSA is generated only when the default route exists in the routing table.

The no-redistribution parameter prevents the OSPF from advertising the external routes imported with the redistribute command to the NSSA on the ASBR. This option is generally used when the NSSA device is both an ASBR and an ABR.

To reduce the number of LSAs sent to the NSSA, you can configure the no-summary parameter on the ABR to prevent it from advertising summary LSAs (Type-3 LSAs) to the NSSA. In addition, you can use the area default-cost command on the NSSA ABR to configure the cost of the default route advertised to the NSSA. By default, this cost is 1.

If an NSSA has multiple ABRs, the ABR with the greatest ID is selected as the Type-7 or Type-5 translator. To configure that an NSSA ABR always functions as a translator, you can use the translator always parameter. If the translator role of an ABR is taken away by another ABR, the ABR still possesses the conversion capability within stability-interval. If the ABR fails to take back its translator role when stability-interval expires, the LSA that changes from Type-7 to Type-5 will be

removed from the autonomous domain.

To avoid route loops, Type-5 LSAs generated from Type-7 convergence will be eliminated immediately after the current device stopped serving as a translator, with no need to wait until the stability-interval expires.

In a same NSSA, you are recommended to configure the **translator always** parameter on only one ABR.

**Configuration** The following example sets area 1 as an NSSA on all routers of the area.

**Examples**

```
Ruijie(config)#router ospf1
Ruijie(config-router)#network 172.16.0.0 0.0.255.255 area0
Ruijie (config-router)#network 192.168.12.0 0.0.0.255 area 1
Ruijie(config-router)# area1nssa
```

**Description**

## 2.6 area range

Use this command to configure inter-area route aggregation for OSPF. Use the **no** form of this command to delete route aggregation. Use the **no** form with the cost parameter to restore the default metric of the aggregate route, but not delete route aggregation.

**area area-id range ip-address net-mask [ advertise | not-advertise ] [ cost cost ]**

**no area area-id range ip-address net-mask [ cost ]**

**Parameter  
Description**

| Parameter                        | Description                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <i>area-id</i>                   | ID of the area where the aggregate route is injected into. The value can be a decimal integer or an IP address. |
| <i>ip address net-mask</i>       | Network segment whose routes are to be aggregated                                                               |
| <b>advertise   not-advertise</b> | Whether to advertise the aggregate route                                                                        |
| <b>cost cost</b>                 | Sets the priority of the interface. The range is from 0 to 16777215.                                            |

**Defaults**

No inter-area route aggregation is configured by default.

The configured aggregation range is advertised by default.

The default metric of the aggregate route depends on whether the device is compatible with RFC1583. If yes, the default metric is the smallest cost of the aggregate route. If no, the default metric is the largest cost of the aggregate route.

**Command****Mode** Routing process configuration mode

**Usage Guide** This command takes effect only on the ABR to aggregate multiple routes of an area into a route and advertise it to other areas. Route combination occurs only on the border of an area. The devices inside an area see the specific routing information, but the devices outside the area see only one aggregate route. The advertise and not-advertise options can set whether to advertise the aggregate route for filtering and masking. The aggregate route is advertised by default. You can use the cost option to set the metric of the aggregate route. You can define route aggregate in multiple areas to simplify the routes in the whole OSPF routing area. This improves the network forwarding performance, especially in large networks. The area range of route aggregation is determined according to the longest match when multiple aggregate routes with direct inclusion relationships are configured.

**Configuration** The following example aggregate the routes of area 1 into a route 172.16.16.0/20.**Examples**

```
Ruijie(config)#router ospf 1
Ruijie(config-router)#network 172.16.0.0 0.0.15.255area0
Ruijie((config-router)#network 172.16.17.0 0.0.15.255area1
Ruijie(config-router)#area1range 172.16.16.0 255.255.240.0
```

## 2.7 area stub

Use this command to set an OSPF area as a stub area or full stub area. Use the **no** form of this command to restore the default setting.

**area** *area-id* **stub** [ **no-summary** ]**no area** *area-id* **stub** [ **no-summary** ]**Parameter Description**

| Parameter         | Description                                                                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-id</i>    | Stub area ID                                                                                                                                                                |
| <b>no-summary</b> | (Optional) Prevents the ABR from advertising the network summary link to the stub area. Here the stub area is called the full stub area. Only the ABR needs this parameter. |

**Defaults** No stub area is defined by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** All devices in the OSPF stub area must be configured with the `area stub` command. The ABR only sends three types of link state advertisement (LSA) to the stub area: 1) type 1, device LSA; 2) type 2, network LSA; 3) type 3, network summary LSA. For the routing table, the devices in the stub area can learn only the routes inside the OSPF routing domain, including the internal default routes generated by the ABR.

To configure a full stub area, use the `area stub` command with the `no-summary` keyword on the ABR. The devices in the full stub area can learn only the routes in the local area and the internal default routes generated by the ABR.

Two commands can configure an OSPF area as a stub area: the `area stub` and `area default-cost` commands. All devices connected to the stub area must be configured with the `area stub` command, but the `area default-cost` command can be executed only on the ABR. The `area default-cost` command defines the initial cost (metric) of the internal default route.

**Configuration** The following example sets area 1 as the stub area on all devices in area 1.

**Examples**

```
Ruijie(config)# router ospf1
Ruijie(config-router)# network 172.16.0.0 0.0.255.255 area 0
Ruijie (config-router)# network 192.168.12.0 0.0.0.255 area 1
Ruijie(config-router)# area 1 stub
```

**Description**

## 2.8 area virtual-link

Use this command to define the OSPF virtual link in routing process configuration mode. Use the **no** form of this command to restore the default setting.

```
area area-id virtual-link router-id [ authentication [ message-digest | null ] ] [ dead-interval
{ seconds | minimal hello-multiplier multiplier } ] [ hello-interval seconds ] [ retransmit-interval
seconds ] [ transmit-delay seconds ] [ [ authentication-key [ 0|7 ] key ] | [ message-digest-key
key-id md5 [ 0|7 ] key ] ]
no area area-id virtual-link router-id [ authentication ] [ dead-interval ] [ hello-interval ]
[ retransmit-interval ] [ transmit-delay ] [ [ authentication-key ] | [ message-digest-key key-id ] ]
```

| Parameter<br>Description | Parameter                                                       | Description                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <i>area-id</i>                                                  | ID of the OSPF transition area. The value can be a decimal integer or an IP address.                                                                                                                                                                                                                                                                   |
|                          | <i>router-id</i>                                                | ID of the router neighboring to the virtual link. It can be viewed with the show ip ospf command.                                                                                                                                                                                                                                                      |
|                          | <b>dead-interval</b> <i>seconds</i>                             | (Optional) Defines the time to declare neighbor loss in seconds. The range is 0 to 2147483647. This value must be consistent with that of the neighbor.                                                                                                                                                                                                |
|                          | <b>minimal</b>                                                  | Enables the Fast Hello function and sets the death clock to 1 second.                                                                                                                                                                                                                                                                                  |
|                          | <b>hello-multiplier</b>                                         | Multiplies dead-interval with hello-interval in the Fast-Hello function.                                                                                                                                                                                                                                                                               |
|                          | <i>multiplier</i>                                               | Specifies the number of Hello packets that are sent every second in the Fast Hello function. The range is from 3 to 20.                                                                                                                                                                                                                                |
|                          | <b>hello-interval</b> <i>seconds</i>                            | (Optional) Defines the interval at which the HELLO packet is sent by the OSPF to the virtual link in seconds. The range is from 1 to 65535. This value must be consistent with that of the neighbor.                                                                                                                                                   |
|                          | <b>retransmit-interval</b> <i>seconds</i>                       | (Optional) OSPF LSA retransmission interval in seconds. The range is from 0 to 65535. The parameter setting must consider the round-trip time of packets on the link.                                                                                                                                                                                  |
|                          | <b>transmit-delay</b> <i>seconds</i>                            | (Optional) OSPF LSA transmission delay in seconds. The range is from 0 to 65535. This value adds the LSA keep alive period. When the LSA keep alive period reaches a threshold, the LSA will be refreshed.                                                                                                                                             |
|                          | <b>authentication-key</b> [0 7] <i>key</i>                      | (Optional) Defines the OSPF plain text authentication key. The plain text authentication key between neighbors must be the same. The service password-encryption command enables the key to be displayed in encrypted manner.<br>0 indicates that the key is displayed in plain text.<br>7 indicates that the key is displayed in cipher text.         |
|                          | <b>message-digest-key</b><br><i>key-id</i> md5 [0 7] <i>key</i> | (Optional) Defines the OSPF MD5 authentication key and key ID. The MD5 authentication key ID and key between neighbors must be the same. The service password-encryption command enables the key to be displayed in encrypted manner.<br>0 indicates that the key is displayed in plain text.<br>7 indicates that the key is displayed in cipher text. |
|                          | <b>authentication</b>                                           | Sets the authentication type to plain text.                                                                                                                                                                                                                                                                                                            |
|                          | <b>message-digest</b>                                           | Sets the authentication type to MD5.                                                                                                                                                                                                                                                                                                                   |
|                          | <b>null</b>                                                     | Sets the authentication type to no authentication.                                                                                                                                                                                                                                                                                                     |

**Defaults**

The following are the default values:

dead-interval: 40seconds

hello-interval: 10seconds

retransmit-interval: 5seconds

transmit-delay: 1second

authentication: null

The Fast Hello function is disabled by default.

The other parameters do not have default values.

### Command

**Mode** Routing process configuration mode

### Usage Guide

A virtual link can connect an area to the backbone area, or another non-backbone area. In the OSPF routing domain, all areas must connect to the backbone area. If an area disconnects from the backbone area, a virtual link to the backbone area is required. Otherwise, the network communication will become abnormal. The virtual link is created between two ABRs. The area that belongs to both ABRs is called the transition area, which can never be a stub area or NSSA.

The router-id parameter indicates the ID of OSPF neighbor router and can be displayed with the show ip ospf neighbor command. You can configure the loopback address as the router ID.

The area virtual-link command defines only the authentication key for a virtual link. You can use the area authentication command to enable the OSPF packet authentication in areas connected over the virtual link in routing process configuration mode.

OSPF supports the Fast Hello function.

If the Fast Hello function is enabled, the OSPF can discover neighbors and detects invalid neighbors quickly. You can enable the OSPF Fast Hello function by specifying the keywords minimal and hello-multiplier, and the multiplier parameter. You can set the death clock to 1 second in minimal and hello-multiplier to a value equal to or greater than 2. In this case, the Hello packet sending interval is less than 1 second.

The hello-interval field of a Hello packet received by a virtual link is omitted if the Fast Hello function is enabled on the virtual link and the hello-interval field is set to 0 for Hello packets advertised from the virtual link.

No matter the Fast Hello function is enabled or not, the values of dead-interval must be consistent on both ends of a virtual link. The values of hello-multiplier on both ends can be different if at least one Hello packet can be received within dead-interval. You can use the show ip ospf virtual-links command to monitor dead-interval and hello-interval configured for a virtual link.

For the Fast Hello function, you can only configure either the **dead-interval minimal hello-multiplier** parameter or the **hello-interval** parameter.

**Configuration** The following example sets area 1 as the transition area to establish virtual link with neighbor 2.2.2.2.

### Examples

```
Ruijie(config)# router ospf 1
Ruijie(config-router)# network 172.16.0.0 0.0.15.255 area0
Ruijie(config-router)# network 172.16.17.0 0.0.15.255 area1
Ruijie(config-router)#area1 virtual-link2.2.2.2
```

The following example sets area 1 as the transition area to establish a virtual link with neighbor 1.1.1.1. This virtual link connects area 10 and the backbone area, and works with the OSPF packet authentication inMD5 mode.

```
Ruijie(config)# routerospf1
Ruijie(config-router)# network172.16.17.0 0.0.15.255area1
```

```
Ruijie(config-router)# network 172.16.252.0 0.0.0.255 area 10
Ruijie(config-router)# area 0 authentication message-digest
Ruijie(config-router)# area 1 virtual-link 1.1.1.1 message-digest-key 1 md5 hello
```

The following example sets area 1 as the transition area to establish a virtual link with neighbor 1.1.1.1, enables the Fast Hello function on this virtual link, and sets the multiplier to 3.

```
Ruijie(config)# router ospf 1
Ruijie(config-router)# network 172.16.17.0 0.0.15.255 area 1
Ruijie(config-router)# network 172.16.252.0 0.0.0.255 area 10
Ruijie(config-router)# area 1 virtual-link 1.1.1.1 dead-interval minimal
hello-multiplier 3
```

**Description**

## 2.9 auto-cost

Use this command to enable the auto-cost function and set the reference bandwidth according to the reference bandwidth. Use the **no** form of this command to restore the default setting.

**auto-cost** [ **reference-bandwidth** *ref-bw* ]

**no auto-cost** [ **reference-bandwidth** ]

#### Parameter Description

| Parameter     | Description                                               |
|---------------|-----------------------------------------------------------|
| <i>ref-bw</i> | Reference bandwidth, in the range from 1 to 4294967 Mbps. |

**Defaults** The default is 100Mbps.

#### Command

**Mode** Routing process configuration mode

#### Usage Guide

By default, the cost of an OSPF interface is equal to the reference value of the auto cost divided by the interface bandwidth.

Run the **auto-cost** command to obtain the reference value of the auto cost. The default value is 100 Mbps.

Run the **bandwidth** command to set the interface bandwidth.

The costs of OSPF interfaces on several typical lines are as follows:

64Kbps serial line: The cost is 1562.

E1 line: The cost is 48.

10M Ethernet: The cost is 10.

100M Ethernet: The cost is 1.

If you run the **ip ospf cost** command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost.

**Configuration** The following example configures the reference bandwidth as 10 Mbps.

**Examples**

```
Ruijie(config)# routerospf1
Ruijie(config-router)# network172.16.10.0 0.0.0.255 area0
Ruijie(config-router)# auto-costreference-bandwidth10
```

| <b>show ip ospf</b> | Displays the OSPF global configuration information                                 |
| <b>ip ospf cost</b> | Sets the cost value of the OSPF interface.                                         |
| <b>bandwidth</b>    | Sets the interface bandwidth. This setting does not affect data transmission rate. |

**Platform** N/A

**Description**

## 2.10 bdf all-interfaces

Use this command to enable Bidirectional Forwarding Detection (BFD) on all OSPF interfaces. Use the **no** form of this command to restore the default setting.

**bdf all-interfaces**

**no bdf all-interfaces**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** BDF is disabled by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** OSPF dynamically discovers the neighbors through Hello packets. With the BFD function enabled, one BFD session will be established for the neighbors that match the FULL rules and the status of the neighbors will be detected through the BFD mechanism. Once the BFD neighbor fails, the OSPF will converge with the network immediately.

You can also use the **ip ospf bfd [ disable ]** command in interface configuration mode to enable or

disable the BFD function on the specified interface, which takes precedence over the **bfd all-interfaces** command in routing process configuration mode.

```

Configuration Ruijie(config)# router ospf 1
Examples Ruijie(config-router)# bfd all-interfaces
    
```

| Related Commands | Command              | Description                                                                       |
|------------------|----------------------|-----------------------------------------------------------------------------------|
|                  | <b>router ospf</b>   | Creates the OSPF routing process and enters routing process configuration mode.   |
|                  | <b>ip ospf bfd ]</b> | Enables the specified interface running OSPF or disabling BFD for link detection. |

**Platform** N/A  
**Description**

## 2.11 capability opaque

Use this command to enable Opaque LSA. Use the **no** form of this command to disable this function.  
**capability opaque**  
**no capability opaque**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** Opaque LSA is enabled by default.

**Command Mode** Routing process configuration mode.

**Usage Guide** N/A

```

Configuration The following example disables Opaque LSA capability.
Examples Ruijie(config)# router ospf 1
Ruijie(config-router)# no capability opaque
    
```

| Related Commands | Command             | Description                                |

|                  | <b>show ip ospf</b> | Displays the global configuration of OSPF. |

**Platform** N/A  
**Description**

## 2.12 clear ip ospf process

Use this command to clear and restart the OSPF instance.

**clear ip ospf ( *process-id* ) process**

| Parameter Description | Parameter         | Description                                                                                                                                                                                                                                                                     |
|-----------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>process-id</i> | OSPF instance ID.<br>When the ID is specified, the command clears data related to the specified instance and restarts the OSPF instance.<br>When no ID is specified, the command clears data related to all running OSPF instances and restarts all the running OSPF instances. |

**Defaults** The rule recommended in the RFC 1583 is used by default.

### Command

**Mode** Privileged EXEC mode

**Usage Guide** Resetting the entire OSPF process causes that all neighbors are re-established and OSPF is greatly affected. Therefore, you are prompted to confirm the execution for deliberation.

**Configuration** The following example clears data of OSPF instance 1 and restarts OSPF instance 1.

**Examples** Ruijie#clearipospflprocess

## 2.14 default-information originate

Use this command to generate a default route to be injected into the OSPF routing domain in routing process configuration mode. Use the **no** form of this command to restore the default setting.

**default-information originate** [ **always** ] [ **metric** *metric* ] [ **metric-type** *type* ] [ **route-map** *map-name* ]

**no default-information originate** [ **always** ] [ **metric** ] [ **metric-type** ] [ **route-map** *map-name* ]

**Parameter Description**

| Parameter                        | Description                                                                                                                                                                                                                                      |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>always</b>                    | (Optional) Generates the default route unconditionally, no matter whether the default route exists locally or not.                                                                                                                               |
| <b>metric</b> <i>metric</i>      | (Optional) Initial metric of the default route in the range from 0 to 16777214                                                                                                                                                                   |
| <b>metric-type</b> <i>type</i>   | (Optional) Type of the default route. There are two type of OSPF external routes: type 1, different metrics on different devices; type 2, same metric on different devices. An external route of type 1 is more trustworthy than that of type 2. |
| <b>route-map</b> <i>map-name</i> | Associated route map name. No route map is associated by default.                                                                                                                                                                                |

**Defaults** No default route is generated by default.  
 The default value of metric is 1.  
 The default value of metric-type is 2.

**Command** Routing process configuration mode

**Mode**

**Usage Guide** When the **redistribute** or **default-information** command is executed, the OSPF-enabled device automatically turns into the ASBR. The ASBR cannot generate the default route automatically or advertise it to all the devices in the OSPF routing domain. The ASBR can generate the default route with the **default-information originate** command in routing process configuration mode. If the **always** parameter is used, the OSPF routing process advertises an external default route to neighbors, no matter the default route exists or not. However, the local device does not display the default route. To make sure whether the default route is generated, use the **show ip ospf database** command to display the OSPF link state database. The external link identified with 0.0.0.0 indicates the default route. You can use the **show ip route** command on the OSPF neighbor to display the default route.

The metric of the external default route can be defined only with the **default-information originate** command.

There are two types of OSPF external routes: type 1 external routes have changeable routing metrics, while type 2 external routes have constant routing metrics. For two parallel routes with the same route metric to the same destination network, the type 1 route takes precedence over the type 2 route. As a result, the **show ip route** command displays only the type 1 route.

This command generates a default route of Type-5 LSA, which will not be flooded to the NSSA area. To generate a default route in the NSSA area, use the **area nssa default-information-originate** command.

The routers in the stub area cannot generate external default routes.

 The range of set metric is 0 to 16777214 for the associated route map. If the value exceeds the range, introducing a route fails.

**Configuration Examples** The following example configures that OSPF generates an external default route and injects it to the OSPF routing domain. The default route is of type 1 and the metric 50.

```
Ruijie(config)#routerospf 1
Ruijie(config-router)#network172.16.24.0 0.0.0.255 area 0
Ruijie(config-router)#default-information originate
alwaysmetric50metric-type1
```

**Related Commands**

| Command                      | Description                                      |
|------------------------------|--------------------------------------------------|
| <b>show ip ospf database</b> | Displays OSPF link state database.               |
| <b>show ip route</b>         | Displays the IP route table.                     |
| <b>redistribute</b>          | Redistributes routes of other routing processes. |

**Platform Description** N/A

## 2.15 default-metric

Use this command to set the **default metric** of OSPF redistribution route. Use the **no** form of this command to restore the default setting.

**default-metric** *metric*

**no default-metric**

| Parameter Description | Parameter     | Description                                                                     |
|-----------------------|---------------|---------------------------------------------------------------------------------|
|                       | <i>metric</i> | Default metric of the OSPF redistribution route in the range from 1 to 16777214 |

**Defaults** The default metric is not configured by default.

### Command

**Mode** Routing process configuration mode

**Usage Guide** The **default-metric** command must work with the **redistribute** command in routing process configuration mode to modify the initial metric of all redistributed routes. The configuration result of the **default-metric** command does not take effect for the external routes injected into the OSPF routing domain with the **default-information originate** command.

**Configuration** The following example configures the default metric of the OSPF redistribution route as 50.

### Examples

```
Switch(config)# router rip
Ruijie(config-router)# network 192.168.12.0
Switch(config-router)# version 2
Ruijie(config-router)# exit
Ruijie(config)# router ospf 1
Ruijie(config-router)# network 172.16.10.0 0.0.0.255 area 0
Switch(config-router)# default-metric 50
Ruijie(config-router)# redistribute rip subnets
```

|------------------|---------------------|------------------------------------------------------|
|                  | <b>redistribute</b> | Redistributes the routes of other routing processes. |
|                  | <b>show ip ospf</b> | Displays the OSPF global configuration information.  |

**Platform** N/A

**Description**

## 2.16 discard-route

Use this command to enable adding the discard-route into the core route table. Use the **no** form of this command to disable this function.

**discard-route** { **internal** | **external** }

**no discard-route** { **internal** | **external** }

| Parameter Description | Parameter       | Description                                                                  |
|-----------------------|-----------------|------------------------------------------------------------------------------|
|                       | <b>internal</b> | Enables adding the discard-route generated with the area range command       |
|                       | <b>external</b> | Enables adding the discard-route generated with the summary-address command. |

**Defaults** Adding the discard-route is enabled by default.

### Command

**Mode** Routing process configuration mode

**Usage Guide** After route aggregation, the range may exceed the actual network range of the route table, and sending the data to the nonexistent network may cause loops or increase router loads. To prevent this situation, the discard-route is added to the route table on the ABR or the ASBR. The discard-route is generated automatically and will not be transmitted.

**Configuration** The following example disables adding the discard routes generated with the area range command.

### Examples

```
Ruijie(config)# router ospf 1
Ruijie(config-router)# no discard-route internal
```

| Related Commands | Command                | Description                                                      |
|------------------|------------------------|------------------------------------------------------------------|
|                  | <b>area range</b>      | Configures the route aggregation between OSPF areas.             |
|                  | <b>summary-address</b> | Configures the route aggregation out of the OSPF routing domain. |

**Platform** N/A

**Description**

## 2.17 distance ospf

Use this command to set the Administration Distance (AD) of different types of OSPF routes. Use the **no** form of this command to restore the default setting.

**distance** { *distance* | **ospf** { [ **intra-area** *distance* ] [ **inter-area** *distance* [ **route-map** *map-name* ] ] }

[ **external** *distance* ] } }  
**no distance** [ **ospf** ]

**Parameter Description**

| Parameter                         | Description                                                     |
|-----------------------------------|-----------------------------------------------------------------|
| <i>distance</i>                   | Sets the route AD in the range from 1 to 255.                   |
| <b>intra-area</b> <i>distance</i> | Sets the AD of the intra-area route in the range from 1 to 255. |
| <b>inter-area</b> <i>distance</i> | Sets the AD of the inter-area route in the range from 1 to 255. |
| <b>External</b> <i>distance</i>   | Sets the AD of the external route in the range from 1 to 255.   |

**Defaults**

The default value is 110.  
 The default intra-area distance is 110.  
 The default inter-area distance is 110.  
 The default external distance is 110.

**Command**

**Mode** OSPF Routing process configuration mode

**Usage Guide** This command is used to specify different ADs for different types of OSPF routes.

**Configuration** The following example sets the OSPF external route AD to 160.

**Examples**

```
Ruijie(config)# routerospf1
Ruijie(config-router)# distance ospf external 160
```

**Description**

## 2.18 distribute-list in

Use this command to configure LSA filtering. Use the **no** form of this command to restore the default setting.

**distribute-list** { [ *access-list-number* | *name* ] | **prefix** *prefix-list-name* [ **gateway** *prefix-list-name* ] | **route-map** *route-map-name* } **in** [ *interface-type* *interface-number* ]  
**no distribute-list** { [ *access-list-number* | *name* ] | **prefix** *prefix-list-name* [ **gateway** *prefix-list-name* ] | **route-map** *route-map-name* } **in** [ *interface-type* *interface-number* ]

**Parameter Description**

| Parameter                               | Description                  |
|-----------------------------------------|------------------------------|
| <i>access-list-number</i>   <b>name</b> | Uses the ACL filtering rule. |

|                                                  |                                                      |
|--------------------------------------------------|------------------------------------------------------|
| <b>gateway</b> <i>prefix-list-name</i>           | Uses the gateway filtering rule.                     |
| <b>Prefix</b> <i>prefix-list-name</i>            | Uses the prefix-list filtering rule.                 |
| <b>route-map</b> <i>route-map-name</i>           | Uses the route-map filtering rule.                   |
| <i>interface-type</i><br><i>interface-number</i> | Configures the LSA route filtering on the interface. |

**Defaults** No filtering is configured by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** This configuration filters the received LSAs, and only those matching the filtering conditions are involved in the Shortest Path First (SPF) calculation to generate the corresponding routes. It does not affect the link status database or the route table of the neighbors. It only affects the routing entries calculated by local OSPF. This function is used to control routes that enter the ABR or ASBR.

The following route-map rules will be supported if the route-map parameter is configured:

**match interface**

**match ip address**

**match ip address prefix-list**

**match ip next-hop**

**match ip next-hop prefix-list**

**match metric**

**match route-type**

**match tag**

Filtering routes by using the **distribute-list in** command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated. In this case, you can run the **area filter-list** or **area range** (containing the **not-advertise** parameter) command on the ABR to prevent generation of black-hole routes.

**Configuration** The following example configures LSA filtering.

**Examples**

```
Ruijie(config)# access-list3permit172.16.0.00.0.127.255
Ruijie(config)# router ospf 25
Ruijie(config-router)# distribute-list 3 in ethernet 0/1
```

**Platform** N/A

**Description**

## 2.19 distribute-list out

Use this command to configure filtering redistribution routes. The function is similar to that of the **redistribute** command. Use the **no** form of this command to restore the default setting.

**distribute-list** { [ *access-list-number* | *name* ] | **prefix** *prefix-list-name* } **out** [ **bgp** | **connected** | **isis** [ *area-tag* ] | **ospf** *process-id* | **rip** | **static** ]

**no distribute-list** { [ *access-list-number* | *name* ] | **prefix** *prefix-list-name* } **out** [ **bgp** | **connected** | **isis** [ *area-tag* ] | **ospf** *process-id* | **rip** | **static** ]

| Parameter Description | Parameter                                                                         | Description                          |
|-----------------------|-----------------------------------------------------------------------------------|--------------------------------------|
|                       | <code>access-list-number   name</code>                                            | Uses the ACL filtering rule.         |
|                       | <code>prefix prefix-list-name</code>                                              | Uses the prefix-list filtering rule. |
|                       | <code>bgp   connected   isis [ area-tag ]   ospf process-id   rip   static</code> | Source of the routes to be filtered  |

**Defaults** No filtering is configured by default.

### Command

**Mode** Routing process configuration mode

### Usage Guide

Similar to the `redistribute route-map` command, the `distribute-list out` command filters the routes that other protocols redistribute to the OSPF. However, the `distribute-list out` command does not redistribute routes by itself. It works with the `redistribute` command in most cases. The ACL filtering rule and the prefix-list filtering rule cannot coexist in the configuration, that is, the two rules cannot be configured at the same time for routes from the same source.

**Configuration** The following example filters the redistributed static routes.

### Examples

```
Ruijie(config)# routerospf1
Ruijie(config)# redistribute static subnets
Ruijie(config-router)# distribute-list 22 outstatic
Ruijie(config-router)# distribute-list prefix jjj out static
% Access-list filter exists, please de-config first
```

#### Commands

| Command                   | Description                                      |
|---------------------------|--------------------------------------------------|
| <b>distribute-list in</b> | Configures LSA filtering.                        |
| <b>redistribute</b>       | Redistributes routes of other routing processes. |

### Platform

N/A

### Description

## 2.20 enable mib-binding

Use this command to bind the Management Information Base (MIB) with the specified OSPFv2 process. Use the **no** form of this command to restore the default setting.

**enable mib-binding**

**no enable mib-binding**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** The MIB is bound with the OSPFv2 process with the smallest ID by default.

### Command

**Mode** Routing process configuration mode

**Usage Guide** OSPFv2 MIB has no OSPFv2 process information, so the user operates a sole OSPFv2 process by SNMP. By default, OSPFv2 MIB is bound with the OSPFv2 process with the smallest ID. User operations take effect for this process.

To operate the specified OSPF process over Simple Network Management Protocol(SNMP), use this command to bind the MIB to SNMP.

**Configuration** The following example operates OSPFv2 process 100 over SNMP:

### Examples

```
Ruijie(config)# routerospf100
Ruijie(config-router)# enable mib-binding
```

|                                                                             | <b>Virtifauthfailure</b>   Authentication error on the virtual interface                                                                  |
|                                                                             | <b>Virtifconfigerror</b>   Parameter configuration error on the virtual interface                                                         |
| <b>isa</b>                                                                  | Configures all traps switches related to the LSA. Use this parameter to set the following specified LSA traps switches.                   |
|                                                                             | <b>Lsdbapproachoverflow</b>   External LSA count has reached the 90% of the upper limit.                                                  |
|                                                                             | <b>Lsdboverflow</b>   External LSA count has reached the upper limit.                                                                     |
|                                                                             | <b>Maxagelsa</b>   LSA reaching the aging time                                                                                            |
|                                                                             | <b>Originatelsa</b>   Generates new LSA                                                                                                   |
| <b>retransmit</b>                                                           | Configures all traps switches related to the retransmission. Use this parameter to set the following specified retransmit traps switches. |
|                                                                             | <b>Iftxretransmit</b>   Packet retransmission on the interface                                                                            |
|                                                                             | <b>Virtiftxretransmit</b>   Packet retransmission on the virtual interface                                                                |
| <b>state-change</b>                                                         | Configures all traps switches related to the state change. Use this parameter to set the following specified state-change switches.       |
|                                                                             | <b>Ifstatechange</b>   Interface state change                                                                                             |
|                                                                             | <b>NbrRestartHelperStatusChange</b>   State change during the neighbor GR process                                                         |
|                                                                             | <b>Nbrstatechange</b>   Neighbor state change                                                                                             |
|                                                                             | <b>NssaTranslatorStatusChange</b>   State change of the NSSA translator                                                                   |
| <b>RestartStatusChange</b>   State change of the GR Restarter on the device |                                                                                                                                           |

|  |                                              |                                                  |
|--|----------------------------------------------|--------------------------------------------------|
|  | <b>Virtifstatechange</b>                     | State change on the virtual interface            |
|  | <b>VirtNbrRestartHelper<br/>StatusChange</b> | Status change of the virtual neighbor GR process |
|  | <b>Virtnbrstatechange</b>                    | State change on the virtual neighbor             |

**Defaults** All TRAP switches are disabled by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** The **snmp-server enable traps ospf** command must be configured before you configure this command, for it is limited by the **snmp-server** command.  
This command is not limited by the binding of process and MIB, allowing to enable the TRAP switch for different processes simultaneously.

**Configuration** The following example enables all TRAP switches of OSPFv2 process 100.

**Examples**

```
Ruijie(config)# routerospf100
Ruijie(config-router)# enable traps
```

**Related  
Commands**

| Command                              | Description                                         |
|--------------------------------------|-----------------------------------------------------|
| <b>show ip ospf</b>                  | Displays the OSPF global configuration information. |
| <b>enable mib-binding</b>            | Binds the OSPFv2 process with MIB.                  |
| <b>snmp-server enable traps ospf</b> | Enables the OSPF TRAP notification function.        |

**Platform** N/A

**Description**

## 2.22 fast-reroute

Use this command to enable the OSPF FRR (Fast Reroute) function for the device. Use the **no** form of this command to restore the default setting.

**fast-reroute** { lfa | downstream-paths | route-map *route-map-name* }

**no fast-reroute** { lfa [ downstream-paths ] | route-map }

**Parameter  
Description**

| Parameter                              | Description                                             |
|----------------------------------------|---------------------------------------------------------|
| <b>lfa</b>                             | Enables the LFA (loop-free alternate) path computation. |
| <b>downstream-paths</b>                | Enables the downstream path computation.                |
| <b>route-map</b> <i>route-map-name</i> | Specifies the backup path through the route map.        |

**Defaults** The FRR function is disabled by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** If the **ifa** parameter is configured, computation of the loop-free standby path is enabled. In this case, you can use the interface mode command to specify the path protection mode of the interface. It is recommended that computation of the loop-free standby path be disabled if any of the following case exists on the network:

1. Virtual links exist.
2. Alternative ABRs exist.
3. An ASBR is also an ABR.
4. Multiple ASBRs advertise the same external route.

If both **ifa** and **downstream-paths** are configured, computation of the downstream path is enabled. If **route-map** is configured, a standby path can be specified for a matched route through the route-map.

When the OSPF fast reroute function is used, it is recommended that BFD be enabled at the same time so that the device can quickly detect any link failure and therefore shorten the forwarding interruption time. If the interface is up or down, to shorten the forwarding interruption time during OSPF fast reroute, you can configure **carrier-delay 0** in L3 interface configuration mode to achieve the fastest switchover speed.

**Configuration** The following example enables FRR for OSPF instance 1 and associates route map *fast reroute*.

**Examples**

```
Ruijie(config)# route-map fast-reroute
Ruijie(config-route-map)# match ip address 1
Ruijie(config-route-map)# set fast-reroute backup-nexthop GigabitEthernet 0/1
backup-nexthop 192.168.1.2
Ruijie(config)# router ospf 1
Ruijie(config-router)# fast-reroute route-map fast-reroute
```

**Description**

## 2.23 graceful-restart

Use this command to enable the graceful restart (GR) of OSPF on the device. Use the **graceful-restart grace-period** command to configure the grace period parameter and enable the OSPF GR function. Use the **no** form of this command to disable this function.

**graceful-restart [ grace-period *grace-period* | inconsistent-lsa-checking ]**

**no graceful-restart [ graceful-period ]**

| Parameter Description | Parameter                               | Description                                                                                                                                                                                              |
|-----------------------|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>grace-period</b> <i>grace-period</i> | Indicates the grace period, which is the maximum time from occurrence of an OSPF failure to completion of the OSPF GR. The value of the graceperiod varies from 1s to 1800s. The default value is 120s.  |
|                       | <b>inconsistent-lsa-checking</b>        | Enables topological change detection. If any topological change is detected, OSPF exits the GR process to complete convergence. After GR is enabled, topological change detection is enabled by default. |

**Defaults** This function is enabled by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide**

GR is configured based on the OSPF instance. Different instances could be configured with different parameters according to the actual situation.

The graceful restart interval is the longest time between the OSPF restart and the graceful restart. In this period, you can perform link status reconstruction to restore the OSPF status to the original. With the interval times out, the OSPF will exit GR and perform common OSPF operations.

The GR interval is 120 seconds set with the graceful-restart command, and the graceful-restart grace-period command allows you to change the interval explicitly.

GR is unavailable when the Fast Hello function is enabled.

**Configuration** The following example enables GR for the OSPF instance 1 and sets the restart interval for GR.

**Examples**

```
Ruijie(config)# router ospf 1
Ruijie(config-router)# graceful-restart
Ruijie(config-router)# graceful-restart grace-period 60
```

## 2.24 graceful-restart helper

Use this command to enable the graceful restart helper function. Use the **no** form of this command to restore the default setting.

**graceful-restart helper disable**

**no graceful-restart helper disable**

**graceful-restart helper** { **strict-lsa-checking** | **internal-lsa-checking** }  
**no graceful-restart helper** { **strict-lsa-checking** | **internal-lsa-checking** }

**Parameter Description**

| Parameter                    | Description                                                                                                                                                                                                                                      |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>disable</b>               | Prohibits a device from acting as a GR helper for another device.                                                                                                                                                                                |
| <b>strict-lsa-checking</b>   | Indicates that changes in Type 1 to Type 5 and Type 7 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network changes, the device will stop acting as the GR helper. |
| <b>internal-lsa-checking</b> | Indicates that changes in Type 1 to Type 3 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network changes, the device will stop acting as the GR helper.            |

**Defaults**

The GR helper is enabled by default.

The router enabled with the GR helper does not check the LSA change by default.

**Command**

**Mode**

Routing process configuration mode

**Usage Guide**

This command is used to configure the GR helper capability of a router. When a neighbor router implements GR, it sends a Grace-LSA to notify all neighbor routers. If the GR helper function is enabled on the local router, the local router becomes the GR helper on receiving the Grace-LSA, and helps the neighbor to complete GR. The **disable** option indicates that GR helper is not provided for any device that implements GR.

After a device becomes the GR helper, the network changes are not detected by default. If any change takes place on the network, the network topology converges after GR is completed. If you wish that network changes can be quickly detected during the GR process, you can configure **strict-lsa-checking** to check Type 1 to 5 and Type 7 LSAs that indicate the network information or **internal-lsa-checking** to check Type 1 to 3 LSAs that indicate internal routes of the AS domain. When the network scale is large, it is recommended that you disable the LSA checking options (**strict-lsa-checking** and **internal-lsa-checking**) because regional network changes may trigger termination of GR and consequently reduce the convergence of the entire network.

**Configuration**

The following example disables the GF helper and modifies the policy of checking network changes.

**Examples**

```
Ruijie(config)# router ospf1
Ruijie(config-router)# graceful-restart helper disable
Ruijie(config-router)# no graceful-restart helper disable
Ruijie(config-router)# graceful-restart helper
strict-lsa-checking
```

|-------------------------|---------------------------|

**Platform** N/A

**Description**

## 2.25 ip ospf authentication

Use this command to configure the authentication type. Use the **no** form of this command to restore the default setting.

**ip ospf authentication [ message-digest | null ]**

**no ip ospf authentication**

| Parameter          | Parameter             | Description                                  |
|--------------------|-----------------------|----------------------------------------------|
| <b>Description</b> | <b>message-digest</b> | Enables MD5 authentication on the interface. |
|                    | <b>null</b>           | Enables no authentication.                   |

**Defaults** No authentication mode is configured and that of the local area is used on the interface by default.

**Command**

**Mode** Interface configuration mode

**Usage Guide** Plaintext authentication is applicable when **no** option is used with the command. Note that the no form of this command restores the default value. Whether authentication is used actually depends on authentication mode configured for the local area of the interface. If authentication mode is configured as **null**, no authentication is enabled. When both the interface and its area are configured with authentication, the one for the interface takes precedence.

**Configuration** The following example configures MD5 authentication for OSPF on fastEthernet 0/1.

**Examples**

```
Ruijie (config)#interface fastEthernet0/1
Ruijie(config-if-FastEthernet 0/1)# ipaddress172.16.1.1
255.255.255.0
Ruijie(config-if-FastEthernet 0/1)# ip ospf authentication
message-digest
```

| Related Commands | Command                           | Description                                                              |
|------------------|-----------------------------------|--------------------------------------------------------------------------|
|                  | <b>area authentication</b>        | Enables authentication and defines authentication mode in the OSPF area. |
|                  | <b>ip ospf authentication-key</b> | Configures the plain text authentication key.                            |
|                  | <b>ip ospf message-digest-key</b> | Configures the MD5 authentication key.                                   |

**Platform** N/A

**Description**

## 2.26 ip ospf authentication-key

Use this command to configure the OSPF plain text authentication key in interface configuration mode. Use the **no** form of this command to restore the default setting.

**ip ospf authentication-key** [ 0 | 7 ] *key*

**no ip ospf authentication-key**

### Parameter Description

| Parameter  | Description                              |
|------------|------------------------------------------|
| 0          | Displays the key in plain text.          |
| 7          | Displays the key in cipher text.         |
| <i>key</i> | Key containing at most eight characters. |

**Defaults** It is disabled by default.

### Command

**Mode** Interface configuration mode

**Usage Guide** The **ip ospf authentication-key** command configures the key that will be inserted in all OSPF packet headers. As a result, if the keys are inconsistent, the OSPF neighbor relationship cannot be established between two devices directly connected, and thus route information exchange is impossible.

The keys may vary by interface, but the devices that are connected to the same physical network segment must use the same key.

To enable the OSPF area authentication, execute the area authentication command in routing process configuration mode.

The authentication can be enabled separately on an interface by executing the ip ospf authentication command in interface configuration mode. When both the interface and the area are configured with authentication, the one for the interface takes precedence.

**Configuration** The following example configures the OSPF authentication key ospfauth for fast Ethernet 0/1.

### Examples

```
Ruijie (config)#interfacefastEthernet0/1
Ruijie(config-if-FastEthernet 0/1)# ipaddress172.16.1.1
255.255.255.0
Ruijie(config-if-FastEthernet 0/1)# ip ospf authentication-key ospfauth
```

### Related Commands

## Description

## 2.27 ip ospf bfd

Use this command to enable or disable the BFD on the specified OSPF interface. Use the **no** form of this command to restore the default setting.

**ip ospf bfd [ disable ]**

**no ip ospf bfd**

Parameter  
Description

| Parameter      | Description                                   |
|----------------|-----------------------------------------------|
| <b>disable</b> | Disables BFD on the specified OSPF interface. |

## Defaults

BFD is not configured by default, and the BFD configuration in OSPF process configuration mode shall prevail.

## Command

## Mode

Interface configuration mode

## Usage Guide

The interface-based configuration takes precedence over the **bfd all-interfaces** command used in process configuration mode.

Based on the actual environment, you can run the **ip ospf bfd** command to enable BFD on a specified interface for link detection, or run the **bfd all-interfaces** command in OSPF process configuration mode to enable BFD on all interface of the OSPF process, or run the **ospf bfd disable** command to disable BFD on a specified interface.

## Configuration

```
Ruijie(config)# interface fastethernet 0/1
```

## Examples

```
Ruijie(config-if-FastEthernet 0/1)# ip address 172.16.1.1 255.255.255.0
```

```
Ruijie(config-if-FastEthernet 0/1)# ip ospf bfd
```

## Description

## 2.28 ip ospf cost

Use this command to configure the cost (OSPF metric) of the OSPF interface for sending a packet in interface configuration mode. Use the **no** form of this command to restore the default setting.

**ip ospf cost** *cost*

**no ip ospf cost**

**Parameter  
Description**

| Parameter   | Description                                      |
|-------------|--------------------------------------------------|
| <i>cost</i> | OSPF interface cost in the range from 0 to 65535 |

**Defaults**

The default interface cost is calculated as follows:

Reference bandwidth/Bandwidth

The reference bandwidth is 100 Mbps by default.

**Command**

**Mode**

Interface configuration mode

**Usage Guide**

By default, the OSPF interface cost is 100Mbps/Bandwidth, where Bandwidth is the interface bandwidth configured with the bandwidth command in interface configuration mode.

The default costs of different types of lines are as follows:

- 64K serial line: 1562
- E1 line: 48
- 10M Ethernet: 10
- 100M Ethernet: 1

The OSPF cost configured with the **ip ospf cost** command will overwrite the default configuration.

**Configuration**

The following example configures the OSPF cost of fastEthernet 0/1 to100.

**Examples**

```
Ruijie(config)# interfacefastEthernet0/1
Ruijie(config-if-FastEthernet 0/1)# ipospfcost100
```

**Description**

## 2.29 ip ospf database-filter all out

Use this command to stop advertising LSAs of an interface, that is, the LSA update packets are not sent on the interface. Use the **no** form of the command to restore the default setting.

**ip ospf database-filter all out**

**no ip ospf database-filter****Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults**

This function is disabled and all LSA update packets can be sent on the interface by default.

**Command****Mode**

Interface configuration mode

**Usage Guide**

To stop sending LSA update packets on the interface, enable this function on the interface. Then, the device maintains the neighboring connections and accepts LSAs from neighbors, but stops sending LSAs to neighbors.

**Configuration**

The following example stops sending LSA update packets of fastEthernet 0/1.

**Examples**

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ip address 172.16.10.1 255.255.255.0
Ruijie(config-if-FastEthernet 0/1)# ip ospf database-filter all out
```

**Description**

## 2.30 ip ospf dead-interval

Use this command to configure the interval for determining the death of an interface neighbor in interface configuration mode. Use the **no** form of this command to restore the default setting.

**ip ospf dead-interval** { *seconds* | **minimal hello-multiplier** *multiplier* }

**no ip ospf dead-interval**

**Parameter  
Description**

| Parameter                                 | Description                                                                                                      |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <i>seconds</i>                            | Defines the interval for determining the neighbor death in seconds. The range is from 0 to 2,147,483,647.        |
| <b>minimal</b>                            | Indicates that the Fast Hello function is enabled to set the dead interval to 1s.                                |
| <b>hello-multiplier</b> <i>multiplier</i> | Indicates the number of Hello packets sent per second in the Fast Hello function. The value ranges from 3 to 20. |

**Defaults**

The value of dead-interval is 4 times the interval configured with the **ip ospf hello-interval** command

by default.

### Command

**Mode** Interface configuration mode

### Usage Guide

The OSPF dead interval is contained in the Hello packet. If OSPF does not receive a Hello packet from a neighbor within the dead interval, it declares that the neighbor is invalid and deletes this neighbor record from the neighbor list. By default, the dead interval is four times the Hello interval. If the Hello interval is modified, the dead interval is modified automatically.

When using this command to manually modify the dead interval, pay attention to the following issues:

1. The dead interval cannot be shorter than the Hello interval.
2. The dead interval must be the same on all routers in the same network segment.

OSPF supports the Fast Hello function.

After the OSPF Fast Hello function is enabled, OSPF finds neighbors and detects neighbor failures faster. You can enable the OSPF Fast Hello function by specifying the **minimal** and **hello-multiplier** keywords and the **multiplier** parameter. The **minimal** keyword indicates that the death interval is set to 1s, and **hello-multiplier** indicates the number of Hello packets sent per second. In this way, the interval at which the Hello packet is sent decreases to less than 1s.

If the Fast Hello function is configured for a virtual link, the Hello interval field of the Hello packet advertised on the virtual link is set to 0, and the Hello interval field of the Hello packet received on this virtual link is ignored.

No matter whether the Fast Hello function is enabled, the death interval must be consistent and the **hello-multiplier** values can be inconsistent on routers at both ends of the virtual link. Ensure that at least one Hello packet can be received within the death interval.

Run the **show ip ospf virtual-links** command to monitor the death interval and Fast Hello interval configured for the virtual link.

The **dead-interval minimal hello-multiplier** and **hello-interval** parameters introduced for the Fast Hello function cannot be configured simultaneously.

### Configuration

The following example configures the interval for determining the death of the OSPF neighbor on fastEthernet 0/1 to 30 seconds.

### Examples

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ip address 172.16.10.1 255.255.255.0
Ruijie(config-if-FastEthernet 0/1)# ip ospf dead-interval 30
```

The following example configures the value of hello-multiplier to 3.

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ip address 172.16.10.1 255.255.255.0
Ruijie(config-if-FastEthernet 0/1)# ip ospf dead-interval minimal hello-multiplier 3
```

|-------------------------------|--------------------------------------------------------------|
| <b>ip ospf hello-interval</b> | Specifies the interval at which the OSPF sends Hello packets |
| <b>show ip ospf interface</b> | Displays OSPF interface information.                         |

**Platform** N/A

**Description**

## 2.31 ip ospf disable all

Use this command to prevent the specified interface from generating OSPF packets. Use the **no** form of this command to restore the default setting.

**ip ospf disable all**

**no ip ospf disable all**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** OSPF packets are generated on the specified interface by default.

**Command**

**Mode** Interface configuration mode

**Usage Guide** The interface configured with this command will ignore whether the network areas are matched. After this command is configured, an interface will not generate OSPF packets even if the interface belongs to the network; therefore, the interface does not receive or send any OSPF packets or participate in OSPF calculation.

**Configuration** The following example prevents the specified interface from generating OSPF packets.

**Examples**

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ip address 172.16.10.1 255.255.255.0
Ruijie(config-if-FastEthernet 0/1)# ip ospf disable all
```

**Description**

## 2.32 ip ospf fast-reroute protection

Use this command to specify the loop-free alternate (LFA) protection mode for an interface. Use the

**no** form of this command to restore the default setting.

**ip ospf fast-reroute protection { node | link-node | disable }**

**no ip ospf fast-reroute protection**

| Parameter Description | Parameter        | Description                       |
|-----------------------|------------------|-----------------------------------|
|                       | <b>node</b>      | Enables LFA node protection.      |
|                       | <b>link-node</b> | Enables LFA link node protection. |
|                       | <b>disable</b>   | Disables LFA protection.          |

**Defaults** LFA node protection is enabled by default.

#### Command

**Mode** Interface configuration mode

**Usage Guide** Enabling the **fast-reroute lfa** command in OSPF process configuration mode will enable OSPF fast reroute and generate a backup route for the master route according to the specified LFA protection mode in interface configuration mode. By default, link protection is enabled on each OSPF interface. In this protection mode, the failure of a master link does not affect forwarding on the backup route. Use the **node** parameter to enable node protection for an interface, that is, the neighbor node of a master link does not affect forwarding on the backup route. Similarly, use the **link-node** parameter to protect the link and neighbor link of a master route at the same time. Use the **disable** parameter to disable the LFA protection function for an interface, that is, a backup entry is not generated for the routes with this interface as the next hop.

**Configuration Examples** The following example sets OSPF LFA fast reroute to link and node protection:

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ip address 172.16.10.1 255.255.255.0
Ruijie(config-if-FastEthernet 0/1)# ip ospf fast-reroute protection link-node
```

| Related Commands | Command             | Description                |
|------------------|---------------------|----------------------------|
|                  | <b>fast-reroute</b> | Enables OSPF fast reroute. |

**Platform Description** N/A

## 2.33 ip ospf fast-reroute no-eligible-backup

Use this command in interface configuration mode to exclude an OSPF interface as a backup interface in OSPF fast reroute calculation. Use the **no** form of this command to restore the default

setting.

**ip ospf fast-reroute no-eligible-backup**  
**no ip ospf fast-reroute no-eligible-backup**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** An OSPF interface can serve as a backup interface by default.

**Command**

**Mode** Interface configuration mode

**Usage Guide** If the remaining bandwidth of an interface is small or if the interface and its active interface may fail at the same time, the interface cannot be used as a standby interface. Therefore, you need to run this command in interface configuration mode to prevent this interface from becoming a standby interface during OSPF fast reroute computation. After this command is executed, the standby interface is selected from other interface.

This command does not take effect if **fast-reroute route-map** is configured.

**Configuration Examples** The following example excludes FastEthernet 0/1 as a backup interface in OSPF fast reroute calculation.

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ip address 172.16.10.1 255.255.255.0
Ruijie(config-if-FastEthernet 0/1)# ip ospf fast-reroute no-eligible-backup
```

| Related Commands | Command             | Description                |
|------------------|---------------------|----------------------------|
|                  | <b>fast-reroute</b> | Enables OSPF fast reroute. |

**Platform**

**Description** N/A

## 2.34 ip ospf hello-interval

Use this command to set the interval for sending Hello packets in interface configuration mode. Use the **no** form of this command to restore the default setting.

**ip ospf hello-interval** *seconds*  
**no ip ospf hello-interval**

| Parameter Description | Parameter      | Description                                                                  |
|-----------------------|----------------|------------------------------------------------------------------------------|
|                       | <i>seconds</i> | Interval for sending Hello packets in seconds. The range is from 1 to 65535. |

**Defaults** The defaults are as follows:  
 10seconds for Ethernet  
 10secondsfor PPP or HDLC encapsulated interfaces  
 10seconds for frame relay PTP interfaces  
 30seconds for non-frame relay PTP sub-interface and X.25 interfaces

**Command**

**Mode** Interface configuration mode

**Usage Guide** The interval of sending the Hello packets is included in the Hello packet. A shorter interval means that OSPF detects the topological change faster, which will increase network traffic. The Hello packet sending intervals for all the devices in the same network segment must be the same. To manually modify the interval to determine neighbor death, ensure that the Hello packet sending interval cannot be greater than dead-interval of the neighbor.

**Configuration** The following example configures the interval of sending the Hello packets on fastEthernet 0/1 to15.

**Examples**

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ip address172.16.10.1 255.255.255.0
Ruijie(config-if-FastEthernet 0/1)# ip ospf hello-interval15
```

**Related Commands**

| Command                      | Description                                                       |
|------------------------------|-------------------------------------------------------------------|
| <b>ip ospf dead-interval</b> | Sets the interval for determining the death of the OSPF neighbor. |

**Platform** N/A

**Description**

## 2.35 ip ospf message-digest-key

Use this command to configure the MD5 authentication key in interface configuration mode. Use the **no** form of this command to restore the default setting.

**ip ospf message-digest-key** *key-id* **md5** [ **0** | **7** ] *key*

**no ip ospf message-digest-key** *key-id*

**Parameter Description**

| Parameter     | Description                              |
|---------------|------------------------------------------|
| <i>key</i>    | Key of up to 16 characters               |
| <b>0</b>      | Displays the key in plain text.          |
| <b>7</b>      | Displays the key in cipher text.         |
| <i>key-id</i> | Key identifier in the range from1 to 255 |

**Defaults** No MD5 key is configured by default.

**Command**

**Mode** Interface configuration mode

**Usage Guide** The **ip ospf message-digest-key** command configures the key that will be inserted in all OSPF packet headers. As a result, if the keys are inconsistent, the OSPF neighboring relationship cannot be established between two devices directly connected, and thus route information exchange is impossible.

The keys can be different for different interfaces, but the devices that are connected to the same physical network segment must be configured with the same key. For neighbors, the same key identifier must correspond to the same key.

To enable OSPF area authentication, execute the **area authentication** command in routing process configuration mode. The authentication can be enabled separately on an interface by executing the **ip ospf authentication** command in interface configuration mode. When both the interface and the area are configured with authentication, the one for the interface takes precedence.

The RGOS software supports smooth modification of MD5 authentication keys, which shall be added before deleted. When an MD5 authentication key of the device is added, the device will regard other devices have not had new keys and thus send multiple OSPF packets by using different keys, till it confirms that the neighbors have been configured with new keys. When all devices have been configured with new keys, it is possible to delete the old key.

**Configuration Examples** The following example adds a new OSPF authentication key "hello5" with key ID 5 for fastEthernet 0/1.

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ip address 172.16.24.2 255.255.255.0
Ruijie(config-if-FastEthernet 0/1)# ip ospf authentication message-digest
Ruijie(config-if-FastEthernet 0/1)# ip ospf message-digest-key 10 md5 hello10
Ruijie(config-if-FastEthernet 0/1)# ip ospf message-digest-key 5md5 hello5
```

When all neighbors are added with new keys, the old keys shall be deleted for all devices.

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# no ip ospf message-digest-key10md5
hello10
```

## 2.36 ip ospf mtu-ignore

Use this command to disable the MTU check when an interface receives the database description packet. Use the **no** form of this command to restore the default setting.

**ip ospf mtu-ignore**

**no ip ospf mtu-ignore**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** MTU check is disabled by default.

### Command

**Mode** Interface configuration mode

**Usage Guide** After receiving the database description packet, the device will check whether the MTU of the neighbor interface is the same as its own MTU. If the received database description packet indicates an MTU greater than the interface's MTU, the neighboring relationship cannot be established. This can be fixed by disabling the MTU check.

**Configuration** The following example disables the MTU check function on fastEthernet 0/1.

### Examples

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ip ospf mtu-ignore
```

## 2.37 ip ospf network

Use this command to configure the OSPF network type in interface configuration mode. Use the **no** form of this command to restore the default setting.

**ip ospf network { broadcast | non-broadcast | point-to-multipoint [ non-broadcast ] | point-to-point }**

**no ip ospf network**

| Parameter Description | Parameter        | Description                                       |
|-----------------------|------------------|---------------------------------------------------|
|                       | <b>broadcast</b> | Sets the OSPF network type as the broadcast type. |

|                                                      |                                                                                                                                                                                                           |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>non-broadcast</b>                                 | Sets the OSPF network type as the non-broadcast multi-path access type, i.e. NBMA network.                                                                                                                |
| <b>point-to-multipoint</b><br><b>[non-broadcast]</b> | Sets the OSPF network type as the point-to-multipoint type.<br>The value is the point-to-multipoint broadcast type by default. The non-broadcast option means the point-to-multipoint non-broadcast type. |
| <b>point-to-point</b>                                | Sets the OSPF network type as the point-to-point type.                                                                                                                                                    |

**Defaults**

The default configurations are as follows:

PTP network type: Point-to-Point Protocol(PPP), Serial Line Internet Protocol(SLIP), frame relay point-to-point (PTP) sub-interface, X.25 PTP sub-interface encapsulation

NBMA network type: frame relay (except for PTP sub-interface), X.25 encapsulation (except for PTP sub-interface)

Broadcast network type: Ethernet encapsulation

By default, the network type is the point-to-multipoint network type.

**Command****Mode**

Interface configuration mode

**Usage Guide**

The broadcast type requires that the interface must have the broadcast capability.

The P2P type requires that the interfaces are interconnected in one-to-one manner.

The NBMA type requires full-meshed connections, and all interconnected routers can directly communicate with each other.

The P2MP type does not raise any requirement.

**Configuration**

The following example configures the frame relay interface network as the P2P type.

**Examples**

```
Ruijie(config)# interface Serial 1/0
Ruijie(config-Serial 1/0)# ip address 172.16.24.4 255.255.255.0
Ruijie(config-Serial 1/0)# encapsulation frame-relay
Ruijie(config-Serial 1/0)# ip ospf network point-to-point
```

The following example configures the frame relay interface network as the NBMA type.

```
Ruijie(config)# interface Serial 1/0
Ruijie(config-Serial 1/0)# ip address 172.16.24.4 255.255.255.0
Ruijie(config-Serial 1/0)# encapsulation frame-relay
Ruijie(config-Serial 1/0)# ip ospf network non-broadcast
Ruijie(config-Serial 1/0)# exit
Ruijie(config)# router ospf 20
Ruijie(config-router)# neighbor 172.16.24.2 priority 1 poll-interval 150
```

**Platform** N/A

**Description**

## 2.38 ip ospf priority

Use this command to configure the OSPF priority in interface configuration mode. Use the **no** form of this command to restore the default setting.

**ip ospf priority** *priority*

**no ip ospf priority**

| Parameter Description | Parameter       | Description                                                         |
|-----------------------|-----------------|---------------------------------------------------------------------|
|                       | <i>priority</i> | Sets the OSPF priority of the interface in the range from 0 to 255. |

**Defaults** The default is 1.

**Command**

**Mode** Interface configuration mode

**Usage Guide** The interface priority is included in the Hello packet. When DR/BDR election occurs in the OSPF broadcast type network, the device with higher priority will become the DR or BDR. If the devices have the same priority, the one with higher ID will become the DR or BDR. The device with priority 0 cannot become DR or BDR. This command is valid only for OSPF broadcast and non-broadcast network types.

**Configuration** The following example configures the priority of fastethernet 0/1 as 0.

**Examples**

```
Switch(config)#interface fastethernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ipospfpriority0
```

| Related Commands | Command                | Description                                   |

|                  | <b>ip ospf network</b> | Configures the network type of the interface. |

**Platform** N/A

**Description**

## 2.39 ip ospf retransmit-interval

Use this command to define the interval for sending the link state update (LSU) packet on the interface in interface configuration mode. Use the **no** form of this command to restore the default setting.

**ip ospf retransmit-interval** *seconds*

**ip ospf retransmit-interval**

| Parameter Description | Parameter      | Description                                                                                                                                                              |
|-----------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>seconds</i> | Interval for sending the LSU packets in seconds. The range is from 1 to 65535. This interval must be greater than the round trip delay of packets between two neighbors. |

**Defaults** The default is 5.

### Command

**Mode** Interface configuration mode

**Usage Guide** After the device sends an LSU packet, the LSU packet stays in the transmission buffer queue. If no confirmation from the neighbor is obtained in the interval defined with the **ip ospf retransmit-interval** command, the LSU will be sent once again.

In serial lines or virtual links, the retransmission interval shall be slightly larger. The LSU packet retransmission interval of virtual links is defined with the area virtual-link command followed with the keyword retransmit-interval.

**Configuration Examples** The following example configures the LSU packet retransmission interval on fastEthernet 0/1 as 10 seconds.

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ip ospf retransmit-interval 10
```

| Related Commands | Command                  | Description                   |
|------------------|--------------------------|-------------------------------|
|                  | <b>area virtual-link</b> | Defines an OSPF virtual link. |

**Platform** N/A

**Description**

## 2.40 ip ospf source-check-ignore

Use this command to disable the source address check in the point-to-point link. Use the **no** form of this command to restore the default setting

**ip ospf source-check-ignore**

**no ip ospf source-check-ignore****Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** This function is enabled by default.

**Command**

**Mode** Interface configuration mode

**Usage Guide** For OSPF, the source address of the received packet is required to be in the same network segment with the receiving interface. However, in a point-to-point link, the addresses of two ends of the link are individually set, and they are not required to be in the same network segment. The peer address is informed during the process of point-to-point link negotiation; therefore, OSPF will check whether the source address of the packet is the informed one. If no, the OSPF regards this packet as illegal and drops it. In some applications, the addresses informed during the negotiation are shielded. You need to disable the source address check to ensure the normal establishment of OSPF neighbors. The source address check shall be never enabled, especially for the unnumbered interfaces.

**Configuration** The following example disables the source address check function in the point-to-point link.

**Examples**

```
Ruijie(config)# interface serial 1/0
Ruijie(config-if)# ip ospf source-check-ignore
```

**Description**

## 2.41 ip ospf subvlan

Use this command to enable OSPF on super VLANs. Use the **no** form of this command to restore the default setting.

**ip ospf subvlan [all | vid]**

**no ip ospf subvlan**

**Parameter  
Description**

| Parameter | Description                                                     |
|-----------|-----------------------------------------------------------------|
| all       | Indicates that packets are allowed to be sent to all sub VLANs. |
| vid       | Specifies the sub VLAN ID. The value ranges from 1 to 4094.     |

**Defaults** The default setting takes effect only on super VLANs with OSPFv3 disabled.

**Command****Mode** Interface configuration mode

**Usage Guide** In normal cases, a super VLAN contains multiple sub VLANs. Multicast packets of a super VLAN are also sent to its sub VLANs. In this case, when OSPF multicast packets are sent over a super VLAN containing multiple sub VLANs, the OSPF multicast packets are replicated multiple times, and the device processing capability is insufficient. As a result, a large number of packets are discarded, causing the neighbor down error. In most scenarios, the OSPF function does not need to be enabled on a super VLAN. Therefore, the OSPF function is disabled by default. However, in some scenarios, the OSPF function must be run on the super VLAN, but packets only need to be sent to one sub VLAN. In this case, run this command to specify a particular sub VLAN. You must be cautious in configuring packet transmission to all sub VLANs, as the large number of sub VLANs may cause a device processing bottleneck, which will lead to the neighbor flap.

**Configuration** The following example sends OSPF multicast packets to sub VLAN 1024 of super VLAN 300.

**Examples**

```
Ruijie(config)# interface vlan 300
Ruijie(config-if-VLAN 300)# ip ospf subvlan 1024
```

## 2.42 ip ospf transmit-delay

Use this command to define the LSU packet transmission delay in interface configuration mode. Use the **no** form of this command to restore the default setting.

**ip ospf transmit delay** *seconds*

**no ip ospf transmit delay**

**Parameter Description**

| Parameter      | Description                                                            |
|----------------|------------------------------------------------------------------------|
| <i>seconds</i> | LSU packet transmission delay in seconds in the range from 1 to 65535. |

**Defaults** The default is 1.

**Command****Mode** Interface configuration mode

**Usage Guide** Before the LSU packet is transmitted, the Age field in all the LSAs of the packet will be increased by the value defined with the **ip ospf transmit-delay** command in interface configuration mode. The configuration of this parameter shall consider the transmission and line transmission delay of the interface. For low-rate lines, the transmission delay of the interface shall be slightly larger. The LSU packet transmission delay of the virtual link is defined with the **area virtual-link** command followed with the keyword **retransmit-interval**.

The RGOS software will resend or request resending the LSA with Age up to 3600. If no update is obtained in time, the aged LSA will be cleared from the link state database.

**Configuration** The following example configures the transmission delay of fastEthernet 0/1 as 10.

**Examples**

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if-FastEthernet 0/1)# ip ospf transmit-delay 10
```

**Related Commands**

**Description**

## 2.43 ispf enable

Use this command to enable the ISPF function. Use the **no** form of this command to disable the ISPF function.

**ispf enable**

**no ispf enable**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** ISPF is disabled by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** OSPF adopts the SPF algorithm to calculate the network topology within an area. SPF algorithm is run for each area independently, Incremental SPF algorithm (ISPF) is an area-based algorithm, If the topology changes, the ISPF algorithm will calculate only the affected nodes of the topology rather than calculating the entire tree, which speeds up the OSPF route convergence and saves CPU resources.

Because the ISPF algorithm is not shared among routers, each router within the same network can have a unique ISPF algorithm. To ensure a faster OSPF convergence, the ISPF function should be

enabled on every router within the network.

Enabling ISPF function only affects the choice of topology calculating algorithm for OSPF. So you can configure the delay time for the ISPF with the **timers spf** command and the **timers throttle spf** command as well.

**Configuration** The following example enables the ISPF function.

**Examples**

```
Ruijie(config)# router ospf 1
Ruijie(config-router)# ispf enable
```

The following example enables the ISPF function on the specified VRF.

```
Ruijie(config)# router ospf 1 vrf vpn1
Ruijie(config-router)# ispf enable
```

## 2.45 max-concurrent-dd

Use this command to specify the maximum number of DD packets that can be processed (initiated or accepted) at the same time. Use the **no** form of this command to restore the default setting.

**max-concurrent-dd** *number*

**no max-concurrent-dd**

| Parameter Description | Parameter     | Description                                               |
|-----------------------|---------------|-----------------------------------------------------------|
|                       | <i>number</i> | Maximum number of DD packets in the range from 1 to 65535 |

**Defaults** The default is 5.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** When a router is exchanging data with multiple neighbors, its performance will be affected. This command is configured to limit the maximum number of DD packets that each OSPF instance can have at the same time.

**Configuration** The following example sets the maximum number of DD packets to 4.

**Examples** After the configuration, the device can initiate to interact with four neighbors and can concurrently accept the interaction. That is, the device can interact with a maximum of eight neighbors.

```
Ruijie(config)# routerospf10
Ruijie(config-router)# max-concurrent-dd4
```

## 2.46 max-metric

Use this command to set the maximum metric of the router-lsa, so that this routing device will not firstly be used as the transmission node by other devices in SPF computing. Use the **no** form of this command to restore the default setting.

```
max-metric router-lsa [external-lsa [ max-metric-value ]][ include-stub ][ on-startup [ seconds ]][ summary-lsa [ max-metric-value ]]
no max-metric router-lsa [external-lsa [ max-metric-value ]][ include-stub ][ on-startup [ seconds ]][ summary-lsa [ max-metric-value ]]
```

| Parameter Description | Parameter               | Description                                                                                            |
|-----------------------|-------------------------|--------------------------------------------------------------------------------------------------------|
|                       | <b>router-lsa</b>       | Configures the maximum metric (0XFFFF) of non-stub links in the Router LSA.                            |
|                       | <b>external-lsa</b>     | Uses the maximum metric instead of the external-lsa metric (including the Type-5 and Type-7).          |
|                       | <i>max-metric-value</i> | Maximum metric of the LAS. The range is 1 to 16777215. The default value is 16711680,                  |
|                       | <b>include-stub</b>     | Configures the maximum metric of the stub links in the Router LSA.                                     |
|                       | <b>on-startup</b>       | Advertises the maximum metric when the routing device starts up.                                       |
|                       | <i>seconds</i>          | Interval of advertising the maximum metric. The range is 5 to 86400. The default value is 600 seconds. |
|                       | <b>summary-lsa</b>      | Uses the maximum metric to replace the summary LSA metric. (including Type-3 and Type-4)               |

**Defaults** The normal metric LSAs are used by default.

### Command

**Mode** Routing process configuration mode

### Usage Guide

With the **max-metric router-lsa** command enabled, the maximum metric of non-stub links in the Router LSA generated by the routing device is set. The link's normal metric is restored after canceling this configuration or reaching the timer.

By default, with this command enabled, the normal metric of the stub links is still advertised, which is the output interface cost. If the **include-stub** parameter is configured, the maximum metric of the stub links will be advertised.

When the device acts as an ABR, if no interval flow transmission is expected, use the **summary-lsa** parameter to set the summary LSA as the maximum metric.

When the device acts as an ASBR device, if no external flow transmission is expected, use the **external lsa** parameter to set the external LSA as the maximum metric.

The **max-metric router-lsa** command is usually used in the following scenes:

The device is restarted, which generally makes the IGP protocol converge faster, so that other devices attempt forwarding the dataflow through the new started-up device. If the current device remains establishing a BGP routing table, the packets sent to these networks will be discarded due to

some BGP routings have not been learned. In this case, use the **on-startup** parameter to set certain delay, so that this device can serve as a transmission node after restarting.

The device is added into the network without being used for dataflow transmission. If the backup path exists, the current device is not used for the dataflow transmission. Otherwise, this device is still used to transmit the dataflow.

Remove the device from the network gracefully. With this command enabled, the current device advertises the maximum metric to all devices, as that the other devices in this network can choose the backup path to for the dataflow transmission before the current device is removed.

**i** For the OSPF implementation in the earlier versions (RFC 1247 or earlier versions), the links with the maximum metric (0xFFFF) in the LSA will not participate in the SPF calculation, that is, no dataflow will be sent to the router that have generated these LSAs.

**Configuration** The following example configures the LSA maximum metric as 100 seconds after starting the device.

**Examples**

```
Ruijie(config)# router ospf 20
Ruijie(config-router)# max-metric router-lsa on-startup 100
```

**Description**

## 2.47 neighbor

Use this command to define the OSPF neighbor in routing process configuration mode. Use the **no** form of this command to restore the default setting.

**Neighbor** *ip-address* [ **poll-interval** *seconds* ] [ **priority** *priority* ] [ **cost** *cost* ] ]  
**no neighbor** *ip-address* [ [ **poll-interval** ] [ **priority** ] ] [ *cost* ] ]

**Parameter Description**

| Parameter                           | Description                                                                                                                                                                                                                                                          |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip address</i>                   | IP address of the neighbor                                                                                                                                                                                                                                           |
| <b>poll-interval</b> <i>seconds</i> | (Optional) Specifies the interval of polling neighbors in seconds. The range is from 0 to 2147483647.<br>Only the non-broadcast (NBMA) network type supports this option.                                                                                            |
| <b>priority</b> <i>priority</i>     | (Optional) Configures the priority of non-broadcast network neighbors. The range is from 0 to 255. Only the non-broadcast (NBMA) network type supports this option.                                                                                                  |
| <b>cost</b> <i>cost</i>             | (Optional) Configures the cost to each neighbor in point-to-multipoint network, not defined by default, where the cost configured on the interface will be used. The range is from 0 to 65535.<br>Only the point-to-multipoint [non-broadcast] network type supports |

|  |              |
|--|--------------|
|  | this option. |
|--|--------------|

**Defaults** No neighbor is defined by default.  
 The default neighbor polling interval is 120 seconds.  
 The default NBMA neighbor priority is 0.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** The RGOS software must explicitly configure the neighbor information for every non-broadcast network neighbor. The IP address of a neighbor must be the master IP address of that neighbor interface.

In the NBMA network, if the neighbor device becomes inactive, in other words, if the Hello packet is not received within the device dead-interval, the OSPF will send more Hello packets to the neighbor. The interval at which the Hello packets are sent is called the polling interval. When the OSPF starts to work for the first time, it sends Hello packets only to the neighbor whose priority is not 0, so that the neighbor whose priority is set as 0 will not participate in the DR/BDR election. When the DR/BDR is generated, the DR/BDR sends the Hello packets to all neighbors to establish the neighbor relationship.

Since the point-to-multipoint non-broadcast network has no broadcast capability, neighbors cannot be found dynamically. So, it is required to use this command to manually configure neighbor. In addition, it is possible to configure the cost to each neighbor through the cost option for the point-to-multipoint network type.

**Configuration Examples** The following example declares an OSPF non-broadcast network neighbor, with the IP address 172.16.24.2, priority 1 and polling interval 150 seconds.

```
Ruijie(config)# routerospf 20
Ruijie(config-router)# network 172.16.24.0 0.0.0.255 area 0
Ruijie(config-router)# neighbor 172.16.24.2 priority 1 poll-interval 150
```

**Related Commands**

## 2.48 nsr

Use this command to enable the nonstop routing (NSR) function for the OSPF instance. Use the **no** form of this command to disable the NSR function.

**nsr**  
**no nsr**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** NSR is disabled by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** NSR enables the device to recover link state and regenerate routes without the assistance from neighbors during active/standby switchover of distributed devices or VSU system. The backup information includes adjacencies and OSPF state.

You need to enable either NSR or GR in the same OSPF process. That is, the NSR feature will be disabled after the GR feature is enabled. Similarly, the GR feature will be disabled after NSR is enabled, and the GR Helper capability is still supported.

The active/standby switchover of distributed devices or VSU system takes a period of time. If the OSPF dead interval is less than the switchover period, OSPF neighbors will be disconnected and the services will be interrupted. It is recommended to configure the OSPF dead interval longer than its default value. It is not recommended to enable the Fast Hello feature after NSR is enabled, because OSPF dead interval is less than 1 second when the Fast Hello feature is enabled and the OSPF neighbors are disconnected and NSR becomes ineffective.

**Configuration** The following example enables NSR.

**Examples**

```
Ruijie(config)#router ospf 1
Ruijie(config-router)# nsr
```

| Related Commands | Command            | Description                       |
|------------------|--------------------|-----------------------------------|
|                  | <b>router ospf</b> | Creates the OSPF routing process. |

**Description**

## 2.49 network area

Use this command to define which interfaces run OSPF and the OSPF areas they belong to in routing process configuration mode. Use the **no** form of this command to restore the default setting.

**network** *ip-address wildcard area area-id*

**no network** *ip-address wildcard area area-id*

| Parameter Description | Parameter         | Description                 |
|-----------------------|-------------------|-----------------------------|
|                       | <i>ip-address</i> | IP address of the interface |

|                 |                                                                                                                                                          |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>wildcard</i> | Defines the comparison bits in the IP address, with 0 for exact match and 1 for no comparison                                                            |
| <i>area-id</i>  | OSPF area identifier. An OSPF area is always associated with an address range. For easy of management, a subnet can be used as the OSPF area identifier. |

**Defaults** No OSPF area is configured by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** The ip-address and wildcard parameters allow associating multiple interfaces with one OSPF area. To run OSPF on an interface, it is required to include the primary IP address and secondary IP address of the interface in the IP address range defined by the network area command. You can determine the OSPF process that the interface takes part in by the means of the best match if the IP address of the interface matches the IP address ranges defined by the network command in multiple OSPF processes.

**Configuration** The following example defines:

**Examples** Three areas: 0, 1 and 172.16.16.0

The interfaces whose IP addresses fall into the 192.168.12.0/24 range to area 1

The interfaces whose IP addresses fall into the 172.16.16.0/20 range to area 2

The remaining interface being assigned to area 0.

```
Ruijie(config)# routerospf 20
Ruijie(config-router)# network172.16.16.0
0.0.15.255 area172.16.16.0
Ruijie(config-router)# network192.168.12.0
0.0.0.255 area 1
Ruijie(config-router)# network0.0.0.0 255.255.255.255 area0
```

## 2.50 overflow database

Use this command to configure the maximum number of LSAs supported by the current OSPF instance. Use the **no** form of this command to restore the default setting.

**overflow database** *number* [ **hard** | **soft** ]

**no overflow database**

| Parameter Description | Parameter          | Description                                                                                                                                           |
|-----------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>number</i>      | Maximum number of LSAs. The range is from 1 to 4294967294.                                                                                            |
|                       | <b>hard   soft</b> | hard: shuts down the OSPF instance when the number of LSAs exceeds that number.<br>soft: issues an alarm when the number of LSAs exceeds that number. |

**Defaults** The maximum number of LSAs supported by the current OSPF instance is not restricted by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** To shut down the OSPF instance when the number of LSAs exceeds that number, use the hard parameter; otherwise, use the soft parameter.

**Configuration Examples** The following example configures that OSPF instance 10 will be shut down when there are more than 10 LSAs.

```
Ruijie(config)# router ospf 10
Ruijie(config-router)# overflow database 10 hard
```

**Description**

## 2.51 overflow database external

Use this command to configure the maximum number of external LSAs and the waiting time from the overflow state to the normal state. Use the **no** form of this command to restore the default setting.

**overflow database external** *max-dbsize* *wait-time*

**no overflow database external**

| Parameter Description | Parameter         | Description                                                                                                                              |
|-----------------------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>max-dbsize</i> | Maximum number of external LSAs (the value shall be the same for all routing devices in the same AS). The range is from 0 to 2147483647. |
|                       | <i>wait-time</i>  | Waiting time of the routing device from the overflow status to normal status. The range is from 0 to 2147483647.                         |

**Defaults** The maximum number of external-LSAs is not restricted by default.

If the maximum number of external-LSAs is restricted, the normal status cannot be restored when the

maximum number is exceeded.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** When the number of external-LSAs exceeds the value of max-db size, the device enters the overflow state. Then no more external-LSA will be loaded and the external-LSAs generated locally will be cleared. After wait-time expires, the device restores to the normal state and external-LSAs are reloaded.

-  When using this function, ensure that all routers of the OSPF backbone area and common areas use the same max-db size value. Otherwise, the following situations occur:
-  The link status is inconsistent on the entire network and neighbors fail to achieve the Full state.
-  Incorrect routes occur, including loops.
-  AS-External-LSAs may be frequently retransmitted.

**Configuration Examples** The following example configures that the maximum number of external LSAs is 10, and it turns to the overflow status upon timeout, and the time interval attempting to restore from the overflow state to the normal state is 3 seconds.

```
Ruijie(config)# routerospf10
Ruijie(config-router)# overflow database external10 3
```

**Description**

## 2.52 overflow memory-lack

Use this command to allow OSPF to enter the OVERFLOW state when the memory lacks. Use the **no** form of this command to disable this function.

- overflow memory-lack**
- no overflow memory-lack**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** This function is enabled by default

**Command** Routing process configuration mode

**Mode**

**Usage Guide** The action of OSPF entering the OVERFLOW state is to discard the newly-learned external route and effectively prevent the memory from increasing.

It is possible that enabling this function causes the route loop in the whole network. To reduce that possibility, OSPF will generate a default route directing to the NULL port and this default route will exist in the OVERFLOW state.

Use the **clear ip ospf process** command to reset the OSPF and remove the OSPF OVERFLOW state.

Use the no form of this command to prevent the OSPF to enter the OVERFLOW state when the memory is insufficient, which may result in the constantly consumption of the memory resources. If the memory is exhausted to some degree, the OSPF instance will stop and all learned routes will be removed.

**Configuration Examples** The following example prevents the OSPF from entering the OVERFLOW state when the memory is insufficient.

```
Ruijie(config)# router ospf 1
Ruijie(config-router)# no overflow memory-lack
```

**Related Commands**

| Command                       | Description                    |

| <b>show ip protocols ospf</b> | Displays the OSPF information. |

**Platform** N/A

**Description**

## 2.53 passive-interface

Use this command to configure the specified network interface or all interface as the passive interfaces. Use the **no** form of this command to restore the default setting.

**passive-interface** { **default** | *interface-type interface-number* | *interface-type interface-number ip-address* }

**no passive-interface** { **default** | *interface-type interface-number* | *interface-type interface-number ip-address* }

**Parameter Description**

| Parameter                                                             | Description                                                       |
|-----------------------------------------------------------------------|-------------------------------------------------------------------|
| <i>interface-type</i><br><i>interface-number</i>                      | Interface to be set as a passive interface                        |
| <b>default</b>                                                        | Sets all the interfaces as passive interfaces                     |
| <i>interface-type</i><br><i>interface-number</i><br><i>ip-address</i> | Sets the address of the specified interface as a passive address. |

**Defaults** No interface is configured as a passive interface by default. All interfaces are allowed to receive or send OSPF packets.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** To prevent other devices in the network from dynamically learning the routing information of the device, set the specified network interface of this device as a passive interface or the IP address of the specified network interface as a passive address

**Configuration Examples** The following example configures fastEthernet 0/1 as a passive interface and the IP address of the interface 1.1.1.1 as the passive address.

```
Ruijie(config)# routerospf 30
Ruijie(config-router)# passive-interface fastEthernet 0/1
Ruijie(config-router)# passive-interface fastEthernet 0/1 1.1.1.1
```

| <b>connected</b>                | Redistribution from direct routes                                                                 |
| <b>isis</b> [ <i>area-tag</i> ] | Redistribution from an IS-IS instance specified in <i>area-tag</i>                                |
| <b>ospf</b> <i>process-id</i>   | Redistribution from an ospf instance specified in <i>process-id</i> in the range from 1 to 65,535 |
| <b>rip</b>                      | Redistribution from rip                                                                           |

|                                        |                                                                                                                                                                                    |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>static</b>                          | Redistribution from static routes                                                                                                                                                  |
| <b>level-1   level-1-2   level-2</b>   | Configures IS-IS route redistribution. The parameter specifies a level, and routes of this level will be redistributed. Only level-2 IS-IS routes can be redistributed by default. |
| <b>match</b>                           | Filters specified routes for configuring OSPF route redistribution. By default, all the OSPF routes are redistributed.                                                             |
| <b>metric</b> <i>metric-value</i>      | Specifies the metric of an OSPF external LSA in the range from 0 to 16777214.                                                                                                      |
| <b>metric-type</b> {1 2}               | Sets the external routing type as E-1 or E-2.                                                                                                                                      |
| <b>route-map</b> <i>route-map-name</i> | Redistribution filter rule                                                                                                                                                         |
| <b>subnets</b>                         | Redistributes the routes of non standard networks.                                                                                                                                 |
| <b>tag</b> <i>tag-value</i>            | Sets the tag value of the routes redistributed to the OSPF in the range from 0 to 4294967295.                                                                                      |

**Defaults**

Redistribution configuration is not supported by default.

If you configure OSPF redistribution, all subtype routes of the instance are redistributed.

If you configure ISIS redistribution, all level-2 subtype routes of the instance are redistributed.

In other cases, all routings of this type are redistributed.

The default metric of the redistribution BGP route is 1. The default metric of LSAs generated by routes of other types is 20.

The default value of metric-type is E-2.

No route-map is associated by default.

**Command****Mode**

Route configuration mode

**Usage Guide**

After the command is configured, the router will become an ASBR, and the related routing information is imported into the OSPF domain and broadcasted to other OSPF routers through type-5 LSAs.

When you configure is route redistribution without the level parameter, level-2 routes can be redistributed by default. In initial redistribution configuration that carries the level parameter, routes of the specified level can be redistributed. When you save the configuration containing both level 1 and level 2, they are merged into level-1-2 for convenience. For details, see the configuration examples.

When you configure OSPF router distribution without the match parameter, the OSPF routes of all sub types are redistributed by default. Then the first configured match parameter is used as the original one. Only the routes matching the specific type can be redistributed. Use the no form of this command to restore the default configuration.

When you filter routes for redistribution by following the route-map rule, the match rule of the route-map rule is specific for the original redistribution parameters. The route-map rule works only when the redistributed OSPF routes follow the match rule.

 The range of set metric is from 0 to 16777214 for the associated route-map. If the value exceeds the range, introducing a route fails.

 The following are the rules for configuring the no form of the redistribute command:1. If the **no** form specifies some parameters, restore their default values.2. If the **no** form contains no

parameter, delete the whole command. If the following configuration exists: redistribute isis 112 level-2 You can use the no redistribute isis 112 level-2 command to modify the configuration. According to preceding rules, this command restores the level-2 parameter to the default value, namely level-2. Therefore, the configuration remains the same after the no form of the preceding command is executed. redistribute isis 112 level-2 To delete the whole command, use the following command: no redistribute isis 112

**Configuration Examples** The following example redistributes routes of **ospf2** and **isis** isis-001 to the OSPF area.

```
Ruijie(config)# router ospf1
Ruijie(config-router)# redistribute ospf 2 subnets
Ruijie(config-router)# redistribute ospf2match
external 1 internal
Ruijie(config-router)# redistribute isisis-001
Ruijie(config-router)# redistribute isisis-001 level-1
```

The following example displays the output of the **show run** command.

```
router ospf 1
redistribute ospf 2 match external 1 internal subnets
redistribute isis isis-001 level-1-2
```

|------------------------|-------------------------------------------------------------------------------|
| <b>summary-address</b> | Configures the aggregate route for the external route of the OSPF route area. |
| <b>default-metric</b>  | Sets the default metric of the OSPF redistribution route.                     |

**Platform** N/A

**Description**

## 2.55 router ospf

Use this command to create the OSPF routing process in global configuration mode. Use the **no** form of this command to restore the default setting.

**router ospf**

**router ospf** *process-id* [ **vrf** *vrf-name* ]

**no router ospf** *process-id*

**Parameter Description**

| Parameter         | Description                                                                          |
|-------------------|--------------------------------------------------------------------------------------|
| <i>process-id</i> | ID of an OSPF process. If the process ID is not configured, process 1 is configured. |
| <i>vrf-name</i>   | VRF of the configured OSPF process for products that support the VRF.                |

**Defaults** No OSPF routing process exists by default.

**Command**

**Mode** Global configuration mode

**Usage Guide** Based on the original implementation, the RGOS10.1 adds the routing process ID to multi-instance OSPF. Different OSPF instances are mutually independent and can be approximately considered as two routing protocols that run independently.

**Configuration** The following example creates the OSPF routing process 10 within the specified vrf: vpn\_1.

**Examples**

```
Ruijie(config)# router ospf10 vrf: vpn_1
```

**Description**

## 2.56 router ospf max-concurrent-dd

Use this command to specify the maximum number of DD packets that can be processed (initiated or accepted) at the same time. Use the **no** form of this command to restore the default setting.

**router ospf max-concurrent-dd** *number*

**no router ospf max-concurrent-dd**

**Parameter Description**

| Parameter     | Description                                                |
|---------------|------------------------------------------------------------|
| <i>number</i> | Maximum number of DD packets in the range from 1 to 65535. |

**Defaults** The default is 10.

**Command**

**Mode** Global configuration mode

**Usage Guide** When a routing device is exchanging data with multiple neighbors, its performance will be affected. This command is configured to limit the maximum number of DD packets that each OSPF instance can have (initiated or accepted) at the same time.

**Configuration** The following example sets the maximum number of DD packets to 4.

**Examples** After the configuration, the device can initiate to interact with four neighbors and can concurrently accept the interaction. That is, the device can interact with a maximum of eight neighbors.

```
Ruijie# configure terminal
Ruijie(config)# router ospfmax-concurrent-dd4
```

#### Related Commands

|--------------------------|--------------------------------------------------------------------------------------------------------|
| <b>max-concurrent-dd</b> | Sets the maximum number of the neighbors that the OSPF routing process can concurrently interact with. |

**Platform** N/A  
**Description**

## 2.57 router-id

Use this command to set the router ID. Use the **no** form of this command to restore the default setting.

**router-id** *router-id*  
**no router-id**

#### Parameter Description

| Parameter        | Description                  |
|------------------|------------------------------|
| <i>router-id</i> | Router ID in IP address form |

#### Defaults

The OSPF routing process will select the maximal interface IP address as the router ID by default. If the loopback interface of an IP address is not configured, the OSPF routing process will select the maximum IP address among all its physical interfaces as the router ID.

#### Command

**Mode** Routing process configuration mode

#### Usage Guide

You can configure any IP address as the router ID. However, the router ID should be unique. Note that once the router ID changes, the OSPF protocol will do a lot of processing. Therefore, it is not recommended to change the router ID. The device can be changed only when no LSA is generated.

**Configuration** The following example modifies the router ID to 0.0.0.36.

#### Examples

```
Ruijie(config)# router ospf 20
Ruijie(config-router)# router-id0.0.0.36
```

**Description**

## 2.58 show ip ospf

Use this command to display the OSPF information.

**show ip ospf** [ *process-id* ]

| Parameter Description | Parameter         | Description     |
|-----------------------|-------------------|-----------------|
|                       | <i>process-id</i> | OSPF process ID |

**Defaults** N/A

### Command

**Mode** Privileged EXEC mode

**Usage Guide** This command displays the information of the OSPF routing process.

**Configuration** The following example displays the output of the **show ip ospf** command.

### Examples

```
Ruijie# show ip ospf
Routing Process "ospf 1" with ID 1.1.1.1
Domain ID type 0x0105, value 0x010101010101
Process uptime is 4 minutes
Process bound to VRF default
Memory Overflow is enabled.
Router is not in overflow state now.
Conforms to RFC2328, and RFC1583Compatibility flag isenabled
Supports only single TOS(TOS0) routes
Enable two-way-maintain
Supports opaque LSA
Supports Graceful Restart
This router is an ASBR (injecting external routing information)
Originating router-LSAs with maximum metric
Condition:on startup for 100 seconds, State:inactive
Advertise stub links with maximum metric in router-LSAs
Advertise summary-LSAs with metric 16711680
Advertise external-LSAs with metric 16711680
Unset reason:timer expired, Originated for 100 seconds
Unset time:00:02:02.080, Time elapsed: 00:23:54.656
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Initial LSA throttle delay 0 msec
Minimum hold time for LSA throttle 5000 msec
Maximum wait time for LSA throttle 5000 msec
Lsa Transmit Pacing timer 40 msec, 10 LS-Upd
Minimum LSA arrival 1000 msec
Pacing lsa-group:240 secs
```

```

Number of incoming current DD exchange neighbors 0/5
Number of outgoing current DD exchange neighbors 0/5
Number of external LSA 4. Checksum 0x0278E0
Number of opaque AS LSA 0. Checksum 0x000000
Number of non-default external LSA 4
External LSA database is unlimited.
Number of LSA originated 6
Number of LSA received 2
Log Neighbor Adjacency Changes :Enabled
Graceful-restart disabled
Graceful-restart helper support enabled
Number of areas attached to this router: 1
BFD enabled
Area 0 (BACKBONE)
Number of interfaces in this area is 1(1)

**Description**

## 2.59 show ip ospf border-routers

Use this command to display the OSPF internal routing table on the ABR/ASBR.

**show ip ospf [*process-id*] border-routers**

**Parameter Description**

| Parameter         | Description     |
|-------------------|-----------------|
| <i>process-id</i> | OSPF process ID |

**Defaults** N/A

**Command**

**Mode** Privileged EXEC mode

**Usage Guide** This command displays the OSPF internal routes from the local routing device to the ABR or ASBR. The OSPF internal routing table is different from the one displayed with the show ip route command. The OSPF internal routing table has the destination address of the router ID instead of the destination network.

**Configuration** The following example displays the output of the **show ip ospf border-mrouters** command.

**Examples**

```
Ruijie# show ip ospf border-routers
OSPF internal Routing Table
Codes:i - Intra-area route, I - Inter-area route
i 1.1.1.1 [2] via 10.0.0.1, FastEthernet 0/1, ABR, ASBR, Area 0.0.0.1 select
The following table describes fields in the output.
```

| Field            | Description                                                                              |
|------------------|------------------------------------------------------------------------------------------|
| Codes            | Route type code, where “i” means intra-area routes, while “I” means inter-area routes.   |
| I                | Intra-area routes                                                                        |
| 1.1.1.1          | Displays the OSPF ID of the border device.                                               |
| [2]              | Displays the cost to the border device.                                                  |
| via 10.0.0.1     | Displays the next-hop gateway to the border device.                                      |
| FastEthernet 0/1 | Displays the interface to the border device.                                             |
| ABR, ASBR        | Displays the type of the border device, including ABR, ASBR, or both.                    |
| Area 0.0.0.1     | Displays the area that learns the route.                                                 |
| select           | Indicates the currently selected optimal path when there are multiple paths to the ASBR. |

**Description**

## 2.60 show ip ospf database

Use this command to display the OSPF link state database information. Use the **no** form of this command to restore the default setting. Different formats of the command will display different LSA information.

**show ip ospf** [ *process-id* [ *area-id* | *ip-address* ] ] **database** [ { **asbr-summary** | **external** | **network** | **nssa-external** | **opaque-area** | **opaque-as** | **opaque-link** | **router** | **summary** } ] [ { **adv-router** | *ip-address* | **self-originate** } | *link-state-id* | **brief** ] [ **database-summary** | **max-age** | **detail** ]

| Parameter Description | Parameter               | Description                                                                            |
|-----------------------|-------------------------|----------------------------------------------------------------------------------------|
|                       | <i>area-id</i>          | (Optional) Displays the area ID.                                                       |
|                       | <b>adv-device</b>       | (Optional) Displays the LSA information generated by the specified advertising device. |
|                       | <i>link-state-id</i>    | (Optional) Displays the LSA information of the specified OSPF link state identifier.   |
|                       | <b>self-originate</b>   | (Optional) Displays the LSA information generated by the device itself.                |
|                       | <b>Max-age</b>          | (Optional) Displays the LSAs aged.                                                     |
|                       | <b>router</b>           | (Optional) Displays the OSPF device LSA information.                                   |
|                       | <b>network</b>          | (Optional) Displays the OSPF network LSA information.                                  |
|                       | <b>summary</b>          | (Optional) Displays the OSPF summary LSA information.                                  |
|                       | <b>asbr-summary</b>     | (Optional) Displays the ASBR summary LSA information.                                  |
|                       | <b>external</b>         | (Optional) Displays the OSPF external LSA information.                                 |
|                       | <b>nssa-external</b>    | (Optional) Displays the category 7 OSPF external LSA information.                      |
|                       | <b>opaque-area</b>      | (Optional) Displays type 10 LSAs.                                                      |
|                       | <b>opaque-as</b>        | (Optional) Displays type 11 LSAs.                                                      |
|                       | <b>opaque-link</b>      | (Optional) Displays type 9 LSAs.                                                       |
|                       | <b>database-summary</b> | (Optional) Displays the statistics of LSAs of the link state database.                 |
|                       | <b>detail</b>           | Displays detailed information of LSAs of the OSPF.                                     |
|                       | <b>brief</b>            | Displays the brief information of the LSAs of the specified type.                      |

**Defaults** N/A

**Command**

**Mode** Privileged EXEC mode

**Usage Guide** When the OSPF link state database is very large, you should display the information on the link state database by item. Proper use of commands may help OSPF troubleshooting.

**Configuration** The following example displays the output of the **show ip ospf database** command.

```

The following table describes the fields in the output of the **show ip ospf database** command.

| Field                     | Description                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------|
| OSPF Device with ID       | Displays the Router ID.                                                                 |
| Device Link States        | Displays the device LSA information.                                                    |
| Net Link States           | Displays the network LSA information.                                                   |
| Summary Net Link States   | Displays the summary network LSA information.                                           |
| NSSA-external Link States | Displays the type 7 autonomous external LSA information.                                |
| AS External Link States   | Displays the type 5 autonomous external LSA information.                                |
| Link ID                   | Displays the Link ID.                                                                   |
| ADV Device                | Displays the ID of the device that advertises the LSAs.                                 |
| Age                       | Displays the keepalive period of the LSA.                                               |
| Seq#                      | Displays the sequence number of the LSA, which is used to check aged or duplicate LSAs. |
| Cksum                     | Displays the checksum of LSAs.                                                          |
| Link-Count                | Displays the number of links in the device LSA information.                             |
| Route                     | Displays the device information included in the LSA.                                    |
| Tag                       | Displays the tag of the LSA.                                                            |

The following example displays the output the **show ip ospf database asbr-summary** command.

```

Ruijie# show ip ospf database asbr-summary
      OSPF Device with ID (1.1.1.35) (Process ID 1)
        ASBR-Summary Link States (Area 0.0.0.1)
LS age: 47
Options: 0x2 (*|-|-|-|-|E|-)
LS Type: ASBR-summary-LSA
Link State ID: 3.3.3.3 (AS Boundary Device address)
Advertising Device: 1.1.1.1
LS Seq Number: 80000001
Checksum: 0xbe8c
Length: 28
Network Mask: /0
      TOS: 0 Metric: 1

```

The following table describes the fields in the output of the **show ip ospf database asbr-summary** command.

| Field                  | Description                                                      |
|------------------------|------------------------------------------------------------------|
| OSPF Device with ID    | Displays the router ID.                                          |
| AS Summary Link States | Displays the summary LSA information in the AS.                  |
| LS age                 | Displays the keepalive period of the LSA.                        |
| Options                | Option                                                           |
| LS Type                | Displays the type of the LSA.                                    |
| Link State ID          | Displays the link ID of the LSA.                                 |
| AdvertisingRouter      | Displays the device advertising the LSA.                         |
| LS Seq Number          | Displays the sequence number of the LSA.                         |
| Checksum               | Displays the checksum of the LSAs.                               |
| Length                 | Displays the length (in bytes) of the LSA.                       |
| Network Mask           | Displays the network mask of the route corresponding to the LSA. |
| TOS                    | TOS value, which can be only 0 now.                              |
| Metric                 | Displays the metric of the route corresponding to the LSA.       |

The following example displays the output of the **show ip ospf database external** command.

```

Ruijie# show ip ospf database external
      OSPF Device with ID (1.1.1.35) (Process ID 1)
        AS External Link States
LS age: 752
Options: 0x2 (*|-|-|-|-|E|-)
LS Type: AS-external-LSA
Link State ID: 20.0.0.0 (External Network Number)
Advertising Device: 1.1.1.1
LS Seq Number: 8000000a

```

```
Checksum: 0x7627
Length: 36
Network Mask: /24
    Metric Type: 2 (Larger than any link state path)
    TOS: 0
    Metric: 20
    Forward Address: 0.0.0.0
    External Route Tag: 0
```

The following table describes the fields in the output of the **show ip ospf database external** command.

| Field                          | Description                                                                                                                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Device with ID            | Displays the router ID.                                                                                                                                                                     |
| Type-5 AS External Link States | Displays autonomous external LSA information.                                                                                                                                               |
| LS age                         | Displays the keepalive period of the LSA.                                                                                                                                                   |
| Options                        | Option                                                                                                                                                                                      |
| LS Type                        | Displays the type of the LSA.                                                                                                                                                               |
| Link State ID                  | Displays the link ID of the LSA.                                                                                                                                                            |
| Advertising Router             | Displays the device advertising the LSA                                                                                                                                                     |
| LS Seq Number                  | Displays the sequence number of the LSA.                                                                                                                                                    |
| Checksum                       | Displays the checksum of the LSAs.                                                                                                                                                          |
| Length                         | Displays the length (in bytes) of the LSA.                                                                                                                                                  |
| Network Mask                   | Displays the network mask of the route corresponding to the LSA.                                                                                                                            |
| Metric Type                    | Indicates the external link type.                                                                                                                                                           |
| TOS                            | TOS value, which can be 0 only now.                                                                                                                                                         |
| Metric                         | Displays the metric of the route corresponding to the LSA.                                                                                                                                  |
| Forward Address                | IP address through which traffic is forwarded to the destination network. If this address is 0.0.0.0, the data traffic will be forwarded to the device that generates the link state.       |
| External Route Tag             | External route tag. Each external route has a 32-byte route tag. The OSPF does not use the route tag by itself, but it will be used by other routing processes to redistribute OSPF routes. |

The following example displays the output of the **show ip ospf database network** command:

```
Ruijie# show ip ospf database network
OSPF Router with ID (1.1.1.1) (Process ID 1)
Network Link States (Area 0.0.0.0)
LS age: 572
Options:0x2 (*|-|-|-|-|E|-)
LS Type:network-LSA
```

```

Link State ID:192.88.88.27 (address of Designated Router)
Advertising Router:1.1.1.1
LS Seq Number: 80000001
Checksum:0x5366
Length: 32
Network Mask: /24
Attached Router:1.1.1.1
Attached Router:3.3.3.3

```

The following table describes the fields in the output of the **show ip ospf database network** command.

| Field               | Description                                                                                                     |
|---------------------|-----------------------------------------------------------------------------------------------------------------|
| OSPF Router with ID | Displays the router ID corresponding to the follow-up information and the process ID corresponding to the OSPF. |
| Network LinStates   | Displays the network LSA information.                                                                           |
| LS age              | Displays the keepalive period of the LSA.                                                                       |
| Options             | Option                                                                                                          |
| LS Type             | Displays the type of the LSA.                                                                                   |
| Link State ID       | Displays the link ID of the LSA.                                                                                |
| Advertising Device  | Displays the device advertising the LSA.                                                                        |
| LS Seq Number       | Displays the sequence number of the LSA.                                                                        |
| Checksum            | Displays the checksum of LSAs.                                                                                  |
| Length              | Displays the length (in bytes) of the LSA.                                                                      |
| Network Mask        | Displays the network mask of the network corresponding to the LSA.                                              |
| Attached Router     | Displays the device that is connected with the network.                                                         |

The following example displays the output of the **show ip ospf database device** command:

```

Ruijie# show ip ospf database router
OSPF Router with ID (1.1.1.1) (Process ID 1)
Router Link States (Area 0.0.0.0)
LS age: 322
Options:0x2 (*|---|---|E|)
Flags:0x3 :ABR ASBR
LS Type:router-LSA
Link State ID:1.1.1.1
Advertising Router:1.1.1.1
LS Seq Number: 80000012
Checksum:0x6d3a
Length: 48
Number of Links: 2
Link connected to:Stub Network
(Link ID) Network/subnet number: 100.0.1.1
(Link Data) Network Mask: 255.255.255.255

```

```
Number of TOS metrics: 0
TOS 0 Metric: 0
```

The following table describes the fields in the output of the **show ip ospf database device** command.

| Field                 | Description                                                  |
|-----------------------|--------------------------------------------------------------|
| OSPF Device with ID   | Displays the router ID.                                      |
| Device Link States    | Displays the device LSA information.                         |
| LS age                | Displays the keepalive period of the LSA.                    |
| Options               | Option                                                       |
| Flag                  | Flag                                                         |
| LS Type               | Displays the type of the LSA.                                |
| Link State ID         | Displays the link ID of the LSA.                             |
| Advertising Router    | Displays the device advertising the LSA.                     |
| LS Seq Number         | Displays the sequence number of the LSA.                     |
| Checksum              | Displays the checksum of LSAs.                               |
| Length                | Displays the length (in bytes) of the LSA.                   |
| Number of Links       | Displays the number of links associated with the device.     |
| Link connected to     | Displays what the link is connected to and the network type. |
| (Link ID)             | Link identifier                                              |
| (Link Data)           | Link data                                                    |
| Number of TOS metrics | TOS value, supporting TOS0 only                              |
| TOS 0 Metrics         | TOS0 metric                                                  |

The following example displays the output of the **show ip ospf database summary** command:

```
Ruijie# show ip ospf database summary
      OSPF Device with ID (1.1.1.1) (Process ID 1)
        Summary Link States (Area 0.0.0.0)
LS age: 499
Options: 0x2 (*|-|-|-|-|E|-)
LS Type: summary-LSA
Link State ID: 10.0.0.0 (summary Network Number)
```

```
Advertising Device: 1.1.1.1
LS Seq Number: 80000004
Checksum: 0x330e
Length: 28
Network Mask: /24
    TOS: 0 Metric: 11
```

The following table describes the fields in the output of the **show ip ospf database summary** command.

| Field                   | Description                                                      |
|-------------------------|------------------------------------------------------------------|
| OSPF Router with ID     | Displays the router ID.                                          |
| Summary Net Link States | Displays the summary network LSA information.                    |
| LS age                  | Displays the keepalive period of the LSA.                        |
| Options                 | Option                                                           |
| LS Type                 | Displays the type of the LSA.                                    |
| Link State ID           | Displays the link ID of the LSA.                                 |
| Advertising Router      | Displays the device advertising the LSA.                         |
| LS Seq Number           | Displays the sequence number of the LSA.                         |
| Checksum                | Displays the checksum of LSAs.                                   |
| Length                  | Displays the length (in bytes) of the LSA.                       |
| Network Mask            | Displays the network mask of the route corresponding to the LSA. |
| TOS                     | TOS value, supporting only 0 now                                 |
| Metric                  | Displays the metric of the route corresponding to the LSA.       |

The following example displays the output of the **show ip ospf database nssa-external** command:

```
Ruijie# show ip ospf database nssa-external
    OSPF Device with ID (1.1.1.1) (Process ID 1)
NSSA-external Link States (Area 0.0.0.1 [NSSA])
LS age: 1
Options: 0x0 (*|-|-|-|-|-|-)
LS Type: AS-NSSA-LSA
Link State ID: 20.0.0.0 (External Network Number For NSSA)
Advertising Device: 1.1.1.1
```

```

LS Seq Number: 80000001
Checksum: 0x033c
Length: 36
Network Mask: /24
    Metric Type: 2 (Larger than any link state path)
    TOS: 0
    Metric: 20
    NSSA: Forward Address: 100.0.2.1
    External Route Tag: 0

```

The following table describes the fields in the output of the **show ip ospf database nssa-external** command.

| Field                     | Description                                                                                                                                                                           |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Router with ID       | Displays the router ID.                                                                                                                                                               |
| NSSA-external Link States | Displays the type 7 autonomous external LSA information.                                                                                                                              |
| LS age                    | Displays the keepalive period of the LSA.                                                                                                                                             |
| Options                   | Option                                                                                                                                                                                |
| LS Type                   | Displays the type of the LSA.                                                                                                                                                         |
| Link State ID             | Displays the link ID of the LSA.                                                                                                                                                      |
| Advertising Router        | Displays the device advertising the LSA.                                                                                                                                              |
| LS Seq Number             | Displays the sequential number of the LSA.                                                                                                                                            |
| Checksum                  | Displays the checksum of the LSAs.                                                                                                                                                    |
| Length                    | Displays the length (in bytes) of the LSA.                                                                                                                                            |
| Network Mask              | Displays the network mask of the route corresponding to the LSA.                                                                                                                      |
| Metric Type               | Displays the metric type.                                                                                                                                                             |
| TOS                       | TOS value, which can be 0 only now.                                                                                                                                                   |
| Metric                    | Displays the metric of the route corresponding to the LSA.                                                                                                                            |
| NSSA:Forward Address      | IP address through which traffic is forwarded to the destination network. If this address is 0.0.0.0, the data traffic will be forwarded to the device that generates the link state. |

|                    |                                                                                                                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| External Route Tag | External route tag. Each external route has a 32-byte route tag. The OSPF does not use the route tag by itself, but it will be used in redistributing OSPF routes by other routing process. |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The following example displays the output of the **show ip ospf database external** command:

```
Ruijie# show ip ospf database external
      OSPF Device with ID (1.1.1.1) (Process ID 1)
      AS External Link States
LS age: 1290
Options: 0x2 (*|-|-|-|-|E|-)
LS Type: AS-external-LSA
Link State ID: 20.0.0.0 (External Network Number)
Advertising Device: 1.1.1.1
LS Seq Number: 8000000a
Checksum: 0x7627
Length: 36
Network Mask: /24
      Metric Type: 2 (Larger than any link state path)
      TOS: 0
      Metric: 20
      Forward Address: 0.0.0.0
      External Route Tag: 0
```

The following table describes the fields in the output of the **show ip ospf database external** command.

| Field                          | Description                                              |
|--------------------------------|----------------------------------------------------------|
| OSPF Device with ID            | Displays the router ID.                                  |
| Type-7 AS External Link States | Displays the type 7 autonomous external LSA information. |
| LS age                         | Displays the keepalive period of the LSA.                |
| Options                        | Option                                                   |
| LS Type                        | Displays the type of the LSA.                            |
| Link State ID                  | Displays the link ID of the LSA.                         |
| Advertising Router             | Displays the device advertising the LSA.                 |
| LS Seq Number                  | Displays the sequence number of the LSA.                 |

|                    |                                                                                                                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Checksum           | Displays the checksum of the LSAs.                                                                                                                                                          |
| Length             | Displays the length (in bytes) of the LSA.                                                                                                                                                  |
| Network Mask       | Displays the network mask of the route corresponding to the LSA.                                                                                                                            |
| Metric Type        | Displays the metric type.                                                                                                                                                                   |
| TOS                | TOS value, which can be 0 only now.                                                                                                                                                         |
| Metric             | Displays the metric of the route corresponding to the LSA.                                                                                                                                  |
| Forward Address    | IP address through which traffic is forwarded to the destination network. If this address is 0.0.0.0, the data traffic will be forwarded to the device that generates the link state.       |
| External Route Tag | External route tag. Each external route has a 32-byte route tag. The OSPF does not use the route tag by itself, but it will be used in redistributing OSPF routes by other routing process. |

The following example displays the output of the **show ip ospf database database-summary** command:

```
Ruijie# show ip ospf database database-summary
OSPF process 1:
Device Link States      : 4
Network Link States    : 2
Summary Link States    : 4
ASBR-Summary Link States : 0
AS External Link States : 4
NSSA-external Link States: 2
```

The following table describes the fields in the output of the command **show ip ospf database database-summary**.

| Field             | Description                             |
|-------------------|-----------------------------------------|
| OSPF Process      | OSPF process ID                         |
| Router Link       | Number of device LSAs in the area       |
| Network Link      | Number of network LSAs in the area      |
| Summary Link      | Number of summary LSAs in the area      |
| ASBR-Summary Link | Number of ASBR summary LSAs in the area |
| AS External Link  | Number of NSSA LSAs in the area         |

|                    |                                 |
|--------------------|---------------------------------|
| NSSA-external Link | Number of NSSA LSAs in the area |
|--------------------|---------------------------------|

## 2.61 show ip ospf interface

Use this command to display the OSPF-associated interface information.

**show ip ospf [ process-id ] interface [ interface-type interface-number | brief ]**

**Parameter Description**

| Parameter               | Description                                  |
|-------------------------|----------------------------------------------|
| <i>process-id</i>       | OSPF process ID                              |
| <i>interface-type</i>   | (Optional) type of the specified interface   |
| <i>interface-number</i> | (Optional) number of the specified interface |
| brief                   | Displays the summary of the interface.       |

**Defaults** N/A

**Command**

**Mode** Privileged EXEC mode

**Usage Guide** This command displays the OSPF information on the interface.

**Configuration** The following example displays the output of the **show ip ospf interface fastEthernet 0/1** command:

**Examples**

```
Ruijie# show ip ospf interface fastEthernet0/1
FastEthernet 0/1 is up, line protocol is up
Internet Address 192.88.88.27/24, Ifindex 4, Area 0.0.0.0, MTU 1500
Matching network config: 192.88.88.0/24
Process ID 1, Router ID 1.1.1.1, Network Type BROADCAST, Cost: 1
Transmit Delay is 1 sec, State DR, Priority 1,BFD enabled
Designated Router (ID) 1.1.1.1, Interface Address 192.88.88.27
Backup Designated Router (ID) 3.3.3.3, Interface Address 192.88.88.72
Timer intervals configured,Hello 10,Dead 40,Wait 40,Retransmit 5
Hello due in 00:00:03
Neighbor Count is 1, Adjacent neighbor count is 1
Crypt Sequence Number is 70784
Hello received 1786 sent 1787, DD received 13 sent 8
```

```
LS-Req received 2 sent 2, LS-Upd received 29 sent 53
LS-Ack received 46 sent 23, Discarded 1
```

The following table describes the fields in the output of the **show ip ospf interface serial 1/0** command.

| Field                        | Description                                                                    |
|------------------------------|--------------------------------------------------------------------------------|
| FastEthernet 0/1 State       | State of the network interface; UP means normal working and Down means faults. |
| Internet Address             | Interface IP address                                                           |
| Area                         | OSPF area of the interface                                                     |
| MTU                          | Corresponding MTU                                                              |
| Matching network config      | Network area configured for the corresponding OSPF                             |
| Process ID                   | Corresponding process ID                                                       |
| Router ID                    | OSPF router id                                                                 |
| Network Type                 | OSPF network type                                                              |
| Cost                         | OSPF interface cost                                                            |
| Transmit Delay is            | OSPF interface transmit delay                                                  |
| State                        | DR/BDR state ID                                                                |
| Priority                     | Priority of the interface                                                      |
| Designated Router(ID)        | DR ID of the interface                                                         |
| DR's Interface address       | Address of the DR of the interface                                             |
| Backup designated device(ID) | Router ID of the BRD of the interface                                          |
| BDR's Interface address      | Address of the BDR of the interface                                            |
| Time intervals configured    | Hello, Dead, Wait, and Retransmit intervals of the interface                   |
| Hello due in                 | Time when the previous Hello is sent                                           |
| Neighbor count               | Total number of neighbors                                                      |
| Adjacent neighbor count      | Number of Full neighbors                                                       |
| Crypt Sequence Number        | The corresponding md5 authentication number of the interface                   |
| Hello received send          | Statistics on the Hello packets sent and received                              |
| DD received send             | Statistics on the DD packets sent and received                                 |
| LS-Req received send         | Statistics on the LS request packets sent and received                         |
| LS-Upd received send         | Statistics on the LS update packets sent and received                          |
| LS-Ack received send         | Statistics on the LS response packets sent and received                        |
| Discard                      | Statistics on the discarded OSPF packets                                       |
| BFD enabled                  | Enables BFD for OSPF.                                                          |

## 2.62 show ip ospf ispf

Use this command to display the ISPF calculation count in the OSPF area.

**show ip ospf [ *process-id* ] ispf**

| Parameter Description | Parameter         | Description |
|-----------------------|-------------------|-------------|
|                       | <i>process-id</i> |             |

**Defaults** N/A

**Command**

**Mode** Privileged EXEC mode

**Usage Guide** This command displays the ISPF calculation count in the OSPF area within the last 30 minutes and total ISPF calculation count by now.

**Configuration** The following displays the ISPF calculation count in the OSPF area.

**Examples**

```
Ruijie# show ip ospf 1 ispf
```

```
OSPF process 1:
```

```
Area_id      30min_counts  Total_counts
0             32             1235
1             6              356
```

Field Description:

| Field        | Description                                                         |
|--------------|---------------------------------------------------------------------|
| Area_id      | OSPF area ID.                                                       |
| 30min_counts | ISPF calculation count in the OSPF area within the last 30 minutes. |
| Total_counts | Total count of ISPF calculation.                                    |

**Description**

## 2.63 show ip ospf neighbor

Use this command to display the OSPF neighbor list.

```
show ip ospf [ process-id ] neighbor [ statistics ] { [ interface-type interface-number ] | [ neighbor-id ]
| [ detail ] }
```

| Parameter Description | Parameter                                        | Description                                                             |
|-----------------------|--------------------------------------------------|-------------------------------------------------------------------------|
|                       | <b>detail</b>                                    | (Optional) Displays the neighbor details.                               |
|                       | <i>interface-type</i><br><i>interface-number</i> | (Optional) Displays the neighbor information of the specified interface |
|                       | <i>neighbor-id</i>                               | (Optional) Displays the information of the specified neighbor           |
|                       | <b>statistics</b>                                | (Optional) Displays the neighbor statistics.                            |

**Defaults** N/A

### Command

**Mode** Privileged EXEC mode

**Usage Guide** This command displays neighbor information usually used to check whether the OSPF is running normally.

**Configuration** The following example displays the output of the **show ip ospf neighbor** command.

### Examples

```
Ruijie# show ip ospf neighbor
OSPF process 1, 1 Neighbors, 1 is Full:
Neighbor ID   Pri   State     BFD State   Dead Time   Address           Interface
3.3.3.3       1     Full/BDR  Up           00:00:32    192.88.88.72     FastEthernet 0/1

Ruijie# show ip ospf neighbor detail
Neighbor 3.3.3.3, interface address 192.88.88.72
In the area 0.0.0.0 via interface FastEthernet 0/1
Neighbor priority is 1, State is Full, 11 state changes
DR is 192.88.88.27, BDR is 192.88.88.72
Options is 0x52 (*|O|-|EA|-|-|E|-)
Dead timer due in 00:00:32
Neighbor is up for 05:11:27
Database Summary List 0
Link State Request List 0
Link State Retransmission List 0
Crypt Sequence Number is 0
Thread Inactivity Timer on
Thread Database Description Retransmission off
Thread Link State Request Retransmission off
```

```
Thread Link State Update Retransmission off
Thread Poll Timer on
Graceful-restart helper disabled
BFD session state up
```

The following table describes the fields in the output of the **show ip ospf neighbor** command.

| Field                         | Description                                                                                                                                                                                                                                                                               |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor ID                   | Neighbor ID                                                                                                                                                                                                                                                                               |
| Pri                           | Neighbor priority (for selection of DR)                                                                                                                                                                                                                                                   |
| State                         | Neighbor status                                                                                                                                                                                                                                                                           |
| Dead Time                     | Remaining time for the neighbor to enter the Dead status                                                                                                                                                                                                                                  |
| Address                       | Interface address of the neighbor                                                                                                                                                                                                                                                         |
| Interface                     | Interface of the neighbor                                                                                                                                                                                                                                                                 |
| interface address             | Interface address of the neighbor device                                                                                                                                                                                                                                                  |
| In the area                   | Displays the area that learns the neighbor.                                                                                                                                                                                                                                               |
| via interface                 | Displays the interface that learns the neighbor                                                                                                                                                                                                                                           |
| Neighbor priority             | Priority of the neighbor OSPF                                                                                                                                                                                                                                                             |
| State                         | OSPF neighbor connection state. FULL means the stable state; DR indicates that the neighbor is the designated device; BDR indicates that the neighbor is the backup designated device; DROTHER indicates that the neighbor is not a DR/BDR. Point-to-point network type has no DR or DBR. |
| State changes times           | Times of state changes                                                                                                                                                                                                                                                                    |
| Dead Time                     | Dead time of the neighbor                                                                                                                                                                                                                                                                 |
| DR                            | Interface address of the DR elected by the neighbor device (that is, the DR field of the Hello packet)                                                                                                                                                                                    |
| BDR                           | Interface address of the BDR elected by the neighbor device (that is, the BDR field of the Hello packet)                                                                                                                                                                                  |
| Options                       | Hello packet E-bit option, where 0 indicates that the area is a STUB area; 2 indicates that the area is not a STUB area.                                                                                                                                                                  |
| Dead timer due in             | Dead time of the neighbor device                                                                                                                                                                                                                                                          |
| Neighbor up time              | Period from when the device is discovered till now                                                                                                                                                                                                                                        |
| Database Summary List         | Statistics on the neighbor DD packets                                                                                                                                                                                                                                                     |
| LinkState Request List        | Statistics on the neighbor LS request packets                                                                                                                                                                                                                                             |
| LinkState Retransmission List | Statistics on the neighbor re-transmit packets                                                                                                                                                                                                                                            |
| Crypt Sequence Number         | Area MD5 authentication code                                                                                                                                                                                                                                                              |

|                                            |                                                                         |
|--------------------------------------------|-------------------------------------------------------------------------|
| Thread Inactivity Timer                    | Status of invalid neighbor timer                                        |
| Thread Database Description Retransmission | Status of DD packet timer of the interface                              |
| ThreadLinkState Request Retransmission     | Status of LS request packet timer of the interface                      |
| ThreadLinkState Update Retransmission      | Status of LS update packet timer of the interface                       |
| Thread Poll Timer                          | Poll Timer start status of the static neighbor                          |
| Graceful-restart helper                    | Whether it is able to function as the GR Helper of a specified neighbor |

**Description**

## 2.64 show ip ospf route

Use this command to display the OSPF routes.

**show ip ospf [ process-id ] route [ count | ip-address mask ]**

| <b>Parameter Description</b> | Parameter              | Description                                                                 |
|------------------------------|------------------------|-----------------------------------------------------------------------------|
|                              | <i>process-id</i>      | OSPF process ID. All OSPF routes will be displayed without an ID specified. |
|                              | <b>count</b>           | Statistics of various OSPF routes                                           |
|                              | <i>ip-address mask</i> | Statistics of routes which have a specified prefix and mask.                |

**Defaults** N/A

**Command Mode** Privileged mode

**Usage Guide** This command displays the OSPF routing information. The count option displays the OSPF routing statistics.

**Configuration** The following example displays the output of the **show ip ospf route** command.

```

Examples OSPF process 1:
Codes: C - connected, D - Discard , O - OSPF,
IA - OSPF inter area N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external
type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
E2 100.0.0.0/24 [1/20] via 192.88.88.126, FastEthernet 0/1
C 192.88.88.0/24 [1] is directly connected, FastEthernet 0/1, Area 0.0.0.1
    
```

The following table describes the fields in the output of the **show ip ospf route** command.

| Field        | Description                                               |
|--------------|-----------------------------------------------------------|
| codes        | Route type and corresponding abbreviation and description |
| 100.0.0.0/24 | Route prefix                                              |
| [1]          | Route cost                                                |
| via          | Route next hop and interface                              |

| Related Commands | Command | Description |

**Platform** N/A  
**Description**

## 2.65 show ip ospf spf

Use this command to display the routing count in the OSPF area.

**show ip ospf [ process-id ] spf**

| Parameter Description | Parameter         | Description     |
|-----------------------|-------------------|-----------------|
|                       | <i>process-id</i> | OSPF process ID |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command displays the routing counts within the latest 30 minutes in the OSPF area and current routing total counts.

**Configuration** The following example displays the output of the **show ip ospf [process-id] spf** command:

```

Examples Ruijie# show ip ospf 1 spf

OSPF process 1:
    
```

| Area_id | 30min_counts | Total_counts |
|---------|--------------|--------------|
| 0       | 32           | 1235         |
| 1       | 6            | 356          |

The following table describes the fields in the output of the **show ip ospf [process-id] spf** command.

| Field        | Description                                      |
|--------------|--------------------------------------------------|
| Area_id      | OSPF area ID                                     |
| 30min_counts | OSPF routing counts within the latest 30 minutes |
| Total_counts | Total counts of the OSPF routing till now        |

#### Related Commands

| Command             | Description                |

| <b>show ip ospf</b> | Displays the OSPF summary. |

**Platform** N/A  
**Description**

## 2.66 show ip ospf summary-address

Use this command to display the converged route of all redistributed routes.

**show ip ospf [process-id] summary-address**

#### Parameter Description

| Parameter         | Description                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------|
| <i>process-id</i> | ID of the OSPF process. All OSPF routing processes will be displayed if this parameter is not configured. |

**Defaults** N/A

#### Command

**Mode** Privileged EXEC mode

**Usage Guide** This command is valid only on the NSSA ABR, and displays only the routes with local aggregation operations.

**Configuration** The following example displays the output of the **show ip ospf summary-address** command:

#### Examples

```
Ruijie# show ip ospf summary-address
OSPF Process 1, Summary-address:
172.16.0.0/16, Metric 20, Type 2, Tag 0, Match count 3, advertise
```

| Field           | Description                               |
|-----------------|-------------------------------------------|
| Summary Address | IP address to be aggregated               |
| Summary Mask    | Mask to be aggregated                     |
| Advertise       | Whether to advertise the aggregated route |

|                    |                                                             |
|--------------------|-------------------------------------------------------------|
| Status             | Whether the aggregation range takes effect                  |
| Aggregated subnets | Number of external routes included in the aggregation range |

## 2.67 show ip ospf topology

Use this command to display topology information for OSPF SPF calculation.

**show ip ospf** [ *process-id* [ *area-id* ] ] **topology** [ **adv-router** *adv-router-id* [ *router-id* ]  
| *self-originate* [ *router-id* ] ]

#### Parameter Description

| Parameter             | Description                                                                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i>     | OSPF process ID.                                                                                                                        |
| <i>area-id</i>        | Displayed area ID                                                                                                                       |
| <b>topology</b>       | Displays a specified OSPF process and topology information summary of an area.                                                          |
| <b>adv-router</b>     | Displays topology information of a specified device. This specified device must be a directly connected neighbor of the current device. |
| <b>self-originate</b> | Displays topology information of the current device.                                                                                    |

**Defaults** N/A

#### Command

**Mode** Privileged EXEC mode

**Usage Guide** This command helps users to understand OSPF SPF calculation topology information and troubleshoot faults caused by topology planning. If the user enables fast reroute calculation, this command displays information related to fast reroute calculation.

**Configuration** The following example displays the result of the show **ip ospf topology** command:

#### Examples

```
Ruijie# show ip ospf topology
OSPF Router with ID (1.1.1.1) (Process ID 1)
Router Topology States (Area 0.0.0.0)
+1.1.1.1
  +2.2.2.2
    +4.4.4.4
      +3.3.3.3
```

```

+4.4.4.4

+2.2.2.2
  +1.1.1.1
    +3.3.3.3
  +4.4.4.4
    +3.3.3.3

+3.3.3.3
  +1.1.1.1
    +2.2.2.2
  +4.4.4.4
+2.2.2.2

```

The following example displays the result of the **show ip ospf topology self-originate** command:

```

Ruijie# show ip ospf topology self-originate
OSPF Router with ID (1.1.1.1) (Process ID 1)
Router Topology States (Area 0.0.0.0)
1.1.1.1
  Self to Destination Metric: 0
Parent Node: -
Child Node:2.2.2.2
  Primary next-hop: -
  Backup next-hop: -
  Backup Neighbor: -

2.2.2.2
  Self to Destination Metric: 1
Parent Node: 1.1.1.1
Child Node:-
  Primary next-hop: FastEthernet 0/1 via 10.0.0.1
  Backup next-hop: FastEthernet 0/2 via 10.0.1.1
  Backup Neighbor: 2.2.2.2
Neighbor to Destination Metric: 0
Neighbor to Self Metric: 10
Neighbor to Primary Neighbor: 0
Self to Neighbor Metric: 1

```

The description of every field displayed by **show ip ospf topology self-originate** is as follows:

| Field                      | Description                                                    |
|----------------------------|----------------------------------------------------------------|
| Self to Destination Metric | Metric from the root node to the current destination node      |
| Parent Node                | Parent node of the current destination node                    |
| Child Node                 | Chile node of the current destination node                     |
| Primary next-hop           | Primary next hop for reaching the current the destination node |

|                                |                                                                 |
|--------------------------------|-----------------------------------------------------------------|
| Backup next-hop                | Backup next hop for reaching the current the destination node   |
| Backup Neighbor                | Backup neighbor for reaching the current the destination node   |
| Neighbor to Destination Metric | Metric from the backup neighbor to the current destination node |
| Neighbor to Self Metric        | Metric from the backup neighbor to the root node                |
| Neighbor to Primary Neighbor   | Metric from the backup neighbor to the primary neighbor         |
| Self to Neighbor Metric        | Metric from the root node to the backup neighbor                |

## 2.68 show ip ospf virtual-link

Use this command to display the OSPF virtual link information.

**show ip ospf [ *process-id* ] virtual-link [ *ip-address* ]**

#### Parameter Description

| Parameter         | Description                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------|
| <i>process-id</i> | ID of the OSPF process. All OSPF routing processes will be displayed if this parameter is not configured. |
| <i>ip-address</i> | Associated ID of a virtual link neighbor                                                                  |

**Defaults** N/A

#### Command

**Mode** Privileged EXEC mode

**Usage Guide** If no virtual link is configured, the command displays the neighbor status and other related information. The show ip ospf neighbor command does not display the neighbor of the virtual link.

**Configuration** The following is the output of the **show ip ospf virtual-links** command:

#### Examples

```
Ruijie# show ip ospf virtual-links
Virtual Link VLINK0 to device 1.1.1.1 is up
Transit area 0.0.0.1 via interface FastEthernet 0/1
Local address 10.0.0.37/32
Remote address 10.0.0.27/32
Transmit Delay is 1 sec, State Point-To-Point,
```

```
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:05
Adjacency state Full
```

The following table describes the fields in the output.

| Field                         | Description                                                 |
|-------------------------------|-------------------------------------------------------------|
| Virtual Link VLINK0 to router | Displays the virtual link neighbors and their status.       |
| Virtual Link State            | Displays the virtual link state.                            |
| Transit area                  | Displays the transit area of the virtual link.              |
| via interface                 | Displays the associated interface of the virtual link.      |
| Local address                 | Local interface address                                     |
| Remote Address                | Peer interface address                                      |
| Transmit Delay                | Displays the transmit delay of the virtual link.            |
| State                         | Interface state                                             |
| Time intervals configured     | Hello, Dead, Wait, and Retransmit interval of the interface |
| Adjacency State               | Neighbor state, where FULL means the stable state           |

## 2.69 summary-address

Use this command to configure the aggregate route out of the OSPF routing domain. Use the **no** form of this command to restore the remove the aggregate route.

**summary-address** *ip-address net-mask* [ **not-advertise** | **tag value** | **cost cost** ]

**no summary-address** *ip-address net-mask* [ **not-advertise** | **tag** | **cost** ]

**Parameter Description**

| Parameter            | Description                                                                                                    |
|----------------------|----------------------------------------------------------------------------------------------------------------|
| <i>ip address</i>    | IP address of the aggregate route                                                                              |
| <i>net-mask</i>      | Network mask of the aggregate route                                                                            |
| <b>not-advertise</b> | Does not advertise the aggregate route. If the parameter is not configured, the aggregate route is advertised. |
| <b>tag value</b>     | Sets the tag value of an aggregate route. The range is from 0 to 4,294,967,295.                                |
| <b>cost cost</b>     | Cost value of the aggregate route. The range is from 0 to 16,777,214.                                          |

**Defaults** No aggregate route is configured by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** When routes are redistributed by another routing process into the OSPF routing process, every route is advertised to the OSPF-enabled device separately in external LSAs. If the incoming routes are continuous addresses, the autonomous border device can advertise only one aggregate route, reducing the scale of routing table greatly.

Unlike the **area range** command, the **area range** command aggregates inter-OSPF-area routes, while the **summary-address** command aggregates external routes of the OSPF routing domain. For the NSSA, the **summary-address** command is valid only on the NSSA ABR now, and aggregates only redistributed routes.

**Configuration** The following example generates an external aggregate route 100.100.0.0/16.

**Examples**

```
Ruijie(config)# router ospf20
Ruijie(config-router)# summary-address100.100.0.0 255.255.0.0
Ruijie(config-router)# redistribute static subnets
Ruijie(config-router)# network200.2.2.0 0.0.0.255 area 1
Ruijie(config-router)# network172.16.24.0 0.0.0.255area 0
Ruijie(config-router)# arealnssa
```

**Related Commands**

**Description**

## 2.70 timers lsa arrival

Use this command to configure the time delay for the same LSA received. Use the **no** form of this command to restore the default setting.

**timers lsa arrival arrival-time**

**no timers lsa arrival**

**Parameter Description**

| Parameter           | Description                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------|
| <i>arrival-time</i> | Configures the time delay when receiving the same LSA. The range is from 0 to 600000 in the unit of milliseconds. |

**Defaults** The default is 1000.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** No action is done when the same LSA is received within the specified time.

**Configuration** The following example configures the time delay for the same LSA as 2seconds.

**Examples**

```
Ruijie(config)# routerospf1
Ruijie(config-router)# timers arrival-time 2000
```

**Related  
Commands**

**Platform** N/A

**Description**

## 2.71 timers pacing lsa-group

Use this command to configure the LSA grouping and then refresh the whole groups as well as the update interval for the aged link state. Use the **no** form of this command to restore the default setting.

**timers pacing lsa-group** *seconds*

**no timers pacing lsa-group**

**Parameter  
Description**

| Parameter      | Description                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>seconds</i> | Parameter used for LSA pacing, checksum calculation, and aging interval.<br>The range is from 10 to 1800 in the unit of seconds. |

**Defaults** The default is 30.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** Each LSA has its own update and aging time (LSA age). If you update and age LSAs separately, many CPU resources will be consumed. To effectively use CPU resources, you can update LSAs of a device in batches.

You can use this command to modify the value of seconds, whose default value is 240 seconds. This parameter needs not to be adjusted often. The optimal group pacing interval is inversely proportional to the number of LSAs that need to be calculated. For example, if you have approximately 10000 LSAs in the database, decreasing the pacing interval would be better. If the switch has a small database (40 to 100 LSAs), increasing the pacing interval to 10 to 20 minutes might be better.

**Configuration** The following example configures the pacing time as 120 seconds.

**Examples**

```
Ruijie(config)# deviceospf 20
Ruijie (config-router)# timers paing lsa-group 120
```

**Related  
Commands**

| Command             | Description                    |
|---------------------|--------------------------------|
| <b>show ip ospf</b> | Displays the OSPF information. |

**Platform**

N/A

**Description**

## 2.72 timers pacing lsa-transmit

Use this command to transmit the LSA grouping updating. Use the **no** form of this command to restore the default setting.

**timers pacing lsa-transmit** *transmit-time transmit-count*

**no timers pacing lsa-transmit**

**Parameter  
Description**

| Parameter             | Description                                                                        |
|-----------------------|------------------------------------------------------------------------------------|
| <i>transmit-time</i>  | Configures the interval of sending the LSA grouping. The range is from 10 to 1000. |
| <i>transmit-count</i> | Configures the number of LS-UPD packets per group. The range is from 1 to 200.     |

**Defaults**

The default configurations are as follows:

Transmit-time: 40 milliseconds.

Transmit-count: 1

**Command****Mode**

Routing process configuration mode

**Usage Guide**

If there are a large number of LSAs and the load on the system is heavy, you can properly use the **transmit-time** and **transmit-count** to inhibit the flooding LS-UPD packet number in the network.

If the CPU and network bandwidth loads are not too much, reduce **transimi-time** and increase **transimit-count** to quicken the environment convergence.

**Configuration**

The following example sets the interval of sending the LS-UPD packets as 50ms, the packets number as 20.

**Examples**

```
Ruijie(config)# routerospf1
Ruijie(config-router)# timers pacing lsa-transmit 50 20
```

**Description**

## 2.73 timers spf

Use this command to configure the delay for SPF calculation after the OSPF receives the topology change as well as the interval between two SPF calculations. Use the **no** form of this command to restore the default setting.

**timers spf** *spf-delay* *spf-holdtime*

**no timers spf**

| Parameter Description | Parameter           | Description                                                                                                                                                                                                                 |
|-----------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>spf-delay</i>    | Defines the SPF calculation waiting period in seconds. The range is from 0 to 2147483647. After receiving the topology change, the OSPF routing process must wait for the specified period to start the SPF calculation.    |
|                       | <i>spf-holdtime</i> | Defines the interval between two SPF calculations in seconds. The range is from 0 to 2147483647. When the waiting time is up but the interval between two calculations is still elapsing, the SPF calculation cannot start. |

**Defaults** For the RGOS not supporting the `timers throttle spf` command, the default values are as follows:

`spf-delay`: 5seconds;

`spf-holdtime`: 10 seconds.

For the RGOS supporting the `timers throttle spf` command, by default, the `timers spf` command takes no effect. `spf-delay` depends on the default configuration of the `timers throttle spf` command.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** Smaller values of *spf-delay* and *spf-holdtime* mean that OSPF adapts to the topology change faster, and the network convergence period is shorter, but this will occupy more CPU of the router.

 The configurations of the **timers spf command** and the `timers throttle spf` command may overwrite each other.

**Configuration Examples** The following example configures the delay and holdover period of the OSPF as 3 and 9 seconds respectively.

```
Ruijie(config)# deviceospf20
```

```
Ruijie(config-router)# timersspf 3 9
```

**Related  
Commands**

| Command                    | Description                                                                                                                                              |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show ip ospf</b>        | Displays the configuration information of the ospf.                                                                                                      |
| <b>timers throttle spf</b> | Configures the exponential back off delay for SPF calculation. The command is recommended to replace the timers spf command because it is more powerful. |

**Platform** N/A

**Description**

## 2.74 timers throttle lsa all

Use this command to configure the exponential back off algorithm for the LSA. Use the **no** form of this command to restore the default setting.

**timers throttle lsa all** *delay-time hold-time max-wait-time*

**no timers throttle lsa all**

**Parameter  
Description**

| Parameter            | Description                                                                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>delay-time</i>    | Configures the time delay of generating the LSA first. The range is from 1 to 600000.                                                                        |
| <i>hold-time</i>     | Configures the minimum interval of refreshing the LSA between the first time and second time. The range is from 1 to 600000.                                 |
| <i>max-wait-time</i> | Configures the maximum interval of successive refreshing the LSA., which determines whether the LSA is refreshed successively. The range is from 1 to 600000 |

**Defaults**

The default configurations are as follows:

**Delay-time:** 0 millisecond,

**Hold-time:** 5000 milliseconds,

**Max-wait-time:** 5000 milliseconds.

**Command**
**Mode**

Routing process configuration mode

**Usage Guide**

If high convergence performance is required for the link change, the value of delay-time can be relatively small. if you expect to reduce the CPU consumption, increase appropriately several values.

 The value of hold-time cannot be smaller than that of delay-time, and the value of max-wait-time cannot be smaller than that of hold-time.

**Configuration Examples** The following example configures the first delay as 10ms, hold-time as 1second and the longest delay as 5seconds.

```
Ruijie(config)# routerospf1
Ruijie(config-router)# timers throttle lsa all 10 1000 5000
```

**Related Commands**

|---------------------|----------------------------------------------------|
| <b>show ip ospf</b> | Displays the configuration information of the ospf |

**Platform** N/A  
**Description**

## 2.75 timers throttle route

Use this command to configure the delay time of route calculation on receiving the ASBR summary LSA and the external summary LSA. Use the **no** form of this command to restore the default setting.

**timers throttle route { inter-area *ia-delay* | ase *ase-delay* }**

**no timers throttle route { inter-area | ase }**

**Parameter Description**

| Parameter         | Description                                                                                                                                                                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>inter-area</b> | Calculates the inter area routes.                                                                                                                                                                                                                        |
| <i>ia-delay</i>   | Sets the delay time of the inter-area route calculation, in the range from 0 to 600,000 in the unit of milliseconds. On receiving the ASBR summary LSA, the router will not calculate the inter-area routes until the <i>ia-delay</i> time runs out.     |
| <b>ase</b>        | Calculates the external routes.                                                                                                                                                                                                                          |
| <i>ase-delay</i>  | Defines the delay time of the external route calculation, in the range from 0 to 600,000 in the unit of milliseconds. On receiving the external summary LSA, the router will not calculate the external routes until the <i>ase-delay</i> time runs out. |

**Defaults** The default values are as follows:  
 ia-delay: 0,  
 ase-delay: 0,

**Command**

**Mode** Routing process configuration mode

**Usage Guide** The default setting is recommended if the network needs to be fast converged. For the instable network where multiple inter-area and external routes exist, if you want to optimize the route

calculation and save the CPU resources, increase the delay time.

**Configuration** The following example sets the .delay time of the inter-area route calculation to one second.

**Examples**

```
Ruijie(config)# router ospf 1
Ruijie(config-router)# timers throttle route inter-area 1000
```

**Description**

## 2.76 timers throttle spf

Use this command to configure the topology change information for OSPF, including the delay for SPF calculation as well as the interval between two SPF calculations in routing process configuration mode. Use the **no** form of this command to restore the default setting.

**timers throttle spf** *spf-delay spf-holdtime spf-max-waittime*

**no timers throttle spf**

**Parameter  
Description**

| Parameter               | Description                                                                                                                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>spf-delay</i>        | Defines the SPF calculation waiting period, in the unit of milliseconds, in the range from 1 to 600,000. After receiving the topology change, the OSPF routing process must wait for the specified period to start the SPF calculation. |
| <i>spf-holdtime</i>     | Defines the interval between two SPF calculations in seconds in the range from 1 to 600,000.                                                                                                                                            |
| <i>spf-max-waittime</i> | Defines the maximum interval between two SPF calculations, in milliseconds in the range from 1 to 60,000.                                                                                                                               |

**Defaults**

The default configurations are as follows:

spf-delay: 1000ms;

spf-holdtime: 5000ms;

spf-max-waittime: 10000ms.

**Command**

**Mode**

Routing process configuration mode

**Usage Guide**

The *spf-delay* parameter indicates the delay time of the topology change to the SPF calculation.

The *spf-holdtime* parameter indicates the minimum interval between two SPF calculations. Then, the interval of the consecutive SPF calculations is at least twice as the last interval until it reaches to *spf-max-waittime*. If the interval between two SPF calculations has exceeded the required value, the

SPF calculation will restart from spf-holdtime.

Smaller spf-delay and spf-holdtime values can make the topology converge faster. A greater spf-max-waittime value can reduce the system resource consumption of SPF calculation. Those configurations can be flexibly adjusted according to the actual stability of the network topology. Compared with the timers spf command, this command is more flexible. It speeds up the SPF calculation convergence, and reduces the system resource consumption of SPF calculation due to the topology change. To this end, the timers throttle spf command is recommended.

- i** The value of spf-holdtime cannot be smaller than the value of spf-delay, or the value of spf-holdtime will be set to be equal to the value of spf-delay;
- The value of spf-max-waittime cannot be smaller than the value of spf-holdtime, or the value of spf-max-waittime will be set to be equal to the value of spf-holdtime automatically;
- The configurations of the timers spf command and the timers throttle spf command may overwrite each other.
- If both the timers spf command and the timers throttle spf command are not configured, the default value of the timers throttle spf command is used.

**Configuration Examples** The following example configures the delay and holdtime and the maximum time interval of the OSPF as 5ms, 1000ms and 90000ms respectively. If the topology changes consecutively, the SPF calculation intervals are: 5ms, 1second, 3 seconds, 7 seconds, 15 seconds, 31 seconds, 63 seconds, 89 seconds, 179 seconds, 179+90seconds...

```
Ruijie(config)# routerospf20
Ruijie(config-router)# timersspf 5 1000 90000
```

**Related Commands**

| Command      | Description                                                                                                                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show ip ospf | Displays the configuration information of OSPF                                                                                                                                                |
| timers spf   | Configures the SPF calculation delay. This command is supported in versions earlier than RGOS 10.4. It is recommended to replace the timers spf command with the timers throttle spf command. |

**Platform** N/A

**Description**

## 2.77 two-way-maintain

Use this command to enable the OSPF two-way-maintain function. Use the **no** form of this command to disable this function.

- two-way-maintain**
- no two-way-maintain**

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

|                    |     |     |
|--------------------|-----|-----|
| <b>Description</b> |     |     |
|                    | N/A | N/A |

**Defaults** This function is enabled by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** In the large-scale network, partial packets delay or dropped may exist due to much CPU and memory are occupied caused by lots of packet transmission. If the Hello packets are handled over dead-interval, the corresponding adjacency will be disconnected. In this case, you can enable the two-way-maintain function for the packets such as DD, LSU, LSR and LSAck packets from a neighbor in the network (except for the Hello packets), avoiding the neighbor invalidation caused by delayed or dropped Hello packets.

**Configuration** The following example disables the OSPF two-way-maintain function.

**Examples**

```
Ruijie(config)# routerospf1
Ruijie(config-router)# notwo-way-maintain
```

|                         |                |                                                    |
|-------------------------|----------------|----------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b> | <b>Description</b>                                 |

### 3 OSPFv3 Commands

#### 3.1 area authentication

Use this command to configure OSPFv3 area authentication. Use the **no** form of this command to restore the default setting.

**area** *area-id* **authentication ipsec spi** *spi* [ **md5** | **sha1** ] [ **0** | **7** ] *key*  
**no area** *area-id* **authentication**

| Parameter Description | Parameter      | Description                                                                     |
|-----------------------|----------------|---------------------------------------------------------------------------------|
|                       | <i>area-id</i> | Specifies an area ID.<br>It can be an integer or the prefix of an IPv4 address. |
|                       | <i>spi</i>     | Specifies a security parameter index, in the range from 256 to 4294967295.      |
|                       | <b>md5</b>     | Specifies a message digest 5 (MD5) authentication mode.                         |
|                       | <b>sha1</b>    | Specifies a secure hash algorithm 1 (SHA1) authentication mode.                 |
|                       | <b>0</b>       | Indicates that a key is displayed in a plain-text format.                       |
|                       | <b>7</b>       | Indicates that a key is displayed in a cipher-text format.                      |
|                       | <i>key</i>     | Specifies an authentication key.                                                |

**Defaults** Authentication is not performed by default.

**Command Mode** Routing process configuration mode

**Usage Guide** RGOS supports three authentication modes:

- null authentication mode, which is configured when authentication is not needed
- MD5 authentication mode
- SHA1 authentication mode

If OSPFv3 area authentication is configured, the configuration takes effect on all interfaces ( except for those of virtual links ) in the area. Interface authentication configuration, however, takes precedence over area authentication configuration.

**Configuration Examples** The following example specifies MD5 authentication for area 1 where OSPFv3 routing processes reside, and sets the authentication password to aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa.

```
Ruijie(config-router)# area 1 authentication ipsec spi 300 md5
aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa
```

**Description**

## 3.2 area default-cost

Use this command to set the cost of the default route for the ABR in the stub/NSSA area. Use the **no** form of this command to restore the default setting.

**area** *area-id* **default-cost** *cost*

**no area** *area-id* **authentication**

| Parameter Description | Parameter      | Description                                                                      |
|-----------------------|----------------|----------------------------------------------------------------------------------|
|                       | <i>area-id</i> | Area ID of the stub/NSSA area.<br>It can be an integer or an IPv4 prefix.        |
|                       | <i>cost</i>    | Cost of the default route of the stub/NSSA area in the range from 0 to 16777215. |

**Defaults** The default cost is 1.

**Command Mode** Routing process configuration mode.

**Usage Guide** This command can only work in the ABR connected to the stub area.

**Configuration Examples** The following example sets the cost of the default route of stub/NSSA area 50 to 100.

```

ipv6 router ospf 1
area 50 stub
area 50 default-cost 100

```

| Related Commands | Command          | Description       |

|                  | <b>area stub</b> | Sets a stub area. |

**Platform** N/A

**Description**

## 3.3 area encryption

Use this command to enable encryption authentication for an OSPFv3 area. Use the **no** form of this command to restore the default setting.

**area** *area-id* **encryption ipsec spi** *spi* **esp null** [ **md5** | **sha1** ] [ **0** | **7** ] *key*  
**no area** *area-id* **encryption**

**Parameter Description**

| Parameter      | Description                                                                     |
|----------------|---------------------------------------------------------------------------------|
| <i>area-id</i> | Specifies an area ID.<br>It can be an integer or the prefix of an IPv4 address. |
| <i>spi</i>     | Specifies a security parameter index, in the range from 256 to 4294967295.      |
| <b>null</b>    | Specifies the null encryption mode.                                             |
| <b>md5</b>     | Specifies the MD5 authentication mode.                                          |
| <b>sha1</b>    | Specifies the SHA1 authentication mode.                                         |
| <b>0</b>       | Indicates that a key is displayed in the plain-text format.                     |
| <b>7</b>       | Indicates that a key is displayed in the cipher-text format.                    |
| <i>Key</i>     | Specifies an authentication key.                                                |

**Defaults** Encryption authentication is not performed by default.

**Command Mode** Routing process configuration mode

**Usage Guide** RGOS supports the null encryption mode and two authentication modes: MD5 and SHA1. If encryption authentication is configured for an OSPFv3 area, the configuration takes effect on all interfaces (except for those of virtual links) in the area. Encryption authentication configuration on interfaces, however, takes precedence over that of the OSPFv3 area.

**Configuration Examples** The following example specifies null encryption and MD5 authentication for area 1 where OSPFv3 routing processes reside, and sets the authentication password to

```
aaaaaaaaaaaaaaaaaaaaaaaaaaaaa.
Ruijie(config-router)# area 1 encryption ipsec spi 300 esp null md5
aaaaaaaaaaaaaaaaaaaaaaaaaaaaa
```

**Related Commands**

**Parameter  
Description**

| Parameter                            | Description                                                                                                                                                                                                    |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-id</i>                       | ID of the NSSA area.                                                                                                                                                                                           |
| <b>no-redistribution</b>             | (Optional) Used when the router is an NSSA Area Border Router (ABR) and you want the redistribute command to import routes only into the normal areas, but not into the NSSA area.                             |
| <b>default-information-originate</b> | (Optional) Used to generate a Type 7 default into the NSSA area. This keyword takes effect only on the NSSA ABR or the NSSA Autonomous System Boundary Router (ASBR).                                          |
| <b>metric value</b>                  | (Optional) Specifies the OSPF default LSA metric. The range is from 0 to 16,777,214, and the default value is 1.                                                                                               |
| <b>metric-type type</b>              | (Optional) Specifies the OSPF metric type for default routes. The value can be 1 or 2 and the default value is 2.                                                                                              |
| <b>no-summary</b>                    | (Optional) Allows an area to be an NSSA but not have summary routes injected into it.                                                                                                                          |
| <b>translator</b>                    | (Optional) Configures the NSSA ABR translator.                                                                                                                                                                 |
| <b>stability-interval seconds</b>    | (Optional) Configures the stability interval after the role of an NSSA ABR is changed from translator to non-translator. The range is from 0 to 2,147,483,647, the default value is 40 and the unit is second. |
| <b>always</b>                        | (Optional) Configures the NSSA ABR to be always translator. The default NSSA ABR is a non-translator.                                                                                                          |

**Defaults** No NSSA area is defined by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** The **default-information-originate** parameter is used to generate a default Type 7 LSA. There is a small difference between NSSA ABR and NSSA ASBR on which this command can take effect. On the ABR, the Type-7 default route generates no matter whether a default route exists in the routing table, while on the ASBR, the Type-7 default route generates only when a default routes exists in the routing table.

The **no-redistribution** parameter is used when the router is an NSSA Area Border Router (ABR) and you want the redistribute command to import routes only into the normal areas, but not into the NSSA area. This parameter is generally used on the device acting as both ASBR and ABR in NSSA area to prevent the routes from being imported into the NSSA area.

The **no-summary** parameter allows an area to be an NSSA but not have summary LSAs injected into

it.

In an NSSA area involving two or more ABR devices, by default, the ABR of larger router ID is elected as the translator for Type-7 to Type-5 translation. You can configure the **translator always** parameter to specify an ABR to be always the translator.

When the translator of an ABR device is replaced, the ABR still has the translation capability within the **stability-interval** time. After the stability-interval timer expires and the ABR is not elected as the translator again, then the LSAs translated from Type-7 to Type-5 will be removed from the AS.

To prevent route loop, the Type-5 LSAs aggregated by the Type-7 are removed once the ABR device loses the translator capability, instead of waiting for the stability-interval expiration.

It is recommended to configure the **translator always** parameter on only one ABR device in an NSSA area.

**Configuration** The following example sets the area 1 as an NSSA area.

**Examples**

```
Ruijie(config)# ipv6 router ospf 1
Ruijie(config-router)# area 1 nssa
```

### 3.5 area-range

Use this command to set the range of the converged inter-area addresses. Use the **no** form of this command to restore the default setting.

**area** *area-id* **range** *ipv6-prefix/prefix-length* [ **advertise**|**not-advertise** ]

**no area** *area-id* **range** *ipv6-prefix/prefix-length*

**Parameter  
Description**

| Parameter                        | Description                                                                                     |
|----------------------------------|-------------------------------------------------------------------------------------------------|
| <i>area-id</i>                   | ID of the area in which the addresses are converged.<br>It can be an integer or an IPv4 prefix. |
| <i>ipv6-prefix/prefix-length</i> | Range of the converged addresses.                                                               |
| <b>advertise</b>                 | Advertises the range of converged addresses.                                                    |
| <b>not-advertise</b>             | The range of the converged addresses is not advertised.<br>By default, the function is enabled. |

**Defaults** No converged inter-area address range is defined by default.

**Command  
Mode** Routing process configuration mode

**Usage Guide** This command applies only to ABR. Use this command to converge multiple routes of an area into one route and advertise it to other areas. This command applies only to ABR. Use this command to converge multiple routes of an area into one route and advertise it to other areas. The routing information combination only takes place on the area border. The specific routing information is seen on the intra-area routers, but only one converged route can be seen on the devices in other areas. By configuring the two options of advertise and not-advertise, you can decide whether to advertise the convergence range to enable blocking and filtering. By default, the range is advertised to the outside. The option cost can be used to set the metric value of convergence routing. A number of route convergence commands can be defined. In this way, the number of the routes in the OSPF AS is reduced. Particularly for a large network, the forwarding performance will be improved. When a number of routes are converged, and the containment relationship exists between items, the area range converged is determined by the longest match principle.

**Configuration** The following example converges the routes in area 1.

**Examples**

```
ipv6 router ospf 1
area 1 range 2001:abcd:1:2::/64
```

### 3.6 area stub

Use this command to create a stub area or set its attributes. Use the **no** form of this command to restore the default setting.

**area area-id stub [ no-summary ]**  
**no area area-id stub [ no-summary ]**

| Parameter Description | Parameter         | Description                                                                                                                                                                        |
|-----------------------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       |                   | <i>area-id</i>                                                                                                                                                                     |
|                       | <b>no-summary</b> | This option applies only to the ABR in the stub area, indicating that the ABR only advertises the type 3 LSA indicating the default route to the stub area, not other type 3 LSAs. |

**Defaults** No stub area is defined by default.

**Command** Routing process configuration mode

**Mode**

**Usage Guide** If an area is at the end of an entire network, it can be designed as the stub area, in which all the routers must execute the `area stub` command. If the area is designed as the stub area, it cannot learn the AS external routing information (type 5 LSAs). In practical application, the external routing information takes a large proportion of the link state database, so the devices in the stub area can only learn very little routing information, thus reducing the system resources required for the running of the OSPFv3 protocol.

By default, a type 3 LSA advertisement indicating default routing on the ABR in the stub area is generated, then the devices in the stub area can get to the outside of the AS.

If a totally stub area needs to be configured, just select the keyword **no-summary** when executing the `area stub` command on the ABR.

**Configuration** The following example enables the ABR in stub area 10 to advertise the default route to the stub area.

**Examples**

```
ipv6 router ospf 1
area 10 stub
area 10 stub no-summary
```

|--|---------------------------------------------|
|  | <i>key</i> specifies an authentication key. |
|--|---------------------------------------------|

**Defaults**

No virtual link is defined by default  
hello-interval: 10 seconds;  
dead-interval: four times of the hello-interval;  
retransmit-interval: five seconds;  
transmit-interval: one second.  
Authentication and encryption are not performed by default.

**Command Mode**

Routing process configuration mode

**Usage Guide**

In the OSPFv3 AS, all the areas must be connected with the backbone area to ensure that they can learn the routes of the whole OSPFv3 AS. If an area cannot be directly connected with the backbone area, it can connect it through a virtual link.

 The virtual link shall not be in the stub/NSSA area.

 **dead-interval**, **dead-interval** and **instance** shall be configured consistently on both sides of the virtual link neighbors, otherwise neighboring relationship cannot be set up between the virtual neighbors.

**Configuration** The following example configures a virtual link.

**Examples**

```
Ruijie(config)# ipv6 router ospf 1
Ruijie(config-router)# area 1 virtual-link 192.1.1.1
```

**Related Commands**

| Command                             | Description                                      |
|-------------------------------------|--------------------------------------------------|
| <b>show ipv6 ospf</b>               | Displays the OSPFv3 routing process information. |
| <b>show ipv6 ospf neighbor</b>      | Displays the OSPFv3 neighbor information.        |
| <b>show ipv6 ospf virtual-links</b> | Displays the OSPFv3 virtual link information.    |

**Platform** N/A

**Description**

### 3.8 auto-cost

The metric of the OSPFv3 protocol is the interface-based bandwidth. Use this command to enable the bandwidth-based interface metric calculation or modify the reference bandwidth. Use the **no** form of this command to restore the default setting.

**auto-cost** [ **reference-bandwidth** *ref-bw* ]

**no auto-cost** [ **reference-bandwidth** ]

| Parameter Description | Parameter                                   | Description                                              |
|-----------------------|---------------------------------------------|----------------------------------------------------------|
|                       | <b>reference-bandwidth</b><br><i>ref-bw</i> | Reference bandwidth in the range from 1 to 4294967 Mbps. |

**Defaults** The interface metric is calculated based on the reference bandwidth, which is 100Mbps.

**Command Mode** Routing process configuration mode

**Usage Guide** Use **no auto-cost reference-bandwidth** to restore it to the default reference bandwidth. You can use **ipv6 ospf cost** in the interface configuration mode to set the cost of the specified interface, and it takes precedence over the metric calculated based on the reference bandwidth.

**Configuration Examples** The following example changes the reference bandwidth to 10M.

```
ipv6 router ospf 1
auto-cost reference-bandwidth 5
```

|                  | <b>show ipv6 ospf</b> | Displays the OSPFv3 routing process information. |

**Platform Description** N/A

### 3.9 bdf all-interfaces

Use this command to enable the BDF on all OSPFv3 interfaces. Use this command to enable the BDF on all OSPFv3 interfaces in the routing configuration mode. Use the **no** form of this command to restore the default setting.

**bdf all-interfaces**

**no bdf all-interfaces**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** This function is disabled by default.

**Command Mode** Routing process configuration mode.

**Usage Guide** The OSPFv3 protocol dynamically discovers the neighbors through the Hello packets. With the BFD function enabled, BFD sessions will be established for the neighbors that match the FULL rules and the status of the neighbors will be detected through the BFD mechanism. Once the BFD neighbor fails, the OSPFv3 will perform the network convergence immediately.

You can also use the interface configuration mode command **ipv6 ospf bfd [disable]** to enable or disable the BFD function on the specified interface, which takes precedence over the command **bfd all-interfaces** in the routing process configuration mode.

**Configuration** N/A

**Examples**

**Description**

### 3.10 clear ipv6 ospf process

Use this command to clear and restart the OSPF process.

**clear ipv6 ospf { process | process-id }**

| Parameter Description | Parameter         | Description                                   |
|-----------------------|-------------------|-----------------------------------------------|
|                       | <i>process-id</i> | OSPF process ID, in the range from 1 to 65535 |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** In normal case, it is not necessary to use this command.

Use the parameter *process-id* to clear only one specific OSPFv3 instance. If no *process-id* is specified, all the OSPFv3 instances will be cleared.

**Configuration** The following example restarts the OSPF process.

**Examples**

```
enble
clear ipv6 ospf process
```

### 3.11 default-information originate

Use this command to generate a default route to the OSPFv3 routing domain in the routing process mode. Use the **no** form of this command to restore the default setting.

**default-information originate** [ **always** ] [ **metric** *metric* ] [ **metric-type** *type* ] [ **route-map** *map* ]

**no default-information originate** [ **always** ] [ **metric** ] [ **metric-type** ] [ **route-map** *map* ]

| Parameter Description | Parameter                      | Description                                                                                                                                                                               |
|-----------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>always</b>                  | ( Optional ) It makes OSPFv3 generate the default route unconditionally, no matter whether the default route exists locally or not.                                                       |
|                       | <b>metric</b> <i>metric</i>    | (Optional) Initial metric value of the default route, in the range from 0 to 16777214                                                                                                     |
|                       | <b>metric-type</b> <i>type</i> | (Optional) Type of the default route. There are two type of OSPF external routes: type 1, different metrics seen on different routers; type 2, the same metric seen on different routers. |
|                       | <b>route-map</b> <i>map</i>    | Associated route-map name, no associated route-map by default                                                                                                                             |

**Defaults**

No default route is created;  
 The initial metric value is 1;  
 The default route type is type 2.

**Command Mode**

Routing process configuration mode

**Usage Guide**

When the **redistribute** or **default-information** command is executed, the OSPFv3-enabled router automatically turns into the autonomous system border router ( ASBR ). But the ASBR cannot generate the default route automatically or advertise it to all the routers in the OSPFv3 routing domain. The ASBR generates default routes by default. It is required to configure with the routing process configuration command **default-information originate**.

If the **always** parameter is used, the OSPF routing process advertises an external default route to the neighbors, no matter whether the default route in the core routing table exists or not. However, the local router does not display the default route. To make sure whether the default route is generated, execute **show ipv6 ospf database** to observe the OSPF link state database. The execution of the **show ipv6 route** command on the OSPF neighbor will display the default route.

The metric of the external default route can be defined only with the **default-information originate** command and cannot be set with the **default-metric** command.

There are two types of OSPFv3 external routes: type 1 external routes have changeable routing metrics, while type 2 external routes have constant routing metrics. For two parallel routes with the same route metric to the same destination network, type 1 takes precedence over type 2. As a result, the **show ipv6 route** command displays only the type 1 route.

This command generates a default route of Type-5 LSA, which will not be flooded to the NSSA area. To generate a default route in the NSSA area, use the **area nssa default-information-originate** command.

**Configuration** The following example generates a default route.

**Examples**

```
Ruijie(config)# ipv6 router ospf 1
Ruijie(config-router)# default-information originate always
```

**Related Commands**

| Command                        | Description                                          |
|--------------------------------|------------------------------------------------------|
| <b>redistribute</b>            | Redistribute routes.                                 |
| <b>show ipv6 ospf</b>          | Displays the OSPFv3 routing process information.     |
| <b>show ipv6 ospf database</b> | Displays the OSPFv3 link state database information. |

**Description**

## 3.12 default-metric

Use this command to set the default metric for the routes to be redistributed. Use the **no** form of this command to restore the default setting

**default-metric** *metric-value*

**no default-metric**

**Parameter Description**

| Parameter           | Description                                                                            |
|---------------------|----------------------------------------------------------------------------------------|
| <i>metric-value</i> | Default metric for the routes to be redistributed.<br>Its range is from 1 to 16777214. |

**Defaults** The default is 20.

**Command**

**Mode** The default route type is type 2.

**Usage Guide** This command can be used together with **redistribute** to set the default metric for the routes to be redistributed. But this command does not apply to two types of routes:

- The **default route generated** with default-information originate;

- The redistributed direct route, for which 20 is always the default metric value.

**Configuration** The following example sets the default metric for the routes to be redistributed to 10.

**Examples**

```
Ruijie(config)# ipv6 router ospf 1
Ruijie(config-router)# default-metric 10
```

**Related  
Commands**

| Command               | Description                                      |
|-----------------------|--------------------------------------------------|
| <b>redistribute</b>   | Redistributes the routes.                        |
| <b>show ipv6 ospf</b> | Displays the OSPFv3 routing process information. |

**Platform** N/A

**Description**

### 3.13 distance

Use this command to set the management distance corresponding to different types of OSPFv3 routes. Use the **no** form of this command to restore the default setting.

**distance** { *distance* | **ospf** { **intra-area** *distance* | **inter-area** *distance* | **external** *distance* } }

**no distance** [ **ospf** ]

**Parameter  
Description**

| Parameter                         | Description                                                                       |
|-----------------------------------|-----------------------------------------------------------------------------------|
| <i>distance</i>                   | Sets the management distance of the route, in the range from 1 to 255.            |
| <b>intra-area</b> <i>distance</i> | Sets the management distance of the intra-area route, in the range from 1 to 255. |
| <b>inter-area</b> <i>distance</i> | Sets the management distance of the inter-area route, in the range from 1 to 255. |
| <b>external</b> <i>distance</i>   | Sets the management distance of the external route, in the range from 1 to 255.   |

**Defaults**

The default value is 110.

Management distance of the intra-area route :110,

Management distance of the inter-area route :110

Management distance of the external-area route: 110.

**Command  
Mode**

Routing process configuration mode.

**Usage Guide**

This command is used to specify different management distances for different types of OSPFv3 routes. The management distance of the route is used for the comparison of routing priority, the

smaller the management distance is, the higher the routing priority.

-  The priority of the route generated by different OSPFv3 processes must be compared using the management distance.
-  Setting the management distance as 255 indicates the routing entry is unreliable and will not for the packet forwarding.

**Configuration** the following example sets the OSPFv3 external route management distance to 160.

**Examples**

```
Ruijie(config)# ipv6 router ospf 20
Ruijie(config-router)# distance ospf external 160
```

**Description**

### 3.14 distribute-list in

Use this command to filter routes that are computed based on Link State Advertisement (LSA). Use the **no** form of this command to restore the default setting.

**distribute-list** { *name* | **prefix-list** *prefix-list-name* } **in** [ *interface-type* *interface-number* ]

**no distribute-list** { *name* | **prefix-list** *prefix-list-name* } **in** [ *interface-type* *interface-number* ]

| Parameter Description | Parameter                                        | Description                                                    |
|-----------------------|--------------------------------------------------|----------------------------------------------------------------|
|                       |                                                  | <i>name</i>                                                    |
|                       | <b>prefix-list</b> <i>prefix-list-name</i>       | Specifies a prefix list filtering rule.                        |
|                       | <i>interface-type</i><br><i>interface-number</i> | Specifies an interface on which LSA-based routes are filtered. |

**Defaults** Routes are not filtered by default.

**Command Mode** Routing process configuration mode

**Usage Guide** Filter the routes computed based on LSA. Only the routes meeting filtering conditions can be forwarded. Route filtering does not affect the link state database and the routing tables of the neighbors. The ACL and prefix list filtering rules cannot be set at the same time. You can set only the ACL filtering rule or the prefix list filtering rule for a specific interface.

The routing filtering rules affect only forwarding of local routes but not route computation based on LSA. When route filtering is configured on an ABR, LSA can still compute routes and generate and send inter-area LSAs with prefixes to other areas. This will cause blackhole routes. To prevent the

generation of blackhole routes, you can run the **area range** command with the **not-advertise** keyword.

**Configuration** The following example filters routes that are computed based on Link State Advertisement (LSA).

**Examples**

```
Ruijie(config)# ipv6 prefix-list aaa seq 10 permit 2001::/64
Ruijie(config)# ipv6 router ospf 25
Ruijie(config-router)# redistribute rip metric 100
Ruijie(config-router)# distribute-list prefix-list aaa in ethernet 0/1
```

Routing process configuration mode

**Usage Guide**

The **distribute-list out** command has the similar function as the **redistribute route-map** command. It can be used to filter the routes that are re-distributed based on other protocols into an OSPFv3 area. It does not directly re-distribute routes but works with the **redistribute** command to re-distribute routes. The ACL and prefix list filtering rules cannot be configured at the same time. You can set only the ACL filtering rule or the prefix list filtering rule to filter the routes from a specific source.

**Configuration** The following example filters static routes that are re-distributed.

**Examples**

```
Ruijie(config)# ipv6 router ospf 1
Ruijie(config-router)# redistribute static subnets
Ruijie(config-router)# distribute-list prefix-list jjj out static
```

**Related  
Commands**

| Command             | Description                                                        |
|---------------------|--------------------------------------------------------------------|
| <b>redistribute</b> | Re-distributes routes that are carried by other routing processes. |

**Platform** N/A

**Description**

### 3.16 enable mib-binding

Use this command to bind MIB to a specific OSPFv3 process. Use the **no** form of this command to restore the default setting.

**enable mib-binding**

**no enable mib-binding**

**Parameter  
Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** MIB is bound to an OSPFv3 process with the smallest process number by default.

**Command  
Mode** Routing process configuration mode

**Usage Guide** OSPFv3 MIB has no configuration information about OSFPv3 processes. You can operate only one OSFPv3 process through SNMP. OSFPv3 MIB is bound to the OSFPv3 process with the smallest process number by default. Users' operations take effect on this process.

To operate a specific OSFPv3 process through SNMP, you can bind OSFPv3 MIB to the process.

**Configuration  
Examples** The following example enables users to operate the OSPFv3 process with the process number of 100 through SNMP.

```
Ruijie(config)# ipv6 router ospf 100
Ruijie(config-router)# enable mib-binding
```

**Related  
Commands**

| Command               | Description                                       |
|-----------------------|---------------------------------------------------|
| <b>show ipv6 ospf</b> | Displays global OSPFv3 configuration information. |
| <b>enable traps</b>   | Enables the OSPFv3 trap function.                 |

**Platform** N/A  
**Description**

### 3.17 enable traps

OSPFv3 processes support eight types of trap information, which are classified into two categories. Use this command to send specific trap information. Use the **no** form of this command to restore the default setting.

```
enable traps [ error [ IfConfigError | IfRxBadPacket | VirtIfConfigError | VirtIfRxBadPacket ] |
state-change [ IfStateChange | NbrStateChange | NssaTranslatorStatusChange |
VirtIfStateChange | VirtNbrStateChange ] ]
no enable traps [ error [ IfConfigError | IfRxBadPacket | VirtIfConfigError | VirtIfRxBadPacket ] |
state-change [ IfStateChange | NbrStateChange | NssaTranslatorStatusChange |
VirtIfStateChange | VirtNbrStateChange ] ]
```

**Parameter Description**

| Parameter                                                               | Description                                                                                                              |
|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Error</b>                                                            | Configures all error-related trap types. This keyword can also specify the following types of error traps:               |
|                                                                         | <b>IfConfigError</b> Specifies an interface parameter error;                                                             |
|                                                                         | <b>IfRxBadPacket</b> Specifies incorrect packets received by an interface;                                               |
|                                                                         | <b>VirtIfConfigError</b> Specifies a parameter error on a virtual interface;                                             |
|                                                                         | <b>VirtIfRxBadPacket</b> Specifies incorrect packets received by a virtual interface.                                    |
| <b>state-change</b>                                                     | Configures all traps related to state change. This keyword can also specify the following traps related to state change: |
|                                                                         | <b>IfStateChange</b> Specifies state change of an interface;                                                             |
|                                                                         | <b>NbrStateChange</b> Specifies state change of a neighbor;                                                              |
|                                                                         | <b>NssaTranslatorStatusChange</b> Specifies status change of the NSSA translator.                                        |
|                                                                         | <b>VirtIfStateChange</b> Specifies state change of a virtual interface;                                                  |
| <b>VirtNbrStateChange</b> Specifies state change of a virtual neighbor. |                                                                                                                          |

**Defaults** All traps are disabled by default.

**Command** Routing process configuration mode

**Mode**

**Usage Guide** Before configuring this command, you must run the **snmp-server enable traps ospf** command; otherwise, OSPFv3 trap information cannot be sent correctly. This is because the function of this command is restricted by the **snmp-server** command.

You can synchronously enable the trap function of different processes even if MIB is not bound to these processes.

**Configuration** The following example enables all traps of OSPFv3 process 100.

**Examples**

```
Ruijie(config)#ipv6 router ospf 100
Ruijie(config-router)# enable traps
```

**Related Commands**

| Command                              | Description                                       |
|--------------------------------------|---------------------------------------------------|
| <b>show ipv6 ospf</b>                | Displays global OSPFv3 configuration information. |
| <b>enable mib-binding</b>            | Binds MIB to an OSPFv3 process.                   |
| <b>snmp-server enable traps ospf</b> | Enables OSPFv3 to send trap information.          |

**Platform** N/A

**Description**

### 3.18 graceful-restart

Use this command to enable the OSPFv3 graceful restart (GR) function and to set the GR period. Use the **no** form of this command to restore the default setting.

**graceful-restart [ grace-period *grace-period* | inconsistent-lsa-checking ]**

**no graceful-restart [ *graceful-period* ]**

**Parameter Description**

| Parameter                               | Description                                                                                                                                                                                                                                             |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>grace-period</b> <i>grace-period</i> | Configures the GR period. The GR period is the longest interval that lasts from the moment when OSPFv3 fails to the moment when OSPFv3 gracefully restarts.<br>The GR period is in the range from 1 to 1800 in the unit of seconds. The default is 120. |
| <b>inconsistent-lsa-checking</b>        | Configures the topology change detection. Once the topology change is detected, the device will exit GR and finish the convergence, This function is enabled by default after GR is enabled.                                                            |

**Defaults** This function is enabled by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** GR is configured based on the OSPFv3 instance. Different instances could be configured with different parameters.

Use this command to configure the GR period. The GR period is the longest interval that lasts from the moment when OSPFv3 fails to the moment that OSPFv3 gracefully restarts. In this period, the device will perform link reconstruction to restore OSPFv3. When the GR period expires, OSPFv3 exits GR and finishes regular operation.

To enable the GR function and set the GR period to the 120 seconds, use the **graceful-restart** command. To modify the GR period, use the **graceful-restart grace-period** command. Topology stability is indispensable for uninterrupted forwarding. If topology changes, OSPFv3 finishes convergence instead of continuing GR to avoid long time interruption

- 1) Disabling the topology change detection: If the topology cannot converge in time in the hot backup process, the long term forwarding interruption may occur.
- 2) Enabling the topology change detection: Forwarding interruption may occur but the interruption time is much shorter than the time it takes to disable topology detection.

It is not recommended to disable the topology change detection. In some scenario where long term forwarding interruption does not occur, disabling the topology change detection minimizes the forwarding interruption time.

The GR function is unavailable when the Fast Hello function is enabled.

**Configuration** The following example enables GR for OSPFv3 instance 1 and sets the GR period to 60 seconds.

**Examples**

```
Ruijie(config)# ipv6 router ospf 1
Ruijie(config-router)# graceful-restart
Ruijie(config-router)# graceful-restart grace-period 60
```

**Description**

### 3.19 graceful-restart helper

Use this command to enable the OSPFv3 graceful restart helper function. Use the **no** form of this command to disable this function.

**graceful-restart helper disable**  
**no graceful-restart helper disable**

Use this command configure the topology change detection method of OSPFv3 GR helper. Use the **no** form of this command to cancel the configuration.

**graceful-restart helper { strict-lsa-checking | internal-lsa-checking }**  
**no graceful-restart helper { strict-lsa-checking | internal-lsa-checking }**

**Parameter**

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

| Description                  |                                                                                                                                                                  |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>disable</b>               | Disables the device to assist other devices in performing GR.                                                                                                    |
| <b>strict-lsa-checking</b>   | Checks the change of the LSA of types 1-5 and 7 to judge whether the network topology changes. If the topology changes, the GR helper function will be disabled. |
| <b>internal-lsa-checking</b> | Checks the change of the LSA of types 1–3 to judge whether the network topology changes. If the topology changes, the GR helper function will be disabled.       |

**Defaults** The GR helper is enabled by default.  
The device where the GR helper is enabled does not check the LSA change by default.

**Command**

**Mode** Routing process configuration mode

**Usage Guide** Use this command to enable the GR helper function. When one neighbor device performs graceful restart, the Grace-LSA is advertised to all neighbors. If the device enabled with the GR helper receives the Grace-LSA, it will become the GR Helper to help the neighbors perform GR. The **disable** option means that it is not allowed to perform the GR helper function for any device in GR. The GR helper does not perform the network change detection by default. The convergence is not performed again until the GR is implemented even if the network changes. Use the **strict-lsa-checking** or **internal-lsa-checking** command to enable the device to detect the change of network topology during the GR. The former checks any LSA (types 1-5,7) that stands for the network information, the latter checks the LSA that stands for the AS inner-area route. In the large scale network, it is not recommended to enable the LSA check option because the partial network changes trigger the ending of the GR, decreasing the convergence speed of the entire network.

**Configuration Examples** The following example disables the GF helper function of the OSPFv3 instance 1 and modifies the topology change detection policy.

```
Ruijie(config)# ipv6 router ospf 1
Ruijie(config-router)# graceful-restart helper disable
Ruijie(config-router)# no graceful-restart helper disable
Ruijie(config-router)# graceful-restart helper strict-lsa-checking
```

### 3.20 ipv6 ospf area

Use this command to enable the interface to participate in the OSPFv3 routing process. Use the **no**

form of this command to restore the default setting.

**ipv6 ospf** *process-id* **area** *area-id* [ **instance** *instance-id* ]

**no ipv6 ospf** *process-id* **area** [ **instance** *instance-id* ]

| Parameter Description | Parameter                          | Description                                                                              |
|-----------------------|------------------------------------|------------------------------------------------------------------------------------------|
|                       | <i>process-id</i>                  | OSPF process ID.                                                                         |
|                       | <b>area</b> <i>area-id</i>         | OSPFv3 area in which the interface participates. It can be an integer or an IPv4 prefix. |
|                       | <b>instance</b> <i>instance-id</i> | Configures the specific OSPFv3 instance on the interface.                                |

**Defaults** This function is disabled by default.

**Command Mode** Interface configuration mode.

**Usage Guide** You can use this command to enable the OSPFv3 on an interface, and then configure the OSPFv3 process with **ipv6 router ospf**. It will be automatically started after this command is used., it will be automatically started after this command is used.

Use **no ipv6 ospf area** to disable the specified interface to participate in the OSPFv3 routing process.

Use **no ipv6 router ospf** to disable all the interfaces to participate in the OSPFv3 routing process.

The neighbor relationship can only be established between the routers with the same instance ID.

After this command is configured, all the prefix information on the interface will be used in the operation of the OSPFv3.

**Configuration Examples** The following example starts the OSPFv3 process on int fastethernet 0/0 for the specified area of the specified instance.

```
int fastethernet 0/0
ipv6 ospf 1 area 2 instance 2
```

| Related Commands | Command                         | Description                                |
|------------------|---------------------------------|--------------------------------------------|
|                  | <b>ipv6 router ospf</b>         | Starts the OSPFv3 routing process.         |
|                  | <b>passive-interface</b>        | Setsthe a passive interface.               |
|                  | <b>show ipv6 ospf interface</b> | Displays the OSPFv3 interface information. |

**Platform Description** N/A

### 3.21 ipv6 ospf authentication

Use this command to configure OSPFv3 interface authentication. Use the **no** form of this command to restore the default setting.

**ipv6 ospf authentication** [ **null** | **ipsec spi** *spi* [ **md5** | **sha1** ] [ **0** | **7** ] *key* ] [ **instance** *instance-id* ]

**no ipv6 ospf authentication** [ instance *instance-id* ]

| Parameter Description | Parameter   | Description                                                                |
|-----------------------|-------------|----------------------------------------------------------------------------|
|                       | <b>null</b> | Indicates that authentication is not performed.                            |
|                       | <i>spi</i>  | Specifies a security parameter index, in the range from 256 to 4294967295. |
|                       | <b>md5</b>  | Specifies the MD5 authentication mode.                                     |
|                       | <b>sha1</b> | Specifies the SHA1 authentication mode.                                    |
|                       | <b>0</b>    | Indicates that a key is displayed in the plain-text format.                |
|                       | <b>7</b>    | Indicates that a key is displayed in the cipher-text format.               |
|                       | <i>key</i>  | Specifies an authentication key.                                           |

**Defaults** Authentication is not performed by default.

**Command Mode** Interface configuration mode

**Usage Guide** RGOS supports three authentication modes:

- null authentication mode, which is configured when authentication is not needed
- MD5 authentication mode
- SHA1 authentication mode

---

 OSPFv3 authentication parameters configured on interconnected interfaces must be consistent.

**Configuration Examples** The following example specifies MD5 authentication in OSPFv3 interface configuration mode and sets the authentication password to aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa.

```
Ruijie(config-if)# ipv6 ospf authentication ipsec spi 300 md5
aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa
```

| Related Commands | Command                                 | Description                            |
|------------------|-----------------------------------------|----------------------------------------|
|                  | <b>ipv6 ospf authentication</b>         | Specifies interface authentication.    |
|                  | <b>area virtual-link authentication</b> | Specifies virtual link authentication. |

**Platform Description** N/A

### 3.22 ipv6 ospf bfd

Use this command to enable or disable the BFD on the specified OSPFv3-enabled interface. Use the **no** form of this command to restore the default setting.

**ipv6 ospf bfd** [ dsable ] [ instance *instance-id* ]  
**no ipv6 ospf bfd** [ instance *instance-id* ]

| Parameter Description | Parameter                   | Description                                                                            |
|-----------------------|-----------------------------|----------------------------------------------------------------------------------------|
|                       | disable                     | Disables the BFD function on the specified OSPF interface.                             |
|                       | instance <i>instance-id</i> | Configures the specified OSPFv3 instance on the interface, in the range from 0 to 255. |

**Defaults** No configuration is made by default. The BFD configuration in the OSPFv3 process configuration mode will apply.

**Command**

**Mode** Interface configuration mode.

**Usage Guide** The command `ipv6 ospf bfd` in the interface configuration mode takes precedence over the `bfd all-interfaces` command in the routing process configuration mode. You can use this command to enable the BFD on the specified interface according to the actual environment, also can use the command `bfd all-interfaces` in the OSPFv3 process configuration mode to enable the BFD function on all OSPFv3 interfaces and use the command `ip v6 ospf bfd disable` to disable the BFD on the specified interface.

**Configuration Examples**

```
Ruijie(config)# int fastethernet 0/0
Ruijie(config-if-fastethernet 0/0)# ipv6 ospf bfd
```

| Related Commands | Command                                         | Description                                                                              |
|------------------|-------------------------------------------------|------------------------------------------------------------------------------------------|
|                  | <code>ipv6 router ospf <i>process-id</i></code> | Starts the OSPFv3 routing process and enter into the routing process configuration mode. |
|                  | <code>bfd all-interfaces</code>                 | Enables the BFD on all OSPFv3 interfaces.                                                |

**Platform** N/A

**Description**

### 3.23 ipv6 ospf cost

Use this command to set the cost of the interface. Use the **no** form of this command to restore the default setting

**ipv6 ospf cost** *cost* [ **instance** *instance-id* ]

**no ipv6 ospf cost** [ **instance** *instance-id* ]

| Parameter Description | Parameter                          | Description                                                      |
|-----------------------|------------------------------------|------------------------------------------------------------------|
|                       | <i>Cost</i>                        | Cost of interface, in the range from 0 to 65535.                 |
|                       | <b>instance</b> <i>instance-id</i> | Configures the specific OSPFv3 instance on the interface, in the |

|  |                      |
|--|----------------------|
|  | range from 0 to 255. |
|--|----------------------|

**Defaults** The default interface cost is the reference bandwidth/Bandwidth (100Mbps by default).

**Command Mode** Interface configuration mode.

**Usage Guide** By default, the cost of the OSPFv3 interface is 100Mbps/Bandwidth, in which the Bandwidth is the bandwidth of the interface and configured with the command **bandwidth** in the interface configuration mode.

The default costs of OSPFv3 interfaces for several typical lines are:

- 64K serial line: 1562;
- E1 line: 48
- 10M Ethernet: 10
- 100M Ethernet: 1

The OSPFv3 cost configured with the command **ipv6 ospf cost** will overwrite the default configuration.

**Configuration** The following example sets the cost of the interface to 1:

**Examples**

```
Ruijie(config)# int fastethernet 0/0
Ruijie(config-if)# ipv6 ospf cost 1
```

| Related Commands | Command               | Description                                                      |

|                  |                       | <b>show ipv6 ospf interface</b>                                  |
|                  | <b>ipv6 ospf area</b> | Sets the interface to participate in the OSPFv3 routing process. |

**Platform** N/A

**Description**

### 3.24 ipv6 ospf dead-interval

Use this command to set a dead interval of neighbors on an interface. If no hello packet is received from a neighbor within the interval, the neighboring relationship is considered to fail. Use the **no** form of this command to restore the default setting

**ipv6 ospf dead-interval** { *seconds* | **minimal hello-multiplier** *multiplier* } [ **instance** *instance-id* ]  
**no ipv6 ospf dead-interval** [ **instance** *instance-id* ]

| Parameter Description | Parameter | Description    |
|-----------------------|-----------|----------------|
|                       |           | <i>seconds</i> |

|                                                      |                                                                                                                                                                                              |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>minimal hello-multiplier</b><br><i>multiplier</i> | Enables the fast hello function, which takes 1s as the dead interval of neighbors.<br><i>Multiplier</i> specifies the number of hello packets sent in one second, in the range from 3 to 20. |
| <b>instance</b> <i>instance-id</i>                   | Configures the specific OSPFv3 instance on the interface, in the range from 0 to 255.                                                                                                        |

**Defaults** If the fast hello function is not enabled, the dead interval of neighbors is four times longer than the hello interval.

 If the hello interval is changed, the dead interval of neighbors varies automatically.

**Command Mode** Interface configuration mode

**Usage Guide** The dead interval of neighbors must be longer than the hello interval.  
The OSPFv3 fast hello function allows OSPFv3 to fast discovery neighbors and detect whether neighboring relationships are valid. To enable the OSPFv3 fast hello function, you can specify the **minimal** and **hello-multiplier** keywords and the *multiplier* parameter in this command. **minimal** specifies the deal interval of neighbors to be 1s; **hello-multiplier** specifies the number of times that hello packets are sent in a second. Therefore, this configuration reduces the hello interval to be shorter than 1s.  
If an interface is enabled with the fast hello function, the **hello-interval** field of hello packets to be advertised by this interface is set to 0, and that of hello packets received from this interface is omitted.

 **dead-interval**, **minimal**, and **hello-multiplier** that are introduced to enable the fast hello function cannot be configured together with **hello-interval**.

No matter whether the fast hello function is configured, the dead interval of neighbors on the interconnected interfaces of neighbors must be consistent. The values of **hello-multiplier** on the interconnected interfaces can be different but you must ensure that at least one hello packet is received within the dead interval of neighbors.

You can use the **show ipv6 ospf interface** command to monitor the dead interval of neighbors and the fast hello interval on an interface.

**Configuration Examples** The following example sets the dead interval of neighbors to 60 seconds on an interface.

```
Ruijie(config)# int fastethernet 0/0
Ruijie(config-if)# ipv6 ospf dead-interval 60
```

|                                 | on an interface.                                                |
| <b>show ipv6 ospf interface</b> | Displays the OSPFv3 interface information.                      |
| <b>ipv6 ospf area</b>           | Sets the interface to participate in the OSPFv3 routing process |

**Platform** N/A

**Description**

### 3.25 ipv6 ospf encryption

Use this command to enable OSPFv3 encryption authentication on an interface. Use the **no** form of this command to restore the default setting.

**ipv6 ospf encryption [ null | ipsec spi spi esp null [ md5 | sha1 ] [ 0 | 7 ] key ]**

**no ipv6 ospf encryption**

**Parameter Description**

| Parameter   | Description                                                                |
|-------------|----------------------------------------------------------------------------|
| <b>null</b> | Indicates that encryption authentication is not performed.                 |
| <i>spi</i>  | Specifies a security parameter index, in the range from 256 to 4294967295. |
| <b>null</b> | Specifies the null encryption mode.                                        |
| <b>md5</b>  | Specifies the MD5 authentication mode.                                     |
| <b>sha1</b> | Specifies the SHA1 authentication mode.                                    |
| <b>0</b>    | Indicates that a key is displayed in the plain-text format.                |
| <b>7</b>    | Indicates that a key is displayed in the cipher-text format.               |
| <i>key</i>  | Specifies an authentication key.                                           |

**Defaults** Encryption authentication is not performed by default.

**Command Mode** Interface configuration mode

**Usage Guide** RGOS supports the null encryption mode and two authentication modes: MD5 and SHA1.

 OSPFv3 encryption authentication parameters configured on interconnected interfaces must be consistent.

**Configuration Examples** The following example specifies null encryption and MD5 authentication in OSPFv3 interface configuration mode and sets the authentication password to aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa.

```
Ruijie(config-if)# ipv6 ospf encryption ipsec spi 300 esp null md5
aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa
```

**Platform** N/A

**Description**

### 3.26 ipv6 ospf hello-interval

Use this command to set the interval for the interface to send the Hello message. Use the **no** form of this command to restore the default setting

**ipv6 ospf hello-interval** *seconds* [ **instance** *instance-id* ]

**no ipv6 ospf hello-interval** [ **instance** *instance-id* ]

**Parameter Description**

| Parameter                          | Description                                                                                     |
|------------------------------------|-------------------------------------------------------------------------------------------------|
| <i>seconds</i>                     | Interval for sending the Hello message.<br>Its range is from 1 to 65535 in the unit of seconds. |
| <b>instance</b> <i>instance-id</i> | Configures the specific OSPFv3 instance on the interface.                                       |

**Defaults**

The broadcast network and point-to-point network :10 seconds. The point-to-multipoint network and NBMA network :30 seconds.

**Command**

**Mode**

Interface configuration mode.

**Usage Guide**

The same hello sending intervals must be set for the neighbors, otherwise the normal adjacency cannot be established.

The dead-interval minimal hello-multiplier and hello-interval parameters for Fast Hello cannot be configured simultaneously.

**Configuration**

The following example sets the interval for the interface to send the Hello message to 20 seconds.

**Examples**

```
ipv6 ospf hello-interval 20
```

**Related Commands**

| Command                         | Description                                                              |
|---------------------------------|--------------------------------------------------------------------------|
| <b>ipv6 ospf dead-interval</b>  | Sets the interval for the interface to consider that the neighbor fails. |
| <b>show ipv6 ospf interface</b> | Displays the OSPFv3 interface information.                               |
| <b>ipv6 ospf area</b>           | Sets the interface to participate in the OSPFv3 routing process.         |

**Platform** N/A

**Description**

### 3.27 ipv6 ospf mtu-ignore

Use this command to ignore the MTU check when an interface receives the database description message. Use the **no** form of this command to restore the default setting.

**ipv6 ospf mtu-ignore** [ **instance** *instance-id* ]

**no ipv6 ospf mtu-ignore** [ **instance** *instance-id* ]

| Parameter Description | Parameter                          | Description                                                                           |
|-----------------------|------------------------------------|---------------------------------------------------------------------------------------|
|                       | <b>instance</b> <i>instance-id</i> | Configures the specific OSPFv3 instance on the interface, in the range from 0 to 255. |

**Defaults** The MTU check is enabled by default.

#### Command

**Mode** Interface configuration mode.

**Usage Guide** After receiving the database description message, the OSPFv3 device will check whether the MTU of neighbor interface is the same as its own MTU. If the received database description message indicates an MTU greater than its own interface's MTU, the neighbor relationship cannot be established. This can be fixed by disabling the MTU check.

**Configuration** The following example disables the MTU check function on the ethernet 1/0.

**Examples**

```
Ruijie(config)# interface ethernet 1/0
Ruijie(config-if)# ipv6 ospf mtu-ignore
```

**Platform** N/A

**Description**

### 3.28 ipv6 ospf neighbor

Use this command to configure the OSPFv3 neighbor manually. Use the **no** form of this command to restore the default setting.

**ipv6 ospf neighbor** *ipv6-address* [ [ **cost** <1-65535> ] [ **poll-interval** <0-2147483647> | **priority** <0-255> ] ] [ **instance** *instance-id* ]

**no ipv6 ospf neighbor** *ipv6-address* [ [ **cost** <1-65535> ] [ **poll-interval** < 0-2147483647 > | **priority** < 0-255 > ] ] [ **instance** *instance-id* ]

| Parameter Description | Parameter                           | Description                                                                                                                                                                                                                                                                 |
|-----------------------|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>cost</b> <i>cost</i>             | (Optional) Configures the cost to each neighbor in point-to-multipoint network. It is not defined by default, where the cost configured on the interface will be used. It ranges from 1 to 65535.<br>Only the networks of the point-to-multipoint type support this option. |
|                       | <b>poll-interval</b> <i>seconds</i> | (Optional) Interval for polling the neighbors (in seconds), which ranges from 1 to 2147483647.<br>Only the networks of the non-broadcast (NBMA) type support this option.                                                                                                   |
|                       | <b>priority</b> <i>priority</i>     | (Optional) Configures the priority value of non-broadcast network neighbors, which ranges from 0 to 255.<br>Only the non-broadcast (NBMA) type network supports this option.                                                                                                |
|                       | <b>instance</b> <i>instance-id</i>  | (Optional) Configures the specific OSPFv3 instance on the interface, which ranges from 0 to 255.                                                                                                                                                                            |

**Defaults** No neighbor is defined;  
Neighbor polling interval: 120 seconds;  
Priority value of non-broadcast network neighbor: 0.

**Command**

**Mode** Interface configuration mode.

**Usage Guide** You can set relevant parameters for the neighbors depending on the actual network type.

**Configuration** The following example shows how to configure the OSPFv3 neighbor in NBMA network as follows:

**Examples** IPv6 address: fe80::2d0:f8ff:fe22:3533, priority value: 1, polling interval: 150 seconds.

```
Ruijie(config)# interface fastEthernet 0/1
Ruijie(config-if)# ipv6 ospf network non-broadcast
Ruijie(config-if)# ipv6 ospf neighbor fe80::2d0:f8ff:fe22:3533 priority 1
poll-interval 150
```

**Description**

### 3.29 ipv6 ospf network

Use this command to set the network type of the interface. Use the **no** form of this command to restore the default setting.

```

ipv6 ospf network { broadcast | non-broadcast | point-to-point | point-to-multipoint
[ non-broadcast ] } [ instance instance-id ]
no ipv6 ospf network [ broadcast | non-broadcast | point-to-point | point-to-multipoint
[ non-broadcast ] ] [ instance instance-id ]
    
```

| Parameter Description | Parameter                                | Description                                                                                     |
|-----------------------|------------------------------------------|-------------------------------------------------------------------------------------------------|
|                       | <b>broadcast</b>                         | Specifies the broadcast network type.                                                           |
|                       | <b>non-broadcast</b>                     | Specifies the non-broadcast network type.                                                       |
|                       | <b>point-to-point</b>                    | Specifies the point-to-point network type.                                                      |
|                       | <b>point-to-multipoint</b>               | Specifies the point-to-multipoint network type.                                                 |
|                       | <b>point-to-multipoint non-broadcast</b> | Specifies the point-to-multipoint non-broadcast network type.                                   |
|                       | <b>instance instance-id</b>              | Configures the specific OSPFv3 instance on the interface with the valid id range from 0 to 255. |

**Defaults** Point-to-point network type: PPP, SLIP, frame relay point-to-point sub-interface and X.25 point-to-point sub-interface encapsulation.  
 NBMA network type: frame relay(except for the point-to-point sub-interface) and X.25 encapsulation (except for the point-to-point sub-interface)  
 Broadcast network type: Ethernet encapsulation.  
 The point-to-multipoint network type is not the default type.

**Command Mode** Interface configuration mode.

**Usage Guide** You can set the network type of the interface according to the actual link type applied and the topology.

**Configuration Examples** The following example sets the network type of the interface that participates in the OSPFv3 to point-to-point.

```

ipv6 ospf network point-to-point
    
```

| Related Commands | Command                         | Description                                                      |

|                  | <b>ipv6 ospf priority</b>       | Sets the interface priority.                                     |
|                  | <b>show ipv6 ospf interface</b> | Displays the OSPFv3 interface information.                       |
|                  | <b>ipv6 ospf area</b>           | Sets the interface to participate in the OSPFv3 routing process. |

**Platform Description** N/A

### 3.30 ipv6 ospf priority

Use this command to set the interface priority. Use the **no** form of this command to restore the default setting.

**ipv6 ospf priority** *number-value* [ **instance** *instance-id* ]

**no ipv6 ospf priority** [ **instance** *instance-id* ]

| Parameter Description | Parameter                          | Description                                                                           |
|-----------------------|------------------------------------|---------------------------------------------------------------------------------------|
|                       | <i>number-value</i>                | The priority of the interface.<br>Its range is from 0 to 255.                         |
|                       | <b>instance</b> <i>instance-id</i> | Configures the specific OSPFv3 instance on the interface. Its range is from 0 to 255. |

**Defaults** The default priority is 1.

**Command Mode** Interface configuration mode.

**Usage Guide** In the broadcast network type, it is necessary to elect the DR/BDR. In electing the DR/BDR, the device of a higher priority is preferred. If several devices are of the same priority, the one with the largest router-ID is preferred.  
The device with the priority level of 0 does not participate in the election of DR/BDR.

**Configuration Examples** The following example disables the interface from being elected as the DR/BDR.

```
Ruijie(config)# interface ethernet 1/0
Ruijie(config-if)# ipv6 ospf priority 0
```

| Related Commands | Command                            | Description                                               |
|------------------|------------------------------------|-----------------------------------------------------------|
|                  | <b>ipv6 ospf network</b>           | Sets the network type of an interface.                    |
|                  | <b>router-id</b>                   | Sets the ID of a router.                                  |
|                  | <b>show ipv6 ospf interface</b>    | Displays the OSPFv3 interface information.                |
|                  | <b>instance</b> <i>instance-id</i> | Configures the specific OSPFv3 instance on the interface. |

**Platform Description** N/A

### 3.31 ipv6 ospf retransmit-interval

Use this command to set the interval for the interface to retransmit the LSA. Use the **no** form of this

command to restore the default setting.

**ipv6 ospf retransmit-interval** *seconds* [ **instance** *instance-id* ]

**no ipv6 ospf retransmit-interval** [ **instance** *instance-id* ]

| Parameter Description | Parameter                          | Description                                                                                  |
|-----------------------|------------------------------------|----------------------------------------------------------------------------------------------|
|                       | <i>seconds</i>                     | Interval for retransmitting the LSA.<br>Its range is from 1 to 65535 in the unit of seconds. |
|                       | <b>instance</b> <i>instance-id</i> | Configures the specific OSPFv3 instance on the interface.                                    |

**Defaults** The default is five seconds.

**Command**

**Mode** Interface configuration mode.

**Usage Guide** To ensure the reliability of the routing information transmission, the LSA sent to the neighbor shall be acknowledged by the neighbor. You can use this command to set the interval for the acknowledgement by the neighbor. If no acknowledgement is received within the specified period, the LSA information will be retransmitted.

**Configuration Examples** The following example sets the interval for retransmitting the LSA to 10 seconds.

**Examples**

```
Ruijie(config)# interface ethernet 1/0
Ruijie(config-if)# ipv6 ospf retransmit-interval 10
```

| Related Commands | Command                         | Description                                                      |
|------------------|---------------------------------|------------------------------------------------------------------|
|                  | <b>show ipv6 ospf interface</b> | Displays the OSPFv3 interface information.                       |
|                  | <b>ipv6 ospf area</b>           | Sets the interface to participate in the OSPFv3 routing process. |

**Platform** N/A

**Description**

### 3.32 ipv6 ospf subvlan

Use this command to enable OSPFv3 on super VLANs. Use the **no** form of this command to restore the default settings.

**ipv6 ospf subvlan** [**all** | *vid*]

**no ipv6 ospf subvlan**

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

| Description |                                                                 |
|-------------|-----------------------------------------------------------------|
| all         | Indicates that packets are allowed to be sent to all sub VLANs. |
| vid         | Specifies the sub VLAN ID. The value ranges from 1 to 4094.     |

**Defaults** The default settings take effect only on super VLANs with OSPFv3 disabled.

**Command Mode** Interface configuration mode.

**Usage Guide** In normal cases, a super VLAN contains multiple sub VLANs. Multicast packets of a super VLAN are also sent to its sub VLANs. In this case, when OSPF multicast packets are sent over a super VLAN containing multiple sub VLANs, the OSPF multicast packets are replicated multiple times, and the device processing capability is insufficient. As a result, a large number of packets are discarded, causing the neighbor down error. In most scenarios, the OSPF function does not need to be enabled on a super VLAN. Therefore, the OSPF function is disabled by default. However, in some scenarios, the OSPF function must be run on the super VLAN, but packets only need to be sent to one sub VLAN. In this case, run this command to specify a particular sub VLAN. You must be cautious in configuring packet transmission to all sub VLANs, as the large number of sub VLANs may cause a device processing bottleneck, which will lead to the neighbor down error.

**Configuration Examples** The following example sends the OSPF multicast packets to sub VLAN 1024 of super VLAN 300.

```
Ruijie(config)# interface vlan 300
Ruijie(config-if-VLAN 300)# ipv6 ospf subvlan 1024
```

### 3.33 ipv6 ospf transmit-delay

Use this command to set the delay on the interface in sending the LSA. Use the **no** form of this command to restore the default setting.

**ipv6 ospf transmit-delay** *seconds* [ **instance** *instance-id* ]

**no ipv6 ospf transmit-delay** [ **instance** *instance-id* ]

| Parameter Description | Parameter                          | Description                                                                                   |
|-----------------------|------------------------------------|-----------------------------------------------------------------------------------------------|
|                       | <i>seconds</i>                     | The delay in sending LSA.<br>Its range is from 1 to 65535 in the unit of seconds.             |
|                       | <b>instance</b> <i>instance-id</i> | Configures the ID of a specific OSPFv3 instance on the interface, in the range from 0 to 255. |

**Defaults** The default is one.

**Command Mode** Interface configuration mode.

**Usage Guide** Use this command to set the delay on the interface in transmitting the LSA.

**Configuration** The following example sets the delay on the interface in transmitting the LSA.

**Examples**

```
Ruijie(config)# interface ethernet 1/0
Ruijie(config-if)# ipv6 ospf transmit-delay 2
```

**Related  
Commands**

| Command                         | Description                                |
|---------------------------------|--------------------------------------------|
| <b>show ipv6 ospf interface</b> | Displays the OSPFv3 interface information. |

**Platform** N/A

**Description**

### 3.34 ipv6 router ospf

Use this command to start the OSPFv3 routing process. Use the **no** form of this command to restore the default setting.

**ipv6 router ospf**

**ipv6 router ospf** *process-id* [ **vrf** *vrf-name* ]

**no ipv6 router ospf** *process-id*

**Parameter  
Description**

| Parameter         | Description                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------------------|
| <i>process-id</i> | OSPFv3 process ID number. Without the process number configured, it indicates that process 1 is started. |
| <i>vrf-name</i>   | Specifies the VRF that OSPFv3 process belongs to.                                                        |

**Defaults** No OSPFv3 routing process is started.

**Command**

**Mode** Global configuration mode.

**Usage Guide** After the OSPFv3 process is started, the routing process configuration mode is entered. At present, our products support up to 32 OSPFv3 processes.

**Configuration** The following example starts OSPFv3 process in the specified VRF VPN1.

**Examples**

```
Ruijie(config)# ipv6 router ospf 1 vrf vpn_1
```

| <b>show ipv6 ospf</b> | Displays the OSPFv3 routing process information. |
|-----------------------|--------------------------------------------------|

**Platform** N/A

**Description**

### 3.35 ipv6 router ospf max-concurrent-dd

Use this command to set the maximum concurrent interacting neighbors allowed in all OSPFv3 routing processes. Use the **no** form of this command to restore the default setting.

**ipv6 router ospf max-concurrent-dd** *number*

**no ipv6 router ospf max-concurrent-dd**

| Parameter Description | Parameter     | Description                                                             |
|-----------------------|---------------|-------------------------------------------------------------------------|
|                       | <i>number</i> | Maximum concurrent interacting neighbors, in the range from 1 to 65535. |

**Defaults** The default is 5.

**Command Mode** Global configuration mode

**Usage Guide** When a router is exchanging data with multiple neighbors at the same time which affects its performance, by configuring this command, the maximum concurrent interacting neighbors allowed in all OSPFv3 routing processes can be restricted.

**Configuration Examples** The following example sets the maximum concurrent interacting neighbors allowed in all OSPFv3 routing processes to 4. The result is that in the interaction between a large number of neighbors, interactions with up to 4 neighbors are allowed to be initiated on this device concurrently, and interactions initiated by up to 4 neighbors are allowed to be received concurrently. That is, interaction with up to 8 neighbors is allowed on this device.

```
Ruijie#conf terminal
Ruijie(config)#ipv6 router ospf max-concurrent-dd 4
```

**Description**

### 3.36 log-adj-changes

Use this command to enable the logging of adjacency changes. Use the **no** form of this command to restore the default setting.

**log-adj-changes**

**no log-adj-changes**

| Parameter Description | Parameter     | Description                           |
|-----------------------|---------------|---------------------------------------|
|                       | <b>detail</b> | Displays details of adjacency changes |

**Defaults** By default, the adjacency state log on the entry of or exit from the FULL state is output.

**Command** Routing process configuration mode

**Mode**

**Usage Guide** N/A

**Configuration** The following example turns on the log of adjacency state change.

```
Ruijie(config)# router ospf 1
Ruijie(config)# log-adj-changes detail
```

**Description**

### 3.37 max-concurrent-dd

Use this command to set the maximum number of DD packets that can be processed concurrently in the OSPFv3 routing process. Use the **no** form of this command to restore the default setting.

**max-concurrent-dd** *number*

**no max-concurrent-dd**

| Parameter Description | Parameter     | Description                                                                                    |
|-----------------------|---------------|------------------------------------------------------------------------------------------------|
|                       | <i>number</i> | Maximum number of DD packets that can be processed concurrently, in the range from 1 to 65535. |

**Defaults** The default is 5.

**Command****Mode** Routing process configuration mode.**Usage Guide** When a router is exchanging data with multiple neighbors at the same time which affects its performance, by configuring this command, the maximum concurrent interacting neighbors allowed in each OSPFv3 instance can be restricted.**Configuration Examples** The following example sets the maximum concurrent interacting neighbors allowed in the current OSPFv3 routing process to 4. The result is that in the interaction between a large number of neighbors, interactions with up to 4 neighbors are allowed to be initiated on this device concurrently, and interactions initiated by up to 4 neighbors are allowed to be received concurrently. That is, interaction with up to 8 neighbors is allowed on this device.

```
router ipv6 ospf 1
max-concurrent-dd 4
```

### 3.38 passive-interface

Use this command to set the passive interface. Use the **no** form of this command to restore the default setting.

**passive-interface** { **default** | *interface-type interface-number* }

**no passive-interface** { **default** | *interface-type interface-number* }

**Parameter Description**

| Parameter                                        | Description                                    |
|--------------------------------------------------|------------------------------------------------|
| default                                          | Sets all the interfaces to passive ones.       |
| <i>interface-type</i><br><i>interface-number</i> | Sets the specified interface to a passive one. |

**Defaults** No passive interface is set by default.**Command Mode** Routing process configuration mode**Usage Guide** After an interface is set to a passive one, it no longer receives or sends the hello message. This command applies to the interfaces participating in the OSPFv3 but not to the virtual links.

**Configuration** The following example enables only the VLAN1 interface to participate in the OSPFv3 process.

**Examples**

```
passive-interface default
no passive-interface vlan 1
```

**Platform** N/A

**Description**

### 3.39 redistribute

Use this command to start the route redistribution in order to import the routing information of other routing protocols to the OSPFv3 routing process. Use the **no** form of this command to restore the default setting.

```
redistribute { bgp | connected | isis [ area-tag ] | ospf process-id | rip | static } [ { level-1 | level-1-2 | level-2 } ] match { internal | external [ 1|2 ] | nssa-external [ 1 | 2 ] } | metric metric-value | metric-type { 1|2 } | route-map route-map-name | tag tag-value ]
no redistribute { bgp | connected | isis [ area-tag ] | ospf process-id | rip | static } [ { level-1 | level-1-2 | level-2 } ] match { internal | external [ 1|2 ] | nssa-external [ 1 | 2 ] } | metric | metric-type { 1|2 } | route-map route-map-name | tag tag-value ]
```

**Parameter  
Description**

| Parameter                                          | Description                                                                                                 |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>bgp</b>                                         | The bgp protocol is redistributed.                                                                          |
| <b>connected</b>                                   | The directly connected route is redistributed.                                                              |
| <b>isis</b> [ <i>area-tag</i> ]                    | The isis is redistributed. The area-tag specifies a particular isis instance.                               |
| <b>ospf</b> <i>process-id</i>                      | The ospf is redistributed. The process-id specifies a particular ospf instance within the range of 1-65535. |
| <b>rip</b>                                         | The rip is redistributed.                                                                                   |
| <b>static</b>                                      | The static route is redistributed.                                                                          |
| <b>level-1</b>   <b>level-1-2</b>   <b>level-2</b> | It is used in the IS-IS route redistribution only and redistributes the routes at a specified level. .      |
| <b>match</b>                                       | It is used in the OSPFv3 route redistribution only and filters specific routes for redistribution;          |

|                                      |                                                                                                                                                                                                                                                          |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                      | <p>internal: inter-area and intra-area routes.</p> <p>external [1 2]: E1, E2 or all external routes.</p> <p>Nssa-external [ 1   2 ]: N1, N2 or all external routes of the NSSA area.</p> <p>All sub-type OSPFv3 routes are redistributed by default.</p> |
| <b>metric</b> <i>metric-value</i>    | Specifies the metric for the OSPFv3 external 2 LSA with <i>metric-value</i> . Its range is 0 to 16777214.                                                                                                                                                |
| <b>metric-type</b> { 1 2 }           | Set the metric type for the external route to E-1 or E-2.                                                                                                                                                                                                |
| <b>route-map</b> <i>map-map-name</i> | <p>Specifies the routing policy for route redistribution.</p> <p>The name of map-tag can be composed of up to 32 characters.</p> <p>No route-map is associated by default.</p>                                                                           |
| <b>tag</b> <i>tag-value</i>          | Specifies the tag value redistributed to the OSPFv3 inner route, in the range of 0 to 4294967295.                                                                                                                                                        |

**Defaults**

The function is disabled by default;

Metric-type: 2;

Level-2 routes are redistributed in the ISIS redistribution

OSPFv3 routes of all sub-types are redistributed in the OSPFv3 redistribution

No route-map is associated

**Command****Mode**

Routing process configuration mode

**Usage Guide**

When a device supports multiple routing protocols, the coordination between these protocols becomes an important task. The device can run the protocols at the same time, so it should redistribute the protocols. This is applicable to all IP routing protocols.

The parameters level-1, level-2 or level-1-2 can be configured in the redistribution of the ISIS routes to indicate the level of the routes in the redistribution. By default, the level-2 ISIS routes are redistributed

When redistributing OSPFv3 routes, you can configure *match* to redistribute the routes of the corresponding sub-type among the redistributed OSPFv3 routes. All types of OSPFv3 routes are redistributed by default.

The *match* parameter of route-map is specific to the source of routes. The parameters *tag*, *metric* and *metric-type* of the set rule of route-map take precedence over the ones configured for the redistribute command.

The metric value of the route-map associated should be in the range of 0 to 16777214. If the metric value is not in this range, the route cannot be introduced.

The rules for the **no** form of the **redistribute** command are as follows:

If some parameters are specified in the no command, restore their default settings;

If no parameters are specified in the **no** command, delete the whole command.

For example, if the configuration is made below:

Now modify the configuration with the command no redistribute isis 112 level-2

According to the above rules, the command only restores level-2 to default and level-2 is default per se, so after the above no command is executed, the configuration remains as

redistribute isis 112 level-2

To delete the whole command, use the command below

**Configuration** The following example redistributes the direct route and associates route-map test :

**Examples**

```
ipv6 router ospf 1
redistribute connect metric 10 route-map test
```

The associated route-map is configured as follows:

```
route-map test permit 10
match metric 20
set metric 30
```

The effect of the above configuration is to set the metric value which is 20 of the redistributed routes to 30, and that of other routes to 10

**Related Commands**

|--------------------------------------|------------------------------------------------------------|
| <b>default-information originate</b> | Sets the default route to be redistributed.                |
| <b>default-metric</b>                | Sets the default metric for the route to be redistributed. |
| <b>summary-prefix</b>                | Sets the converged address range of the external route.    |
| <b>show ipv6 ospf</b>                | Displays the OSPFv3 routing process information.           |
| <b>show ipv6 ospf database</b>       | Displays the OSPFv3 link state database information.       |

**Platform** N/A

**Description**

### 3.40 router-id

Use this command to set the router ID (device ID). Use the **no** form of this command to restore the default setting.

**router-id** *router-id*

**no router-id**

**Parameter Description**

| Parameter        | Description                                  |
|------------------|----------------------------------------------|
| <i>router-id</i> | ID of the device in the IPv4 address format. |

**Defaults**

The OSPFv3 routing process, the largest IPv4 address of all loopback interfaces is elected as the router ID; If there is no loopback interface with an IPv4 address, the OSPFv3 process will elect the largest IPv4 of all other interfaces as the router ID

**Command**

Routing process configuration mode

**Mode**

**Usage Guide** Each device that runs the OSPFv3 process shall be identified with a router ID. Router ID is in the format of IPv4 address.

Any IPv4 address can be set as the router ID, but the router ID of every routers in the AS must be unique. If multiple OSPFv3 processes are running on the same device, the router ID of every process must be unique. Note that the change of the router ID results in considerable processing work in the protocol. Therefore, it is not recommended to change any router ID without proper reason. A prompt will be given to ask whether you are sure to modify the router ID. It is recommended that you specify a router ID once an OSPFv3 process starts before configuring other parameters for the process

**Configuration** The following example sets the ID of the device that participates in the OSPFv3 process to 1.1.1.1.

**Examples**

```
router-id 1.1.1.1
```

**Related Commands**

| Command                   | Description                                      |
|---------------------------|--------------------------------------------------|
| <b>ipv6 ospf priority</b> | Sets the interface priority.                     |
| <b>show ipv6 ospf</b>     | Displays the OSPFv3 routing process information. |

**Platform** N/A

**Description**

### 3.41 summary-prefix

Use this command to configure the converged route outside the OSPFv3 routing domain in the routing process configuration mode. Use the **no** form of this command to restore the default settings.

**summary-prefix** *ipv6-prefix/prefix-length* [ **not-advertise** ] [ **tag number** ] [ **cost cost** ]

**no summary-prefix** *ipv6-prefix/prefix-length* [ **not-advertise** ] [ **tag** ] [ **cost** ]

**Parameter Description**

| Parameter                        | Description                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------------------|
| <i>ipv6-prefix/prefix-length</i> | Address range of the converged route                                                               |
| <b>not-advertise</b>             | Does not advertise the converged route to neighbors. Absence of this parameter means to advertise. |
| <b>tag number</b>                | Tag value redistributed to the OSPFv3 inner route, in the range from 0 to 4294967295.              |
| <b>cost cost</b>                 | Cost value of converged route, in the range from 0 to 16777214.                                    |

**Defaults** No converged route is configured by default.

**Command** Routing process configuration mode.

**Mode**

**Usage Guide** When routes are redistributed by another routing process into the OSPFv3 routing process, every route is advertised to the OSPFv3-enabled device separately in the form of external link state. If the incoming routes are continuous addresses, the autonomous system border device can advertise only one converged route, thus reducing the scale of routing table greatly.

It is different from the **area range** command. The area range involves the convergence of routes between OSPFv3 areas, while the **summary-prefix** involves the convergence of external routes of the OSPFv3 routing domain.

Configuring the **summary-prefix** command on the ASBR can perform convergence for only redistributed routes; while configuring this command on the NSSA ABR translator can perform convergence for the redistributed routes and the Type-5 routes translated from Type-7.

**Configuration** The following example configures the external route within the 2001:DB8::/64 to the converged route 2001:DB8::/64 to advertise it.

**Examples**

```
summary-prefix 2001 :DB8 : : /64
```

**Related Commands**

| Command             | Description                                            |
|---------------------|--------------------------------------------------------|
| <b>area-range</b>   | Configures route convergence between the OSPFv3 areas. |
| <b>redistribute</b> | Redistributes the routes in other routing process.     |

**Platform** N/A

**Description**

### 3.42 show ipv6 ospf

Use this command to display the information of the OSPFv3 process.

**show ipv6 ospf** [ *process-id* ]

**Parameter Description**

| Parameter         | Description             |
|-------------------|-------------------------|
| <i>process-id</i> | OSPF process ID number. |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays the information about the OSPFv3 process.

**Examples**

```
Ruijie# show ipv6 ospf
Routing Process "OSPFv3 (1)" with ID 1.1.1.1
```

```

Process uptime is 24 minutes
Enable two-way-maintain
SPF schedule delay 5 secs, Hold time between SPF's 10 secs
Initial LSA throttle delay 0 msec
Minimum hold time for LSA throttle 5000 msec
Maximum wait time for LSA throttle 5000 msec
Lsa Transmit Pacing timer 40 msec, 1 LS-Update
LSA interval 5 secs, Minimum LSA arrival 1000 msec
Pacing lsa-group: 30 secs
Number of incoming current DD exchange neighbors 0/5
Number of outgoing current DD exchange neighbors 0/5
Number of external LSA 0. Checksum Sum 0x0000
Number of AS-Scoped Unknown LSA 0
Number of LSA originated 11
Number of LSA received 4
Log Neighbor Adjacency Changes : Enabled
Number of areas in this router is 2
Area BACKBONE(0)
Number of interfaces in this area is 1(1)
SPF algorithm executed 4 times
Number of LSA 3. Checksum Sum 0x1DDF1
Number of Unknown LSA 0

Area 0.0.0.1 (NSSA)
Number of interfaces in this area is 1(1)
SPF algorithm executed 5 times
Number of LSA 7. Checksum Sum 0x445FE
Number of Unknown LSA 0
    
```

### 3.44 show ipv6 ospf interface

Use this command to display the OSPFv3 interface information.

**show ipv6 ospf** [ *process- id* ] **interface** [ *interface-type interface-number* | **brief** ]

| Parameter Description | Parameter          | Description                                      |
|-----------------------|--------------------|--------------------------------------------------|
|                       |                    | <i>interface-type</i><br><i>interface-number</i> |
|                       | <i>process- id</i> | OSPFv3 process ID                                |
|                       | <b>brief</b>       | Displays the interface summary.                  |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** N/A

**Configuration Examples** The following example displays the information about the OSPFv3 interface.

```
Ruijie# show ipv6 ospf interface
FastEthernet 1/0 is up, line protocol is up
Interface ID 2
IPv6 Prefixes
fe80::2d0:22ff:fe22:2223/64 (Link-Local Address)
OSPFv3 Process (1), Area 0.0.0.0, Instance ID 0
Router ID 1.1.1.1, Network Type BROADCAST, Cost: 1
Transmit Delay is 1 sec, State BDR, Priority 1
Designated Router (ID) 2.2.2.2
Interface Address fe80::c800:eff:fe84:1c
Backup Designated Router (ID) 1.1.1.1
Interface Address fe80::2d0:22ff:fe22:2223
```

```
Timer interval configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:02
Neighbor Count is 1, Adjacent neighbor count is 1
Hello received 26 sent 26, DD received 5 sent 4
LS-Req received 1 sent 1, LS-Upd received 3 sent 6
LS-Ack received 6 sent 2, Discarded 0
```

| Related Commands | Command               | Description                                                 |
|------------------|-----------------------|-------------------------------------------------------------|
|                  |                       | <b>ipv6 router ospf</b>                                     |
|                  | <b>ipv6 ospf area</b> | Enables the interface to participate in the OSPFv3 process. |

**Platform** N/A

**Description**

### 3.45 show ipv6 ospf neighbor

Use this command to display the neighbor information of the OSPFv3 process.

**show ipv6 ospf** [ *process-id* ] **neighbor** [ **interface-type** *interface-number* [ **detail** ] ] *neighbor-id* [ **detail** | **statistics** ]

| Parameter Description | Parameter                                        | Description                          |
|-----------------------|--------------------------------------------------|--------------------------------------|
|                       |                                                  | <i>process-id</i>                    |
|                       | <b>detail</b>                                    | Displays details about the neighbor. |
|                       | <i>interface-type</i><br><i>interface-number</i> | Interface type and interface number  |
|                       | <i>neighbor-id</i>                               | Neighbor's router ID                 |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following command displays the brief information about the OSPFv3 neighbor.

**Examples**

```
Ruijie# show ipv6 ospf neighbor
OSPFv3 Process (1) , 1 Neighbors, 1 is Full:
Neighbor ID Pri State Dead Time Interface Instance ID
2.2.2.2 1 Full/DR 00:00:33 FastEthernet 1/0 0
Ruijie# show ipv6 ospf neighbor detail
```

```
Neighbor 2.2.2.2, interface address fe80::c800:eff:fe84:1c
In the area 0.0.0.0 via interface FastEthernet 1/0
Neighbor priority is 1, State is Full, 6 state changes
DR is 2.2.2.2 BDR is 1.1.1.1
Options is 0x000013 (-|R|-|-|E|V6)
Dead timer due in 00:00:36
Database Summary List 0
Link State Request List 0
Link State Retransmission List 0
BFD session state up
```

**Description**

### 3.46 show ipv6 ospf restart

Use this command to display the OSPFv3 graceful restart configuration.

**show ipv6 ospf [ *process-id* ] restart**

**Parameter  
Description**

| Parameter         | Description               |
|-------------------|---------------------------|
| <i>process-id</i> | OSPFv3 process ID number. |

**Defaults** N/A

**Command  
Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following example displays the restarter status.

**Examples**

```
Ruijie# show ipv6 ospf restart
Routing Process is ospf 1
Graceful-restart enabled
Restart grace period 120 secs
Current Restart status is plannedRestart
```

```
Current Restart remaining time 50 secs
Graceful-restart helper support enabled
```

The following example displays the helper status.

```
Ruijie# show ipv6 ospf restart
Routing Process is ospf 1
Neighbor 10.1.1.2, interface addr 10.1.1.2
In the area 0.0.0.0 via interface GigabitEthernet 6/0/0
Graceful-restart helper enabled
Current helper status is helping
Current helper remaining time 50 secs
```

**Description**

### 3.47 show ipv6 ospf route

Use this command to display the OSPFv3 route information.

**show ipv6 ospf [ process- id ] route [ count ]**

**Parameter Description**

| Parameter          | Description                   |
|--------------------|-------------------------------|
| <i>process- id</i> | OSPFv3 process ID number.     |
| <b>count</b>       | Total number of OSPFv3 routes |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration Examples** The following example displays the information about OSPFv3 routes.

```
Ruijie# show ipv6 ospf route
OSPFv3 Process (1)
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
Destination Metric Next-hop
E2 2001:DB8:1::/64 1/20 via fe80::c800:eff:fe84:1c, FastEthernet 1/0
```

```
O 2001:DB8:2::/64 11 via fe80::c800:eff:fe84:1c, FastEthernet 1/0,
Area 0.0.0.0
```

|-------------------------|------------------------------------|
| <b>ipv6 router ospf</b> | Starts the OSPFv3 routing process. |

**Platform** N/A  
**Description**

### 3.48 show ipv6 ospf summary-prefix

Use this command to display the external route convergence information of OSPFv3

**show ipv6 ospf [ *process-id* ] summary-prefix**

**Parameter  
Description**

| Parameter         | Description              |
|-------------------|--------------------------|
| <i>process-id</i> | OSPFv3 process ID number |

**Defaults** N/A

**Command  
Mode** Privileged EXEC mode.

**Usage Guide** N/A

**Configuration** The following example displays the external route convergence information of OSPFv3.

**Examples**

```
Ruijie# show ipv6 ospf summary-prefix
OSPFv3 Process 1, Summary-prefix:
2001:db8::/64, Metric 16777215, Type0, Tag0, Match count0, advertise
```

| <b>ipv6 router ospf</b> | Starts the OSPFv3 routing process.                               |
| <b>summary-prefix</b>   | Configures the converge route outside the OSPFv3 routing domain. |

**Platform** N/A  
**Description**

### 3.49 show ipv6 ospf topology

Use this command to display the topology information about each area of OSPFv3.

**show ipv6 ospf** [ *process- id* ] **topology** [ **area** *area-id* ]

| Parameter Description | Parameter          | Description              |
|-----------------------|--------------------|--------------------------|
|                       | <i>process- id</i> | OSPFv3 process ID number |
|                       | <i>area-id</i>     | Area ID                  |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration** The following command displays the topology information about each area of OSPFv3.

```

Ruijie# show ipv6 ospf topology
OSPFv3 Process (1)
OSPFv3 paths to Area (0.0.0.0) routers
Router ID      Bits  Metric  Next-Hop
Interface
1.1.1.1        B   --
2.2.2.2        EB  1       2.2.2.2/fe80::21a:a9ff:fe41:5b06
GigabitEthernet 0/6

OSPFv3 paths to Area (0.0.0.1) routers
Router ID      Bits  Metric  Next-Hop
Interface
1.1.1.1        V B   --
2.2.2.2        VEB 1       2.2.2.2/fe80::21a:a9ff:fe41:5b06
GigabitEthernet 0/6
    
```

|                  | <b>ipv6 router ospf</b> | Starts the OSPFv3 routing process.             |
|                  | <b>area range</b>       | Configures the address range of the OSPF area. |

**Platform Description** N/A

### 3.50 show ipv6 ospf virtual-links

Use this command to display the virtual link information of the OSPFv3 process

**show ipv6 ospf [ *process-id* ] virtual-links**

| Parameter Description | Parameter         | Description              |
|-----------------------|-------------------|--------------------------|
|                       | <i>process-id</i> | OSPFv3 process ID number |

**Defaults** N/A

**Command Mode** Privileged EXEC mode.

**Usage Guide** N/A

**Configuration** The following command displays the information about the OSPFv3 virtual link.

**Examples**

```
Ruijie# show ipv6 ospf virtual-links
Virtual Link VLINK1 to router 2.2.2.2 is down
  Transit area 0.0.0.1 via interface FastEthernet 1/0, instance ID 0
  Local address *
  Remote address 3333::1/128
  Transmit Delay is 1 sec, State Down,
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5

  Hello due in 00:00:08

  Adajcency state Full
```

| <b>Command Mode</b>          | Routing process configuration mode                                                                                                                                                                                                                                         |           |             |         |                                                                                                                      |
| <b>Usage Guide</b>           | Each LSA has its own lifetime, that is, LSA aging time. An LSA existing for 1800s will be refreshed so that the living time of the LSA will not exceed its aging time. This ensures that normal LSAs are not                                                               |           |             |         |                                                                                                                      |

cleared due to timeout of aging time. If update and aging operations of each LSA are separately computed, a large number of CPU resources will be consumed.

To effectively utilize CPU resources, configure the device to group LSAs for uniform refreshment. The time for refreshing a group of LSAs is called an LSA group pace interval. Grouping refreshment is to put the LSAs to be refreshed within an LSA group pace interval into a group and refresh them uniformly.

When the number of LSAs is fixed, a longer LSA group pace interval will allow the CPU to process more LSAs when the timer expires for one time. To keep the stability of the CPU, you are recommended not to set an over long LSA group pace interval. This prevents the CPU from processing excessive LSAs when the timer expires each time. If the CPU processes a large number of LSAs each time, it is recommended to shorten the LSA group pace interval. For example, if the database has 10000 LSAs, you need to reduce the LSA group pace interval. If it has only 40 to 100 LSAs, you can adjust the group pace interval to 10 through 20 minutes.

**Configuration** The following example sets the LSA group pace interval to 120 seconds.

**Examples**

```
Ruijie(config)# ipv6 router ospf 1
Ruijie(config-router)#timers pacing lsa-group 120
```

**Related  
Commands**

| Command               | Description                                |
|-----------------------|--------------------------------------------|
| <b>show ipv6 ospf</b> | Displays OSPFv3 configuration information. |

**Platform** N/A  
**Description**

### 3.53 timers pacing lsa-transmit

Use this command to set an interval for sending LSA groups. Use the **no** form of this command to restore the default setting.

**timers pacing lsa-transmit** *transmit-time transmit-count*

**no timers pacing lsa-transmit**

**Parameter  
Description**

| Parameter             | Description                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>transmit-time</i>  | Specifies the interval for sending LSA groups. The range is from 10 to 1000 in the unit of milliseconds. |
| <i>transmit-count</i> | Specifies the number of LS-UPD packets in an LSA group. The range is from 1 to 200.                      |

**Defaults** The default transmit-time is 40 and the transmit-count is 1.

**Command  
Mode** Routing process configuration mode

**Usage Guide** There are usually a lot of LSAs on a network; therefore, the load of the device is very high. Setting proper **transmit-time** and **transmit-count** values can restrict flooding of LS-UPD packets on the network.

When the CPU load is not high and network bandwidth usage is not large, you can reduce the **transmit-time** value and increase the **transmit-count** value to accelerate route convergence.

**Configuration Examples** The following example sets the interval for sending LS-UPDs to 50 milliseconds and the specified 20 packets to be sent each time.

```
Ruijie(config)# ipv6 router ospf 1
Ruijie(config-router)# timers pacing lsa-transmit 50 20
```

**Related Commands**

| <b>show ipv6 ospf</b> | Displays OSPFv3 process information. |

**Platform** N/A  
**Description**

### 3.54 timers spf

Use this command to set the delay and interval for the OSPFv3 to calculate SPF after receiving the topology change. Use the **no** format of this command to restore the default setting.

**timers spf** *delay holdtime*

**no timers spf**

**Parameter Description**

| Parameter           | Description                                                                                                                                                                                                                                 |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>spf-delay</i>    | Defines the waiting time for the SPF calculation, which ranges from 0 to 2147483647 seconds. After receiving the topology change information, the OSPF routing process has to waiting for a given period before making the SPF calculation. |
| <i>spf-holdtime</i> | Defines the interval between two SPF calculations, which ranges from 0 to 2147483647 seconds. If the interval has not passed even if the waiting time has elapsed, no SPF calculation can be made yet.                                      |

**Defaults** There are two default situations: 1. The versions earlier than RGOS 10.4 do not support the command **timers throttle spf**. The system default is **timers spf 5 10**. 2. The RGOS 10.4 and the later versions do support the command **timers throttle spf**, where **timer spf** takes no effect by default. The delay for SPF calculation is subject to the default setting of the command **timers throttle spf**. Refer to the description of the command.

**Command Mode** Routing process configuration mode

**Usage Guide** The smaller the *spf-delay* and *spf-holdtime*, the shorter time the OSPF takes to adapt to the topology change, but the more CPU time will be used of the router.

 The **timer spf** configuration and the **timers throttle spf** configuration will overwrite each other.

**Configuration Examples** The following example sets the delay and holdtime of the OSPFv3 to 3 seconds and 9 seconds respectively.

```
Ruijie(config)# ipv6 router ospf 20
Ruijie(config-router)# timers spf 3 9
```

**Related Commands**

| Command                    | Description                                                     |

| <b>timers throttle spf</b> | Configures the exponential backoff delay of the SPF calculation |

**Platform** N/A

**Description**

### 3.55 timers throttle lsa all

Use this command to configure an exponential backoff algorithm for generating LSAs. Use the **no** form of this command to restore the default setting.

**timers throttle lsa all** *delay-time hold-time max-wait-time*

**no timers throttle lsa all**

**Parameter Description**

| Parameter            | Description                                                                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>delay-time</i>    | Specifies a shortest LSA generation delay, in milliseconds (the first batch of LSAs is usually generated immediately).<br>The range is from 0 to 600000 in the unit of milliseconds.                                               |
| <i>hold-time</i>     | Specifies a shortest interval between the first two times of LSA refreshment, in milliseconds.<br>The range is from 1 to 600000 in the unit of milliseconds                                                                        |
| <i>max-wait-time</i> | Specifies a longest interval for consecutive two times of LSA refreshment, in milliseconds. The value is used to determine whether LSAs are refreshed consecutively.<br>The range is from 1 to 600000 in the unit of milliseconds. |

**Defaults** The default *delay-time* is 0, *hold-time* is 5000 and *max-wait-time* is 5000.

**Command** Routing process configuration mode

**Mode**

**Usage Guide** If high route convergence capability is needed when links are changed, set a small *delay-time* value. To reduce CPU consumption, you can properly increase the values of the parameters.

 The *hold-time* value cannot be smaller than the *delay-time* value and must be smaller than or equal to the *max-wait-time* value.

**Configuration Examples** The following example sets *delay-time* to 10 milliseconds, *hold-time* to one second, and *max-wait-time* to five seconds.

```
Ruijie(config)# ipv6 router ospf 1
Ruijie(config-router)# timers throttle lsa all 10 1000 5000
```

**Related Commands**

|-----------------------------|--------------------------------------|
| <code>show ipv6 ospf</code> | Displays OSPFv3 process information. |

**Platform** N/A

**Description**

### 3.56 timers throttle route

Use this command to configure the delay time of route calculation on receiving the ASBR summary LSA and the external summary LSA. Use the **no** form of this command to restore the default setting.

**timers throttle route** { **inter-area** *ia-delay* | **ase** *ase-delay* }

**no timers throttle route** { **inter-area** | **ase** }

**Parameter Description**

| Parameter         | Description                                                                                                                                                                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>inter-area</b> | Calculates the inter area routes.                                                                                                                                                                                                                    |
| <i>ia-delay</i>   | Sets the delay time of the inter-area route calculation, in the range from 0 to 600000 in the unit of milliseconds. On receiving the ASBR summary LSA, the router will not calculate the inter-area routes until the <i>ia-delay</i> time runs out.  |
| <b>ase</b>        | Calculates the external routes.                                                                                                                                                                                                                      |
| <i>ase-delay</i>  | Sets the delay time of the external route calculation, in the range from 0 to 600000 in the unit of milliseconds. On receiving the external summary LSA, the router will not calculate the external routes until the <i>ase-delay</i> time runs out. |

**Defaults** The default *ia-delay* is 0 and *ase-delay* is 0.

**Command** Routing process configuration mode

**Mode**

**Usage Guide** The default setting is recommended if the network needs to be fast converged. For the instable network where multiple inter-area and external routes exist, if you want to optimize the route calculation and save the CPU resources, increase the delay time.

**Configuration** The following example sets the delay time of the inter-area route calculation to one second.

**Examples**

```
Ruijie(config)# ipv6 router ospf 1
Ruijie(config-router)# timers throttle route inter-area 1000
```

**Platform** N/A

**Description**

### 3.57 timers throttle spf

Use this command to configure, the delay for SPF calculation as well as the minimum and maximum intervals between two SPF calculations after receiving the topology change information for OSPFv3 in the routing process configuration mode. Use the **no** form of this command to restore the default setting.

**timers throttle spf** *spf-delay spf-holdtime spf-max-waittime*

**no timers throttle spf**

**Parameter Description**

| Parameter               | Description                                                                                                                                         |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>spf-delay</i>        | Specifies an SPF calculation delay after the topology change information is received.<br>The range is from 1 to 600000 in the unit of milliseconds. |
| <i>spf-holdtime</i>     | Specifies a shortest interval between two SPF calculations.<br>The range is from 1 to 600000 in the unit of milliseconds.                           |
| <i>spf-max-waittime</i> | Specifies a longest interval between two SPF calculations.<br>The range is from 1 to 600000 in the unit of milliseconds.                            |

**Defaults** The default *spf-delay* is 1000. *spf-holdtime* is 5000 and *spf-max-waittime* is 10000.

**Command**

**Mode** Routing process configuration mode.

**Usage Guide** *Spf-delay* refers to the delay from the topology change to the SPF calculation. *Spf-holdtime* refers to the minimum interval between the first and the second SPF calculations. Then, the interval of the consecutive SPF calculations is at least twice as the last interval till it reaches to *spf-max-waittime*. If

the interval between two SPF calculations has exceeded the required minimum value, the interval of SPF calculation will re-start from *spf-holdtime*.

Smaller *spf-delay* and *spf-holdtime* value can make the topology convergence faster. Greater *spf-max-waittime* value can reduce the SPF calculations. Those configuration are flexible according to the actual stability of the network topology.

Compared with the timers spf command, this command is more flexible. It not only speeds up the SPF convergence calculation, but also reduces the system resources consumption of SPF calculation as the topology changes continuously. Therefore, the timers throttle spf command is recommended.

- i The spf-holdtime cannot be smaller than spf-delay, or the spf-holdtime will be set to be equal to spf-delay;
- i The spf-max-waittime cannot be smaller than spf-holdtime, or the spf-max-waittime will be set to be equal to spf-holdtime automatically;
- i The configuration of the timers spf command and of the timers throttle spf command are overwritten each other.
- i With neither timers spf command nor timers throttle spf command configured, the default value refers to the default of the timers throttle spf command

**Configuration Examples** The following example configures the delay and holdtime and the maximum time interval of the OSPFv3 as 5ms, 1000ms and 90000ms respectively. If the topology changes consecutively, the time for SPF calculation is: five milliseconds, one second, three seconds, seven seconds, 15 seconds, 31 seconds, 63 seconds, 89 seconds, 179 seconds, 179+90 seconds.....

```
Ruijie(config)# ipv6 router ospf 20
Ruijie(config-router)# timers spf 5 1000 90000
```

**Related Commands**

| Command                | Description                                            |
|------------------------|--------------------------------------------------------|
| <b>clear ipv6 ospf</b> | Restarts part of the OSPFv3 function.                  |

**Platform** N/A  
**Description**

### 3.58 two-way-maintain

Use this command to enable two-way OSPFv3 maintenance. Use the **no** form of this command to disable this function.

**two-way-maintain**  
**no two-way-maintain**

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

|                    |     |     |
|--------------------|-----|-----|
| <b>Description</b> |     |     |
|                    | N/A | N/A |

**Defaults** Two-way OSPFv3 maintenance is enabled by default.

**Command Mode** Routing process configuration mode

**Usage Guide** Sometimes, there are a lot of sent and received packets on a network, occupying large CPU and memory resources. As a result, some packets cannot be processed immediately or are directly lost. If hello packets from a neighbor cannot be processed within the dead interval of neighbors, the connection with the neighbor will be interrupted due to connection timeout. If two-way OSPFv3 maintenance is enabled and a large number of packets exist on the network, besides hello packets, the two-way neighboring relationship between the device and the neighbor can also be maintained by DD, LSU, LSR, and LSAck packets from the neighbor. This prevents the neighboring relationship from failing due to receiving delay or discarding of hello packets.

**Configuration** The following example disables two-way OSPFv3 maintenance.

**Examples**

```
Ruijie(config)# ipv6 router ospf 1
Ruijie(config-router)# no two-way-maintain
```

|                         |                       |                                                   |
|-------------------------|-----------------------|---------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>        | <b>Description</b>                                |
|                         | <b>show ipv6 ospf</b> | Displays global OSPFv3 configuration information. |

**Platform Description** N/A

## 4 IS-IS Commands

### 4.1 address-family ipv6

Use this command to enter the **address-family ipv6** mode. Use the **no** form of this command to delete all configurations in the **address-family ipv6**.

**address-family ipv6** [ *unicast* ]

**no address-family ipv6** [ *unicast* ]

| Parameter Description | Parameter      | Description                  |
|-----------------------|----------------|------------------------------|
|                       | <i>unicast</i> | IPv6 unicast address prefix. |

**Defaults** By default, no address-family ipv6 is configured.

**Command Mode** IS-IS routing process configuration mode

**Usage Guide** This command is used for the IPv6 special configurations.  
To exit to the IS-IS routing process configuration mode, use the **exit-address-family** command.

#### Configuration

##### Examples

```
Ruijie(config)# router isis
Ruijie(config-router)# address-family ipv6 unicast
```

| Related Commands | Command             | Description                         |
|------------------|---------------------|-------------------------------------|
|                  | exit-address-family | Exits the address-family ipv6 mode. |

**Platform Description** N/A

### 4.2 adjacency-check

Use this command to detect protocols supported by the adjacency in the Hello packets. Use the **no** form of this command is to cancel this detection.

**adjacency-check**

**no adjacency-check**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|-----------------------|-----------|-------------|

|     |     |
|-----|-----|
| N/A | N/A |
|-----|-----|

**Defaults** By default, this detection is enabled.

**Command Mode** IS-IS routing process configuration mode or address-family ipv6 mode

**Usage Guide** N/A

**Configuration Examples**

```
Ruijie(config)# router isis
Ruijie(config-router)# adjacency-check
Ruijie(config-router)# address-family ipv6
Ruijie(config-router-af)# adjacency-check
```

**Platform Description** N/A

### 4.3 area-password

Use this command to set the plain-text authentication password for the Level-1 area. Use the **no** form of this command to cancel the password set.

**area-password** [ 0 | 7 ] *password-string* [ **send-only** ]  
**no area-password** [ **send-only** ]

| Parameter Description  | Parameter | Description                                                                                                                                                         |
|------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                        | <b>0</b>  |                                                                                                                                                                     |
| <b>7</b>               |           | Indicates that the key is displayed in ciphertext.                                                                                                                  |
| <i>password-string</i> |           | Indicates the password string for plaintext authentication. The string can contain up to 126 characters.                                                            |
| <b>send-only</b>       |           | Indicates that the plaintext authentication password is only used to authenticate sent Hello packets in Level-1 areas. Received Hello packets are not authenticate. |

**Defaults** By default, no authentication password is set.

**Command Mode** IS-IS routing process configuration mode

**Usage Guide** Run this command to enable authentication of received LSPs, CSNPs, and PSNPs in Level-1 areas

and include authentication information in these packets before they are sent. All IS-IS devices in an area must be configured with the same password.

This command does not take effect if the **authentication mode** command is executed. You need to first delete the previous command configuration.

To delete the password, run the **no area-password** command. If you run the **no area-password send-only** command, only the **send-only** setting is canceled. If you run the **area-password psw send-only** and **no area-password send-only** commands in sequence, the configuration is changed to **area-password psw**.

**Configuration Examples** The following example specifies the authentication in the IS-IS area using the plaintext mode with the password being *redgiant* and the password applicable to the packets sent only, but not to the packets received.

```
Ruijie(config)# router isis
Ruijie(config-router)# area-password redgiant send-only
```

**Related Commands**

| Command                    | Description                              |
|----------------------------|------------------------------------------|
| <b>domain-password</b>     | Sets the Level-2 domain password.        |
| <b>authentication mode</b> | Specifies the IS-IS authentication mode. |

**Platform Description** N/A

## 4.4 authentication key-chain

Use this command to specify the key-chain used by the IS-IS authentication. Use the **no** form of this command to cancel the key-chain specified.

**authentication key-chain** *name-of-chain* [ **level-1** | **level-2** ]

**no authentication key-chain** *name-of-chain* [ **level-1** | **level-2** ]

**Parameter Description**

| Parameter            | Description                                            |
|----------------------|--------------------------------------------------------|
| <i>name-of-chain</i> | Key-chain name with the maximum length being 255.      |
| <b>level-1</b>       | Specifies the authentication key-chain of the Level-1. |
| <b>level-2</b>       | Specifies the authentication key-chain of the Level-2. |

**Defaults** By default, the authentication key-chain is not specified.

**Command Mode** IS-IS routing process configuration mode

**Usage Guide** If the **key chain** command is not used to configure the corresponding key-chain, the authentication will not be performed. In addition, to make the IS-IS key-chain authentication effective, you need to configure the **authentication mode** command at the same time.

This key-chain can apply to the plain-text authentication mode and MD5 encrypted authentication mode. You can use the **authentication mode** command to set the authentication mode.

The length of the password key-string in the key-chain shall not be larger than 80 characters if the plain-text authentication mode is used, otherwise this configuration will fail.

Only one key-chain is used at one time. So, when configuring this command, the said key-chain will be replaced by the new specified one.

If the Level is not specified, the key-chain will apply to both Level-1 and Level-2.

The key-chain specified by this command works on the LSP, CSNP and PSNP packets. The IS-IS will send or receive the password that belongs to this key-chain.

There may contain multiple passwords in the key-chain. When sending the packets, use the password with small number first. While receiving the packets, the packet will be received as long as the password of this packet received corresponds to any password in the key-chain.

**Configuration** The following example specifies the authentication in the IS-IS area using the key-chain named *kc*:

**Examples**

```
Ruijie(config)# router isis
Ruijie(config-router)# authentication key-chain kc level-1
```

**Related  
Commands**

| Command                         | Description                                                                                          |
|---------------------------------|------------------------------------------------------------------------------------------------------|
| <b>authentication mode</b>      | Specifies the IS-IS authentication mode.                                                             |
| <b>authentication send-only</b> | Specifies the IS-IS authentication applicable to the sent packets only, but not to packets received. |
| <b>key-chain</b>                | Configures the key-chain.                                                                            |

**Platform** N/A

**Description**

## 4.5 authentication mode

Use this command to specify the mode of IS-IS authentication. Use the **no** form of this command to cancel the specified IS-IS authentication mode.

**authentication mode** { **md5** | **text** } [ **level-1** | **level-2** ]

**no authentication mode** { **md5** | **text** } [ **level-1** | **level-2** ]

**Parameter  
Description**

| Parameter      | Description                                                     |
|----------------|-----------------------------------------------------------------|
| <b>md5</b>     | Specifies the MD5 authentication mode to use.                   |
| <b>text</b>    | Specifies the plain-text authentication mode to use.            |
| <b>level-1</b> | Specifies the authentication mode taking effect on the Level-1. |
| <b>level-2</b> | Specifies the authentication mode taking effect on the Level-2. |

**Defaults** By default, the authentication mode is not specified.

**Command Mode** IS-IS routing process configuration mode

**Usage Guide** To make the key-chain configured by the **authentication key-chain** command effective, you must use the **authentication mode** command to specify the authentication mode.

If no Level is specified, the authentication mode specified is applicable to both Level-1 and Level-2.

When configuring the **authentication mode** command, if the **area-password** or **domain-password** command has been executed to configure the plaintext authentication before, the said commands will be overwritten by the new command.

If the **authentication mode** command has been configured, the **area-password** or **domain-password** will not be configured successfully, you need to delete the **authentication mode** command first.

**Configuration Examples** The following example specifies authentication in the IS-IS area to be the MD5 authentication mode.

```
Ruijie(config)# router isis
Ruijie(config-router)# authentication mode md5 level-1
```

**Related Commands**

| Command                         | Description                                                                                              |
|---------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>area-password</b>            | Sets the area plaintext authentication password.                                                         |
| <b>authentication key-chain</b> | Specifies the key-chain used by the IS-IS authentication.                                                |
| <b>authentication send-only</b> | Specifies the IS-IS authentication applicable to the packets sent only, but not to the packets received. |
| <b>domain-password</b>          | Sets the domain plaintext authentication password.                                                       |

**Platform Description** N/A

## 4.6 authentication send-only

Use this command to specify the IS-IS authentication only applicable to the packets sent, but not to the packets received. Use the **no** form of this command to perform the authentication on the packets received.

**authentication send-only [ level-1 | level-2 ]**

**no authentication send-only [ level-1 | level-2 ]**

**Parameter Description**

| Parameter      | Description                                        |
|----------------|----------------------------------------------------|
| <b>level-1</b> | Specifies setting <b>send-only</b> on the Level-1. |
| <b>level-2</b> | Specifies setting <b>send-only</b> on the Level-2. |

- Defaults** By default, this command is not configured. If the IS-IS authentication is configured, the authentication will be performed on the packets both sent and received.
- Command** IS-IS routing process configuration mode
- Mode**
- Usage Guide** With this command configured, the IS-IS will set the authentication password in the packets sent, however, the authentication will not be performed on the packets received. It can apply to the following two occasions: 1. before deploying the IS-IS authentication for all devices in the network. 2. before changing the authentication password or authentication mode. Before the above two tasks start, you need to configure the **authentication send-only** command first to make each device perform no authentication on the packets received, so as to avoid the network oscillation caused during the subsequent authentication password deployment. After the deployment of the entire network authentication finished, execute the **no isis authentication send-only** command to cancel the **send-only** authentication mode.
- This command can apply to the plain-text authentication mode and MD5 authentication mode. You can use the **authentication mode** command to set the authentication mode.
- If the Level is not specified, the authentication mode specified is applicable to both Level-1 and Level-2.

**Configuration** The following example specifies the authentication in the IS-IS area to be the **send-only** mode.

**Examples**

```
Ruijie(config)# router isis
Ruijie(config-router)# authentication send-only level-1
```

**Related Commands**

| Command                         | Description                                   |
|---------------------------------|-----------------------------------------------|
| <b>authentication key-chain</b> | Specifies the IS-IS authentication key-chain. |
| <b>authentication mode</b>      | Specifies the mode of IS-IS authentication.   |

**Platform** N/A

**Description**

## 4.7 bfd all-interfaces

Use this command to configure all interfaces running the IS-IS protocol to conduct BFD link detection.  
**bfd all-interfaces [anti-congestion]**

Use the **no** form of this command to configure all interfaces running the IS-IS protocol to not conduct BFD link detection.

**no bfd all-interfaces [anti-congestion]**

**Parameter**

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

| Description |                 |                                |
|-------------|-----------------|--------------------------------|
|             | anti-congestion | IS-IS BFD anti-flapping option |

**Defaults** The IS-IS support for BFD is disabled on all interfaces by default.

**Command Mode** IS-IS routing process configuration mode

**Default Level** 14

**Usage Guide** There are two methods for enabling or disabling the IS-IS support for BFD on interfaces.

Method 1: In IS-IS routing process configuration mode, run the [ **no** ] **bfd all-interfaces [anti-congestion]** command to enable or disable the IS-IS support for BFD on all interfaces running the IS-IS protocol.

Method 2: In interface configuration mode, run the **isis bfd [disable | anti-congestion]** command to enable or disable the IS-IS support for BFD on a specified interface.

In normal cases, the BFD function enables to send detection packets to detect the link status at an interval of several milliseconds. When a link exception such as link interruption occurs, the BFD function enables to rapidly detect the link exception, and notify a device running the IS-IS protocol to delete neighbors and delete neighbor availability information from LSP packets. The device running the IS-IS protocol performs route re-calculation and generates a new route, to bypass the failure link, thereby implementing fast convergence. With the introduction of some new technologies such as the Multi-Service Transport Platform (MSTP), link congestion easily occurs in peak hours. When congestion occurs, the BFD function allows to rapidly detect a link exception, notify a device running the IS-IS protocol to delete a neighbor and delete neighbor availability information from LSP packets, and perform link switching to bypass the congested link. The interval for an IS-IS neighbor to send a Hello detection packet is 10 seconds and the timeout time is 30 seconds. When an exception is detected via the BFD function, IS-IS Hello packets can be normally received, an IS-IS neighbor relationship can be rapidly established, and the route is restored to pass the congested link. Then, BFD is performed again. If there is still a link exception, link switching is performed again, and the process repeats. The route switches between the congested link and other links and flapping occurs.

The anti-flapping function can be enabled to prevent route flapping in the case of link congestion. After the anti-flapping function is enabled, if a link is congested, the IS-IS neighbor status keeps alive but the neighbor availability information in LSP packets is deleted, and the route switches to a non-congested link. After the link is restored, that is, congestion is removed, the neighbor availability information is restored in LSP packets, and the route switches back to the originally congested link, thereby preventing route flapping.

When IS-IS anti-flapping is enabled, the BFD anti-flapping command (**bfd up-dampening**) must be configured on an interface. The two commands must be configured simultaneously. If only one of them is configured, the anti-flapping function does not take effect or a network exception is incurred.

For details about how to enable the BFD anti-flapping function on an interface, see the configuration example of the ISIS BFD command.

-  Before the IS-IS support for BFD is configured, a BFD session must be configured on an interface.
-  When the BFD anti-flapping command is configured on an interface, if the IS-IS support for BFD is

already configured on the interface, the anti-flapping function must be enabled for a device running the IS-IS protocol.

-  When the IS-IS anti-flapping option is configured, the BFD anti-flapping command must be configured on an interface.

**Configuration** The following example configures all interfaces running the IS-IS protocol to conduct BFD.

**Examples**

```
Ruijie(config)# router isis 123
Ruijie(config-router)# bfd all-interface
```

## 4.8 clear clns neighbors

Use this command to clear all IS-IS neighbor relation tables.

**clear clns neighbors**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       |           | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command is used in the condition of needing to refresh the IS-IS neighbor relation table immediately.

**Configuration** The following example clears all IS-IS neighbor relation tables.

**Examples**

```
Ruijie# clear clns neighbors
```

| Related Commands | Command | Description       |
|------------------|---------|-------------------|
|                  |         | <b>clear isis</b> |

**Platform Description** N/A

## 4.9 clear isis \*

Use this command to clear the data structure of all IS-ISs.

**clear isis \***

| <b>Parameter Description</b> | Parameter | Description |
|------------------------------|-----------|-------------|
|                              | N/A       | N/A         |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** This command is used in the condition of needing to refresh the LSP immediately. For example, after executing the **area-password** and **domain-password** commands, the previous LSPs still exist in this router, you can use this command to clear these LSPs.

**Configuration Examples** Ruijie# `clear isis *`

| <b>Related Commands</b> | Command                           | Description                 |
|-------------------------|-----------------------------------|-----------------------------|
|                         | <code>clear clns neighbors</code> | Clears all IS-IS neighbors. |

**Platform Description** N/A

### 4.10 clear isis counter

Use this command to clear various statistics of IS-IS.

`clear isis [ tag ] counter`

| <b>Parameter Description</b> | Parameter  | Description    |
|------------------------------|------------|----------------|
|                              | <i>tag</i> | IS-IS instance |

**Defaults** N/A

**Command Mode** Privileged EXEC mode

**Usage Guide** N/A

**Configuration Examples** The following example clears various statistics of IS-IS.

Ruijie# `clear isis counter`

| <b>Related Commands</b> | Command | Description |
|-------------------------|---------|-------------|
|                         |         |             |

|                     |                                          |
|---------------------|------------------------------------------|
| <b>clear isis *</b> | Clears the data structure of all IS-ISs. |
|---------------------|------------------------------------------|

**Platform** N/A

**Description**

## 4.11 default-information originate

Use this command to generate a default routing information and advertise it by LSP. Use the **no** form of this command to delete the default routing information from LSP.

**default-information originate** [ **route-map** *map-name* ]

**no default-information originate** [ **route-map** *map-name* ]

| Parameter          | Parameter       | Description                                                                                                            |
|--------------------|-----------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <i>map-name</i> | (Optional) Associated route-map's name, with the maximum length being 32. By default, the route-map is not associated. |

**Defaults** By default, there is no default route.

**Command** IS-IS routing process configuration mode or address-family ipv6 mode.

**Mode**

**Usage Guide** The default route is not generated in the Level-2 domain. Use this command to allow the default route to enter the Level-2 domain.

**Configuration** The following example generates a default routing information and advertises it by LSP

**Examples**

```
Ruijie(config)# router isis
Ruijie(config-router)# default-information originate
Ruijie(config-router)# address-family ipv6
Ruijie(config-router-af)# default-information originate
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform** N/A

**Description**

## 4.12 distance

Use this command to set the management distance of the IS-IS routes. Use the **no** form of this command to restore the default settings.

**distance** *my-cost*

**no distance**

| Parameter<br>Description | Parameter | Description    |
|--------------------------|-----------|----------------|
|                          |           | <i>my-cost</i> |

**Defaults** By default, the distance is 115.

**Command Mode** IS-IS routing process configuration mode or IS-IS address-family ipv6 configuration mode

**Usage Guide** Use this command to configure the management distance of the IS-IS routes. The shorter the management distance, the more reliable the routing information is.

**Configuration** The following example sets the management distance of the IS-IS routes.

```
Ruijie(config)# router isis
Ruijie(config-router)# distance 100
```

| Related<br>Commands | Command | Description        |
|---------------------|---------|--------------------|
|                     |         | <b>isis metric</b> |

**Platform** N/A  
**Description**

### 4.13 domain-password

Use this command to set the plain-text authentication password of Level-2 domain. Use the **no** form of this command to cancel the password configured.

**domain-password** [ 0 | 7 ] *password-string* [ **send-only** ]  
**no domain-password** [ **send-only** ]

| Parameter<br>Description | Parameter              | Description                                                                                                                                                          |
|--------------------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          |                        | <b>0</b>                                                                                                                                                             |
|                          | <b>7</b>               | Indicates that the key is displayed in ciphertext.                                                                                                                   |
|                          | <i>password-string</i> | Indicates the password string for plaintext authentication. The string can contain up to 126 characters.                                                             |
|                          | <b>send-only</b>       | Indicates that the plaintext authentication password is only used to authenticate sent Hello packets in Level-1 areas. Received Hello packets are not authenticated. |

**Defaults** By default, no authentication password is set.

**Command** IS-IS routing process configuration mode  
**Mode**

**Usage Guide** Run this command to enable authentication of received LSPs, CSNPs, and PSNPs in Level-2 domains and include authentication information in these packets before they are sent. All IS-IS devices in a Level-2 domain must be configured with the same password.

This command does not take effect if the **authentication mode** command is executed. You need to first delete the previous command configuration.

To delete the password, run the **no domain-password** command. If you run the **no domain-password send-only** command, only the **send-only** setting is canceled. If you run the **domain-password psw send-only** and **no domain-password send-only** commands in sequence, the configuration is changed to **domain-password psw**.

**Configuration** Ruijie(config)# **router isis**

**Examples** Ruijie(config-router)# **domain-password redgiant**

**Related Commands**

| Command                    | Description                                                  |
|----------------------------|--------------------------------------------------------------|
| <b>area-password</b>       | Sets the plain-text authentication password of Level-1 area. |
| <b>authentication mode</b> | Specifies the IS-IS authentication mode.                     |

**Platform** N/A  
**Description**

## 4.14 enable mib-binding

Use this command to bind MIBs with an IS-IS process. Use the **no** form of this command to unbind the MIB from the IS-IS process.

**enable mib-binding**

**no enable mib-binding**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** By default, MIBs are bound with IS-IS process 1.

**Command** IS-IS routing process configuration mode  
**Mode**

**Usage Guide** By default, MIBs are bound with IS-IS process 1. The IS-IS process support multiple processes. The administrator can use this command to bind MIBs with the IS-IS process.

**Configuration** The following example binds the MIB with an IS-IS process.

**Examples**

```
Ruijie# configure terminal
Ruijie(config)# router isis
Ruijie(config-router)# enable mib-binding
```

**Related Commands**

|----------------------------------------|-------------------------------------------------------------|
| <b>graceful-restart helper disable</b> | Disables the IS-IS GR Help capability.                      |
| <b>isis hello-interval</b>             | Sets the interval of sending Hello packets.                 |
| <b>isis hello-multiplier</b>           | Sets the Hello holdtime multiplier for the IS-IS interface. |

**Platform** N/A

**Description**

## 4.15 enable traps

Use this command to enable the system to send one or multiple types of IS-IS trap packets. Use the **no** form of this command to disable the system to send IS-IS trap packets.

**enable traps** { **all** | *traps set* }

**no enable traps** { **all** | *traps set* }

**Parameter Description**

| Parameter        | Description                                        |
|------------------|----------------------------------------------------|
| <b>all</b>       | Indicates all types of IS-IS trap packets.         |
| <i>traps set</i> | Indicates the specified type of IS-IS trap packet. |

**Defaults** By default, no IS-IS trap is sent.

**Command Mode** IS-IS routing process configuration mode

**Usage Guide** There are 18 types of IS-IS packets. The IS-IS packets can be classified into multiple sets. Each set includes several types of trap packets. To enable the system to send the IS-IS trap packet, you need to enable the global IS-IS trap using the **snmp-server enable traps isis** command, specify the host to receive the IS-IS trap packets, and use the **enable traps** { **all** | *traps set* } command to specify the type of IS-IS trap packet to be sent.

**Configuration Examples** The following example enables the system to send all IS-IS trap packets to the host of IP address 192.168.1.1.

```
Ruijie# configure terminal
Ruijie(config)#snmp-server enable traps isis
Ruijie(config)#snmp-server host 10.1.1.1 traps version 2c public
```

```
Ruijie(config)#router isis
Ruijie(config-router)# enable traps all
```

| Command                                | Description                                                 |
|----------------------------------------|-------------------------------------------------------------|
| <b>graceful-restart helper disable</b> | Disables the IS-IS GR Help capability.                      |
| <b>isis hello-interval</b>             | Sets the interval of sending Hello packets.                 |
| <b>isis hello-multiplier</b>           | Sets the Hello holdtime multiplier for the IS-IS interface. |

**Platform** N/A

**Description**

### 4.16 exit-address-family

Use this command to exit IS-IS address family IPv6 configuration mode and return to IS-IS routing process configuration mode.

**exit-address-family**

**Parameter Description**

| Parameter | Description |
|-----------|-------------|
| N/A       | N/A         |

**Defaults** N/A

**Command Mode** IS-IS address-family IPv6 configuration mode

**Usage Guide** N/A

**Configuration Examples** The following example exits IS-IS address family IPv6 configuration mode.

```
Ruijie (config-router-af)#exit-address-family
Ruijie (config-router)#
```

**Related Commands**

| <b>isis hello-multiplier</b>           | Sets the Hello holdtime multiplier for the IS-IS interface. |

**Platform** N/A

**Description**

## 4.17 graceful-restart

Use this command to enable the IS-IS GR Restart capability. Use the **no** form of this command to disable this capability.

**graceful-restart**

**no graceful-restart**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** IS-IS GR is enabled by default.

**Command Mode** IS-IS routing process configuration mode

**Usage Guide** Use this command to enable the IS-IS GR Restart capability. As long as the network conditions remain unchanged, IS-IS can be restarted and restored to the pre-restart state without impact on data forwarding.

**Configuration** The following example enables the IS-IS GR Restart capability.

**Examples**

```
Ruijie(config)# router isis
Ruijie(config-router)# graceful-restart
```

| Related Commands | Command                                | Description                                                 |
|------------------|----------------------------------------|-------------------------------------------------------------|
|                  | <b>graceful-restart helper disable</b> | Disables the IS-IS GR Help capability.                      |
|                  | <b>isis hello-interval</b>             | Sets the interval of sending Hello packets.                 |
|                  | <b>isis hello-multiplier</b>           | Sets the Hello holdtime multiplier for the IS-IS interface. |

**Platform** N/A

**Description**

## 4.18 graceful-restart grace-period

Use this command to configure the maximal interval for the graceful-restart. Use the **no** form of this command to restore the default interval.

**graceful-restart grace-period** *seconds*

**no graceful-restart grace-period**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|-----------------------|-----------|-------------|

|                |                                                                                             |
|----------------|---------------------------------------------------------------------------------------------|
| <i>seconds</i> | Time interval allowed for the device graceful-restart, in the range of 1 to 65,535 seconds. |
|----------------|---------------------------------------------------------------------------------------------|

**Defaults** The default value is 300 seconds.

**Command Mode** IS-IS routing process configuration mode

**Usage Guide** N/A

**Configuration** The following example sets the interval of the grace-restart to 40 seconds.

**Examples**

```
Ruijie(config)# router isis
Ruijie(config-router)# graceful-restart grace-period 40
```

| Related Commands | Command                           | Description                                              |
|------------------|-----------------------------------|----------------------------------------------------------|
|                  | <b>graceful-restart</b>           | Enables the IS-IS GR Restart capability.                 |
|                  | <b>show isis graceful-restart</b> | Displays the status information of the IS-IS GR Restart. |

**Platform** N/A

**Description**

## 4.19 graceful-restart helper disable

Use this command to disable the IS-IS GR Helper capability. Use the **no** form of this command to enable this capability.

- graceful-restart helper disable**
- no graceful-restart helper disable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** IS-IS GR Helper capacity is enabled by default.

**Command Mode** IS-IS routing process configuration mode

**Usage Guide** To disable the IS-IS GR Helper capability, execute this command. In this case, the IS-IS will ignore the request of graceful-restarting the device.

**Configuration** The following example disables the IS-IS GR Helper capability.

**Examples**

```
Ruijie(config)# router isis
```

```
Ruijie(config-router)# graceful-restart helper disable
```

| Related Commands | Command | Description             |
|------------------|---------|-------------------------|
|                  |         | <b>graceful-restart</b> |

**Platform** N/A

**Description**

## 4.20 hello padding

Use this command to pad IS-IS Hello packets.

**hello padding [ multi-point | point-to-point ]**

Use the **no** form of this command to cancel the padding of IS-IS Hello packets.

**no hello padding [ multi-point | point-to-point ]**

| Parameter Description | Parameter             | Description                         |
|-----------------------|-----------------------|-------------------------------------|
|                       |                       | <b>multi-point</b>                  |
|                       | <b>point-to-point</b> | Pads Hello packets of the P2P type. |

**Defaults** Padding is enabled for Hello packets of the LAN type and P2P type by default.

**Command Mode** IS-IS routing process configuration mode

**Default Level** 14

**Usage Guide** Hello packets can be padded to notify a neighbor of the MTU supported by the local device. You can use this command to set whether to pad all Hello packets sent by the IS-IS process. You can also separately specify the type of Hello packets for padding, for example, you can set not to pad all Hello packets of the LAN type or not to pad all Hello packets of the P2P type.

The **isis hello padding** command is available in interface configuration mode. Hello packets sent by a specific interface are not padded if the padding of such Hello packets is cancelled in IS-IS routing process configuration mode or the padding of Hello packets sent by the interface is cancelled in interface configuration mode.

**Configuration** The following example configures to cancel the padding of Hello packets of the P2P type.

**Examples**

```
Ruijie(config)# router isis
Ruijie(config-router)# no hello padding point-to-point
```

## 4.21 hostname dynamic

Use this command to replace the System ID of the router with the destination router's hostname.

Use the **no** form of this command to cancel this replacement.

**hostname dynamic**

**no hostname dynamic**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** By default, the hostname dynamic function is disabled.

**Command Mode** IS-IS routing process configuration mode

**Usage Guide** With this command configured, the hostname of the destination router replaces the System ID. The System IDs shown in the execution of the command such as **show isis database**, **show isis neighbors** are all replaced by the hostname of the destination router.

**Configuration Examples** Ruijie(config)# **router isis**

Ruijie(config-router)# **hostname dynamic**

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform** N/A

**Description**

## 4.22 ignore-lsp-errors

Use this command to ignore the LSP checksum errors. Use the **no** form of this command to not ignore the LSP checksum errors.

**ignore-lsp-errors**

**no ignore-lsp-errors**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** By default, the LSP checksum errors are not ignored.

**Command** IS-IS routing process configuration mode  
**Mode**

**Usage Guide** When the local IS-IS receives a LSP, it will calculate the checksum of LSP received and compare the calculated checksum with that in the LSP packets. By default, if the checksum in the LSP packets is different from the checksum calculated, this LSP will be discarded without processing. If we execute the ignore-lsp-errors command to ignore the checksum errors, the LSP packets with the incorrect checksum will be processed as the normal packets.

**Configuration Examples**

```
Ruijie(config)# router isis
Ruijie(config-router)# ignore-lsp-errors
```

**Description**

## 4.23 ip router isis

Use this command to enable the IPv4 IS-IS on the specified interface. Use the **no** form of this command to disable the IPv4 IS-IS routing on the specified interface.

**ip router isis** [ tag ]

**no ip router isis** [ tag ]

**Parameter Description**

| Parameter | Description          |
|-----------|----------------------|
| tag       | IS-IS instance name. |

**Defaults** By default, the Ipv4 IS-IS is disabled on the interface.

**Command** Interface configuration mode  
**Mode**

**Usage Guide** Use this command to enable the IS-IS IPv4 routing protocol on the interface. The **no** form of this command disables the IS-IS IPv4 routing.

If the **no ipv4 unicast-routing** is executed in global configuration mode, the IS-IS will disable the IPv4 routing function on all interfaces, namely execute the **no ipv4 router isis** [tag] on all interfaces automatically, while other IS-IS configurations will remain unchanged.

**Configuration Examples**

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if)# ip router isis
```

| Related Commands | Command                 | Description                              |
|------------------|-------------------------|------------------------------------------|
|                  | <b>ipv6 router isis</b> | Enables the IPv6 IS-IS on the interface. |
|                  | <b>router isis</b>      | Creates IS-IS instances.                 |

**Platform** N/A

**Description**

## 4.24 ipv6 router isis

Use this command to enable the IPv6 IS-IS routing on the specified interface. This command must be configured in the IS-IS configuration. The interface will run on the IS-IS instance named with Tag. If this IS-IS instance is inexistent or this IS-IS instance is not enabled and not initialized, the interface will not enable the IS-IS routing.

Use the **no** form of this command to disable the IPv6 IS-IS routing on the specified interface.

**ipv6 router isis** [ tag ]

**no ipv6 router isis** [ tag ]

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       |           | tag         |

**Defaults** By default, the Ipv6 IS-IS routing is not supported on the interface.

**Command Mode** Interface configuration mode

**Usage Guide** Configure this command to enable the IS-IS IPv6 routing protocol on the interface. The **no** form of this command disables the IS-IS IPv6 routing.

If the **no ipv6 unicast-routing** is executed in the global configuration mode, the IS-IS will disable the IPv6 routing function on all interfaces, namely execute the **no ipv6 router isis** [ tag ] on all interfaces automatically, while other IS-IS configurations will remain unchanged.

**Configuration Examples** Ruijie(config)# **interface GigabitEthernet 0/1**

Ruijie(config-if)# **ipv6 router isis**

| Related Commands | Command               | Description                              |

|                  | <b>ip router isis</b> | Enables the IPv4 IS-IS on the interface. |
|                  | <b>router isis</b>    | Creates IS-IS instances.                 |

**Platform** N/A

**Description**

## 4.25 isis authentication key-chain

Use this command to set the key-chain used by the IS-IS interface authentication. Use the **no** form of this command to cancel the specified key-chain.

**isis authentication key-chain** *name-of-chain* [ **level-1** | **level-2** ]

**no isis authentication key-chain** *name-of-chain* [ **level-1** | **level-2** ]

| Parameter Description | Parameter            | Description                                            |
|-----------------------|----------------------|--------------------------------------------------------|
|                       | <i>name-of-chain</i> | Key-chain name with the maximum length being 255.      |
|                       | <b>level-1</b>       | Specifies the authentication key-chain of the Level-1. |
|                       | <b>level-2</b>       | Specifies the authentication key-chain of the Level-2. |

**Defaults** By default, no IS-IS interface authentication key-chain is specified.

**Command** Interface configuration mode

**Mode**

**Usage Guide** If the **key chain** command is not used to configure the corresponding key-chain, the authentication will not be performed. In addition, to make the IS-IS key-chain authentication effective, you need to configure the **isis authentication mode** command at the same time.

This key-chain can apply to the plain-text authentication mode and MD5 encrypted authentication mode. You can use the **isis authentication mode** command to set the authentication mode.

The length of the password key-string in the key-chain shall not be larger than 254 characters if the plain-text authentication mode is used, otherwise this configuration will fail.

Only one key-chain is used at one time. So, when configuring this command, the said key-chain will be overwritten by the new specified one.

If the Level is not specified, the key-chain will apply to both Level-1 and Level-2.

The key-chain specified by this command works on the Hello packets. The IS-IS will send or receive the password that belongs to this key-chain.

There may contain multiple passwords in the key-chain. When sending the packets, use the password with small number first. While receiving the packets, the packet will be received as long as the password of this packet received corresponds to any password in the key-chain.

The authentication commands configured in the IS-IS configuration mode such as authentication key-chain are effective to the LSP, SNP packets, but take no effect on the IS-IS interface.

**Configuration Examples** The following example specifies the authentication key-chain of the interface GigabitEthernet 0/1 named as *kc*.

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if)# isis authentication key-chain kc
```

**Related Commands**

| Command                         | Description                           |
|---------------------------------|---------------------------------------|
| <b>isis authentication mode</b> | Specifies the mode of IS-IS interface |

|                                      |                                                                                                                    |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------|
|                                      | authentication.                                                                                                    |
| <b>isis authentication send-only</b> | Specifies the IS-IS interface authentication only applicable to the packets sent, but not to the packets received. |
| <b>key-chain</b>                     | Configures the key-chain.                                                                                          |

**Platform** N/A

**Description**

## 4.26 isis authentication mode

Use this command to specify the mode of IS-IS interface authentication. Use the **no** form of this command to remove the configuration.

**isis authentication mode** { md5 | text } [ level-1 | level-2 ]

**no isis authentication mode** { md5 | text } [ level-1 | level-2 ]

**Parameter Description**

| Parameter      | Description                                                                |
|----------------|----------------------------------------------------------------------------|
| <b>md5</b>     | Specifies the MD5 authentication mode.                                     |
| <b>text</b>    | Specifies the plain-text authentication mode.                              |
| <b>level-1</b> | Specifies the interface authentication mode to take effect on the Level-1. |
| <b>level-2</b> | Specifies the interface authentication mode to take effect on the Level-2. |

**Defaults** By default, no interface authentication mode is specified.

**Command** Interface configuration mode

**Mode**

**Usage Guide** To make the key-chain configured by the **isis authentication key-chain** command take effect, you must use the **isis authentication mode** command to specify the authentication mode. If the Level is not specified, the authentication mode specified will apply on both Level-1 and Level-2. When configuring the **isis authentication mode** command, if the isis password has been executed, the set command will be overwritten by this command. If the **isis authentication mode** command has been executed, the **isis password** will not be configured successfully. So, you need to delete the **isis authentication mode** command first.

**Configuration** The following example specifies the authentication mode on the Level-2 of the interface

**Examples** GigabitEthernet 0/1 to be the MD5 authentication mode.

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if)# isis authentication mode md5 level-2
```

| Related Commands | Command                              | Description                                                                                                      |

|                  | <b>isis authentication key-chain</b> | Specifies the key-chain used by the IS-IS interface authentication.                                              |
|                  | <b>isis authentication send-only</b> | Specifies the IS-IS interface authentication to only apply on the packets sent, but not on the packets received. |
|                  | <b>key-chain</b>                     | Configures the key-chain.                                                                                        |
|                  | <b>isis password</b>                 | Sets the plain-text authentication password for the packets transmit on the IS-IS interface.                     |

**Platform** N/A

**Description**

## 4.27 isis authentication send-only

Use this command to specify the IS-IS interface authentication to only apply to the packets sent and not to the packets received. Use the **no** form of this command to restore the authentication of packets received on the interface.

**isis authentication send-only [ level-1 | level-2 ]**

**no isis authentication send-only [ level-1 | level-2 ]**

| Parameter Description | Parameter      | Description                                               |
|-----------------------|----------------|-----------------------------------------------------------|
|                       | <b>level-1</b> | Set the <b>send-only</b> on the Level-1 of the interface. |
|                       | <b>level-2</b> | Set the <b>send-only</b> on the Level-2 of the interface. |

**Defaults** By default, this command is not configured. If the IS-IS interface authentication has been configured, then the authentication will be performed on the packets sent and recieved at the same time.

**Command Mode** Interface configuration mode

**Usage Guide** With this command configured, the IS-IS will set the authentication password in the Hello packets sent from the interface, however, the authentication will not be performed on the Hello packets received. It can apply to the following two occasions: 1. before deploying the IS-IS interface authentication for all devices in the network. 2. before changing the authentication password or authentication mode. Before the above two tasks start, you need to configure the **isis authentication send-only** command first to make each device perform no authentication on the Hello packets received, so as to avoid the network oscillation caused during the subsequent IS-IS interface authentication deployment. After the deployment of the entire network authentication finished, execute the **no isis authentication send-only** command to cancel the **send-only** authentication mode.

This command can apply to the plain-text authentication mode and MD5 authentication mode. You

can use the **isis authentication mode** command to set the mode used by the IS-IS interface authentication.

If the Level is not specified, the authentication mode specified is applicable to the Level-1 and Level-2.

**Configuration Examples** The following example specifies the authentication on the Level-1 of the interface GigabitEthernet 0/1 using send-only authentication mode.

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if)# isis authentication send-only level-1
```

| <b>key-chain</b>                     | Configures the key-chain.                                           |

**Platform** N/A

**Description**

## 4.28 isis bfd

Use this command to enable association between IS-IS and BFD on an interface.

**isis bfd [ disable | anti-congestion]**

Use the **no** form of this command to disable association between IS-IS and BFD on an interface.

**no isis bfd [ disable | anti-congestion]**

**Parameter Description**

| Parameter              | Description                                                 |
|------------------------|-------------------------------------------------------------|
| <b>disable</b>         | Disables association between IS-IS and BFD on an interface. |
| <b>anti-congestion</b> | Indicates the IS-IS BFD anti-flapping option.               |

**Defaults** If the **bfd all-interfaces** command is configured, association between IS-IS and BFD is enabled on an interface.

If the **bfd all-interfaces** command is not configured, association between IS-IS and BFD is disabled on an interface.

By default, the anti-flapping function is disabled.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide** There are two methods for enabling or disabling association between IS-IS and BFD on interfaces.

Method 1: In IS-IS routing process configuration mode, run the [ **no** ] **bfd all-interfaces [anti-congestion]** command to enable or disable association between IS-IS and BFD on all interfaces running the IS-IS protocol.

Method 2: In interface configuration mode, run the **isis bfd [disable | anti-congestion]** command to enable or disable association between IS-IS and BFD on a specified interface.

In normal cases, the device with the BFD function enabled sends detection packets to detect the link status at an interval of several milliseconds. When a link exception such as link interruption occurs, the device with the BFD function enabled rapidly detects the link exception and informs a device running the IS-IS protocol to delete neighbors and delete neighbor availability information from LSP packets. The device running the IS-IS protocol performs route re-calculation and generates a new route, to bypass the failed link, thereby implementing fast convergence. With the introduction of some new technologies such as the Multi-Service Transport Platform (MSTP), link congestion easily occurs in peak hours. When congestion occurs, the device with the BFD function enabled rapidly detects a link exception, informs a device running the IS-IS protocol to delete a neighbor and delete neighbor availability information from LSP packets, and performs link switching to bypass the congested link. The interval for an IS-IS neighbor to send a Hello detection packet is 10 seconds, and the timeout time is 30 seconds. When an exception is detected via the BFD function, IS-IS Hello packets can be normally received, the IS-IS neighbor relationship can be rapidly reestablished, and the route is restored to pass the congested link. Then, BFD is performed again. If there is still a link exception, link switching is performed repeatedly. The route switches between the congested link and other links and flapping occurs.

The anti-flapping function can be enabled to prevent route flapping in the case of link congestion. After the anti-flapping function is enabled, if a link is congested, the IS-IS neighbor keeps alive but the neighbor availability information in LSP packets is deleted, and the route switches to a non-congested link. After the link is restored, that is, congestion is eliminated, the neighbor availability information is restored in LSP packets, and the route switches back to the originally congested link, thereby preventing route flapping.

When IS-IS anti-flapping is enabled, the BFD anti-flapping command (**bfd up-dampening**) must be configured on an interface. The two commands must be configured simultaneously. If only one of them is configured, the anti-flapping function does not take effect or a network exception is incurred.

- 
-  Before association between IS-IS and BFD is configured, a BFD session must be configured on an interface.
  -  When the BFD anti-flapping command is configured on an interface, if association between IS-IS and BFD is already configured on the interface, the anti-flapping function must be enabled for a device running the IS-IS protocol.
  -  When the IS-IS anti-flapping option is configured, the BFD anti-flapping command must be configured on an interface.
- 

**Configuration** 1. The following example disables association between IS-IS and BFD on GigabitEthernet 0/1.

**Examples** Ruijie(config)# interface GigabitEthernet 0/1

```
Ruijie(config-if)# no switchport
Ruijie(config-if)# isis bfd disable
```

2. The following example enables the IS-IS BFD anti-flapping option and configures the BFD anti-flapping command on GigabitEthernet 0/1.

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if)# no switchport
Ruijie(config-if)# isis bfd anti-congestion
Ruijie(config-if)# bfd up-dampening 60000
```

## 4.29 isis circuit-type

Use this command to set the circuit-type for the IS-IS interface. Use the **no** form of this command to restore the default settings.

**isis circuit-type { level-1 | level-1-2 | level-2-only }**

**no isis circuit-type**

### Parameter Description

| Parameter           | Description                                         |
|---------------------|-----------------------------------------------------|
| <b>level-1</b>      | Forms the Level-1 adjacency.                        |
| <b>level-2-only</b> | Forms the Level-2 adjacency.                        |
| <b>level-1-2</b>    | Forms the Level-1-2 adjacency.                      |
| <b>external</b>     | Uses the interface as an external domain interface. |

**Defaults** By default, the circuit-type is Level-1-2.

**Command Mode** Interface configuration mode

**Usage Guide** If the circuit type is set to Level-1 or Level-2-only, IS-IS will only send PDUs of the corresponding Level.

If the system type is set to Level-1 or Level-2-only, IS-IS only processes the instances of the corresponding Level, and the interface only sends the PDUs of the same Level specified by the **is-type** and **circuit-type** commands.

If the interface is set to **external**, the interface will work as an external domain interface and IS-IS will not send PDUs of the corresponding Level.

**Configuration Examples** Ruijie(config)# **interface GigabitEthernet 0/1**

```
Ruijie(config-if)# isis circuit-type level-2-only
```

### Related Commands

| Command          | Description                       |
|------------------|-----------------------------------|
| <b>isis-type</b> | Sets the Level of IS-IS instance. |

**Platform** N/A  
**Description**

### 4.30 isis csnp-interval

Use this command to set the interval for broadcasting the CSNP packets on the IS-IS interface, with the unit being second. Use the **no** form of this command to restore the default interval.

**isis csnp-interval** *interval* [ **level-1** | **level-2** ]  
**no isis csnp-interval** [ *interval* ] [ **level-1** | **level-2** ]

| Parameter Description | Parameter       | Description                                                                                   |
|-----------------------|-----------------|-----------------------------------------------------------------------------------------------|
|                       | <i>interval</i> | Interval for sending the CSNP packets in the range of 0 to 65535, with the unit being second. |
|                       | <b>level-1</b>  | Interval for sending the CSNP packets configured only on the Level-1.                         |
|                       | <b>level-2</b>  | Interval for sending the CSNP packets configured only on the Level-2.                         |

**Defaults** By default, in the broadcast network, the interval for sending the CSNP packets is 10 seconds. While in the P2P interface network, no CSNP packet is sent by default.  
 When using this command without the parameter Level-1 and Level-2, the new setting is defaulted to be applicable to the Level-1 and Level-2 at the time.

**Command Mode** Interface configuration mode

**Usage Guide** Configure this command to change the interval for sending the CSNP packets. By default, the DIS on the broadcast network sends the CSNP packets every 10 seconds.  
 For the P2P interface network, by default, the CSNP packets will only be sent at the beginning of adjacency formation. If the interface is set to mesh-groups, you can configure the periodic sending of the CSNP packets.  
 If the csnp-interval is set to 0, no CSNP packets will be sent.

**Configuration Examples**

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if)# isis csnp-interval 20
```

**Platform** N/A  
**Description**

## 4.31 isis hello-interval

Use this command to set the interval for sending Hello packets on the interface, with the unit being second. Use the **no** form of this command to restore the default interval.

**isis hello-interval** { *interval* | **minimal** } [ **level-1** | **level-2** ]

**no isis hello-interval** [ **level-1** | **level-2** ]

| Parameter Description | Parameter       | Description                                                        |
|-----------------------|-----------------|--------------------------------------------------------------------|
|                       | <i>interval</i> | Interval for sending the Hello packet, in the range of 1 to 65536. |
|                       | <b>minimal</b>  | The holdtime is set to the minimal value 1.                        |
|                       | <b>level-1</b>  | This interval applies on the Level-1.                              |
|                       | <b>level-2</b>  | This interval applies on the Level-2.                              |

**Defaults** By default, the interval value is 10 seconds, which is applicable to the Level-1 and Level-2 at the same time.

When using this command without the parameter Level-1 and Level-2, the new setting is defaulted to be applicable to the Level-1 and Level-2 at the time.

**Command Mode** Interface configuration mode

**Usage Guide** Configure this command to change the interval for sending Hello packets. By default, the multiplier of the Hello holdtime is 3, and the DIS in broadcast network sends Hello packets at an interval which is three times of non-DIS. If this IS is elected as DIS on this interface, the interface will send Hello packets every 3.3 seconds by default.

If the key word "minimal" is used, then the "holdtime" in Hello packets will be set to 1, and hello interval will be calculated based on the hello-multiplier. For example, if hello-multiplier is configured to 4 and "isis hello-interval minimal" is configured at the same time, the value of hello-interval shall be 1s/4 (250ms).

By default, the CPU protection is enabled on the switch, so that the number of packets corresponding to the destination group addresses of ISIS (AllISSystems, AllL1ISSystems, AllL2ISSystems) is limited when they are sent to the CPU, for example , the default limited value is 400pps. The number of packets received by the switch may be larger than the default value if there are many neighbors or the interval for sending Hello packets is short, resulting in continual vibration of the adjacent relation. In this case, you need to raise the limit of IS-IS packets using the global commands **cpu-protect type isis-is pps**, **cpu-protect type isis-l1is pps** and **cpu-protect type isis-l2is pps**.

**Configuration Examples** The following example sets the interval for sending Hello packets on the interface.

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if)# isis hello-interval 5 level-1
```

The following example sets the Holdtime for sending Hello packets on the interface to the minimum value 1.

```
Ruijie(config)# interface GigabitEthernet 0/1
```

```
Ruijie(config-if)# isis hello-interval minimal
```

**Related  
Commands**

| Command                      | Description                                  |
|------------------------------|----------------------------------------------|
| <b>isis hello-multiplier</b> | Sets the multiplier of the Hello hold timer. |

**Platform** N/A

**Description**

## 4.32 isis hello-multiplier

Use this command to set the multiplier of Hello hold timer. Use the **no** form of this command to restore the default settings.

**isis hello-multiplier** *multiplier-number* [ **level-1** | **level-2** ]

**no isis hello-multiplier** [ *multiplier-number* ] [ **level-1** | **level-2** ]

**Parameter  
Description**

| Parameter                | Description                                |
|--------------------------|--------------------------------------------|
| <i>multiplier-number</i> | Multiplier value in the range of 2 to 100. |

**Defaults** By default, the multiplier is 3..

**Command  
Mode** Interface configuration mode

**Usage Guide** Use this command to set the multiplier of Hello holdtime. The holdtime value in the Hello packet is the product of hello-interval and this multiplier.

**Configuration**

```
Ruijie(config)# router isis
```

**Examples**

```
Ruijie(config-router)# isis hello-multiplier 5
```

**Related  
Commands**

| Command                    | Description                                      |
|----------------------------|--------------------------------------------------|
| <b>isis hello-interval</b> | Sets the interval for sending the Hello packets. |

**Platform** N/A

**Description**

## 4.33 isis hello padding

Use this command to specify the filling mode for the IS-IS Hello packets. Use the **no** form of this command to fill no IS-IS Hello packets.

**isis hello padding**

**no isis hello padding**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       |           | N/A         |

**Command Mode** Interface configuration mode

**Usage Guide** Fill the IS-IS Hello packets to advertise the MTU supported to the neighbors. Hello packets can be padded to notify a neighbor of the MTU supported by the local device. In IS-IS routing process configuration mode, the corresponding **hello padding** command also exists. Hello packets sent by a specific interface are not padded if the padding of such Hello packets is cancelled in IS-IS routing process configuration mode or the padding of Hello packets sent by the local interface is cancelled in interface configuration mode.

**Configuration** The following example fills no IS-IS Hello packets.

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if)# no isis hello padding
```

**Platform Description** N/A

### 4.34 isis lsp-interval

Use this command to set the interval for the LSP PDU transmission. Use the **no** form of this command to restore the default interval.

**isis lsp-interval** *milliseconds* [ **level-1** | **level-2**]

**no isis lsp-interval** [ **level-1** | **level-2**]

| Parameter Description | Parameter      | Description                               |
|-----------------------|----------------|-------------------------------------------|
|                       |                | <i>milliseconds</i>                       |
|                       | <b>level-1</b> | Applies the setting only to Level-1 LSPs. |
|                       | <b>level-2</b> | Applies the setting only to Level-2 LSPs. |

**Defaults** By default, the lsp-interval is 33ms.

**Command** Interface configuration mode  
**Mode**

**Usage Guide** N/A

**Configuration** The following example sets the interval for the LSP PDU transmission to 100.

**Examples**

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if)# isis lsp-interval 100
```

**Related  
Commands**

| Command                         | Description                                              |
|---------------------------------|----------------------------------------------------------|
| <b>isis retransmit-interval</b> | Sets the LSP retransmission interval in the P2P network. |

**Platform** N/A  
**Description**

## 4.35 isis mesh-group

Use this command to add the interface to the specified mesh-group. Use the **no** form of this command to separate the interface from the mesh-group.

**isis mesh-group** { **blocked** | *mesh-group-id* }  
**no isis mesh-group**

**Parameter  
Description**

| Parameter            | Description                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------|
| <b>blocked</b>       | Blocks all LSP forwarding on the interface.                                                              |
| <i>mesh-group-id</i> | Adds the interface to the mesh-group of specified mesh-group-id with the range being 1 to 4,294,967,295. |

**Defaults** By default, the interface is not added to any mesh-group.

**Command** Interface configuration mode  
**Mode**

**Usage Guide** Mesh-groups can control the exceeding and redundant LSP spreading in the NBMA network. In the normal condition, the IS-IS router spreads out the LSP from all interfaces except for the receiving one, that is, if a router is configured multiple subinterfaces, the LSP will be sent from all subinterfaces and the neighbors will receive many same LSPs, which wastes a large number of CPU and bandwidth. The IS-IS mesh-group allows grouping the router interfaces, so if a LSP is received by one subinterface in the group, this LSP will not be spread out through other subinterfaces in the group. And if the router receives the LSP from the interface out of the group, it will spread out the LSP from other interfaces as usual.

If you need to configure the **mesh-group** on the IS-IS interface, use the **isis csnp-interval** command

to configure the interval for sending the non-0 CSNP packets, so as to send the CNSP packets regularly to synchronize the LSP and ensure the integrity of LSP synchronization between neighbors in network.

**Configuration** Ruijie#**configure terminal**

**Examples** Ruijie (config)# **interface GigabitEthernet 0/1**  
Ruijie (config-if)#**isis mesh-group 1**

| Related Commands | Command | Description                        |
|------------------|---------|------------------------------------|
|                  |         | <b>isis network point-to-point</b> |

**Platform** N/A

**Description**

## 4.36 isis metric

Use this command to set the metric for the interface. Use the **no** form of this command to restore the default metric.

**isis metric** *metric* [ **level-1** | **level-2** ]

**no isis metric** [ *metric* ] [ **level-1** | **level-2** ]

| Parameter Description | Parameter      | Description                                       |
|-----------------------|----------------|---------------------------------------------------|
|                       |                | <i>metric</i>                                     |
|                       | <b>level-1</b> | Sets this metric to apply on the Level-1 circuit. |
|                       | <b>level-2</b> | Sets this metric to apply on the Level-2 circuit. |

**Defaults** By default, the metric is 10, which applies on both Level-1 and Level-2 circuit.

**Command Mode** Interface configuration mode

**Usage Guide** The Metric value is in the TLV of the IP reachable information and is applied to the SPF calculation. The greater metric value means the more routing cost on this interface and the longer path calculated by SPF.

This value is effective only when the metric-style includes narrow.

**Configuration Examples** Ruijie (config)# **interface GigabitEthernet 0/1**  
Ruijie (config-if)#**isis metric 1**

**Mode**

**Usage Guide** N/A

**Configuration** Ruijie(config)# interface GigabitEthernet 0/1

**Examples** Ruijie(config-if)# isis network point-to-point

| Related Commands | Command                | Description                                             |
|------------------|------------------------|---------------------------------------------------------|
|                  | <b>isis mesh-group</b> | Adds the IS-IS interface into the specified mesh group. |

**Platform** N/A

**Description**

## 4.38 isis password

Use this command to set the plain-text authentication password for the Hello packet transmitted on the interface. Use the **no** form of this command to remove the configurations.

**isis password password-string [ send-only ] [ level-1 | level-2 ]**

**no isis password [ send-only ] [ level-1 | level-2 ]**

| Parameter | Parameter | Description |
|-----------|-----------|-------------|
|-----------|-----------|-------------|

|                    |                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> |                                                                                                                                         |
| <b>0</b>           | Indicates that the key is displayed in plaintext.                                                                                       |
| <b>7</b>           | Indicates that the key is displayed in ciphertext.                                                                                      |
| password-string    | Indicates the password string for plaintext authentication. The string can contain up to 126 characters.                                |
| <b>send-only</b>   | Indicates that the plaintext authentication password is only used to authenticate sent packets. Received packets are not authenticated. |
| <b>level-1</b>     | Applies the setting to the Level-1 circuit type.                                                                                        |
| <b>level-2</b>     | Applies the setting to the Level-2 circuit type.                                                                                        |

**Defaults** By default, both the passwords on the Level-1 and Level-2 are not configured.

**Command Mode** Interface configuration mode

**Usage Guide** This command is used to set the plain-text authentication password for the Hello packets transmitted on the interface. Use the **no** form of this command to clear the passwords. When the Level is not specified, the authentication password configured is by default applicable to every Level. If the **isis authentication mode** command has been executed, this command will not be configured successfully. To configure this command, you need to delete the **isis authentication mode** command first.

Running the **no isis password send-only** command can only disable the **send-only** option.

**Configuration Examples**

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if)# isis password redgiant
```

| <b>Related Commands</b> | Command                  | Description                                               |
|-------------------------|--------------------------|-----------------------------------------------------------|
|                         | isis authentication mode | Specifies the mode of the IS-IS interface authentication. |

**Platform Description** N/A

### 4.39 isis priority

Use this command to set the priority for the DIS election on the LAN. Use the **no** form of this command to restore the default priority.

**isis priority** *value* [ **level-1** | **level-2** ]  
**no isis priority** [ *value* ] [ **level-1** | **level-2** ]

| <b>Parameter Description</b> | Parameter | Description |
|------------------------------|-----------|-------------|
|                              |           |             |

|                |                                                 |
|----------------|-------------------------------------------------|
| <i>value</i>   | Value of the priority in the range of 0 to 127. |
| <b>level-1</b> | Applies to the Level-1 circuit.                 |
| <b>level-2</b> | Applies to the Level-2 circuit.                 |

**Defaults** The default priority value is 64 and it is applied on both Level-1 and Leve-2 circuit.

**Command Mode** Interface configuration mode

**Usage Guide** Use this command to change the priority value in the Hello of LAN.  
 The low priority value has the lower priority in the DIS election than the high priority value.  
 This command takes no effect on the Point-to-Point network interface.  
 The **no isis priority** command is used to restore the priority to the default value no matter whether the parameter is followed. If you want to modify the configured priority, you can either use the **isis priority** command with parameter specified to overwrite the configured command directly, or configure a new parameter after restoring the priority to the default value.

```

Configuration Ruijie# configure terminal
Examples Ruijie(config)# interface GigabitEthernet 0/1
    Ruijie(config-if)# isis priority 127 level-1
    
```

| Related Commands | Command | Description |
|------------------|---------|-------------|
|                  | N/A     | N/A         |

**Platform Description** N/A

### 4.40 isis psnp-interval

Use this command to set the minimum transmission interval of PSNP packets.

**isis psnp-interval** *seconds* [ **level-1** | **level-2** ]

Use the **no** form of this command to cancel the specified minimum transmission interval of PSNP packets.

**no isis psnp-interval** [ **level-1** | **level-2** ]

| Parameter Description | Parameter      | Description                                                    |
|-----------------------|----------------|----------------------------------------------------------------|
|                       | seconds        | seconds                                                        |
| <b>level-1</b>        | <b>level-1</b> | Indicates that the configuration takes effect only at Level-1. |
| <b>level-2</b>        | <b>level-2</b> | Indicates that the configuration takes effect only at Level-2. |

**Defaults** This command is not configured by default. The default minimum transmission interval is 2 seconds and takes effect both at Level-1 and Level-2.

**Command Mode** Interface configuration mode

**Default Level** 14

**Usage Guide** PSNP packets are used to request for LSP packets or respond to received LSP packets in a point-to-point network. In both cases, it is recommended to send PSNP packets rapidly. If there are excessive LSP packets but the device performance is poor, you can set the PSNP packet transmission interval and LSP retransmission time to larger values, to reduce the device load.

**Configuration Examples** The following example sets the PSNP packet transmission interval to 5 seconds for Interface GigabitEthernet 0/1 at Level-2.

```
Ruijie(config)# interface GigabitEthernet 0/1
Ruijie(config-if)# isis psnp-interval 5 level-2
```

## 4.41 isis retransmit-interval

Use this command to set the LSP retransmission interval. Use the **no** form of this command to restore the default interval.

**isis retransmit-interval** *seconds* [ **level-1** | **level-2** ]

**no isis retransmit-interval** [ **level-1** | **level-2** ]

| Parameter Description | Parameter      | Description                                                                                        |
|-----------------------|----------------|----------------------------------------------------------------------------------------------------|
|                       | <i>seconds</i> | Indicates the LSP retransmission interval. The value range is 0 to 65,535, in the unit of seconds. |
|                       | <b>level-1</b> | Applies the setting only to Level-1 LSPs.                                                          |
|                       | <b>level-2</b> | Applies the setting only to Level-2 LSPs.                                                          |

**Defaults** The default value is 5s.

**Command Mode** Interface configuration mode

**Usage Guide** Use this command to configure the LSP retransmission interval. In a P2P network, after a device sends an LSP, if the device receives no PSNP response within the time specified by this command, it will resend the LSP. If the retransmission interval is set to 0, the LSP will not be resent.

The following example sets the LSP retransmission interval to 10s.

**Configuration Examples**

```
Ruijie(config)# interface serial 0/1
Ruijie(config-if)# isis retransmit-interval 10 level-2
```

| Related Commands | Command | Description              |
|------------------|---------|--------------------------|
|                  |         | <b>isis lsp-interval</b> |

**Platform** N/A

**Description**

## 4.42 isis subvlan

Use this command to enable IS-IS on super VLANs. Use the **no** form of this command to restore the default setting.

**isis subvlan** [**all** | *vid*]

**no isis subvlan**

| Parameter Description | Parameter  | Description                                                 |
|-----------------------|------------|-------------------------------------------------------------|
|                       |            | <i>all</i>                                                  |
|                       | <i>vid</i> | Specifies the sub VLAN ID. The value ranges from 1 to 4094. |

**Defaults** The default setting takes effect only on super VLANs with IS-IS disabled.

**Command Mode** Interface configuration mode.

**Usage Guide** In normal cases, a super VLAN contains multiple sub VLANs. Multicast packets of a super VLAN are also sent to its sub VLANs. In this case, when IS-IS multicast packets are sent over a super VLAN containing multiple sub VLANs, the IS-IS multicast packets are replicated multiple times, and the device processing capability is insufficient. As a result, a large number of packets are discarded, causing the neighbor down error. In most scenarios, the IS-IS function does not need to be enabled on a super VLAN. Therefore, the IS-IS function is disabled by default. However, in some scenarios, the IS-IS function must be run on the super VLAN, but packets only need to be sent to one sub VLAN. In this case, run this command to specify a particular sub VLAN. You must be cautious in configuring packet transmission to all sub VLANs, as the large number of sub VLANs may cause a device processing bottleneck, which will lead to the neighbor down error.

**Configuration Examples** The following example sends the IS-IS multicast packets to sub VLAN 1024 of super VLAN 300.

```
Ruijie(config)# interface vlan 300
Ruijie(config-if-VLAN 300)# isis subvlan 1024
```

## 4.43 isis three-way-handshake disable

Use this command to disable three-way handshake for point-to-point network. Use the **no** form of this command to enable three-way handshake for point-to-point network.

**isis three-way-handshake disable**

**no isis three-way-handshake disable**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       | N/A       | N/A         |

**Defaults** By default, three-way handshake is enabled.

**Command Mode** Interface configuration mode

**Usage Guide** In the point-to-point network, three-way handshake is enabled by default. That is to say, the IS-IS neighbor can be established only after three-way handshake is successful. You can use this command to cancel three-way handshake negotiation to accelerate IS-IS neighbor establishment or for the the device not supporting three-way handshake.

**Configuration** The following example disables three-way handshake on interface GigabitEthernet 0/0.

**Examples**

```
Ruijie(config)#int GigabitEthernet 0/0
Ruijie(config-if)# isis network point-to-point
Ruijie(config-if)# isis three-way-handshake disable
```

| Related Commands | Command            | Description                             |
|------------------|--------------------|-----------------------------------------|
|                  | <b>metric-type</b> | Sets the metric type.                   |
|                  | <b>isis metric</b> | Sets the metric value of the interface. |

**Platform Description** N/A

## 4.44 isis wide-metric

Use this command to set the wide metric of the interface. Use the **no** form of this command to restore the default wide metric.

**isis wide-metric** *metric* [ **level-1** | **level-2** ]

**no isis wide-metric** [ *metric* ] [ **level-1** | **level-2** ]

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|-----------------------|-----------|-------------|

|                |                                                   |
|----------------|---------------------------------------------------|
| <i>metric</i>  | Metric value in the range of 1 to 16,777,241.     |
| <b>level-1</b> | Sets this Metric to apply on the Level-1 circuit. |
| <b>level-2</b> | Sets this Metric to apply on the Level-2 circuit. |

**Defaults** By default, the metric value is 10 and it is applicable to both Level-1, Level-2 circuit.

**Command Mode** Interface configuration mode

**Usage Guide** The Metric value is in the TLV of the IP reachable information and is applied to the SPF calculation. The greater metric value means the more routing cost on this interface and the longer path calculated by SPF.  
This value is effective only when the metric-style includes wide.

**Configuration** Ruijie(config)# **interface GigabitEthernet 0/1**

**Examples** Ruijie(config-if)#**isis wide-metric 1000**

**Related Commands**

| Command            | Description                             |

**Description**

## 4.45 is-type

Use this command to specify the level for the IS-IS process. Use the **no** form of this command to restore the default level for IS-IS process.

**is-type { level-1 | level-1-2 | level-2-only }**

**no is-type**

**Parameter Description**

| Parameter           | Description                                                      |
|---------------------|------------------------------------------------------------------|
| <b>level-1</b>      | Specifies the IS-IS process running on the Level-1 only.         |
| <b>level-1-2</b>    | Specifies the IS-IS process running on both Level-1 and Level-2. |
| <b>level-2-only</b> | Specifies the IS-IS process running on the Level-2 only.         |

**Defaults** By default, the IS-IS process runs on Level-1-2.

**Command Mode** IS-IS routing process configuration mode

**Usage Guide** Changing the is-type enables or disables the route of one Level.

**Configuration** Ruijie(config)# **router isis**  
**Examples** Ruijie(config-router)# **is-type level-1**

| Related Commands | Command | Description              |
|------------------|---------|--------------------------|
|                  |         | <b>isis circuit-type</b> |

**Platform** N/A  
**Description**

### 4.46 log-adjacency-changes

Use this command to log the changes of the IS adjacency status in case of debug disabled. Use the **no** form of this command to disable this function.

**log-adjacency-changes**  
**no log-adjacency-changes**

| Parameter Description | Parameter | Description |
|-----------------------|-----------|-------------|
|                       |           | N/A         |

**Defaults** By default, this function is enabled.

**Command Mode** IS-IS routing process configuration mode

**Usage Guide** You can also use the **debug** command to log the changes of the IS adjacency status. But using the IS-IS debug command will exhaust large numbers of resources.

**Configuration** Ruijie(config)# **router isis**  
**Examples** Ruijie(config-router)# **log-adjacency-changes**

| Related Commands | Command | Description |
|------------------|---------|-------------|

**Platform** N/A  
**Description**

## 4.47 lsp-fragments-extend

Use this command to enable the LSP fragment extension mode for a level. Use the **no** form of this command to disable the LSP fragment extension mode for a level.

**lsp-fragments-extend** [ level-1 | level-2 ] [compatible rfc3786]

**no lsp-fragments-extend** [ level-1 | level-2 ] [compatible rfc3786]

| Parameter Description | Parameter         | Description                                                   |
|-----------------------|-------------------|---------------------------------------------------------------|
|                       | <b>level-1</b>    | Enables the LSP fragment extension mode for the Level-1 only. |
|                       | <b>level-2</b>    | Enables the LSP fragment extension mode for the Level-2 only. |
|                       | <b>compatible</b> | Compatible with RFC3786                                       |
|                       | <b>rfc3786</b>    | The older version of extended LSP implementation.             |

**Defaults** By default, LSP fragment extension is disabled.  
If no level is specified, the LSP fragment extension mode is enabled for both Level-1 and Level-2.

**Command Mode** IS-IS routing process configuration mode

**Usage Guide** The originating LSP can be divided up to 256 fragments. After the 256 fragments are filled, the subsequent link state information, such as the neighbor and IP routing, will be discarded, resulting in network problem.  
To avoid the above problem, you can enable the LSP fragment extension function, and configure the additional system ID using the **virtual-system** command.  
If there are other vendor's device supporting RFC3786 standard in the network, you need to display the link state database of the device when enabling or disabling the **compatible** option. If there is indeed the vendor's device, you can use the **clear isis \*** command to clear the remaining LSP packets to trigger the system to update the link state database.

**Configuration Examples** The following example enables the LSP fragment extension mode for the Level-2.

```
Ruijie(config)# router isis
Ruijie(config-router)# lsp-fragments-extend level-2
```

| Related Commands | Command | Description |

**Platform Description** N/A

## 4.48 Isp-gen-interval

Use this command to set the minimal interval of the LSP generation. Use the **no** form of this command to restore the default value.

**Isp-gen-interval** [ **level-1** | **level-2** ] *maximum-interval* [*initial-interval* *hold-interval*]

**no Isp-gen-interval** [ **level-1** | **level-2** ]

| Parameter Description | Parameter               | Description                                                                                                                                                                        |
|-----------------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <b>level-1</b>          | Applies the configuration only to Level-1.                                                                                                                                         |
|                       | <b>level-2</b>          | Applies the configuration only to Level-2.                                                                                                                                         |
|                       | <i>maximum-interval</i> | Indicates the maximum interval for generating two consecutive LSP packets. The value range is <b>1</b> to <b>65535</b> (in seconds). The default value is <b>5</b> .               |
|                       | <i>initial-interval</i> | Indicates the waiting time for generating an LSP packet for the first time. The value range is <b>0</b> to <b>60000</b> (in milliseconds). The default value is <b>50</b> .        |
|                       | <i>hold-interval</i>    | Indicates the minimum interval for generating an LSP packet for the second time. The value range is <b>10</b> to <b>60000</b> (in milliseconds). The default value is <b>200</b> . |

**Defaults** By default, this command is not configured and the interval of the minimal generation is 5s, it is effective on both Level-1 and Level-2

**Command Mode** IS-IS routing process configuration mode

**Usage Guide** The LSP packet generation interval refers to the interval for generating two different LSP packets. A smaller generation interval indicates faster network convergence, which, however, will be accompanied by frequent flooding on the network.

The waiting time for generating an LSP packet for the first time is the initial interval. If the network becomes unstable, the LSP packet regeneration interval is changed to be less than the maximum interval, and the interval for generating an LSP packet for the second time becomes the hold interval. A corresponding penalty will be added to this interval: The next interval for regenerating a LSP packet doubles the previous interval for generating the same LSP packet, until the regeneration interval reaches the maximum interval. Subsequent LSP packets will be generated at the maximum interval. When the network becomes stable, the LSP packet regeneration interval becomes greater than the maximum interval, and the waiting time for LSP packet generation is restored to the initial interval.

Link changes have high requirements for convergence. The initial interval can be set to a small value. The preceding parameters can also be adjusted to larger values to reduce CPU consumption. The value of **initial-interval** cannot be greater than that of **maximum-interval**. Otherwise, the value of **initial-interval** will be used as the value of **maximum-interval**.

The value of **hold-interval** cannot be greater than that of **maximum-interval**. Otherwise, the value of **hold-interval** will be used as the value of **maximum-interval**.

The value of **initial-interval** cannot be greater than that of **hold-interval**. Otherwise, the value of **initial-interval** will be used as the value of **hold-interval**.

**Configuration Examples** The following example sets the minimum interval for generating two duplicate LSP packets to 10 seconds, the interval for generating a duplicate LSP packet for the first time to 100 ms, and the interval for generating a duplicate LSP packet for the second time to 200 ms.

```
Ruijie(config)# router isis
Ruijie(config-router)# lsp-gen-interval 10 100 200
```

The following example sets the minimum interval for generating two duplicate LSP packets to 5 seconds.

```
Ruijie(config)# router isis
Ruijie(config-router)# lsp-gen-interval 5
```

**Related Commands**

| Command                     | Description                              |
|-----------------------------|------------------------------------------|
| <b>lsp-refresh-interval</b> | Configures the interval for LSP refresh. |

**Platform** N/A  
**Description**

## 4.49 lsp-length originate

Use this command to set the maximum length for transmitting LSP packets.

**lsp-length originate** *size* [ **level-1** | **level-2** ]

Use the **no** form of this command to restore the default value.

**no lsp-length originate** [ **level-1** | **level-2** ]

**Parameter Description**

| Parameter      | Description                                                                                                        |
|----------------|--------------------------------------------------------------------------------------------------------------------|
| <i>size</i>    | Specifies the maximum length for transmitting LSP packets. The value range is <b>512</b> to <b>16000</b> in bytes. |
| <b>level-1</b> | Indicates that the configuration takes effect only at Level-1.                                                     |
| <b>level-2</b> | Indicates that the configuration takes effect only at Level-2.                                                     |

**Defaults** The default value of the maximum length for transmitting LSP packets is **1492**. If no level is specified, the default value is **level-1-2**, that is, the configuration takes effect at both Level-1 and Level-2.

**Command Mode** IS-IS routing process configuration mode

**Default Level** 14

**Usage Guide** In principle, the length of LSP and SNP packets cannot be greater than the interface MTU. Otherwise, LSP packets and SNP packets are directly discarded upon being sent.

**Configuration** The following example sets the maximum length for transmitting LSP packets at Level-2 to 1498 bytes.

**Examples**

```
Ruijie(config)# router isis 1
Ruijie(config-router)# lsp-length originate 1498 level-2
```

## 4.50 lsp-length receive

Use this command to set the maximum length for receiving LSP packets.

**lsp-length receive** *size*

Use the **no** form of this command to restore the default value.

**no lsp-length receive**

| Parameter Description | Parameter   | Description                                                                                                                  |
|-----------------------|-------------|------------------------------------------------------------------------------------------------------------------------------|
|                       | <i>size</i> | Specifies the maximum length of LSP packets. The value range is <b>1,492</b> to <b>16,000</b> in bytes according to the RFC. |

**Defaults** The default value is **1492**.

**Command Mode** IS-IS routing process configuration mode

**Default Level** 14

**Usage Guide** This command is used to control the maximum length of LSP packets that can be received by the local device. In fact, to prevent a route convergence failure, intermediate nodes need to receive LSP packets with the maximum length of the interface MTU as long as the memory permits. In this sense, this command seems nominal. The maximum length for receiving LSP packets cannot be less than the maximum length for transmitting LSP packets. If the maximum length for receiving LSP packets is less than the maximum length for transmitting LSP packets, the maximum length for receiving LSP packets is automatically adjusted to the maximum length for transmitting LSP packets.

**Configuration** The following example configures the maximum length for receiving LSP packets to 1498 bytes.

**Examples**

```
Ruijie(config)# router isis
Ruijie(config-router)# lsp-length receive 1498
```

## 4.51 lsp-refresh-interval

Use this command to set the LSP refresh interval. Use the **no** form of this command to restore the

default value.

**lsp-refresh-interval** *interval*

**no lsp-refresh-interval**

**Parameter  
Description**

| Parameter       | Description                                                             |
|-----------------|-------------------------------------------------------------------------|
| <i>interval</i> | LSP refresh interval in the range of 1 to 65535 with unit being second. |

**Defaults** By default, the lsp-refresh-interval is 900 seconds.

**Command  
Mode** IS-IS routing process configuration mode

**Usage Guide** If the LSP stable status lasts for the time of refresh interval, LSP will refresh this LSP and update the LSP version and publish it.  
It should be noted that the lsp-refresh-interval must be less than the max lifetime.

**Configuration** Ruijie(config)# **router isis**

**Examples** Ruijie(config-router)# **lsp-refresh-interval 600**

## 4.52 max-area-addresses

Use this command to set the maximal number of area address allowed. Use the **no** form of this command to restore the default value.

**max-area-addresses** *value*

**no max-area-addresses**

**Parameter  
Description**

| Parameter    | Description                                                         |
|--------------|---------------------------------------------------------------------|
| <i>value</i> | The maximal number of area address allowed, in the range of 3 to 6. |

**Defaults** By default, the max-area-addresses is 3.

**Command  
Mode** IS-IS routing process configuration mode

**Usage Guide** For the IS routers of Level-1, only the ones with the same max-area-addresses are allowed to establish the adjacency relation.

**Configuration** Ruijie(config)# **router isis**  
**Examples** Ruijie(config-router)# **max-area-addresses 5**

**Description**

### 4.53 maximum-paths

Use this command to set the maximum number of IS-IS equal-cost routing entries in the routing table.  
**maximum-paths** *maximum*

Use the **no** form of this command to restore the default value.  
**no maximum-paths**

| Parameter Description | Parameter | Description    |
|-----------------------|-----------|----------------|
|                       |           | <i>maximum</i> |

**Defaults** The default value is **2**.

**Command Mode** IS-IS routing process configuration mode, IS-IS address-family IPv6 configuration mode

**Default Level** 14

**Usage Guide** This command is used by the IS-IS protocol to control the number of IS-IS equal-cost routing entries in the routing table. The routing table itself also has a command for controlling the number of equal-cost routing entries. The effective number of equal-cost routing entries is the smaller of the two values.

**Configuration Examples** The following example sets the maximum number of IS-IS IPv4 equal-cost routing entries in the routing table to **5**.  

```
Ruijie(config)# router isis
Ruijie(config-router)# maximum-paths 5
```

The following example sets the maximum number of IS-IS IPv6 equal-cost routing entries in the routing table to **6**.  

```
Ruijie(config)# router isis
```

```
Ruijie(config-router)# address-family ipv6
Ruijie(config-router-af)# maximum-paths 6
```

## 4.54 max-lsp-lifetime

Use this command to set the maximum value of the LSP lifetime. Use the **no** form of this command to restore the default value.

**max-lsp-lifetime** *value*

**no max-lsp-lifetime**

### Parameter Description

| Parameter    | Description                                                                            |
|--------------|----------------------------------------------------------------------------------------|
| <i>value</i> | Maximum value of the LSP lifetime in the range of 1 to 65,535, with unit being second. |

### Defaults

By default, the max-lsp-lifetime is 1200 seconds.

### Command Mode

IS-IS routing process configuration mode

### Usage Guide

It should be noted that the max-lsp-lifetime must be greater the lsp-refresh-interval 300.

### Configuration Examples

```
Ruijie(config)# router isis
```

```
Ruijie(config-router)# max-lsp-lifetime 1500
```

### Related Commands

### Description

## 4.55 metric-style

Use this command to set the metric style. Use the **no** form of this command to restore the default metric style.

**metric-style** { **narrow** [ **transition** ] | **wide** [ **transition** ] | **transition** } [ **level-1** | **level-1-2** | **level-2** | ]

**no metric-style** { **narrow** [ **transition** ] | **wide** [ **transition** ] | **transition** } [ **level-1** | **level-1-2** | **level-2** | ]

### Parameter Description

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

|                   |                                                                                       |
|-------------------|---------------------------------------------------------------------------------------|
| <b>narrow</b>     | Uses the old metric style with the router interface metric ranging from 1 to 63.      |
| <b>wide</b>       | Uses the new metric style with the router interface metric ranging from 1 to 16777214 |
| <b>transition</b> | Allows the router to send and receive the new and old metric style.                   |
| <b>level-1</b>    | This metric-style on the Level-1 circuit.                                             |
| <b>level-2</b>    | This metric-style applies on the Level-2 circuit.                                     |
| <b>level-1-2</b>  | This metric-style applies on the Level-1-2 circuit.                                   |

**Defaults** By default, the metric-style is narrow.

**Command** IS-IS routing process configuration mode

**Mode**

**Usage Guide** The metric value of the interface is specified by the **isis metric** *metric* when the metric-style is set to narrow, while the metric value is specified by the **isis wide-metric** *metric* in case that the metric-style is set to wide or **transition**.

**Configuration** Ruijie(config)# **router isis**  
**Examples** Ruijie(config-router)# **metric-style wide**

|                  | <b>isis wide-metric</b> | Sets the wide metric of the interface. |

**Platform** N/A

**Description**

## 4.56 multi-topology

Use this command to enable IS-IS to support IPv6 unicast topology. Use the **no** form of this command to restore the default setting.

**multi-topology [ transition ]**  
**no multi-topology [ transition ]**

| Parameter Description | Parameter | Description       |
|-----------------------|-----------|-------------------|
|                       |           | <b>transition</b> |

**Defaults** By default, multitopology is not configured, namely, IS-IS does not support IPv6 unicast topology.

**Command** IS-IS address-family IPv6 configuration mode

**Mode**

- Usage Guide**
1. When this command is not configured, IPv4 and IPv6 share the same IS-IS physical topology, which is also called default topology.
  2. If the **transition** parameter is not specified, the device runs in multi-topology mode, the IS-IS v4 process works in the default topology while the IS-IS v6 process works in the IPv6 unicast topology.
  3. If the **transition** parameter is specified, the device runs in multi-topology transition mode and the IS-IS v6 process runs in both the default topology and IPv6 unicast topology.

The above three configurations are exclusive.

The device which runs in multi-topology transition mode can transmit the multi-topology TLV and the default topology TLV. The multi-topology transition mode can be applied in incremental deployment to ensure smooth network migration. However, this mode may cause leaking of routes between the default topology and IPv6 unicast topology. Be careful to configure multi-topology transition mode, as this configuration may lead to network problems such as route blackhole and network loop.

Before you configure this command, you need to set the metric style as wide or transition mode. Configuring the metric style as narrow and configuring only one Level to support wide or transition mode will disable the multitopology routing (MTR) function.

**Configuration** The following example configures multi-topology.

**Examples**

```
Ruijie(config)# router isis
Ruijie(config-router)# address-family ipv6
Ruijie(config-router-af)# multi-topology
```

**Related Commands**

| Command            | Description              |
|--------------------|--------------------------|
| <b>router isis</b> | Creates IS-IS instances. |

**Platform** N/A  
**Description**

### 4.57 net

Use this command to set the IS-IS NET (Network Entry Title) address. Use the **no** form of this command to delete this NET address.

- net** *net-address*  
**no net** *net-address*

**Parameter Description**

| Parameter          | Description                                                                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>net-address</i> | The format of net-address is shown as below:<br>XX..XXXX.YYYY.YYYY.YYYY.00, the XX...XXXX is the area address and the YYYY.YYYY.YYYY is the system ID. |

**Defaults** By default, no NET address is set.

**Command** IS-IS routing process configuration mode

**Mode**

**Usage Guide** This command is used to set the Area ID and System ID for the IS-IS. Up to three NET addresses are allowed to be set by default, namely three addresses with different Area can be set. However, the System ID must be the same.

**Configuration** Ruijie(config)# **router isis**

**Examples** Ruijie(config-router)# **net** 49.0000.0001.0002.0003.00

**Related Commands**

| Command            | Description              |

**Description**

## 4.58 passive-interface

Use this command to configure the passive interface. Use the **no** form of this command to remove the passive interface.

**passive-interface** [ **default** ] { *interface-type interface-number* }

**no passive-interface** [ **default** ] { *interface-type interface-number* }

**Parameter Description**

| Parameter               | Description                                      |
|-------------------------|--------------------------------------------------|
| <b>default</b>          | Configures IS-IS disabled interfaces as passive. |
| <i>interface-type</i>   | Indicates the interface type.                    |
| <i>interface-number</i> | Indicates the interface number.                  |

**Defaults** The passive interface is not configured by default.

**Command** IS-IS routing process configuration mode

**Mode**

**Usage Guide** Use this command to disable the interface to receive and send the IS-IS packets, but to advertise the IP address of the interface.

After the **default** option is configured, if the number of IS-IS disabled interfaces exceeds 255, the first 255 interfaces are configured as passive and the remaining interfaces are non-passive.

**Configuration** The following example configures interface GigabitEthernet 0/0 as passive.

**Examples** Ruijie(config)# **router isis** 1

```
Ruijie(config-router)# passive-interface GigabitEthernet 0/0
```

| <b>metric</b> <i>metric-value</i>                                                             | Sets the metric value of redistributing the route, in the range of 0 to 4261412864.<br>If the metric option is not specified, the external metric value is used.                                                                                                                                                                                                                                                                                                                                                 |
| <b>metric-type</b> { <b>internal</b>   <b>external</b> }                                      | Sets the metric type of redistributing the route.<br><b>internal</b> : use the internal metric type.<br><b>external</b> : use the external metric type.<br>If the metric-type is not specified, the <b>internal</b> type is used by default.                                                                                                                                                                                                                                                                     |
| <b>route-map</b> <i>map-tag</i>                                                               | Sets the route-map during the external routes redistribution, which is used to filter the redistributed routes or set attributions of the routes.<br>The name of <i>map-tag</i> shall not be over 32 characters.<br>No route-map is configured by default.                                                                                                                                                                                                                                                       |
| <b>level-1</b>   <b>level-1-2</b>   <b>level-2</b>                                            | Specifies the Level of receiving the redistributed routing information.<br>If the Level is not specified, it is defaulted to be redistributed into the Level-2 .                                                                                                                                                                                                                                                                                                                                                 |

|  |                                                                                                                                                                                                                      |
|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <p>The format is shown as below:</p> <p><b>level-1:</b> redistribute into the Level-1</p> <p><b>level-1-2:</b> redistribute into both Level-1 and Level-2.</p> <p><b>level-2:</b> redistribute into the Level-2.</p> |
|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Defaults** By default, no redistribution is configured.

**Command Mode** IS-IS routing process configuration mode , IS-IS address-family ipv6 mode

**Usage Guide** Configure "**no redistributbue { bgp | ospf processs-id | rip | connected | static }**" to disable protocol redistribution. If "**no redistribute**" is followed by any other parameter, it means that this parameter is restored to the default setting instead of disabling protocol redistribution. For example: "**no redistribute bgp**" will disable bgp redistribution, while "**no redistribute bgp route-map aa**" will disable route-map aa filtering during redistribution instead of disabling bgp redistribution. The routing information will be placed into the IP External Reachability Information TLV of LSP when redistributing external route in the IPv4 mode. The routing information will be placed to the IPv6 Reachable TLV of LSP when redistributing external route in the IPv6 mode. In the old version of some vendors, after configuring the **metric-type** to the **external**, the redistributed route metric will be added by 64 and then perform the routing according to the metric value during the routing calculation, which violates the protocol. In actual application, the priority of the external route may be higher than that of the internal route. When connecting with these old version of some vendors, the related configuration (such as the **metric** or the **metric-type**) of each device can be modified to ensure that the priority of the internal route is higher than the external.

The following example sets the metric value to 10.

**Configuration Examples**

```
Ruijie(config)# router isis
Ruijie(config-router)# redistribute ospf 1 metric 10 level-1
```

|                  | <b>redistribute isis [ tag ] level-2 into level-1</b> | Redistributes the reachable routing information from Level-2 into Level-1. |
|                  | <b>redistribute isis [ tag ] level-1 into level-2</b> | Redistributes the reachable routing information from Level-1 into Level-2. |
|                  | <b>route-map</b>                                      | Configures the route map.                                                  |

**Platform Description** N/A

## 4.60 redistribute isis level-1 into level-2

Use this command to redistribute the Level-1 reachable routing information of the IS-IS instance into

the Level-2 of current instance. Use the **no** form of this command to disable this redistribution.
